Boston, Massachusetts, U. S. America,

May 19th 1879.

Sir :

*In accordance with the wishes of my husband,
the late Dr. Charles Pickering, I have directed
Messrs. Little, Brown, & Co., of Boston, to forward
to your care, ~~through Trübner & Co.~~, a copy of the
work entitled "Chronological History of Plants,"
by Charles Pickering.*

*I shall consider it a favor if you will let me
know whether the work reaches you safely.*

Yours respectfully,

Sarah I. Pickering.

Address Mrs. Charles Pickering,

Care Little, Brown, & Co., Boston, Mass.,

U. S. America.

CHRONOLOGICAL
HISTORY OF PLANTS.

P R E F A C E.

THIS work, to the preparation of which the last sixteen years of DR. PICKERING'S life were devoted, forms the last of the contributions to knowledge due to the zeal and industry in the accumulation of facts which early distinguished him. Unhappily, he did not live to see its publication, but died March 17, 1878, while it was passing through the press.

The manuscript, however, was complete, even including the alphabetical index, the whole of which he had prepared, with the exception of the paging, which it was his custom to render conformable to the printed sheets of the work as fast as he received proofs of them. The manuscript was written with great care, and he had made very few changes in the pages, about six hundred and fifteen in number, which he had seen in type. The remainder of the work has accordingly been printed in exact conformity with the manuscript.

Three biographical notices of the author have been added; one from the "Unitarian Review" for April, 1878; another from the "Proceedings" of the American Academy of Arts and Sciences, Boston, Massachusetts; and a third from the "Proceedings" of the Academy of Natural Sciences, Philadelphia, Pennsylvania.

A steel engraving of a photograph of DR. PICKERING, taken a few years ago, has also been prefixed to the volume.

S. S. P.

Boston, U. S. A., May 1, 1879.

Charles Pickering

CHRONOLOGICAL

HISTORY OF PLANTS:

MAN'S RECORD

OF HIS OWN EXISTENCE ILLUSTRATED THROUGH THEIR NAMES,
USES, AND COMPANIONSHIP.

BY CHARLES PICKERING, M.D.,
AUTHOR OF "RACES OF MAN."

"And out of the ground the LORD God formed every beast of the field, and every fowl of the air; and brought them unto Adam to see what he would call them."

BOSTON:
LITTLE, BROWN, AND COMPANY.
1879.

A. 373

Entered according to Act of Congress, in the year 1879, by

MRS. CHARLES PICKERING,

In the Office of the Librarian of Congress, at Washington.

BIOGRAPHICAL NOTICES

OF

DR. CHARLES PICKERING.

THE Life of this distinguished naturalist is to be found in his works. His time, thought, and strength were given to them. They bear marks of the painstaking, patient, thoughtful, conscientious student, whose life was spent in the search after truth. He seemed to be the most equable and unexcitable of men; but underneath that quiet exterior was an enthusiasm which no dangers or difficulties could daunt, and which no amount of labor or length of time could chill. The love of knowledge in his chosen sphere was with him at once a governing principle and a ruling passion. It showed itself in his childhood, and continued as long as he lived. An early friend, Mr. John L. Gardner, speaking of the boyhood of Mr. John C. Lee, says: "You are right in supposing that our early rambles in Wenham were favorable to the cultivation and improvement of his natural liking for the wonders of animal and vegetable life; for our companion was CHARLES PICKERING, a born naturalist, who seemed instinctively to know all the habits and resorts of flying and creeping things, and has since become one of our most distinguished men of science."* At the time here referred to, Charles Pickering could not have been more than nine years old. But the passion which in his early boyhood gave him such an influence with his associates, only increased in strength with advancing years. It carried him into almost every corner of the earth in his search after facts pertaining to his favorite science. Nothing to him was common or unclean, if only it could throw some additional light on that. No weed was looked upon by him as worthless; no place seemed inaccessible; no ancient monuments or hieroglyphics were given up by him as illegible or unintelligible; no plodding through the dusty records of the remotest antiquity was wearisome to him,—if only it promised to furnish some new fact, which might add to the completeness of his work. We doubt if any one naturalist ever united in himself, so far as he did, the qualities of an exact original observer on the most enlarged scale and of an inquirer into all that had been learned before. His minute, laborious, and extended explorations, into all possible records of past ages, seemed of themselves more than enough for the work of a lifetime. It almost makes one's head ache to

* Memorial of John Clarke Lee, by Rev. E. B. Willson, p. 8.

look at the index, which barely points to the authors whom he had consulted and the subjects which he had investigated. If, with his vast accumulation of facts, he was exceedingly cautious in his generalizations, and looked sometimes with a sort of amused distrust on the popular theories of the hour, it should be regarded rather as a virtue than a failing in these days of hasty inferences from very imperfect data. He not only visited every quarter of the earth, but went through the whole range of history wherever it could bear upon his subject, in quest of any thing that might help him better to understand "The Races of Man and their Geographical Distribution, The Geographical Distribution of Animals and Plants, and The Chronological History of Plants." The field was vast; the laborer did not shrink from the work which it imposed, but engaged in it and carried it on all the more earnestly on that account. The ripest fruits of his labors are here placed before the reader.

Instead of attempting a sketch of the author's Life, we give below Notices which appeared soon after his death from persons who had seen him under different circumstances and in different relations. It is hoped that the reader will excuse in them a few repetitions.

J. H. M.

[The following Notice, written by Rev. JOHN H. MORISON, was published in the "Unitarian Review," April, 1878.]

DIED in Boston, March 17, of pneumonia, Dr. CHARLES PICKERING, a very remarkable man, whose life and uncommon powers of intellectual labor and attainment have been employed among us for the advancement of science and the improvement of our race.

He was the grandson of Colonel Timothy Pickering, a member of Washington's Cabinet, and one of the most distinguished men of his day. His father, Timothy, son of Colonel Pickering, died before he was thirty years of age. Charles was born in 1805, and with his brother Edward was brought up by their mother, Mrs. Lurena Pickering, a woman of rare excellence, and well fitted to fill the most responsible of all offices in the early training of two such sons. Very early Charles showed the strong bent of his mind towards natural history, and would come home from his boyish excursions loaded with plants, insects, birds, and quadrupeds. He was a member of the class of 1823 at Harvard College, and graduated from the Massachusetts Medical School in 1826. He practised medicine several years in Philadelphia, and while there devoted much of his time to the American Academy of Natural Sciences of that city, being an active member of that as of many other scientific societies.

In 1838, Dr. Pickering was appointed Naturalist of the United States Exploring Expedition, under the command of Charles Wilkes, U. S. N., and sailed with the expedition on board the "Vincennes." This must have given him grand opportunities for extending his favorite studies on a magnificent scale. And these oppor-

tunities for original observation were still further enlarged ; for soon after his return from this voyage on the 11th of October, 1843, he left Boston, and visited Egypt, Arabia, India, and the eastern part of Africa, for observation. After his return, he published, in 1848, "The Races of Man, and their Geographical Distribution," being vol. ix. of the Exploring Expedition. In 1854, he had ready for the press "The Geographical Distribution of Animals and Plants," being vol. xv. of the United States Exploring Expedition ; but, in consequence of the slowness of our government in such matters, only the first portion of this work has been printed.

The great work of Dr. Pickering's life, "The Chronological History of Plants," to which he had devoted sixteen years of laborious research, was only recently completed, and is now passing through the press.

One has only to reflect on the titles of these books, to see how vast an extent of knowledge was required to give to them the completeness at which Dr. Pickering always and conscientiously aimed. We are not competent to judge of their merits ; but we have no doubt of the immense stores of accurate and thoroughly digested information contained in these volumes. He was himself a living encyclopædia of knowledge. We do not suppose that there was a more learned naturalist in the world, if there was indeed one who had made more extended and minute original explorations. His mind was capacious enough to hold, and tenacious enough to keep, all the vast stores of knowledge which he had treasured up ; but no one ever had less a passion or a gift for display. He was the most modest of men. Only those who knew him best, and who from similar pursuits could sympathize with him, were able to see what a mine of knowledge he was.

His books are on too large a scale, and too much crowded with facts, ever to be popular. They must serve rather as vast storehouses ; and from them teachers and writers on natural history will draw the treasures which they may hold forth as gems or jewels to attract and delight the popular mind. He had as little the faculty of showing himself off, or making a show of what he knew, as any man that we ever have known.

The great and solid qualities of such a mind, and such a character and life, cannot be too earnestly commended in this age of self-seeking, when men are so ingenious and fertile in expedients to make a grand exhibition of their slender attainments, — like a Roman shop, where all the goods are exposed in the window.

Here was a man of large capacity, of the finest moral sensibilities, and the most perfect integrity, engaged during a long life in the profoundest studies, asking neither fame nor money, nor any other reward, but simply the privilege of gaining knowledge and storing it up in convenient forms for the service of others. He was fortunate and happy in his nearest relationships, and most exemplary in all his connection and intercourse with others. But the love of knowledge was the one passion of his life. He asked no richer satisfaction than to search for it as for hidden treasure.

It is said that we are a superficial people, and that we are always striving for immediate effect. This is too much the characteristic of our age, though probably

not more so than of any previous age. The froth and effervescence of the moment pass away, and only the substantial qualities come down to us from distant generations ; while the noise and excitement, and the superficial ambitions and agitations of the present hour, obtrude themselves upon us, and hide from us the more modest and enduring pursuits in which the ablest and best minds among us are engaged, and by which our age will be known among future generations. It is therefore very refreshing, and a great encouragement, to become acquainted with a man like Dr. Pickering, — so thoughtful, so able, so profound, so laborious, and far-reaching in his investigations, traversing distant continents and unknown seas, or exploring the records of distant ages, to extend and perfect our knowledge of the ways and works of God.

Dr. Pickering was married, in 1851, to Sarah S., daughter of the late Daniel Hammond, Esq., of this city, and leaves no children. His name and memory will always be dear to those who knew him ; and his works will always be a helpful legacy to those who, with the same love of truth, shall be engaged in similar pursuits.

[At a meeting of the Academy of Natural Sciences of Philadelphia, May 7, 1878, the President, Dr. W. S. W. RUSCHENBERGER, read the following :]

It is a custom of this Society to announce the death of every member or correspondent when it occurs, without accompanying the announcement with a notice of his career. From this custom may be excepted those members who have been conspicuous by their success in the cultivation of natural science, or who have won the general approbation of the Academy by generous contribution towards the advancement of science, or who have largely aided the progress of the Society by their labors.

For such reasons, it seems appropriate that the archives of the Society should contain a record to show why his contemporary and fellow-members entertained sentiments of sincere respect and cordial esteem for the late Dr. CHARLES PICKERING.

The records show that Charles Pickering, M.D., of Salem, Mass., was elected a correspondent of this Society Nov. 28, 1826. He had then just entered the twenty-second year of his age. Early in the following year (1827), he became a resident of Philadelphia, and therefore a member. From that date until 1838, he was rarely absent from any meeting of the Academy.

At that time, the details of the affairs of the Society were conducted chiefly by standing committees. Dr. Pickering served on the Zoölogical Committee from Dec. 25, 1827, until January, 1838, — ten years ; on the Botanical Committee from Dec. 28, 1828 (of which he was the chairman from January, 1833), until January, 1837, — eight years ; on the Publication Committee from December, 1829, until De-

cember, 1833,—four years; and on the Library Committee from January, 1837, until January, 1838,—one year.

He was Librarian from December, 1828, until December, 1833,—five years; and a Curator from December, 1833, until December, 1837,—four years.

The record tells us that he discharged faithfully and efficiently the duties of all the positions to which he was appointed.

To Dr. Pickering was intrusted the transfer to the Academy of the great collection of plants bequeathed by the Rev. Lewis David Von Schweinitz, who died in 1834. He prepared a catalogue of American plants in the collection of the Academy, and presented it at the stated meeting held May 13, 1834. Those plants which were previously in the collection, many of them Mr. Nuttall's types, he intercalated in the Schweinitz herbarium, attaching an appropriate label to each. On the 24th of March, 1835, on motion of Professor H. D. Rogers, it was unanimously resolved, "That the thanks of the Society be awarded to Dr. Charles Pickering for the highly successful manner in which he has executed the very arduous task of collating and arranging the extensive herbarium of the Academy."

The work done by Dr. Pickering has contributed much to facilitate the labors of his successors in the botanical department of the Academy.

On the 26th of January, 1836, on motion of Dr. Samuel George Morton, it was unanimously resolved, "That the grateful thanks of the Institution be tendered to Dr. Pickering for his voluntary journey to New Harmony, the faithful execution of the trust reposed in him of selecting from the library of Mr. Maclure such works as were designed for the Academy, and for the prompt and successful arrangements made by him for the transportation of said books to this city."

The mission just referred to occupied Dr. Pickering about three months, and brought to the Academy's library an addition of about 2,300 volumes of valuable scientific works.

The services of Dr. Pickering to the Academy were important in every sense, and are worthy of grateful remembrance.

While laboring for the Academy, he qualified himself perfectly to discharge efficiently those duties which devolved upon him in 1838, when he became a member of the United States Exploring Expedition. The means and facilities requisite for the instruction and training of students of natural science were at that period nowhere in the country more ample than in the Academy; and it is believed that at this time they are not better in any other institution in the United States.

On the 19th of October, 1827, Dr. Pickering read, at a meeting of the American Philosophical Society, a paper "On the Geographical Distribution of Plants," which was published in the third volume of the "Transactions" in 1830. He was elected a member of the American Philosophical Society Jan. 15, 1828, and resigned in November, 1837.

He was elected Recording Secretary of the Pennsylvania Horticultural Society February, 1830, and served till September, 1837, when he resigned.

In conjunction with James H. Dana, Dr. Pickering read, Feb. 20, 1838, before the Yale Natural History Society, of which he was a member, a "Description of a Crustaceous Animal belonging to the genus *Caligus*, *C. Americanus*," which occupies forty pages of vol. xxxviii. of Silliman's "Journal."

Dr. Pickering was appointed a member of the scientific corps attached to the United States Exploring Expedition, under command of Lieutenant Charles Wilkes. He was placed on board of the flag-ship "Vincennes." The expedition sailed from Hampton Roads Aug. 19, 1838, and arrived off Sandy Hook, N. Y., June 10, 1842, after an absence of nearly four years. He is recorded among those present at the stated meeting of the Academy July 5, and frequently afterwards until he again went abroad. The first record of his presence after his return is May 20, 1845, and from that date he occasionally attended meetings every year. He was last present Nov. 7, 1876.

Oct. 11, 1843, Dr. Pickering left Boston and visited Egypt, Arabia, India, and the eastern part of Africa, for the sake of extending and verifying observations made while attached to the United States Exploring Expedition. Upon his return he settled in Boston, and prepared his "Races of Man and their Geographical Distribution," quarto, pp. 447, published by Charles C. Little and James Brown, Boston, 1848, being vol. ix. of the Exploring Expedition.

In 1850 he contributed a paper, Enumeration of the Races of Man, to the "Edinburgh New Philosophical Journal," vol. xlviii.

His work entitled "The Geographical Distribution of Animals and Plants," quarto, pp. 212, being vol. xv. of the Exploring Expedition, was published by Little & Brown, Boston, 1854.

In the "Proceedings" of the American Academy of Arts and Sciences are recorded his observations on the Egyptian computation of time, October, 1849; on the Egyptian Astronomical Cycle, May, 1850; on Sulphur Vapor, Dec. 9, 1856; on the Coptic Alphabet, March 8, 1859; on the Geographical Distribution of Species, March 22, 1859, and Dec. 11, 1860; and on the Jewish Calendar, Oct. 11, 1864. At the request of the Secretary of the Institution he prepared a paper on the Gliddon Mummy Case in the Museum of the Smithsonian Institution, in June, 1867, which is published in vol. xvi. of the "Smithsonian Contributions to Knowledge."

The "Geographical Distribution of Animals and Plants. Part II. Plants in their Wild State," quarto, was published by the Naturalists' Agency, Salem, 1876. It is preceded by a note: "The following 524 pages comprise about one-half of a prepared volume, the printing of which was suspended in 1860. — Charles Pickering."

The great work of Dr. Pickering's life, "The Chronological History of Plants," to which he had devoted sixteen years of laborious research, was only recently completed, and is now passing through the press.

This imperfect summary of work completed is sufficient evidence of his unremitting industry, and suggests that he fully utilized his opportunities to qualify himself for research during the ten years he zealously wrought in the offices and on

the committees of the Academy. He was certainly a distinguished alumnus of the Institution.

Dr. Pickering was characterized by imperturbable firmness of purpose, and by his loyalty to truth, and integrity in every sense. He was extremely modest, averse to parade, and remarkably free from pretension of every kind. His acquirements were extensive, varied, and minutely accurate. His friends loved him for his unaggressive, always tranquil temper, and his obliging disposition.

To this imperfect outline of Dr. Pickering's scientific career, though a thing apart, may be added a few words on his heredity.

Colonel Timothy Pickering, his grandfather, was a native of Salem, Mass., but his active participation in the Revolution brought him to Philadelphia. He served in the army, took part in the battles of Brandywine and Germantown, and was present at the surrender of Yorktown. He was appointed postmaster-general, August, 1792, secretary of war, January, 1795, and secretary of state, December, 1795, from which office he was removed May 12, 1800, by President John Adams. His son, Timothy Pickering, jr., the father of Dr. Pickering, was born in this city Oct. 1, 1779. He graduated at Harvard College; was appointed a midshipman in the navy Jan. 17, 1799; served creditably one cruise under command of the famous Stephen Decatur, and resigned May 2, 1801.

His father, Colonel Pickering, had acquired extensive tracts of "wild lands" in western Pennsylvania. Finding himself in restricted circumstances when removed from office by President John Adams, he determined to transfer his family to those lands with a view to their settlement. Timothy Pickering, jr., joined his father, and settled at Starucca, now in Susquehanna County, Pa. There he married Lurena Cole, Dec. 29, 1804, and there Dr. Charles Pickering was born Nov. 10, 1805. His father died May 14, 1807, in the twenty-eighth year of his age. A few years prior to this date, Colonel Pickering had changed his place of residence to a farm at Wenham, near Salem, and thither he took the widow and her son to remain members of his own household. There Dr. Pickering was raised and educated, under the immediate direction of his mother and the supervision of his distinguished grandfather.

[The following article, by Dr. ASA GRAY, is reprinted from the "Proceedings" of the American Academy of Arts and Sciences, vol. xiii.]

CHARLES PICKERING, M. D., died in Boston, of pneumonia, on the 17th of March, 1878, in the seventy-third year of his age. He was of a noted New England stock, being a grandson of Colonel Timothy Pickering, a member of Washington's military family and of his first Cabinet as President; and he was elected into this Academy under the presidency of his uncle, John Pickering. He was born on Starucca Creek, on the Upper Susquehanna, in the northern part of Pennsylvania, at a settlement

made on a grant of land taken up by his grandfather, who then resided there. His father, Timothy Pickering, jr., died in the twenty-eighth year of his age, leaving to the care of the mother — who lived to a good old age — the two sons, Charles and his brother Edward, who were much united in their earlier and later lives, and were not long divided in death, the subject of this notice having been for only a year the survivor.

Dr. Pickering was a member of the class of 1823 at Harvard College, but left before graduation. He studied medicine, and took the degree of M. D. at the Harvard Medical School in 1826. Living in these earlier years at Salem, he was associated with the late William Oakes in botanical exploration; and it is believed that the two first explored the White Mountains together, following in the steps of the first botanist to ascend Mount Washington, Dr. Manasseh Cutler of Essex County, and of Francis Boott and Dr. Bigelow. His taste for natural history showed itself in boyhood, both for botany and zoölogy, and probably decided his choice of a profession. He may have intended to practise medicine for a livelihood when, about the year 1829, he took up his residence at Philadelphia; but it is probable that he was attracted thither more by the facilities that city offered for the pursuit of natural history than by its renown as a centre of medical education. We soon find him acting as one of the curators of the Academy of Natural Sciences, and also as librarian, and with reputation established as the most erudite and sharp-sighted of all the young naturalists of that region. His knowledge then, as in mature years, was encyclopedic and minute; and his bent was toward a certain subtlety and exhaustiveness of investigation, which is characteristic of his later writings. Still, in those days in which he was looked up to as an oracle, and consulted as a dictionary by his co-workers, he had published nothing which can now be recalled, except a brief essay on the geographical distribution and leading characteristics of the United States flora, which very few of our day have ever seen.

When the United States surveying and exploring expedition to the South Seas, which sailed under the command of then Lieutenant Charles Wilkes in the summer of 1838, was first organized under Commodore T. Ap-Catesby Jones, about two years before, Dr. Pickering's reputation was such that he was at once selected as the principal zoologist. Subsequently, as the plan expanded, others were added. Yet the scientific fame of that expedition most largely rests upon the collections and the work of Dr. Pickering and his surviving associate, Professor Dana; the latter taking, in addition to the geology, the Corals and the Crustacea, and other special departments of zoölogy being otherwise provided for by the accession of Mr. Couthouy and Mr. Peale. Dr. Pickering, although retaining the ichthyology, particularly turned his attention, during the nearly four years' voyage of circumnavigation, to anthropology, and to the study of the geographical distribution of animals and plants; to the latter especially, as affected by or as evidence of the operations, movements, and diffusion of the races of man. To these the subjects of his predilection, and to investigations bearing upon them, all his remaining life was assiduously devoted. The

South Pacific exploring expedition had visited various parts of the world ; but it necessarily left out regions of the highest interest to the anthropological investigator, those occupied in early times by the race to which we belong, and by the peoples with which the Aryan race has been most in contact. Desirous to extend his personal observations as far as possible, Dr. Pickering, a year after the return of the expedition, and at his own charges, crossed the Atlantic, visited Egypt, Arabia, the eastern part of Africa, and western and northern India. Then, in 1848, he published his volume on "The Races of Man, and their Geographical Distribution," being the ninth volume of the Reports of the Wilkes' Exploring Expedition. Some time afterwards, he prepared, for the fifteenth volume of this series, an extensive work on "The Geographical Distribution of Animals and Plants." But, in the course of the printing, the appropriations by Congress intermitted or ceased, and the publication of the results of this celebrated expedition was suspended. Publication it could hardly be called ; for Congress printed only one hundred copies, in a sumptuous form, for presentation to States and foreign courts ; and then the several authors were allowed to use the types and copper-plates for printing as many copies as they required and could pay for. Under this privilege, Dr. Pickering brought out in 1854 a small edition of the first part of his essay, — perhaps the most important part, — and in 1876 a more bulky portion, "On Plants and Animals in their Wild State," which is largely a transcript of the note-book memoranda as jotted down at the time of observation or collection.

These are all his publications, excepting some short communications to scientific journals and the proceedings of learned societies to which he belonged. But he is known to have been long and laboriously engaged upon a work for which, under his exhaustive treatment, a lifetime seems hardly sufficient, — a digest, in fact, of the history and migrations of all the animals and plants with which civilized man has had to do from the earliest period traceable by records. When Dr. Pickering died, he was carrying this work through the press at his own individual expense ; had already in type five or six hundred quarto pages ; and it is understood that the remainder, of about equal extent, is ready for the printer. This formidable treatise is entitled "Chronological History of Plants: Man's Record of his own Existence, illustrated through their Names, Uses, and Companionship." Its character is indicated in the brief introductory sentences : —

"In the distribution of species over the globe, the order of Nature has been obscured, through the interference of man. He has transported animals and plants to countries where they were previously unknown ; extirpating the forest and cultivating the soil, until at length the face of the globe itself is changed. To ascertain the amount of this interference, displaced species must be distinguished, and traced each to its original home. Detached observations have already been given in the twenty-first and succeeding chapters of my 'Races of Man ;' but, when such observations are extended to all parts of the globe, the accumulated facts require some plan of arrangement. A list will naturally assume the chronological order, beginning

with Egypt, the country that contains the earliest records of the human family, and receding geographically from the same central point of reference."

Then, starting with "4713 B.C.," and "4491 B.C., beginning of the first Great Year in the Egyptian reckoning," he begins the list, which, under the running heading of "Chronological Arrangement of accompanying Animals and Plants," first treats of the vegetables and animals mentioned in the book of Genesis, and of the "Commencement of Bedouin or Nomadic Life in the Desert;" passes to the "Colonization of Egypt," and to critical notices (philological and natural-historical) of its plants and animals, as well their earliest mention as their latest known migrations; reaches the beginning of the Christian era at about the 470th page; and so proceeds, till our wonder at the patience and the erudition of the writer passes all bounds. We are ready to agree with a biographer, who declares that our associate was "a living encyclopædia of knowledge;" that there never was a naturalist "who had made more extended and minute original explorations;" and we fully agree that "no one ever had less a passion or a gift for display;" "that he was engaged during a long life in the profoundest studies, asking neither fame nor money, nor any other reward, but simply the privilege of gaining knowledge and of storing it up in convenient forms for the service of others;" that "the love of knowledge was the one passion of his life," and that "he asked no richer satisfaction than to search for it as for hidden treasure." He was singularly retiring and reticent, very dry in ordinary intercourse, but never cynical; delicate and keen in perception and judgment; just, upright, and exemplary in every relation; and to those who knew him well communicative, sympathetic, and even genial. In the voyage of circumnavigation he was the soul of industry, and a hardy explorer. The published narrative of the commander shows that he took a part in every fatiguing excursion or perilous ascent. Perhaps the most singular peril (recorded in the narrative) was that in which this light-framed man once found himself on the Peruvian Andes, when he was swooped upon by a condor, evidently minded to carry off the naturalist who was contemplating the magnificent ornithological specimen.

Dr. Pickering married in the year 1851, and leaves a widow, but no children to inherit this honored name.

MAN'S RECORD

OF

HIS OWN EXISTENCE.

IN the distribution of species over the Globe, the order of nature has been obscured through the interference of man. He has transported animals and plants to countries where they were previously unknown; extirpating the forest and cultivating the soil, until at length the face of the Globe itself is changed.

To ascertain the amount of this interference, displaced species must be distinguished, and traced each to its original home. Detached observations have been already given in the Twenty-first and succeeding chapters of my *Races of Man*; but, when such observations are extended to all parts of the Globe, the accumulated facts require some plan of arrangement.

A list will naturally assume the chronological order, beginning with Egypt, the country that contains the earliest records of the human family; and receding geographically from the same central point of reference.

"4713 B. C." (= 4493 + $\frac{1}{3}$ of a "phœnix," = 220 years = $\frac{1}{7}$ of a "Great Year"), the so-called "Julian Period." The Egyptian years however being calendar years = 4711 B. C.

4491 B. C. (= 4493 in calendar years = 2953 + 1540), beginning of the first *Great Year* in the Egyptian reckoning.

Artemisia Judaica of the Sinai Desert. A kind of *wormwood* called in Egypt "shyeh;" in which we recognize the "shyh" of Genesis ii. 5, — xxi. 15, Job xxx. 4 to 7, and "shea" of Haly Abbas, and Avicenna: A. *Judaica* was observed by Rauwolf iii. 22. p. 456, and Hasselquist, in Palestine; by Forskal p. 198, and Delile, in the Desert around Suez, collected there for transportation to the drug shops of Egypt.

The "land of Havilah" containing *gold*, "*bdellium* and the *onyx-stone*" — (Gen. ii. 11) has been identified with a district on the Persian Gulf at the mouth of the Euphrates: where the principal of the Bahrein islands continues to bear the name Aval (Gen. x. 7 and 29, xxv. 18, Forster, and Sm. geogr. dict.).

Borassus dichotomus of the shores of the Persian Gulf. A branching palm called "oka-mundel" (Graham): the "vthlh" of the land of Havilah — (Gen. ii. 11), and of Numb. xi. 7, is identified by Josephus, Aquila, Symmachus, Theod. . . . , and Hieronymus, with "vthëlliön," the gum-like substance *bdellium*: "vthëlliön" is described by Dioscorides as the exudation of an Arabian tree; and among the Romans "*bdellium*" is mentioned by Plautus, and Pliny: the "dum" of Abu Hanifa is identified by Ebn Baitar with the "mukl;" Arabian *bdellium* according to Avicenna 206 is the product of a kind of palm called "rum" (read "dum" by Sprengel); and a second branching palm called "dum," but sometimes "tafi," was observed by Forskal cxxvi. under cultivation in Yemen. Eastward, *bdellium* is called in Hindustanee "gugal" or "muql" (D'roz.); "mokl asrak" or *bdellium* according to Kaempfer amoen. 668 is the inspissated juice of fruit of a flabellate-leaved palm growing on both sides of the Persian Gulf, but not met with by himself; its preparation "from the unripe fruit" was witnessed by Herbertus de Jager (who however gives the species as "*B. flabelliformis*"): *B. dichotomus* was observed by Vaupel "in various parts of Goozerat," also covering "the whole of Diu Island," and according to Nimmo "a solitary tree grows" as far South as the vicinity of Bombay, but its "fructification has not been examined" (Graham).

Balsamodendron agallocha of Northeastern Hindustan. A small tree called in Sanscrit "googula" (Lindl.), in Bengalee "googul" (Drur.); and its reputed product, called in Bengalee "guggul" and in Hindustanee "gugal" or "muql" (D'roz.), is possibly the "vthlh" in question: — the kind of "vthellion" brought by the way of Petra from India is described by Dioscorides as inferior in quality, emitting less fragrance when burned as incense; and the "indicum" kind is distinguished from the Bactrian by Pliny xii. 19: *B. agallocha* is regarded by Royle antiq. hind. med. as the probable source of *Indian bdellium*; is termed "amyris commiphora" by Roxburgh ii. 244, is known to grow in Silhet and Assam, its trunk crooked with many drooping crooked branches, the branchlets often ending in thorn-like points, and the googul is collected from incisions in the cool season (Lindl., and Drur.). From transported specimens, is termed "commiphora Madagascariensis" by Jacquin hort. ii. pl. 249. (See B. mukul.)

Balsamodendron Africanum of Equatorial East Africa. Called in the Kinyoro language "m'gazoo," at Ugogo "katatee" (Grant); and possibly included in the "vthlh" in question: — observed by Grant frequent from "2° S. to 3° N." on the Nile, and affording *bdellium*, the "Wanyamuezi" boil its gum, mix it with butter, and anoint their persons." The plant, received from Africa, is described by Arnott.

4271 B. C. (= 1141 + "130 years" of Gen. v. 3 = 4273 in Egyptian calendar years = 4493 — $\frac{1}{3}$ of a "phoenix" or $\frac{1}{2}$ of a "Great Year"), Adam.

Ficus carica of the countries around the Persian Gulf. Called in Britain *fig*, in Greece "sukēa" (Fraas), in Egypt and Yemen "tin" (Forsk.), in which we recognize the "tanē" whose leaves were sewed together for aprons — (Gen. iii. 7), mentioned besides in Numb. xiii. 23 and xx. 5, Deut. viii. 8, Micah iv. 4, 2 K. xx. 7, and Zechariah iii. 10: clusters of the fruit are figured among offerings under the Fourth dynasty at Gizeh (Leps. d. ii. pl. 10); figures of the tree with its peculiar leaves were observed by myself under the Twelfth dynasty at Benihasan, also under the Seventeenth and Eighteenth; and to the present day the tree is commonly cultivated in the gardens of Egypt (Del., and Lane). Farther North, the "suke" is mentioned by Homer, Herodotus, Aristophanes, and other Greek writers: a "figus" was standing on the site selected for the city of Rome, and dried figs carried by Helico home to Switzerland were among the novelties that brought on the First invasion of the Gauls (Plin. xii. 2 and xv. 20): *F. carica*, belonging to a Tropical genus, does not harmonize with the vegetable growth in the Mediterranean countries, but has at least become completely naturalized. Southward from Egypt, was observed by Forskal only under cultivation in Yemen; and I found it only in the cultivated state on Zanzibar. Eastward, is called "unjeer" in Persian and as far as Bombay, "dumur" or "dumbar" in Bengalee (D'roz. and Lindl.), occurs "in gardens all over India" (Graham), as witnessed also by myself; and is enumerated by Mason as "exotic" in Burmah. By European colonists, was carried to America, where it continues under successful cultivation in our Southern States.

Syneio Arabicus of Egypt and Northern Arabia. A kind of *grounbel* called in Egypt "kus" (Forsk.), in which we recognize the "kwitz" of the expulsion — (Gen. iii. 18), mentioned besides by Isaiah xxxii. 13, Jeremiah iv. 3, and Ezekiel xxviii. 24: *S. Arabicus* was observed by Forskal, and Delile, growing spontaneously around Cairo. From transported specimens, is described by Linnæus, and Moench (Pers., and Steud.).

Suaeda hortensis of Arabia and Egypt. A salsolaceous plant called in Egypt "tartyr" (Del.), in which we recognize the "thrtlr" of the expulsion — (Gen. iii. 18), and of Hosea x. 8: *S. hortensis* was observed by Delile growing spontaneously around Cairo; by Forskal p. 71, frequent there in gardens, growing also among rubbish around Taes in Yemen, but called "mullah" in both localities. "*S. trigyna*" observed by Cavanilles iii. pl. 289 in Spain, is regarded by Schultes as probably identical (Steud.).

Inabasis aphylla of the Egyptian, Syrian, and Tartarian Desert. Another salsolaceous plant called in Egypt "tartir" (Forsk.), and therefore possibly the "thrtlr" in question: — *A. aphylla* is not a weed, but grows in the sands of the Desert; was observed by Forskal p. 55 around the pyramids, and by Delile, near Alexandria. Farther North, by Sibthorp as far as Thyatira in Asia Minor; is known to grow also around Tripoli, and on the shores of the Caspian (Buxb. cent. i. pl. 18, Pall., and Pers.).

Second generation. September 1st, 4234, among living men.

The "tzan" of Genesis iv. 2 — is admitted to be the *sheep* (compare 1 Sam. xxv. 2); regarded even by Dicæar as probably the first animal domesticated (Varro re rust. ii. 1). The sheep forms one of the original hieroglyphic characters: the breed being the remarkable one with spreading horns (Leps. d. ii. pl. 6) kept in flocks under the Third and Fourth dynasties; and after it became extinct, the pattern of the head continuing in mythological representations and hieroglyphic writing. Sheep with curled horns make their first appearance under the Twelfth dynasty, at Benihasan. The long duration of certain breeds of sheep is shown by Dinon's mention of the Somali

breed, covered with hair instead of wool; and by the further remark of Marco Polo 192, that the head is always black and the body white; a peculiarity I found true to the present day. In Switzerland, during the Stone Age, sheep were in some instances kept by the inhabitants; as appears from debris of the earliest villages (Herr, in Troyon). Eastward, the sheep is mentioned in the Sama Veda (Stevenson), and the Institutes of Menu (Braminical version); the head forms part of an imaginary animal in the Buddhist cave-temples at Adjunta; and I remarked ram-headed personages in the Braminical cave-temples at Ellora. By European colonists, the sheep has been successfully introduced into America, the Hawaiian Islands, and Australia.

Abel slain by his brother Cain. Who departed to the land of "nwth" refuge, "east of Eden"; — and building a stronghold "oyr," named it after "his son Enoch" (Gesen., and Greenf.).

Third generation. Jan. 1st, 4200, among living men: Enoch son of Cain.

Fourth generation. May 1st, 4167, among living men: Irad son of Enoch.

4141 B. C. (= 4036 + "105 years" of Gen. v. 6), Seth.

Fifth generation. Sept. 1st, 4134, among living men: Mehujael son of Irad.

Sixth generation. Jan. 1st, 4100, among living men: Methusael son of Mehujael.

Seventh generation. May 1st, 4067, among living men: Lamech son of Methusael and the second homicide on record, Adah and Zillah the two wives of Lamech.

4036 B. C. (= 3946 + "90 years" of Gen. v. 9), Enos. "Then it was begun to call on name of Jehovah" — (Gen. iv. 26); essentially the invocation continuing among the Arabs to the present day.

Eighth generation. Sept. 1st, 4034, among the living: Naamah daughter of Zillah.

Instruments of *music* invented by Jubal son of Adah (Gen. iv. 21).

The "knwr" or *harp* invented by Jubal — is admitted to be some form of that instrument. Harpers are figured in Egypt under the Fourth dynasty; and under the Twelfth, a different form of harp is carried by the foreigners at Benihasan. The "knwr" is again mentioned in Gen. xxxi. 27; was improved by David, Am. vi. 5, 1 Sam. xvi. 23 to xix. 9; was in use under Solomon and Jehoshaphat, 2 Sam. vi. 5, 2 Chron. xx. 27; and down to the captivity, Psalm cxxxvii. 2; and in some of these passages, is translated "kinura" in the Septuagint. The instrument figured on coins ascribed to Simon Maccabæus (Kitt. cycl. bibl. ii. p. 371 and 373), is probably the "knwr" of the Jews.

The "owgb" or organ invented by Jubal — is referred by Gesenius and others to the mouth-organ or *syrinx*, also called "Pandean pipe." The "surigx," according to Horapollon ii. 109, forms a hieroglyphic character; and a character not unlike the instrument occurs on the monuments from the time of at least the Twenty-sixth dynasty. The "owgb" is again mentioned in Psalm cl. 4, Job xxi. 12, xxx. 31; and the "surigx" is regarded as of remote antiquity by Pindar xii., Aristotle poet. i., Virgil ecl. ii., and Athenæus iv. 182. To the present day, the Pandean pipe is in use in Egypt and Syria (Kitt. cycl. bibl.); and was seen by myself as far East as the Feejee Islands.

Tubal-cain son of Zillah is named in Gen. iv. 22 as the first worker of *metals*, "an instructor of every artificer in brass and iron." — Traditional reminiscences of Tubal-cain appear to have reached the time of the Romans; etymology identifying him with the Latin "Vulcanus."

The "nhshd" is admitted to be *copper*, and may have been procured at Wadi Maghara in the Sinai peninsula; if so, here will be the commencement of *Monumental history*: — metals were known to the Egyptians as early at least as the Second king of the Third dynasty (Maneth.), and may have been procured from this very mine; containing at least the hieroglyphic oval of a successor in the same dynasty.

Commencement of Bedouin or *nomadic life* in the Desert, by another son of Adah, Jabal by name — and "the father of such as dwell in tents and (of such as have) cattle" (Gen. iv. 20). Confirmation is again found at Wadi Maghara, in the native figured under the Third dynasty, clearly belonging to the *White Race*, and in features, beard and costume well representing the Arabs inhabiting the Sinai peninsula to the present day.

Ninth generation. Jan. 1st, 4000, among living men.

II. COLONIZATION OF EGYPT.

In comparison with lands clothed with vegetation, Egypt presents a most uninviting aspect: an upland waste of bare light-coloured soil, even where exposed to the sea air of the Mediterranean; and on advancing inland, seeming interminable and destitute of vegetation.

The Desert is known to be intersected by a deeply-sunk narrow trench containing the river with its borders rendered level by the overflow, and thus far covered with grasses and other herbaceous and humble plants; a thread of green across a vast expanse from South to North, widening only on reaching the many channels of the outlet. There are naturally no trees; or at least, the *willow* (*Salix subserata*) at the river-brink is very rare, and seems properly to belong to Nubia.

In the Desert however, where plants at first seem wanting and are only to be found by diligent search, there are at least two kinds of shrubs: a low bushy *Acacia*, and a *tamarisk*; alike inconspicuous, and very rarely met with. The other Desert plants are also inconspicuous and occur singly at long intervals.

On now including both Desert and river-flat, the flora of Egypt is mainly characterized by its meagerness, and by negative traits. The soil everywhere powdery is found to be devoid of cryptogamous plants, of Lichens, Mosses, and Ferns (the exceptions confined to artificial localities, as the top of pyramids and walls of cisterns, with a single Fern *Adiantum capillus-veneris* growing within reach of the sea air of the Mediterranean).

Of other tribes of plants abounding in Syria and on the nearest Greek islands, the following disappear: Saxifragaceæ, Droseraceæ, Primulaceæ, Violaceæ, Valerianaceæ, Gentianaceæ (with the exception of *Erythraea spicata* on the seashore), Orchidaceæ, the genus *Carex* (with the exception of *C. divisa* on the seashore), Hypericaceæ, Globulariaceæ (with the exception of *G. alypum* along the Mediterranean within reach of the sea air), Onagraceæ, Crassulaceæ, Dipsacaceæ (with the exception of *Scabiosa arenaria* on the seashore), Rosaceæ (with the exception of *Poterium sanguisorba* within reach of the sea air of the Mediterranean), and heaths with all Ericaceæ especially marking the striking change in climate and soil.

Though a careful observer throughout my stay in Egypt I did not make extended notes, nor seek to distinguish in all instances the imported plants. I did not anticipate ever being engaged in a work like the present, and have here to offer only a compiled account of the indigenous vegetable growth, to be revised and amended by future observers.

Beginning with the Desert, unchanged in aspect throughout the whole period of human history, no plants brought by the hand of man having found foothold, the *Desert plants* may be enumerated as follows:—

Munzpernum leæba; not far from Cairo, Forsk.; and in Upper Egypt, Del.

Banias spinosa, L.; not far from Cairo, Forsk.

Anastatica Hieracuntica, L.; not far from Cairo, Forsk. Extending to Barbary, Pers.

Ricotia Aegyptiaca, L.; in Syria not far from Salehyeh, Savign. and Del.

Lunaria parviflora, Del.; around the pyramids at Sakhara, Del.

Sisymbrium hirsutum, Vahl; not far from Cairo, Forsk. and Del.

Cheiranthus lividus; not far from Cairo, Forsk. and Del.

Farsetia scabra, Cheiranthus of Desf.; not far from Cairo, Forsk.; and observed by myself around the pyramids of Gizeh. Extending into Arabia and Barbary, growing also near Smyrna, Pers. and Sibth.

Hesperis acris, Forsk.; not far from Cairo, Forsk.; Desert of "Gubbeh" and at "Mataryeh," Del.

——— *pygmaea*, Del.; not far from Alexandria, also on the boundary between Egypt and Syria, Oliv., Savign., and Del.

Brassica teretifolia, Desf.; around the pyramids at Sakhara, Del. Extending to Barbary, Desf. and Pers.

Eruaria crassifolia, Brassica of Forsk.; not far from Cairo, Forsk.; and "near the pyramids of Sakhara," Del.

Capparis Aegyptiaca, Lam.; near Minyeh in Upper Egypt, Del.

Cleome Aulica, Cleome of L.; "around the pyramids," Del. Extending into Arabia and Barbary, Shaw, Desf., and Pers.

Roridula droserifolia, Forsk.; not far from Suez, Forsk.; ravines between the Nile and the Red Sea, Del.

Sodada decidua, Forsk.; throughout Yemen, Forsk.; and in Upper Egypt, Del.

Reseda canescens, L.; not far from Cairo, Forsk. and Del.; "Salmantica," Pers.

——— *subulata*, Del.; Cairo to Alexandria, Del.

——— *pruinosa*; not far from Alexandria, also in Syria, Del.

Ochradenus baccatus, Del.; not far from Suez, also in Upper Egypt, Del.

Helianthemum Lippii, Cistus of L.; not far from Alexandria, Forsk. and Del.

——— *stipulatum*, Cistus of Forsk.; not far from Cairo, Forsk. and Del.

——— *glutinosum*, Cistus of L.; not far from Alexandria, Del. Extending to the Northern shores of the Mediterranean, Cav. and Pers.; but not yet found in Greece.

——— *roseum*, Cistus of Jacq.; not far from Alexandria, Del.

Frankenia revoluta, Forsk.; not far from Alexandria, Forsk. and Del.

Alsine succulenta, Illecebrum alsinifolium of L.; between Cairo and Suez, Del. Extending to Spain, Pers.

Gypsophila capillaris, Rokejeka of Forsk.; not far from Cairo, Forsk.; and near Suez, Del.

Paronychia Arabica, Illecebrum of L.; not far from Cairo, Forsk. and Del.

Polycarpha fragilis, Del.; not far from Cairo, Del.

Erodium hirtum, Geranium of Forsk.; not far from Cairo, Forsk.; and Alexandria, Del.

——— *triangulare*, Geranium of Forsk.; not far from Cairo, Forsk.

——— *glaucophyllum*, Geranium of L.; not far from Cairo, Del.; Memphis, Pers.

——— *malopoides*, Geranium of Desf.; not far from Cairo, Del. Extending to Sicily and Barbary, Cav. and Pers.

Ruta tuberculata, Forsk.; not far from Cairo, Forsk.; also in Nubia, Del.

Peganum harmala, L.; not far from Cairo, Forsk.; and Alexandria, Del. Extending to Crete, Greece, Spain, and Siberia, Sibth. and Pers.

Nitraria retusa, Peganum of Forsk.; not far from Cairo, Forsk.; Alexandria and Damietta, Del.; Desf. and Pers.

Fagonia Cretica, L.; not far from Cairo, Del. Extending to Yemen, Crete, and Barbary, Forsk., Desf. and Pers.

——— *Arabica*, L.; not far from Cairo, Del.; and at Mor in Arabia, Forsk.

——— *glutinosa*, Del.; not far from Cairo, Del.

——— *mollis*, Del.; not far from Suez, Del.

——— *latifolia*, Del.; not far from Cairo, Del.

Tribulus pentandrus, Forsk.; not far from Cairo, Forsk.; and in Upper Egypt, Del.

- Zygophyllum simplex*, L.; not far from Cairo, Forsk. and Del.; at Mor and Ghorab in Arabia, Forsk.
- *coccineum*, L.; not far from Cairo, Forsk. Extending to Barbary and Siberia, Shaw and Pers.
- *album*, L.; not far from Alexandria, Forsk. and Del.; and at Ghorab in Arabia, Forsk. Extending to Cyprus, Barbary, and the Canary Islands, Sibth., Desf. and Pers.
- *decumbens*, Del.; not far from Suez, Del.
- Rhus oxyacanthoides*, Desf.; Upper Egypt, Del.
- Genista monosperma*, Spartium auct.; not far from Cairo, Del.; and Suez, Forsk. Extending to Morocco and Spain, Pers.
- Spartium Thebaicum*, Del.; Upper Egypt and in Nubia, Del.
- Ononis serrata*, Forsk.; not far from Alexandria, Forsk. and Del.
- *vaginalis*, Vahl.; not far from Alexandria, Forsk. and Del.
- Alhagi Maurorum*, Hedysarum of L.; Cairo to Alexandria, Forsk. and Del.
- Hedysarum Ptolemaicum*, Del.; between Cairo and Suez, Del.
- Indigofera paucifolia*, Del.; Upper Egypt, Del.
- Astragalus trimestris*, L.; not far from Cairo, Forsk.
- *hispidulus*, Dec.; not far from Alexandria, Del. Extending to Persia, Mx.
- *tomentosus*, Lam.; not far from Rosetta, Forsk.
- *longiflorus*, Del.; not far from Suez, Del.
- *tumidus*, Colutea of Forsk.; not far from Cairo, Forsk. and Del. Extending to Syria and Spain, Russel and Pers.
- *trigonus*, Dec.; not far from Alexandria, Del.
- Psoralea plicata*, Del.; Thebes, Del.
- Lotus dichotomus*, Del.; not far from Cairo, Del.
- Cassia acutifolia*, Del.; Philæ, Del.
- *senna*, L.; not far from Cairo, Forsk.; and in Upper Egypt, Del.
- Acacia albidia*, Del.; above Philæ, Del.
- *seyal*, Mimosa of Forsk.; Arabia, Forsk.; between the Nile and the Red sea, also near Thebes and Syene, Del.
- *gummifera*, Mimosa of Forsk.; Arabia, Forsk.; Upper Egypt, Del.
- *heterocarpa*, Del.; Upper Egypt not far from "Qoceyr," Del.
- Neurada procumbens*, L.; not far from Cairo, Forsk.; and Alexandria, Del. Extending to Arabia and Barbary, Pers.
- Tamarix Gallica*, L.; not far from Cairo, Del. Extending to the Caspian sea, Russia, Greece, Italy, France, and Spain, Sibth. and Pers.
- *Africana*, Desf.; Upper Egypt, Del. Extending to Greece and Barbary, Bory & Chab., and Pers.
- *passerinoides*, Del.; in the Fayoum, Jom. and Del.
- Cucumis colocynthis*, L.; not far from Cairo, Forsk.; Upper Egypt and Nubia, Del. Extending to Mor in Yemen, Forsk.
- *prophetarum*.
- Moscnbryanthemum nodiflorum*, L.; not far from Cairo, Forsk.; and Alexandria, Del. Extending to the maritime sands of Greece and Italy, Sibth. and Pers.; and to Spain, the Canary Islands, and Madeira, A. Dec.
- *Copticum*, L.; not far from Cairo, Del.
- Gymnocarpus decandrum*, Forsk.; East of Cairo in the Desert, Forsk. and Del.
- Arizon Canariense*, L.; not far from Cairo, Forsk. Extending to Canary Islands, Pers.
- Reaumuria vermiculata*, L.; not far from Cairo, Forsk.; and Alexandria, Del. Extending to Syria, Sicily, and Barbary, Pers.
- Bupleurum proliferum*, Del.; not far from Alexandria, Del.
- Bubon tortuosus*, Desf.; not far from Cairo, Forsk. Extending to Barbary, Pers.
- Sonchus divaricatus*, Desf.; Cairo to Alexandria, Del.
- Prenanthes spinosa*, Forsk.; towards Suez, Forsk.; and Cairo, Del. Extending to Barbary and Spain, Pers.
- Senecio squalidus*, L.; towards Cairo in the Desert, Forsk.; Alexandria, Del.
- Chrysocoma spinosa*, Stœhelina of Vahl; not far from Cairo, Forsk. and Del.
- Santolina fragrantissima*, Forsk.; not far from Cairo, Forsk.; and Suez, Del.
- Artemisia Judaica*, L.; (already mentioned). Frequent towards Suez, Del.; extending into Arabia, Palestine, and Numidia, Pers.
- *monosperma*, Del.; not far from Cairo and Suez, Del.
- *inculta*, Del.; towards Suez, Del.
- *Valentina*, Lam.; Cairo to Alexandria, Del. Extending to Spain, Pers.
- Gnaphalium cauliflorum*, Desf.; not far from Cairo, Forsk.; and Rosetta, Del. Extending to Tunis, Pers.
- Pulicaria undulata*, Inula of L.; towards Suez, Del.
- Francocuria crispa*, Aster of Forsk.; not far from Cairo, Forsk.; border of Desert near the Pyramids, Del. Extending in sunny situations to Senegal and the Ganges, Dec.
- Cotula cinerea*, Del.; around the pyramids at Gizeh and Sakhara, Del.
- Bupthalmum graveolens*, Forsk.; not far from Cairo, Forsk. and Del.
- Centaurea crupinoides*, Desf.; not far from Alexandria, Del. Extending to Barbary in the Desert, Pers.
- *Lippii*, L.; not far from Cairo, Forsk.; and Rosetta, Del. Extending to Barbary, Pers.
- *Aegyptiaca*, L.; not far from Cairo, Del.
- Calendula Aegyptiaca*, Desf.; not far from Cairo, Del.
- Echinops spinosus*, L.; not far from Cairo, Forsk.; and Alexandria, Del. Extending to Cyprus, the Greek islands, and Barbary, Sibth. and Pers.
- Plantago cylindrica*, Forsk.; not far from Cairo, Forsk. and Del.
- *argentea*, Desf.; not far from Cairo, Forsk. Extending to Barbary and France, Pers.
- Statice pruinosa*, L.; not far from Alexandria, Forsk.; and along the shore of the Red sea, Del. Extending to Palestine, Del.
- Linaria Aegyptiaca*, Antirrhinum of L.; not far from Cairo, Forsk.; and Suez, Del. Extending to the Greek islands, Sibth.
- *halava*, Forsk.; not far from Cairo, Forsk.
- Scrophularia Deserti*, Del.; towards Suez, Del.
- Acanthodium spicata*, Del.; "Ageroud" or Hahiroth, on the route to Suez, Del.
- Salvia Aegyptiaca*, L.; not far from Cairo, Del. Extending to the Canary Islands, Pers.
- Lavendula stricta*, Del.; not far from Suez, Del.
- Heliotropium crispum*, Desf.; not far from Cairo, Forsk. and Del.
- *lineatum*, Vahl; not far from Cairo, Forsk.; and around the Pyramids, Del.
- Lithospermum arnebia*; not far from Cairo, Forsk. and Del.
- *callosum*, Vahl; not far from Cairo, Forsk. and Del.
- Anchusa spinocarpus*, Forsk.; not far from Cairo, Forsk.; near Salehyeh, in the Desert, Del.
- *hispidia*, Forsk.; not far from Cairo, Forsk.; and Alexandria, Del.
- Borago Africana*, L.; not far from Cairo, Forsk. and Del.
- Convolvulus Forskalii*; Sinai, Forsk.; between Cairo and Salehyeh, in the Desert, Del.

Convolvulus armatus, Del. ; towards Suez, Del.
Hyoscyamus muticus, L. ; not far from Cairo, Forsk. ; and in Upper Egypt, Del.
Damia cordata ; not far from Cairo, Forsk. and Del. Extending to Taas in Yemen, Forsk.
Periploca secamone, L.
Cynanchum pyrotechnicum, Forsk. ; Arabia, Forsk. ; and towards Suez, Del.
 ——— *argel*, Del. ; Philæ, Del.
Asclepias gigantea, L. ; throughout Arabia, Forsk. ; Upper Egypt and in Nubia, Del. Observed by myself in the Desert of the Thebaid, also on the Cape Verd Islands, and in central Hindustan.
Anabasis aphylla, L. ; not far from Cairo, Forsk. ; and Alexandria, Del. Extending to the Caspian, Asia Minor, and Tripoli, Sibth. and Pers.
Salsola alopecuroides, Del. ; around the pyramids of Gizeh in the Desert, Del.
 ——— *villosa*, Del. ; not far from Alexandria, Del.
 ——— *fetida*, Del. ; Upper Egypt, Del.
Traganum nudatum, Del. ; not far from Cairo, Del.
Cornulata muricata, Salsola of L. ; not far from Cairo, Forsk. ; and around the Pyramids, Del.
 ——— *monacantha*, Del. ; not far from Cairo, around the pyramids at Gizeh and Sakhara, also in Upper Egypt, Del.
Pteranthus echinatus, Camphorosma of L. ; not far from Cairo, Del. Extending to Cyprus and Barbary, Sibth. and Pers.
Rumex vesicarius, L. ; not far from Cairo, Forsk. and Del.
 ——— *spinus*, L. ; not far from Cairo, Forsk. ; and Alex-

andria, Del. Extending to Greece and Morocco, Sibth. and Pers.
Calligonum comosum, L'Her. ; not far from Cairo, Del. Extending to Barbary, Pers.
Croton oblongifolium, Del. ; "Ageroud" or Hahiroth on the route to Suez, Del.
Euphorbia retusa, Forsk. ; not far from Cairo, Forsk. and Del.
Forskalea tenacissima, L. ; not far from Cairo, Forsk.
Parietaria alsinefolia, Del. ; among rocks near Cairo, Del.
Ephedra distachya, L. ; not far from Cairo, Forsk. Extending to Mount Athos, and Barbary, Sibth. and Pers.
 ——— *altissima*, Desf. ; near "Abouqyr & Etkou," Del. Extending to Barbary, Desf.
Pennisetum dichotomum, Panicum of Forsk. ; not far from Cairo, and frequent throughout Arabia, Forsk. ; towards Suez, Del.
Panicum turgidum, Forsk. ; not far from Cairo, and frequent in Arabia, Forsk. ; Gizeh, Del.
Andropogon foveolatum, Del. ; towards Suez, Del.
Stipa.
Avena Forskalii ; not far from Cairo, Forsk. ; around the pyramids of Sakhara, Del.
Aristida alata ; towards Suez, Del. Extending to Barbary, Desf.
 ——— *obtusa*, Del. ; between Cairo and Suez, Del.
 ——— *paucis*, Desf. ; Upper Egypt, and in Syria, Del. Extending to Barbary, Desf.
Rottbolla hirsuta, Vahl ; Alexandria, Forsk. ; towards Suez, Del.

The Desert plants, about one hundred and fifty in number, constitute all that is botanically interesting in the Egyptian flora. The Desert tribe of *Zygophyllaceæ* being unusual in variety, while the presence of *Nourada* and *spinescent Crucifera* is very striking. But of strictly Egyptian features, the most characteristic seem an unusual development of *Resedaceæ*, and especially of *Salsolaceæ*, the latter with plants resembling them in sensible properties everywhere dominant.

The river-flat green and grassy is altogether European, the indigenous plants nearly all occurring on the opposite side of the Mediterranean ; and this continues even within the Tropics, the landscape as far as the First cataract hardly presenting a distinguishable Tropical feature.

The following list of the plants indigenous on the river-flat includes maritime species along the Mediterranean, also certain Greek and Syrian species occasionally found within reach of the sea air on the facing upland.

Al. nis dentata, Del. ; Alexandria, Del.
Delphinium nanum, Dec. (Steud.) ; upland at Alexandria, Delile. Extending to the Dardanelles, Forsk.
Nymphæa cærulea, Savign. ; Rosetta, Damietta, and Cairo, Del.
Glaucium hybridum, Chelidonium of L. ; Cairo to Alexandria, Forsk. Extending to Cyprus and Greece, Sibth.
Hypecoum patens, Mnemosilla of Forsk. ; upland at Alexandria, Del.
Cakile maritima, Bunias of L. ; Alexandria, Forsk. Extending in maritime situations to Greece and the Atlantic shores of both Europe and North America.
Ulla annua, L. ; Alexandria, Del. Extending to Greece and Spain, Sibth. and Pers.
Lepidium draba, Cochlearia of L. ; upland at Alexandria, Del. Extending throughout Greece to Caucasus and middle Europe, Sibth. and Vieb.
Cochlearia Nilotica, Del. ; along the banks of the Nile, Del.

- Zannichellia palustris*, L.; Damietta, Del. Extending to Constantinople, middle Europe, Sicily, Algeria, England, New Zealand, and North America to Oregon, Sibth. and A. Dec.
- Ruppia maritima*, L.; Alexandria and in Lake Menzaleh, Del. Extending in brackish water to Cyprus, the Peloponnesus, and the Atlantic shores of Europe and North America, Sibth., Pers., and others.
- Potamogeton maritimum*, L.; Rosetta and Damietta, Del. Extending in brackish water to the Peloponnesus, and the Atlantic shores of Europe and North America, Sibth., Pers., and others.
- *crispum*, L.; Rosetta and Cairo, Del. Extending to Constantinople, middle Europe, and Australia, Sibth., Pers., and A. Dec.
- Alisma plantago*, L.; Rosetta, Del. Extending to Greece, Denmark, Abyssinia, Australia, and North America, Sibth., Pers., A. Dec., and others.
- Panocraton maritimum*, L.; Alexandria, Del. Extending in maritime situations to Cyprus and Greece, Sibth.
- Alum subhirsutum*, L.; upland at Alexandria, Del. Extending to Cyprus, Crete, Greece, Italy, and Spain, Sibth. and Pers.

- Allium roseum*, L.; upland at Alexandria, Del. Extending to Crete, the Peloponnesus, Montpellier, and Algeria, Sibth. and Pers.
- *pallescens*, L.; upland at Alexandria, Del. Extending to the Greek islands, Pannonia, Italy, Montpellier, and Spain, Sibth. and Pers.
- Asphodelus fistulosus*, L.; upland at Cairo, Forsk. and Del. Extending through the Greek islands to Athens, France, and Spain, Sibth. and Pers.
- Scilla maritima*, L.; brought to Alexandria from the Desert, Del. Extending to the Peloponnesus and Attica, Syria, Barbary, Spain, and Portugal, Sibth. and Pers.
- Muscari comosum*, Hyacinthus of L.; Alexandria, Del. Extending to Cyprus, Bithynia, the Peloponnesus, and middle Europe, Sibth. and Pers.
- Hyacinthus serotinus*, L.; upland at Cairo, Forsk. and Del. Extending to Spain, Pers.
- Iris sisyrinchium*, L.; upland at Cairo, Forsk.; Alexandria, Del. Extending in maritime situations to Cyprus, the Peloponnesus, Barbary, Spain, and Portugal, Sibth. and Pers.
- Asparagus aphyllus*, L.; Alexandria, Forsk. and Del. Extending to Crete and Mount Athos, Sicily, Spain, Portugal, and Barbary, Sibth. and Pers.
- Juncus acutus*, L.; Alexandria, Del. Extending in maritime situations to Greece, and the Atlantic shores of Europe, Sibth. and Pers.
- *maritimus*, Sm.; Alexandria, Forsk. and Del. Extending in maritime situations to Crete, and the Atlantic shores of Europe and North America, Sibth., Pers., and A. Gray.
- *rigidus*, Desf.; moist sandy spots in the Desert, Del. Extending in maritime situations to Barbary, Pers.
- *multiflorus*, Desf.; Del. Extending to Barbary, Pers.
- Cyperus mucronatus*, Rottb.; Rosetta, Forsk.; Fountain of Moses in the Sinai peninsula, Del. Extending to Arabia and India, Pers.
- *fuscus*, L.; Rosetta and Cairo, Forsk.; Rosetta, Del. Extending to Smyrna and Constantinople, Denmark, and Barbary, Sibth., and Pers.
- *Michelianus*, Scirpus of L.; canal at Alexandria, Del. Extending to Bithynia, Europe and Barbary, Sibth. and Pers.
- *esculentus*, L.; Forsk.; Rosetta, Del. Extending to Greece, Italy, Montpellier, and Barbary, Gittard and Pers.
- *fastigiatus*, Forsk.; Rosetta, Forsk.
- *ornithopodioides*, Del.; Damietta, Del.
- Schwann mucronatus*, L.; Alexandria, Forsk.; Rosetta, Del. Extending in maritime situations to Crete, the Peloponnesus, and other portions of Southern Europe, to Morocco, Sibth. and Del.
- Scirpus maritimus*, L.; Cairo, Forsk. Extending in "salt marshes" to Cyprus, Constantinople, the Peloponnesus, and the Atlantic shores of Europe and North America, Sibth., Pers., and others.
- *fimbrisetus*, Del.; Damietta, Syria, France, Del.
- *mucronatus*, L.; Rosetta, Piedmont, and India, Del. Extending in maritime situations to Greece and England, Sibth. and Chaub.
- Eleocharis palustris*, Scirpus of L.; Cairo, Forsk.; Rosetta and the Fayoum, Del. Extending to Greece, Northern Europe, and North America, Sibth., Pers., and others.
- *caducus*, Scirpus of Del.; Damietta, Del.
- *pollicaris*, Scirpus of Del.; Damietta, Del.
- Isolopis inclinata*, Del.; around Salehyeh, Del.
- *uninodis*, Del.; Damietta, Del.
- Fimbristylis dichotoma*, Scirpus of L.; Cairo, Forsk.; Rosetta, Del. Extending in maritime sands to the Black Sea, Arabia, and India, Sibth. and Pers.
- Carex divisa*, Huds.; Alexandria, Del. Extending in "salt marshes" to the Atlantic shores of Europe, Pers.
- Lygeum spartum*, L.; Alexandria, Del. Extending to Spain, Pers.
- Saccharum Acgyptiacum*, Willd.; Rosetta, Forsk.; sandy portions of the banks of the Nile, Del.
- Andropogon annulatum*, Forsk.; Rosetta, Forsk.; near Cairo, and in Syria, Del.
- Phalaris Canariensis*, L.; Cairo, Forsk.; Alexandria, Del. Extending to Constantinople, Greece, and the Canary Islands, Forsk., Sibth., and Pers.
- *aquatica*, L.; Alexandria and Cairo, Del. Extending in watery situations to Asia Minor and the Tiber, Sibth. and Pers.
- *paradoxa*, L.; around Salehyeh, Del. Extending to Greece and Portugal, Sibth. and Pers.
- Panicum obtusifolium*, Del.; margin of canals at Damietta, San, and Cairo, Del.
- *Numidianum*, Lam.; Damietta, Del. Extending to Barbary, Pers.
- *coloratum*, L.; Damietta and Cairo, Del.
- *repens*, L.; Rosetta and Cairo, Del. Extending to Crete, Barbary, and Spain, Sibth. and Pers.
- *sorgi*, Del.; Upper Egypt, Del.
- *leigonum*, Del.; Cairo, Del.
- *prostratum*, Lam.; Damietta, Del.
- Crypsis aculeata*, Anthoxanthum of L.; Alexandria, Forsk.; Cairo, Del. Extending to Bithynia, Barbary, and Southern Europe, Sibth. and Pers.
- *alopecurioides*, Heleochoa of Host; sand islands in the Nile near Cairo, Del.
- Polypogon Monspeliense*, Alopecurus of L.; Cairo, Forsk.; Del. Extending to Athens, Barbary, and the Atlantic shores of France and England, Sibth. and Pers.
- Milium lendigerum*, L.; Alexandria, Del. Extending in maritime situations to Asia Minor, Greece, Montpellier, and England, Sibth., Gittard, and Pers.
- *arundinaceum*, Agrostis miliacea of L.; Alexandria, Del. Extending to Athens and Zacynthus, Sibth.
- Agrostis pungens*, Schreb.; Alexandria, Del. Extending in maritime situations to Greece, Southern France, and Spain, Sibth. and Pers.
- *spicata*, Vahl; towards Suez in the Desert, and near Lohaja in Arabia, Forsk.; coast from "Abouqyr" to Rosetta, Del.
- Poa divaricata*, Gouan; Alexandria, Del. Extending in maritime situations to Cyprus, and Montpellier, Sibth. and Pers.
- *Acgyptiaca*, Willd.; Cairo, Forsk.; sand island in Nile near Cairo, Del.
- *cynosuroides*, Uniola bipinnata of L.; Cairo, Forsk.; well known throughout Lower and Upper Egypt, Del. Extending to India, Pers.
- Dactylis repens*, Desf.; Alexandria, Del. Extending in maritime situations to Barbary, Pers.
- Chrysurus aureus*, Cynosurus of L.; Alexandria, Forsk. p. 27. Extending to Cyprus, Asia Minor, Greece, other portions of Southern Europe, and Barbary, Sibth. and Pers.
- Festuca cynosuroides*, Desf.; Alexandria, Del. Extending to Barbary, Pers.
- *fusca*, L.; Cairo, Forsk.; river-flat in Lower Egypt and at Cairo, Del. Extending to Palestine, Pers.
- *uniglumis*, Sm.; Alexandria, Forsk.; Rosetta, Del. Extending to the Peloponnesus and England, Sibth. and Pers.
- *inops*, Del.; Rosetta, Del.
- *calycina*, L.; Alexandria, and on the upland at Cairo, Forsk.; Del. Extending to Spain, Pers.
- *divaricata*, Desf.; Alexandria, Forsk.; and Rosetta, Del. Extending in maritime situations to Barbary, Pers.
- Dinaba paspalodes*, Dactylis of Willd.; Damietta, and Persia, Del. Extending to India, Pers.
- Kaleria phleoides*, Festuca of Villars; Cairo, Del. Ex-

tending to Greece, Barbary, and Southern France, Bory and Pers.

Bromus rubens, L.; Alexandria, Forsk. and Del. Extending to Crete and the Peloponnesus, Sibth. and Bory.

— *purpurascens*, Del.; Alexandria, Del.

— *Madridentis*, L.; Rosetta, Del. Extending to Spain and England, Pers.

— *distachyos*, L.; Alexandria, Forsk. and Del. Extending to Constantinople, the Peloponnesus, and other parts of Southern Europe, Sibth. and Pers.

Stipa juncea, L.; Alexandria, Del. Extending to Crete, Lycia, Barbary, and middle Europe, Sibth. and Pers.

— *paleacea*, Willd.; upland at Alexandria and Cairo, Del. Extending to Crete, the Peloponnesus, and Barbary, Sibth. and Pers.

Avena pumila, Desf.; upland at Cairo, Del. Extending to Barbary, Pers.

— *arundinacea*, Del.; upland at Rosetta, Del.

Trisetaria linearis, Forsk.; Alexandria, Forsk.; sand hills at Alexandria, Rosetta, and in the Delta, Del. Extending to Syria, Labill. and Del.

Lagurus oratus, L.; Alexandria, Forsk.; on the upland there, Del. Extending to Greece, and other portions of Southern Europe, Sibth. and Pers.

— *A. yptiaca*, Desf.; Del.

Phragmites maxima, Arundo of Forsk.; Canoe, and Ghobeibe beyond Suez, Forsk. p. 24; islands in the Nile, Del. "Differ'n; from *A. phragmites*," Bory and Chaub.

Calamagrostis vulgaris, Arundo of L.; Ghobeibe beyond Suez, Forsk. Extending to Smyrna, England, and Denmark, Sibth. and Pers.

Ammophila arenaria, Arundo of L.; Alexandria, Del. Extending in maritime sand to Greece, and the Atlantic shores of Europe and North America, Sibth., Pers., and others.

Aristida plumosa, L.; Alexandria, and on the upland at Cairo, Forsk.; Rosetta, Del. Extending to Armenia and Tunis, Pers.

Rottbollia incurvata, L.; Alexandria, Del. Extending in maritime sand to Cyprus, Zacynthus, and the Atlantic shores of Europe as far as Denmark, Sibth. and Pers.

— *filiformis*, Roth.; Alexandria and Rosetta, Del. Extending to Southern Europe, Pers.

— *fasciculata*, Desf.; Rosetta, Del. Extending to Barbary, Pers.

Agropyron triaristata, Willd.; upland at Alexandria, Del. Extending to Greece, perhaps a var. of *Ae. ovata*, Bory & Chaub. *Ae. ovata* growing at the Dardanelles, on the Greek islands, in other parts of Southern Europe, and in Barbary, Forsk., Sibth., and Pers.

Elymus geniculatus, Del.; in fields of barley at Alexandria, Del.

Hordeum maritimum, Vahl.; Cairo, Del. Extending in maritime situations to the Greek islands, and the Atlantic shores of Europe as far as Denmark, Sibth. and Pers.

Triticum bicorne, Forsk.; Alexandria, Forsk.; on the upland there, Del.

— *bulgaricum*, Sm.; Alexandria, Del. Extending in maritime situations to England, Pers.

— *junceum*, L.; Alexandria, Del. Extending in maritime situations to Smyrna, Constantinople, the Greek islands, Morocco, and the Atlantic shores of Europe as far as Britain, Forsk., Sibth., and Pers.

Sorghum Halepense, Holcus of L.; Cairo, and in Nubia, Del. Extending to Syria, Smyrna, Tenedos, Constantinople, and Mauritania, Forsk. and Pers.

Chara vulgaris, L.; Rosetta, Del. Extending in river water to Crete, Athens, and throughout Europe as far as Denmark and England, Sibth. and Pers.

Marsilea Aegyptiaca, Del.; ditches in the Delta, and moist situations near Cairo, Del.

Adiantum capillus-veneris, L.; Cairo, Forsk.; Alexandria, Del. Extending to Kurma in Yemen, and among moist rocks throughout Greece, Forsk. and Sibth.

The river-flat along the Nile was originally a pastoral tract, at one time in all probability abounding in game. Frequented at first by the few species of birds and quadrupeds that have their home in the Desert, the valley soon became a route of migration among the animal tribes themselves: enabling antelopes, the lion, hyæna, genetie (viverra), and ichneumon to cross the wide expanse of Desert: together with reptiles as the chameleon and monitor, and even some Tropical birds: affording at the same time ingress into the African continent to Northern migratory birds, and some Northern quadrupeds.

Tenth generation. May 1st, 3917, among living men.

Man may have entered Egypt in the hunter state, subsisting on fish and game; though I am not aware of any evidence of the fact. The absence from Egyptian soil of the rude stone relics which in other countries mark an initial period of barbarism is very striking.

Tradition of the existence somewhere of such a state of society seems to have been preserved among the Egyptians.—the hieroglyphic character of the *stone adze* occurring on the Gliddon mummy-case, while the usual representations clearly belong to the metallic

adze. Another hieroglyphic character traceable as far back at least as the Fifth dynasty (Leps. d. ii. pl. 44 and 64, Buns. and Birch 617) somewhat resembles the smooth stone hatchets called *celts* of the Stone period in Europe; is perhaps the "arvelōs" for dividing leather, mentioned by Nicander ther. 423.

If Egypt was colonized by shepherds, men in the pastoral state, they probably resembled the Arabs of the Sinai peninsula above mentioned;—but who already under the Third dynasty are figured as physically distinct from and enemies of the Egyptians.

3916 B. C. (= 3876 + "70 years" of Gen. v. 12), Cainan.

Atriplex halimus of the seashore of Europe and the Mediterranean countries, and salines as far as Siberia. The *sea orach* is called in Germany "meldenstrauch," in Greece "almuria" (Fraas), in Egypt "gataf" (Del.), in Egyptian "arim" (transl. Sept. Job xxx. 4) or "shlēh" (Kirch.). "shlō" meaning hedge (transl. Sept. Isai. v. 2 and Hos. ii. 6); and is one of the few indigenous plants of Egypt that affords sustenance to man:—the "kathaf el-bahri" is mentioned by Ebn Baitar; and *A. halimus* was observed by Delile from Cairo to the shore of the Mediterranean. Farther North, the "alimōn" is identified in Syn. Diosc. with the "ērmōn vasis" or "saphis" or "ōsirithōs

thiathēma" or "ēliou stēphanōs" or "iērōs kaulōs" of the prophets, and "athēnōrōs" of Pythagoras; is mentioned also by Theophrastus; by Antiphanes, as esculent "alima trōgōntēs" (Athen.); by Dioscorides, as cooked and eaten, growing along the seashore and suitable besides for hedges; by Pliny xxii. 33, as an "olus maritimum"; A. halimus is known to grow in Siberia (Pers.); its tops were found by Belon, and Tournefort trav. p. 43, eaten in Greece; is termed by Tournefort inst. 505 "a. latifolia sive halimus fruticosus"; was observed by Sibthorp, Chaubard, and Fraas, on the seashore from Cyprus and the Greek islands to the Peloponnesus; is known to grow on the seashore of Barbary, Spain, Portugal, and even as far as England (Pers.). By European colonists, was carried to Austral Africa, and to Chili (Moquin, and A. Dec.); to Australia, observed by R. Brown; to the Hawaiian Islands, through the salt manufacture, as observed by myself.

Eleventh generation. Sept. 1st, 3934, among living men:

Twelfth generation. Jan. 1st, 3900, among living men:

The same year (= 3902 in calendar years = $2498 + 203 + 448 + 198 + 297 + 26 + 18 + 26 + 20 + 42 + 39 + 27 + 60$) of the Euseb.-Maneth. table, the Afr.-Maneth. table giving $2857 + 274 + 214 + 302 + 253 = 3900$, a date seemingly indicated by Manetho's numbers.

Papyrus antiquorum of Abyssinia. The Egyptians according to their own account originally subsisted on the *papyrus-rush* (Horap. i. 30), and the plant may have been known to the first colonists, its seeds floating down the Nile, — but its final disappearance from Egypt indicates an exotic maintained through cultivation: P. antiquorum was in Egypt before the invention of writing, the paper made from it constituting a hieroglyphic character; was observed by myself figured in standing crops under the Fourth dynasty and on subsequent monuments; continued in the days of Pliny xiii. 21 to be eaten by the Egyptians, but whether crude or boiled only the juice swallowed; was last seen in Egypt in 1800, by Delile near Damietta (not met with by Forskal); is not mentioned by Clot-Bey, and at the time of my own visit was regarded as extinct. Farther South, the "papurōn" was found by Artemidorus on the margin of lakes in the Somali country (Strab. xvi. 4. 14); and specimens of P. antiquorum were procured by Bruce from lakes Tzana and Gooderoo in Abyssinia (Greville). Northward from Egypt, the plant in the days of Pliny grew along the Euphrates, also around a lake in Syria (the same perhaps where it continues to the present day), but in these localities as in Sicily and Southern Italy its presence is doubtless due to the hand of man.

In the absence of plants suitable for cultivation, Agriculture could not have originated on the banks of the Nile; but the first colonists may have brought knowledge of the art, and may even for a time have confined their attention to the above-mentioned Papyrus.

3876 B. C. (= 3811 + "65 years" of Gen. v. 15). Mahalaleel.

It is worthy of remark, that most of the objects of early cultivation in Egypt are Northern plants, from Palestine and the countries beyond; and as the dryer and main portion of the river-flat became occupied and irrigated, game became scarce and some of the larger kinds disappeared.

With the introduction of Agriculture came *weeds*, the climate eminently favouring the naturalization of exotics; reminding me in fact of our Northern greenhouses, where Subarctic and Equatorial plants are often subjected to the same amount of heat and moisture, and yet are found flourishing side by side — At the present day, the soil having been upturned for ages, the spontaneous growth on the river-flat consists largely of imported weeds.

Thirteenth generation. May 1st, 3867, among living men:

Of the condition of mankind at this period we have some positive knowledge; the hieroglyphic characters including implements that had been long in use, implying often customs and associations by no means novel when the objects were selected for representation. The state of society seems in many respects not unlike Bedouin life, but the men were by no means inferior in intelligence nor less ambitious in their aims — than our leading spirits of the present day.

Names were given to birds and beasts before man had occasion to commune with his fellows, and the whole account in Genesis of his earlier history seems to imply the possession of language. Man's "natural language" of gestures, utterances, and exclamations is more expressive than words; but perhaps something may be learned from the hieroglyphic characters, the mouth  representing the articulation "r," that (according to Plato) means rushing on: now we can conceive of a torrent of expletives like the scolding of birds and certain quadrupeds, yet it seems more probable that the intellectual torrent proceeding out of the mouth consisted of regularly-formed words.

Fourteenth generation. Sept. 1st, 3834, among living men:

However it may have been with language, *writing* was certainly invented in Egypt. This appears from the hieroglyphic forms of objects peculiar to Egypt, also historically, the Greeks having preserved the name of the inventor of writing Thōt. His name is besides found engrafted in the Egyptian language in the word "thōt," having the same meaning — and pronounced like our English "thought"; may also have been the origin of the Greek "thōkēin."

The original words of the Coptic or *Egyptian language* are not arbitrarily nor accidentally

chosen; but formed by system they bear such intimate relation to the hieroglyphic characters as to seem the work of one hand. — This continued to be the spoken language of Egypt in the time of Joseph and the Jewish Exodus (Gen. xli. 43 and 45, xlii. 23, and Psalm cxiv. 1): in the days of Manetho there were two languages in Egypt (Jos. c. A.), the Coptic written with hieroglyphic characters as a sacred language (Rosetta Stone), while the spoken language may have been the Chaldaic or ancient Arabic: Greek characters were substituted for hieroglyphic by the early Christians, and the Egyptian language has thus been preserved in manuscripts, transmitted writings and translations, and in the services of the Coptic church.

Thôt is the earliest Egyptian whose name has been preserved. Of his personal history we know nothing: except that a hieroglyphic character signifying both laughter and scribe (Horap. i. 37), it may be inferred that his invention was received with ridicule. — Plato was deterred from making disclosures on the subject by the fear of like consequences.

Where each character represents a word, some plan of association would of course be necessary: and besides the hint of Plato and the so-called "natural language," I have thought to distinguish human biography; each chapter corresponding to an articulate sound; the order — having been measurably preserved in the derived alphabets, Phœnician, Greek, and Roman.

ā guttural, the exclamations ah! aha!

"ahē" a cow, "ahē" to have need, "ahē" life (conception); "ahē" or "ahē" or "aha" verily; "ahē" to walk orderly, expect; — in Chaldaic "ahy" to grant life. The hieroglyphic character occurs as early at least as the Third dynasty, also in the Book of the Dead, and continues in use under the . . . dynasty (Buns. and Birch, and Leps. d. ii. pl. 7). Serious consequences have followed this selection: indicated in the "molten calf" of the Israelites (Ex. xxxii. 4 to 24); veneration of the cow among the Egyptians, mentioned by Herodotus. Among the Hindus, of all nations most resembling the Ancient Egyptians, killing a cow has often proved a more serious affair than killing a man. Farther East, the cow is or has been at the foundation of the institutions of China, and Japan. Among the Phœnicians, the word "alwph" or "alph" (the Greek "alpha") by a remarkable exception is of both genders, and signifies "cow and bull." Among the earliest Romans, killing a cow was punished with hardly less than death (Pliny). And among the Greeks, "arhē" signifying beginning or foundation, is in pronunciation near enough to the Egyptian "ahē" to have originally meant cow. The inventor of writing very certainly had no intention of influencing the religious belief of thousands of millions of human beings: but it would seem, had he adopted a different mode of writing conception, cow-worship would not have become universal.

The progress of words geographically, is illustrated by another Egyptian name of the cow, "vahsé" or "vahsi" or "vēhsi"; — in Hebrew "bkr," continued to the present day in the "bakar" of Syria, Arabia, and Egypt: in ancient Italy "vacca"; in France "vache"; but beyond, the word did not cross the Channel into England, as though the animal there was already provided with a name: this excluding name was doubtless "cow," occurring besides in the Scandinavian languages, and in German, Persian, Sanscrit, and even Chinese (see also the Egyptian word "kōōh"). Now as the male everywhere accompanied the female, precise correspondence in the progress of names might be looked for; and we find in Hebrew "thwr," continued to the present day in the "thour" of Syria, Arabia, and Egypt: in ancient Greece, "tauros"; in ancient Italy, "taurus"; in France "taureau"; another word that did not cross the Channel: the excluding name being evidently "bull"; in Sanscrit "bali" (Mason).

The cow therefore was already the companion of man when writing was invented: — a historic reference under the Second dynasty to cattle, *Bos taurus*, has been preserved (Maneth.): under the Third and Fourth dynasties, cattle are figured in herds, a peculiar long-horned breed, which continues under the Twelfth, but afterwards disappears from the monuments, and doubtless became extinct. At Benihasan under the Twelfth dynasty, cattle in the state of secondary wildness are figured; some individuals particoloured, but hunted with other game, probably in a foreign country and North of Egypt. Cattle are mentioned in the history of Abram (Gen. iv. 20 and xi. 16); also by Homer, and Greek writers generally. In Switzerland during the Stone Age were kept by the inhabitants, as appears from debris of the earliest villages (Heer, in Troyon). From Europe, were carried to America, the Hawaiian, Taheitian, Samoan and Feejeean islands, New Zealand, and Australia; and in Austral America and on Hawaii, have relapsed into secondary wildness. (See hornless, and Indian cattle.)

"apas" ancient; "apē" or "apē" or "aphē" head; "aa" to do, to make; — in Hebrew "ab" father. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 5, and k. pl. 24 to 27).

● "al" stone; "al" mute, deaf; (the number "a-l-ē" signifying "aphōnian" silence, Horap. i. 28); "alō" to let alone; "at" or "ath" the negative prefix or particle; — in Hebrew "al" noth-

ing; in Arabic "Allah" (the stone worshipped by the Arabians in the time of Strabo?); in Greek "las" or "laos" stone, meaning also people. The character occurs from the Fourth to the Twenty-sixth dynasty (3d pyramid. Vyse, and Buns. and Birch).

 "anah" or "anh" to live; "ang" or "anak" or "anok" I; — in Bactrian "anhu" to live (Buns. and Birch v. p. 748). The character occurs on the Gliddon mummy-case and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 7 to 67).

 "allou" "nouval" pupil of the eye; "alou" boy, also girl; "alōoui" children; "athreu" or "hatrēu" twins; "arēj" or "arēj" or "arēj" limit, end. — The character occurs under the . . . dynasty (Champ. dict. 70 and 71, and Buns. and Birch).

 ā, in Greek ēi, the sound of wailing; in Egyptian "ouēi!," in Greek "ouai!," in Latin "vae!" "nei" appointed time; "čēt" pregnant; "čič" therefore; "něh" to shake off, "něh" to save (i.e. deliverance), "něh" wailing; "tōučit" or "tōčit" lamentation, to bewail; — in Hebrew "něyč" lamentation. The character occurs from the Fourth dynasty to the Roman conquest (Leps. d. ii. pl. 98, and k. pl. 56).

 ibis-feather walking; "ouēi" "či" I am; "či" to labour; "či" to come; "ouēi" divorce, distance. — This and the simple ibis-feather are painted green on the Gliddon mummy-case; to all appearance conventionally, being marked with the usual oblique parallel lines. The walking feather occurs also under the Third dynasty; and continues in use under Roman dominion (Leps. d. ii. pl. to iv. pl. 87, and k. pl. 6 to 29).

 "vči" to lift the eyes; "čis" look!, behold!; "oučin" light. — The character occurs from the Tenth to the Eighteenth dynasty (Leps. d. ii. pl. 147, and iii. pl. 62).

 (snake with tail in mouth, signifying world; also universal king, as the air that pervades the world; snake called by the Egyptians "mčisi," Horap. i. 2. 56 and 61; "misi" snake, Kirch.) ; "mčišō" midwife; "misi" or "mčs" born; "mčst" or "mčstč" to hate; "tshōučit" or "tshēučit" futile; "oučiči" or "oučiči" one, everyone; "čičr" to stand over or before; "ačr" air, — in Greek "ačr," in Latin "aer," in English "air." The character occurs from the Third to the Eighteenth dynasty (Leps. d. ii. pl. 5. 110, and k. pl. 15 to 29).

 "čičnč" or "čični" likeness, imitator; — in Greek "čithōs" image, fashion or form. The character occurs from the Third to the Twenty-ninth dynasty (Leps. d. ii. pl. 6, and k. pl. 5 to 49).

 (pelican "pčlčkana" signifying love to the extreme of folly; for in striving to beat out fire around its nest, the bird sets its wings on fire and is thus captured, Horap. i. 51); "oučičnč" to be moved, stirred up; "mči" or "mai" love; "mč" or "mči" to love; "oučičtč" to pine away, be consumed. — The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 63).

The *pelican*, *Pelicanus onocrotalus*, is known to be frequent in Egypt (Clot-Bey ii. 89): and farther South near the mouth of the Red Sea, flocks were observed by myself from Mocha.

v, the act of breathing, the pervading meaning saved.

 "včt" or "včt" rib; — in Greek the letter "včta"; in Latin "vita" life; in Hebrew "čvl" breath, "hvč" life, Eve the mother of all living (Gen. iii. 20); in Greek "včōs" li'e, in French "vie," in English "alive." The character occurs from the Third dynasty to the Fifth (Leps. d. ii. pl. 3 and 29).

 (falcon or sparrowhawk, signifying soul; its Egyptian name "vai-čth" literally meaning "soul within the heart," Horap. i. 7); "vait" or "vais" or "včj" or "včsh" hawk; "včrrč" or "včri" new, a youth; "včtsh" or "včtsh" or "včtsh" naked; "valhčt" simple, innocent, pure. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 63). The character of the falcon resting on its perch, occurs on the Gliddon mummy-case.

Horapollon's further remark, That the falcon instead of water drinks blood, by which also the soul is nourished, seems to imply knowledge of the real function of the heart: that at the time when writing was invented, some idea of the continual supply or *circulation of the blood* already prevailed.

first shoot of the date-palm: "vai" (or "vais," Chaeremon in Porphy. abst. iv. 7) palm-leaf, (palm signifying year, and its leaf month, Horap. i. 3 and 4), "avčt" or "čvat" or "čvčt" or "čvčt" or "čvčt" month. The selection for chronological purposes is stated by Horapollon to be owing to the *date-palm* putting forth a leaf with every lunation, or twelve annually: — to the present day in Egypt (according to Clot-Bey), the lowest ring of leaves is cut annually, leaving cicatrices by which the age can be readily ascertained; some trees reaching several centuries. The source also of remarkable etymological interferences connected with the plant in various languages: as, . . . , in Greek and Latin "phōinix" or "phoenix," in French "datte" and "date," in English "date" and "date"; also in Greek, "vaion" palm-leaf, a little while, "apō vaičs" from infancy. The character of the palm-shoot occurs from the Fourth dynasty to the end of hieroglyphic writing

(Leps. d. ii. pl. 26, and k. pl. 13 to 63). The character of the palm-leaf occurs under the Third dynasty (Leps. d. ii. pl. 3).

Phoenix dactylifera of the countries around the Persian Gulf. Called in Britain *date*, in France "dattier" (Nugent), in Germany "dattelpalme" (Grieb), in Italy "palma" and the fruit "dattero" (Lenz), in Greece "phōinika" and the fruit "kōurmathēs" (Fraas), in Egypt and Yemen "nachl" (Forsk.), and at the time of the invention of writing already in the Mediterranean countries, — where its introduction has changed the whole aspect of the Southern shores: *P. dactylifera* is figured apart from hieroglyphic writing at Benihasan under the Twelfth dynasty, and in planted groves continues to the present day prominent in the landscape throughout Egypt. "Threescore and ten palm trees" were found by the Israelites at Elim in the Desert (Ex. xv. 27): and farther North, the "phōinikōs" planted on Delos was seen by Homer *od. vi. 162*; the "palma" is mentioned by Varro i. 22, Columella, and Pliny: and *P. dactylifera* continues cultivated for ornament on the Northern shores of the Mediterranean, except in Spain rarely ripening fruit. (A. Dec.). Southward from Egypt, was observed by Forskal. and myself, under cultivation in Yemen, but the opposite Somali country supplied with imported fruit from Muscat; and two or three stocks planted on Zanzibar were barren. Eastward, seemed the pinnate-leaved palm figured in the cave-temples at Adjunta; is called in the environs of Bombay "kajooree" (Grah.), but does not in Hindustan produce edible fruit (Royle *fibr. pl.* and others), was observed by myself under cultivation with other palms for its crude sap called "toddy." Farther East, is enumerated by Mason as "exotic" in Burma and called "swon-balwon." (Compare *P. sylvestris*)

 night-heron; "avōk" or "avōk" raven, "vai" nycticorax (compare nycticorax destroying nestlings of crow at night, Horap. ii. 24); "vai tshinē" messengers; "vōki" maid-servant, "vōki" pregnant; "vēnē" or "vēnnē" door-post. The selection seems connected with the note quōk uttered by the bird while flying high overhead in the night. — In Latin "voco" to call, "venio" to come. The character occurs in the Book of the Dead, and from the Seventeenth dynasty to the Nineteenth (Buns. and Birch, and Leps. d. iii. pl. 5 and 140).

The *night-heron*, *Ardea nycticorax*, indigenous and well known in Egypt when writing was invented. The bird is widely diffused over the Northern Hemisphere wherever there is water; and is frequent even in North America.

 jackal; ("kuna" signifying sacred scribe, also laughter, Horap. i. 37), "sōvē" or "sōvi" laughter; "savē" wise ("svō" learning, Horap. i. 36); — in Hebrew "sfr" scribe; in Greek "sōphōs" wise; in Latin "sapiens," in Spanish "sabbe," in French "savant." The selection has given rise among Northern nations to the assignment of superior cunning to the fox: a persuasion at the present day too universal to be eradicated from the human mind. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 35 to 67).

 "vavē" or "vaavē" insipid; "vél" to enervate, weaken; "vel" to liquefy; — in Hebrew "vew" inane, in English "veal." The character occurs under the Fourth dynasty, also in the Book of the Dead, and continues in use under the Twenty second (Leps. d. ii. pl. 10, and k. pl. 12 to 24).

 "vōuhē" or "vōuhi" eyelids (discerning or diagnosis of life or death by the sacred scribe, Horap. i. 36); "vour" or "hvour" sinister; "vōor" or "vōrvēr" or "vērvōr" to reject, cast away; "val" or "vél" eye; "véllē" or "vllē" blind; "vōl" interpretation, solution; — The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 66, and Champ. dict. 384).

 "vatshōr" a saw; "vatshōr" or "vatshar" fox (jackal; "vassara" of Herodotus iv. p. 192 Lybian fox); "vas" or "visi" to saw asunder; "vrvōrt" cut in two or rent; "viki" band or halter; "vasis" rope-maker; "vatshi" or "phatshi" half; "sēvē" or "sēvi" or "sēfi" sword; — in Hebrew "vtsr" to cut off or gather grapes, "vtso" to divide; in English "sever." The character occurs from the Fourth dynasty to the Nineteenth (Leps. d. ii. pl. 35, to iii. pl. 138).

 (man eating hours signifying horoscope; for men eat at stated hours, Horap. i. 40); "ōuēv" or "ōuēv" or "ōuēv" priest; "ōuēv" or "ōuav" or "ōuav" clean, immaculate, holy; "ōuavēs" sincerity, sincere; — in English "wave." The character occurs under the dynasty (Champ. text p. 357).

 "varōt" or "varvōt" money; "vēkē" or "vēkē" or "vukē" or "vēhē" recompense, hire; "vōtsh" to dismiss; "vōk" servant; "vōk" or "vēk" to depart. The character occurs under the . . . dynasty (Champ. dict. 26).

 (finger signifying stomach, Horap. ii. 6); "thēv" finger; "thēvi" basket; "thēvi" or "thvai" cavern; "avē" or "ēvi" or "ēivē" or "ēvi" or "ōvē" or "ōvi" thirst, to thirst; "thēviō" or "thēvia" or "thēvia" or "thvviē" or "thvviō" or "thvviēu" or "thvviēu" humility, to be humiliated; — in Greek "thivis" basket. The character occurs from the Fourth dynasty to the Fifth (Leps. d. ii. pl. 22 and 101).

 “kivě” or “ėkivě” paps; “kēv” double; — in Hebrew “hv” bosom. The character occurs under the . . . dynasty (Champol. gram., and Rosselin. cxlii. 1): and may be further traced in the form B of the Greek letter vēta.

 (three water-jars signifying rising of the Nile, Horap. i. 21); “valkōu” water-jar; “vēvi” or “vēuvi” to pour forth; “mvēvi” cisterns; — in Arabic “beybe” lake, cisterns. The character occurs from the Third dynasty to the Twenty-first (Leps. d. ii. pl. 3, and k. pl. 7 to 43). The character of four water-jars occurs from the Fourth dynasty to the Fifteenth (Leps. d. pl. 97, and k. pl. 7 to 15).

 “vairi” or “vir” basket, pannier; “ėtphō” burden. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 7, and k. pl. 14 to 67).

 portable furnace? (burning censer signifying Egypt together with its immoderate heat and continual animal productiveness and procreation, Horap. i. 22); “vērvēr” or “vērvr” or “rvrvr” hot, to boil or effervesce; — in Latin “fervor” boiling, fervour, zeal. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, iii. pl. 147, and k. pl. 35 to 67).

The art of making *pottery*, known therefore when writing was invented: also various kinds of earthenware vases and implements in use, — as appears from figures on the Gliddon mummy-case, and on monuments under the Third and Fourth dynasties. The details of the manufacture are fully represented under the Twelfth dynasty at Benihasan.

 (lioness signifying a woman with but one child, Horap. ii. 78); “lavai” or “lavōi” lioness; “livi” or “livě” fury, madness, to be mad against; “livi” thirst, to desire; “lōvlěv” love, to love; “lēvė” or “lōvi” or “lōvė” to be insane; — in Hebrew “lvya” lioness; in English “love.” The character occurs under the . . . dynasty (Champ. dict. 114).

 (“hēlithōna,” swallow or its burrow, signifying all the wealth of the parents left to the children, Horap. ii. 29); “vēni” or “vēnė” or “vēni” swallow; “vēv” burrow, cave; “vē” nest, tomb; “valjė” or “vēljė” or “vēlj” or “vljė” earthen ware; “vō” or “vō” wood; “vētsh” or “vētsh” or “vōtsh” to be stript; “vōl” or “ėvōl” out; “vatshi” corpse; “val” or “vōl” end; — in Hebrew “bn,” in Arabic “ben” son, in Latin “bona” estate. The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 25).

The *bank-swallow*, *Hirundo riparia*, observed by myself as far up the Nile as the Thebaid: and near Manfalout “Feb. 7th,” numbers were “scooping out their holes, all in a line, about a foot below the” even summit of the river-bank; and here at least in Nile mud.

b, in Greek mp, inherently meaning beggar. The exclamation bah! (There is perhaps no evidence of the use b in the Egyptian language; and the inherent meaning of p, will be found strongly analogous.)

“vaėmpė” or “vampė” goat; “jōp” or “jöv” beggar — Compare the Persian “bg” food (“vėkōs” in Herodotus ii. 2), the Hebrew “by” implore, the Greek “pai” child, and English “boy.” The hieroglyphic character occurs under the Seventeenth dynasty (Leps. d. iii. pl. 15, and Buns. and Birch).

Other hieroglyphic characters furnish evidence, that the *goat*, *Capra hircus*, was already domesticated when writing was invented: — a historic reference to the goat under the Second dynasty, has been preserved: as distinct from the capricorn, the goat is figured in herds under the Fourth dynasty (Leps. d. ii. pl. 9), the horns more or less diverging, but presenting no peculiarity of breed; as in all the figures of this and later times examined by myself on the monuments. A variety with spreading horns, is however given by Bunsen and Birch as a hieroglyphic character.

 The goat is mentioned in the history of Isaac (Gen. xxvii. 9 to 16); and by ancient writers generally. In Switzerland during the Stone period, the inhabitants kept goats; as appears from debris of the earliest villages (Heer, in Troyon). Eastward in Hindustan, the goat is mentioned in the Sama Veda (Stevenson); also in the institutes of Menu (Braminical version); but I looked in vain for figures in the cave-temples. By European colonists, the goat was carried to America, and to the islands of the Pacific; and at the time of my visit, had run wild on the Hawaiian, Tahitian, and Feejeean Groups, and had been recently introduced into the Samoan.

g hard or gh, its pervading meaning anger.

 (wasp suspended in the air, signifying bloodshed, Horap. ii. 23); “gatėv” or “gotėv” slaughter, to be slain; “agō” wherefore?; “agėm” or “agōm” or “agōm” eagle; “gėtgėt” or “gėtgėt” or “gōtgėt” to inspect, investigate, scrutinize. — The character is placed over a king’s oval from at least the Third dynasty, and continues over one of the two ovals to perhaps the end of hieroglyphic writing (Leps. k. pl. 5 to 66).

 (bee signifying a people obedient to their king, Horap. i. 59); “ga” a people, nation; “agōri” or “agōri” asp or cobra; “ėgrėi” beneath, against; “ga” under; “garat” under me; “garōf” against him, under him: “garōn” against us, with us; “gėn” or “gōun” or

“ēgōun,” to, from, with, against, into, out of; “gēivi” protection, cover, shadow.—The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 6 to 67).

The species of *cobra*, as appears from the painted figure on the Gliddon mummy-case, is the indigenous *C. haje*;—to the present day, tamed and kept by serpent-charmers. From early times, the reptile seems also connected with mythology: and hence perhaps the worship extended in Hindustan to a corresponding species.

 (the bee efficient in governing on account of its sting, Horap. i. 59); “gōl” to incite; “gēlgēl” or “gēlgōl” or “gōlgēl” to stab, sting; “gisi” affliction, working, “gōsi” to work hard; “gēmgem” or “gēmgom” or “gōmgēm” to afflict with hardship or grief.—The character occurs under the Fourth dynasty, also in the Book of the Dead (Leps. d. ii. pl. 28).

 (lion signifying anger, Horap. i. 17); “gēm” or “gēm” to become heated, fervent, feverish; “gmōm” heat, “gmōm” anger; “gōki” to gnaw;—in Chaldaic “hma” anger; in Hebrew “hmē” anger, “nkm” and “nkmē” vengeance; in Greek the third letter “gamma.” The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 28, and k. pl. 21 to 67).

 a turnout; “gir” junction of two paths; “gatēn” by the side; “gag” or “gēk” or “gēkh” or “gōkh” or “gōk” or “gōkh” to scrape or shave; “gajēn” or “gajō” before, in front.—The character occurs under the Fourth dynasty (Leps. d. ii. pl. 28); and in modified forms

 from the Twelfth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 122, iii. pl. 260, and k. pl. 20 to 67).

 “hag” neck; “gōg” to draw up; “gēk” or “gēk” or “gōk” or “gōk” to gird up; “gēk” or “gōk” to fight; “gōrps” or “gōres” fist; “gōlk” or “kōlj” bent, perverse: “gōg” or “gagou” itching; “gag” or “gēt” neck; “gat” or “gath” or “gthai” or “gōt” or “gōt” thick, thickness, fat; “gēt” or “gōnt” to approximate.—The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 51).

 “hrōur” or “krōur” a frog; “hrō” or “hrōū” or “hrau” or “grōū” voice; “gōl” to be hoarse; “hōmhēm” or “hēmhēm” to growl, roar; “fiahōm” or “atshahōm” groans, to groan; “gērgēr” to snore, snoring or snorting.—The character occurs under the Twelfth dynasty (Leps. d. ii. pl. 142).

 (“ēgmōs” angle of the eye towards the temples, Edw.); “ig” demon;—in Hebrew “ankē” groaning, in English “anguish,” “anger” and its exacerbation “gangrene.” The character occurs under the . . . dynasty (Champ. mon. xxxviii, text 373).

 (lion flagellating his young, signifying immoderate anger, Horap. ii. 36); “grōd” children, “gēl” young one; “gēllō” or “gēllō” elder, old woman; “gōrf” or “kōrf” or “kōrf” or “kērf” to abolish; “kōur” a slap; “gāē” or “gāē” end, final.—The character occurs under the . . . dynasty (Champ. mon. iv. pl. 311).

 g soft or j or dsh, its pervading meaning rage. spring of a lion; “jōns” violence, unjust, unjustly; “jinjōns” or “jinshōns” injustice; “jnah” violence;—in colloquial English “jounce.” The character occurs from the Fourth dynasty to the Nineteenth (Leps. d. pl. 15, and k. pl. 32).

 (cynocephalus or baboon signifying rage, bones of lion-whelps clashing fire, Horap. ii. 36 and i. 14), “jōnt” rage; “jol” waves, billows; “jētshphid” to foam; “grajrēj” to gnash the teeth.—The character occurs under the . . . dynasty (Champ. dict. 114). In the Phœnician alphabet, the camel has been substituted, as will be further explained in treating of this alphabet.

Apart from hieroglyphic writing, the *dog-faced baboon*, *Cynocephalus*, is figured under the Fourth dynasty (Leps. d. ii. pl. 13), and at Benihasan under the Twelfth, as observed by myself; and from at least the Seventeenth dynasty is connected with the mythology, as the monkey is to the present day in Hindustan. The species of *Cynocephalus* figured is probably either the Abyssinian, or the one inhabiting Yemen.

 (spinal column or back-bone, signifying a stand, or the loins, Horap. ii. 8; “japhōji” spinal column, Kirch); “jōkjēk” or “jōkjēk” obstinacy, contumacy, to contend; “jōnt” or “shōnt” or “shōnt” to attempt, make trial; “jid” to wrestle;—in colloquial English “spunk.” The character occurs under the . . . dynasty (Champ. dict. 100).

 (forepart of lion signifying power, Horap. i. 18); “jiē” or “jōm” or “jōm” power; “jēmjōm” to be powerful; “jōor” or “jōr” or “jōrē” or “jōri” or “jōr” or “jōrē” strong, powerful; “ēr-mētjōri” to tyrannize, oppress by violence; “jōis” or “jōēis” lord, master; “jas” or “jēs” to exalt, be exalted; “jērācit” or “jasi” or “jisi” high, superior; “jōōré” generous; “ja” to allow.—The character occurs under the Third dynasty, also in the Book of the Dead, and continues in use under the Twenty-fourth (Leps. d. ii. pl. 3, and k. pl. 12 to 47).

 (sparrow seeking protection of the owl, and finding oppression, Horap. ii. 48); "jaj" sparrow; "jajě" or "jaji" or "jajě" or "jěji" enemy; "jijě" or "jijěču" enemies; "jatchě" sinister; "jajvōn" malignant; "jōl" or "jěl" to encompass; "jaljěl" or "jōlj" or "jōljěl" enclosure, fence; "jō" or "jōě" or "jōi" or "jō" wall; "jēr" jeer, derision. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3 to 6, and k. pl. 5 to 63).

From the coloured figure on the Gliddon mummy-case, the character is found to be the *Fringilla domestica*, or *house sparrow* of Europe and Western Asia; a bird very destructive to grain-crops. — Under the Third dynasty, the thick bill continues distinguishable; but later monuments present only a small bird.

 (smoke ascending signifying fire, Horap. ii. 15); "shshōr" smoke; "jaivěs" or "jvvēs" or "jěvs" sparks, coals; "jěl" or "jěla" to burn; "jōf" or "jōf" burning; "jrōm" fire; "kva" or "jikva" vengeance. — The character occurs under the Third dynasty (Leps. d. ii. pl. 3).

 (fire and water signifying purity, Horap. i. 41); "jōkēr" to temper, purge with fire; "jajō" frying-pan; "jōi" caldron, warm bath, sweat-bath; "jakam" or "jakēm" or "jěkēm" or "jōkēm" or "jōkm" to wash; "jihap" adversary; "jōōu" to denounce, send; "jōl ēvōl" or "jěl" to deny; "jě" or "ji" or "jō" to speak, dispute; "jahēm" or "jahm" or "jōhm" pollution, polluted; "jajh" pure; "jijnit" ordeal; — in vulgar English "to jaw." The character occurs from the Twentieth dynasty to the Roman conquest (Champ. gram. 535, Ross. mon. stor. 22 and 23, Buns. and Birch).

 "jōkěf" or "jookěf" or "jōkhf" a goad; — in English, the phrase "spur of the occasion." The character occurs under the . . . dynasty (Rosell. m. civ. 77. 2, Buns. and Birch).

 (writing materials, ink, rush-style, and sieve, signifying sacred scribe, also conclusion; a race of cynocephali acquainted with writing, Horap. i. 36 and 14); "jōrvěs" a little vase; "jillēs" a little bag or pot; "jōi" band or tie; "joli" or "jōlēs" or "jōōlēs" rust, corrosion; "jphēout" ink; "jōlēs" or "jōlēs" little reeds; "jē" or "jēi" or "jōul" beam in the eye; "jphōi" accusation, calumny; "jvin" revenge, a stain; "shōlj" accusation, stain; "jōlj" or "jōlj" or "jēs," to adhere, hold fast; "sōlj" or "sōlj" to blot out, expunge; "jphiō" to confound, make ashamed, castigation, reproof; "jphiēd" to abstain; "jiphiēd" shamefacedness, fear of disgrace; "jěv" or "jěv" sharp, pungent; "jōkēr" or "jōkr" sharp; "jōkēr" to afflict; "jōtf" or "jōth" or "jiēi" to wound; "jōl" to cover; "jōōvē" to darken; "ji-vōtē" or "ji-fōtē" to nauseate; "jōk" or "jōk" end. — The character occurs from the Third dynasty to the Twentieth (Leps. d. ii. pl. 5, iii. pl. 224, and k. pl. 36). Apart from the hieroglyphic text, scribes in the act of writing are figured under the Fourth dynasty, as observed by myself at Gizeh.

Juncus spinosus of Egypt and the neighbouring countries. A kind of *rush* called in Greece "vrōulō," in Egypt "sammar" (Forsk.), and clearly the "shōinō" used among the Egyptians to make sieves "kōskinōn," and exclusively for writing — to the time of Horapollō i. 36: sieves "cribrorum" made in Egypt of "juncorum" or "oxyschoenon" are mentioned by Pliny xxi. 65; "sammar" mats, by Abd-allatif; *J. spinosus* was observed by Forskal, and Delile, growing along the Mediterranean border of Egypt, but elegant mats made of it were brought from Upper Egypt and the region around Suez and exported to Constantinople. Words relating to mats as "shōinōtōnōs" and "shōinōpōlēs" occur in Herodotus and other Greek writers; and the living *J. spinosus* was observed by Forskal p. 75, and Hawkins (Sibth.), on the seashore of Crete and the Greek islands as far as the Dardanelles and Constantinople.

 (the word "svō" signifying both instruction and plenary aliment, Horap. i. 36); "jōm" or "jōm" or "jōdmě" or "jōdmi" or "jōmē" scroll or book; "jōvi" epistle; "jōkě" or "jōkě" or "jōkě" or "jōk" to fill, plenary, perfect; "jōtshjēsh" dry and soft bread; "jōōuf" paper-rush; "jaatě" or "jatě" to be nourished, increased; "jajh" to nourish, sustain; "jal" or "jēlō" or "jōili" to deposit; — in English "joke" used colloquially for affair. The character occurs under the . . . dynasty (Champ. dict. 304): serving besides to mark the "end of sentences" (Buns. and Birch). In Greece (Homer as understood by Pliny xiii. 21 to 23) "pugillarium" or writing-tablets were in use before the Trojan war; and Pliny further states, that the Greeks continued unacquainted with paper until the conquest of Egypt by Alexander (see Papyrus antiquorum).

 (ear signifying job impending, Horap. ii. 22); "maajě" or "majě" or "mējě" or "matshj" ear; "jismē" to hear, attend; "jinsōtēm" act of hearing, rumour; "jinsōms ēvōl" or "tshansōms ēvōl" or "jōutsht ēvōl" or "jinjōutsht" or "shinshōtsht" or "shōtsht" to expect; "jisvō" to learn, be instructed. — The character occurs under the . . . dynasty (Champ. dict. 62).

 (dog signifying magistrate or judge, from showing favour to nobody, Horap. i. 37 and 38); "jaar" solid; "jajō" or "jōtn" neck; "jarěv" or "jērěv" pulled by the neck, exposed to view; "jinārěh" keeper, guard; "jērěj" or "jērěj" or "shērěsh" hunter; "jrōjs" a hunt; "jěr" or "jěrj" or "jōrj" to enquire, hunt, seek, explore; "jōh" or

"jöh" or "jinjōmjēm" touch, to touch; "jajithöl" tow, "shashinōu" undressed flax, "shashētöl" tip of nose; "shashitōn" upper garment; "thōuraji" sacred cloak (compare "royal robe" in Horap. i. 38); "jihvas," garments; "jat" or "jēt" or "jōt" or "jōtē" to penetrate. — The character occurs under the Third dynasty (Leps. d. ii. pl. 3); and the dog without any accompaniment, under the Nineteenth (Leps. k. pl. 32).

The dog, from North America, known in Egypt nearly or quite as far back as the time of the invention of writing: — hunting with *greyhounds* is figured under the Third dynasty (Leps. d. ii. pl. 6); also under the Twelfth, at Benihasan; and I was assured, is practised to the present day in Nubia, the superior swiftness of the breed being recognized, as in Europe. Under the Fourth dynasty, in the one or two instances observed at Gizeh, the dog continued of the breed figured in Leps. d. ii. pl. 3, agreeing with the jackal in the pointed muzzle, but the tail curling. Under the Twelfth dynasty at Benihasan, the breeds were numerous, one of them being pretty distinctly the *turnspit*. In Switzerland during the Stone period, dogs were kept by the inhabitants; as appears from debris of the earliest villages (Rutim, in Troyon). Eastward in Hindustan, the dog is mentioned in the Sama Veda (Stevenson); in the Institutes of Menu (Braminical version); a horseman followed by hounds is figured in the Buddhist cave-temples at Adjunta, but I met with no figures of the dog in Braminical cave-temples. The sign for dog enters into the "primitive" characters of Chinese writing (Pauth. 84): and a "large dog" was brought to the emperor Wou-wang by ambassadors from the country of Lou in the West (Chou-King), probably a *Tibetan mastiff*; such as are figured on the monuments at Niniveh, and mentioned by Greek and Roman writers, and by Marco Polo 116 as "chenz mastin qe sunt grant come asnes."

The Australians appear to be the only considerable portion of mankind destitute of the companionship of the dog; yet the *dingo*, according to Leidy, is only the domestic dog carried there and become wild (facts pointing to Hindustan). Eastward from China and the Malayan archipelago, the dog was carried by Polynesians throughout the islands of the Pacific (except only that I was unable to ascertain, whether it was aboriginally known in New Zealand). The American tribes, from the Arctic Sea to Cape Horn, had the companionship of the dog, and certain remarkable breeds had been developed before the visit of Columbus (F. Columb. 25): further, according to Coues, the cross between the coyote and female dog is regularly procured by our Northwestern tribes, and according to Gabb, dogs one-fourth coyote are pointed out; the fact therefore seems established, that the coyote or American barking wolf, *Canis latrans*, is the dog in its original wild state.

△△ "matshi" or "tshi" balance-scales; "jātmē" a heap; "jōt" or "mējt" or "mōujsh" or "mōujt" mixture, mingled, to mingle; "jpō" or "jpiō" or "jipé" or "jipō" to argue, argument; "mōutsh" circumspection, deliberation, to consider; "jitshojnē" to consult, deliberate; "phōji" or "jéj" to split; "tshiē" length; — in English "match." The character occurs from the Tenth dynasty to the Twentieth (Leps. d. ii. pl. 145, and iii. pl. 232).

8 "matshi" or "tshi" or "tshiē" weight; "tshiē" length; "tshi" or "jintshi" mensuration; "mjēhē" or "ēmjh" or "mējēh" or "mjēhē" eyebrows. — The character occurs under the Third dynasty, and continues in use (Leps. d. ii. pl. 3). A second form 8 occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 22, k. pl. 52, and Rosselin. 8 mon. stor. ix. 35). A third form 8 occurs in the Book of the Dead 125. 9, and continues in use under the Twentieth dynasty (Rossel. mon. cult. xlix; "the weight or adjustment of the balance," Buns. and Birch.)

△ "jōlh" apex, an affair of no moment; "jōlh" or "jēlh" least; — in English the colloquial phrase "little end of the horn," the exclamation "fudge!". The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 23 to 63).

th soft, the Greek *thēta*, its pervading meaning soothing.

8 (two crows "kōrōnas" signifying matrimony, Horap. i. 9); "thēniō" eclipse; "thēitōuō" or "thētshē" neighbour; "thē" or "thē" like unto; "thōn" or "tēnthōn" to assimilate, become similar; "thōthēh" keeping company with, friendship; "tharin" confidence, "tharin" bond; "that" or "thēt" or "thōt" good disposition, blessing, consolation; "thrimōs" gladness, joy; "thēl" gladness, exultation; "thōn" our. — The character occurs under the Seventeenth and Eighteenth dynasties (Leps. d. iii. pl. 13, 15, 65, 73, and k. pl. 53). The further signification of "Mars and Venus," given by Horapollon i. 8, belongs doubtless to a subsequent period: the cry of "ēkkōri," from "kōri" meaning "korōnē," was kept up in his own day at Greek weddings.

8 "thē" prow of a ship; "thē" womb. — The character occurs from the Fourth dynasty and the Book of the Dead, to the Eighteenth (Leps. d. ii. pl. 18, and Buns. and Birch).

8 (scarabæus signifying only-begotten or principal, also race or family, also father, also the world or orderly arrangement, also male, Horap. i. 10); "thiōt" father; "mauaat" or "mmauat" alone, only-begotten; "thatsh" or "thētsh" or "thōtsh" or "thōtsh" arrangement, to dispose; "thēmsō" to establish; "thōuōt" image (image of the world, Horap. i. 10); "thō"

habitable world; "thamiē" or "thamiō" creation, work, to make; "thamiēōut" accomplished. — The character occurs as early as the Fourth dynasty, also in the Book of the Dead, and continues in use until the end of hieroglyphic writing (Leps. d. ii. pl. 27, and k. pl. 11 to 77).

 cottage-window, (compare vulture signifying beholding, or "ōuranian" firmament, or "athēnan" occupying the Upper hemisphere, Horap. i. 11); "thimarmēnē" name of the Second sphere; "thimē" or "thimē" village; "thimē" woman, wife; "th" feminine particle; "thē" her, she. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 67): is an early if not the earliest form of the Greek thēlta, and transferred by the Romans continues as our Western capital letter D.

 (vulture signifying mother, also "ōriōn" limit, also compassion, Horap. i. 11); "maau" or "mēōu" or "mau-th" or "mōuth," Plutarch) mother; "thōtsh" or "thōtsh" limit, bounds; "mēthnaēt" compassion. — The character occurs from the Third dynasty to the Roman conquest (Leps. d. ii. pl. 2, and k. pl. 5 to 60).

 falcon's perch: "thastō" or "tasthō" to return; "thōtēn" or "tha" or "thai" or "thē" of thee, thine; "thaē" end; — in English "thee." The perch with the bird resting on it, occurs on the Gliddon mummy-case, also under the Third dynasty (Leps. d. ii. pl. 3). The perch without the bird, occurs as early as the . . . dynasty (Champ. dict. 331): seems besides the origin of one form of the Phoenician thld Δ, or Hebrew ד, and the form ρ of the corresponding Greek letter thēlta.

In the highly finished figure on the Gliddon mummy-case, the two appendages of the perch are found to be feathers: additional proof, that the art of *falconry* was known when writing was invented. *Falconry* seems to belong especially to the country on the Euphrates, — and was found by Layard practised among the Arabs there to the present day.

k initial or c hard, its pervading meaning compensation.

 "kēn" or "kōun" bosom. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 6, and k. pl. 5 to 64).

 a scroll; "kēl" or "kōl" or "kōl" to roll together. — The character occurs under the . . . dynasty (Champ. dict. 339 and gr. 466, tab. and stat. Brit. mus., and Buns. and Birch).

 "karira" hook, iron clasp; "kēli" or "kēlli" or "kēlli" or "kēllē" lock, bolt, lever; "kēvvē" or "kvvē" folding or doubling. — The character occurs from the Third or Fourth dynasty to the end of hieroglyphic writing (Leps. k. pl. 5, 6, 7 to 67).

 "kōōh" cup or bowl; "kēlōl" or "kaji" water-bucket; "kaa" or "ka" or "kē" or "kē" or "kō" to place; — in English "cow." — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 5 to 67). The Egyptian drinking-cups (according to Herodotus) were made of copper: and the above shallow pattern is continued on the Assyrian monuments, and in the drinking-cups of copper or brass used to the present day by the Hindus. The above word "kōōh" may prove the origin of the name "cow," in the languages around the Mediterranean not applied to the animal, but occurring farther North and East (see cow).

 hand folded in receiving payment: "kah" or "kahi" or "kēhi" dust; "kaks" custom, conscience: "kad" or "kat" wisdom, prudence, shrewd; "kēn" sufficient; — in Hebrew "kph" hollow of the hand, the eleventh letter; corresponding to the tenth Greek letter kappa, and both indicating the number twenty. The character occurs under the . . . dynasty (Champ. dict. 98). The form of the incurved hand is continued in the third letter of the Roman alphabet, or our capital C.

 (vulture signifying two drachmas, unity consisting of two lines according to the Egyptians, Horap. i. 11); "kēēs" or "kas" bone; "kas" a small piece of money ("the earliest Egyptian money being perhaps rounded and bone-shaped, like that by the Greeks called ὀβολοί," Zoeg.; compare "ōvēlōi" obelisks); "kēv" or "kitē" or "kidi" drachma or di-drachma; "kōv" or "kōv" multiplication; — in English "cash" The character occurs on the Gliddon mummy-case, also under the Third and Fourth dynasties (Leps. d. ii. pl. 3 and 25). The  flat ring of silver occurs from the Fourth dynasty to the Nineteenth (Leps. d. ii. pl. 18 and 98 to iii. pl. 10, and k. pl. 36).

 "kōria" the two clavicles and fore part of the throat; "kōria" painted; "karia" red leather lining, helmet; "kēktōs" variegated, spotted; "klam" or "klōm" garland; "kthēmōs" ornament, adorned; "kēmōs" ear-ring; "kanēfōi" or "hanēu" curls; "klal" collar; "kēnhē" shoulder; "klaria" left shoulder of the constellation Twins; "kal" cincture or garment ("kal-asiris" of Herodotus). — The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 2, iii. pl. 138 and 254, and iv. pl. 3).

 "kid" sport; "kēmtō" or "kōmtō" or "kmtō" agitation, concussion, earthquake; "kim" or "kin" vibration, bounding, to leap; "kēmkēm" a timbrel or tambourine; "kōlh" to beat. — The character occurs under the Nineteenth dynasty (Leps. d. iii. pl. 162).

 kneading-trough; "köv" or "köp" leaven; "köt" or "köt" or "kat" wicker basket; "kam" rush of which cords are made; "ham" rush; "kēmē" or "kēmē" or "kēmi" Egypt; "katsh" reed; "kērousia" prison; "kalibi" hut, house of reeds; "kalibōs" house of reeds. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 7, and k. pl. 7 to 67). The kneading-trough was found by C. C. Felton lett. used to the present day for a cradle in Greece.

Triodia pungens of the shores of the Southern portion of the Red Sea. The character checkered with black — on the Gliddon mummy-case, as is a drinking-cup under the Tenth dynasty (Leps. d. ii. pl. 145), after the manner of the shallow baskets made in Yemen at Makulla; which baskets are sometimes brought down the Nile through Nubia to Egypt: I did not compare the material, but I remarked a creeping grass of rattan-like hardness in the maritime sands at Mocha, the spikelets Festuca-like but with soft hairs among the florets. T. pungens called "schoucham," was observed by Forskal p. 22 growing in sandy places from Lohaia to Mocha.

 Pinnotheres, the parasitic crab in oysters and other bivalves; ("pinna" and crab, or "pin-nophulax," signifying cared for by his household, Horap. ii. 102); "harakinōs" crab; "karkinōs" the constellation Cancer in the Zodiac; "kēv" or "köv" debility, infirmity; "kōōvēf" weak; "kōui" or "kouji" small, young; "klētōs" relatives; "kaphēōs" uncle; "kaurēa" aunt by the father's side; "kē" or "kēōuēi" or "kaōui" or "kōōu" or "kōōuē" others; "kēsēēpē" the rest. — The character occurs under the Fourth dynasty (Leps. d. ii. pl. 10). A second form  from the Tenth dynasty to the Twenty-second (Leps. d. ii. pl. 150, and k. pl. 27 to 44). A third form  under the Eighteenth dynasty (Leps. d. iii. pl. 50).

 a hinge: (pinnotheres by its claw warning its protector, Horap. ii. 102); "kēljē" angle; "klē" or "kēli" knee; "kōlj" or "kēlj" to incline, bend; "kēljēli" to bend knee; "kērsō" door; "kērs" kind of fish; "kōulaji" a little fish; — in English "the cardinal point." The character occurs from the Third dynasty to the Fifth (Leps. d. ii. pl. 3, 39, and 65) and in a modified form  under the Nineteenth (Leps. d. iii. pl. 162, and Rosell. m. cul. xxix. 1).

 (pinna closing its shell, Horap. ii. 102); "kōulōl" to wrap, envelop; "kēms" or "kēmts" obscurity; "klōōlē" clouds; "kaki" or "haki" or "kakē" or "kēkē" darkness; "kēkē" pupil of the eye; ("hēmian" black part of the eye, Plut. is. & osir. p. 364); "hamē" or "kamē" or "kamē" or "kēm" black; "kōd" around, circuit. — The character occurs as early as the Nineteenth dynasty (Leps. d. iii. pl. 162, and Rosellin. mon. cul. xlv. 4).

a. ē, i, ō, ū, or the short guttural. The interjection eh!, used for interrupting.

 (crocodile rendered immovable by touch of ibis-feather, Horap. ii. 77); "ē" or "ēhrēi" or "ēhrēn" or "ēhrai" or "ēhlēi" or "ērat" or "ērm" or "ērn" to; "ēmpō" or "ēvō" or "ēvōōu" mute; "ēt" or "ēti" who; "ēthē" how; "ētvē" or "ēthvē" on account of; "ēti" yet, — in Greek "ēti," in English "yet." — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 67): is further traceable in the form of the fifth letter of the Phoenician, Greek, Roman, and West European alphabets.

★ (star signifying five, from the five planets; also night; also god inhabiting the world, the Egyptians thinking that nothing would stand or hold together without god, Horap. i. 13 and ii. 1); "dē" five; "ēvē" obscurity; "ējōrh" or "ējōrh" night (the Egyptians thinking night the beginning of all things, Aristot. xii. 6, and Damasc., compare Gen. i. 2); "ēhi" an age. — The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. k. pl. 7 to 67). The star within a circle  occurs from the Twenty-eighth dynasty to the end of hieroglyphic writing (sarcoph. Amyrt., Champ. dict. 13, and Leps. d. iv. pl. 85): is besides the "pēntalpha" of the Greeks, described by Lucian (compare the above five guttural vowel-sounds).

 shrine: "ēlam" portico or piazza; "ēlpēēi" or "ērpē" or "ērphēi" temple; ("ērvit" sacrina, gestatoria, Edw.); "ēthēp" hidden mystery, sacred vow; — in Greek "ēlpis" hope. The character occurs under the Fourth dynasty (Leps. d. ii. pl. 19). A second form  under the Fifth dynasty, and continues in use more or less modified until the Roman conquest (Leps. d. ii. pl. 63 to iv. pl. 37).

 "ēnkōt" bed; "ējēn" or "ējn" or "ējm" or "ējō" upon; "ēnkōt" or "ēnkāt" or "ēnkōtk" sleep, to sleep; "vtshē" or "ēvtshē" or "ēvtshē" or "ēvtshē" or "ēvtshi" or "ōvtsh" or "ōvtsh" or "ōvētsh" to slumber, be unconscious, incoherent, absence of care, torpor, oblivion; — in Hebrew "byd" (pronounced "bēd" by my Egyptian guide) house; in English "bed." The character occurs from the Third dynasty to the Roman conquest (Leps. d. ii. pl. 3, and k. pl. 7 to 59).

 (ant and "nuktērithōs" wings signifying staying in the house, for if the wings are placed on an ant-hill none of the ants will come out, Horap. ii. 60); "ērvī" or "ērsō" or "ērsō" habitation; "ērij" bird. — The character occurs under the . . . dynasty (Champ. grām. 371, 372).

— “mōtnēs” or “mōthnēs” cessation, rest, ease; “ēmtan” or “ēmtōn” cessation, repose; “mōtn” or “mōtēn” or “mōtēn” tranquil, more easy, to be quiet; “ēthmōtēn” level, straight; “ēat” horizon, region from which the winds blow; “ēsthōn” spacious; “ēski” interval, space between. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 67).

(“aiga” goat or capricorn, signifying superior excellence in hearing, on account of breathing through its ears and nostrils, Horap. ii. 64; “ēhēōn” goat, Edw.); “satēm” or “sōtēm” or “sētēm” or “sētm” hearing, to hear, to obey; — “aix” in Greek signifying both goat and the constellation Capricorn. The character occurs under the . . . dynasty (Champ. dict. 126).

From some mountainous district, probably the Sinai peninsula, *capricornus* were brought to Egypt as early as the invention of writing; — and were kept in at least a semidomesticated state, one being a regular attendant on the herds of cattle figured under the Third dynasty (Leps. d. ii. pl. 6); also under the Fourth and Fifth (as observed by myself), and down to the Twelfth. In Switzerland during the Stone period, the *Capra ibex* or capricorn descended occasionally or in winter to the base of the mountains, and was hunted with other game, as appears from debris of the earliest villages (Rütimeyer, and Heer, in Troyon p. 272 and 442). The constellation “capricornus” is mentioned by Horace; and the “ibices” of “the Alps,” by Pliny viii. 79.

“mēhē” or “mēhi” wing; “rētēh” to unfold the wings; “ēnkōts” snares, ambush; “vērsēlia” goatsucker lying in wait for sleeping boys, mother of boys (mother stealthily visiting her sleeping babe); “jiōuē” or “jiōui” stealth, stealthy; — The character occurs from the Eighteenth dynasty to the end of hieroglyphic writing (Leps. d. iii. pl. 68, and cornices of temples in Egypt).

f, puffing or forcible breathing, its pervading meaning soul. The interjection *hie* !

(“anēmōnēs” flower, signifying malady, Horap. ii. 7); “phīē” bud; “phēriōōu” or “phriōōu” beautiful, splendid; “phēri” or “phēri” or “phiri” or “phōri” splendour, brilliant, to bloom; “ēfēphiri” it will bloom; “iavi” or “tshavē” or “tshaphē” or “tshafē” or “jēvis” malady; — in English, the phrase “Under the rose a serpent.” The character occurs from the Third dynasty to the Twentieth (Leps. d. ii. pl. 3, and k. pl. 14 to 41). A second form of perhaps the same character, occurs in the Book of the Dead, and from the Twelfth dynasty to the Roman conquest (Leps. d. ii. pl. 121, iii. pl. 143, and k. pl. 14 to 59).

Papaver hybridum of the East Mediterranean countries. A kind of *poppay* called in Greece “*paparōna*” (Fraas), in Egypt “*aub el num*” (Forsk.), but in Coptic “*nēman*” (Kirch.), and possibly the “*anēmōnēs*” in question: — *P. hybridum* was observed by Forskal, and Delile, at Alexandria on the Mediterranean border. Farther North, the “*mēkōn tritē agriōtēra*” having according to Dioscorides more powerful medicinal properties and an oblong capsule, is referred here by Fraas: *P. hybridum*, regarded by Bieberstein as wild in the Crimea, by Grisebach as wild along the Propontis and Ægean sea, and by Reuter on Zante (A. Dec.), was observed by Sibthorp, Chaubard, and Fraas, a weed only in cultivated ground throughout Greece. Westward, is described by Gerarde, and Morison ii. pl. 14; is termed “*p. erraticum capite oblongo hispido*” by Tournefort inst. 238; and is known to occur in Italy (Lenz), and in grain-fields throughout middle Europe as far as Britain (Engl. bot. pl. 43, and Pers.).

Adonis æstivalis of the Mediterranean countries. Called in France “*goutte de sang*” (Fee), in Greece “*agriō paparōna*” together with *Anemone stellata* (Sibth.), and possibly the “*anēmōnēs*” in question: — the “*agrias anēmōnēs*” being confounded according to Dioscorides ii. 207 with “*argēmōnēn*” called “*ēupatōriōn*,” and the “*argēmōnē*” is identified in Syn. Diosc. with “*anthēmis*,” and in the illustrated Vienna manuscript with *A. æstivalis* (Sibth.): the last-named plant was observed by Sibthorp, and Bory, frequent in fallow ground in Greece; and by Forskal, and Delile, on the Mediterranean border of Egypt. Westward, is termed “*ranunculus arvensis foliis chamæmeli flore phœniceo*” by Tournefort inst. 291, and is known to occur in fallow ground as far as middle Europe (Jacq. austr. pl. 354, and Pers.: see *A. autumnalis*).

Adonis dentata of Egypt. A yellow-flowered species — observed by Delile in grain-fields around Alexandria. In seeming correspondence with the conventional yellow colour of hospital flags.

(serpent signifying mouth, for it avails by the mouth only, Horap. i. 43): “*hōf*” asp or viper, serpent; “*hfō nkauri*” deaf serpent; “*phōgi*” valid; “*phagēr*” magician; “*phagri*” witchcrafts, charmer; “*phaeri*” poisoner; “*phanikōts*” subtle contriver, double-dealer; “*fēj*” or “*fēj*” or “*fēsh*” or “*fōsh*” fraud, to defraud, circumvent; “*fōji*” to defraud, be defrauded; “*krōf*” deceit; “*phī*” a kiss; “*phai ē phai*” together; “*phai*” here, this; “*phōōu*” to day; “*phēēt*” or “*phē*” who; “*phē*” or “*nthōf*” he; “*phōtēn*” you; “*phōk*” yours; “*phōi*” mine; “*phōlh*” a wound; — in Hebrew “*aphōē*” viper; “*phdn*” valid, firm, a viper; the letter “*pha*” or “*phē*” or “*phy*” signifying mouth: in Greek, the corresponding letter “*phi*.” The character occurs on the

Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 66).

The *Cerastes* or horned viper of Egypt, is said to be frequent there; and may probably extend into Palestine:—for it appears to be the “phdn” of Isaiah xi. 8, and Psalm xci. 13, and lviii. 4, in the passage, “the deaf adder” that “stoppereth her ear; which will not hearken to the voice of charmers, charming never so wisely.” In fact, I have not seen the *Cerastes* made use of by serpent-charmers.

 “phōrōs” eyelashes; “phōrōs” terror; “fōt” to be anxious, troubled; “fōi” or “fōi” or “fō” or “vō” hair; “phunōs” hedgehog; “fōd” artery, vein; “fō” canal, river; “fōi” flowing water; “vōtē” or “fōtē” or “fōd” or “fōd” perspiration; “phēn” or “phēn” or “phōn” or “phōnpēn” or “phōnphēn” to superabound, overflow; “phōn” to grow cold: “phrō” cold; “fōda” fundament; “phēētpōhōn” bursting of contained waters; “fōjsh” to cast down; “tshōuf” to evacuate.—The character occurs under the Twenty-sixth dynasty (Leps. d. iii. pl. 276).

The *hedgchog* called “phunōs” in Egyptian—is doubtless the long-eared species, *Erinaceus auritus*, figured on the monuments as early as the Third dynasty (Leps. d. ii. pl. 3); carried in cages as though regarded sacred under the Fourth, Fifth, and as late as the Twelfth dynasty; and observed by myself to inhabit Lower Egypt.

 “thifi” a bile; “noutf” a bile, to be discharged, set free; “iavi” sickness; “ēiaavē” corrupt blood, serous effusion; “fōrfēr” to flow from, drop from; “thōftēf” to distil, drop, fall; “phōshi” fused, spread out, drained; “phērphōr” to diminish, dissolve.—The character occurs in the Book of the Dead, also under the Seventeenth dynasty (Leps. d. iii. pl. 5).

 joint of meat; “af” or “afōui” flesh; “lēfli” crumb, morsel; “lōvlēf” or “lōflēf” to putrefy, become corrupt.—The character occurs from the Third dynasty to the Roman conquest (Leps. d. ii. pl. 3, and k. pl. 23 to 59): is besides the origin of the form φ of the Greek letter phi. The full Egyptian sound of f, though not occurring in Greek, is continued in Latin and English; confirmation being found even in the name of the letter “ef”

 meat fly: “af” fly; “fēnt” or “fnt” worms; “er-phent” or “rfnt” to produce worms; “af-hōns” to smell foully.—The character occurs under the Nineteenth dynasty (Leps. d. iii. pl. 162).

The *meat-fly*, *Musca vomitoria*, known therefore at the time of the formation of the Egyptian language.—“Three flies of solid gold,” were found with the body of queen Aahotep of the Seventeenth dynasty (newsp. account). That *M. vomitoria* produces meat-maggots, was known to Homer il. xix. 25: the blue colour of its abdomen, is alluded to by Pausanias x. 28; and the young or maggot state “galba” is mentioned by Suetonius. By European colonists, *M. vomitoria* was introduced into America; and at the present day, has become widely distributed over the globe: but I do not remember meeting with the insect on the islands of the Pacific.

 (fish signifying wickedness, pollution, Horap. i. 42); “tvf” or “tēvf” fish; “fōri” *mult.*: “tshafōuri” sole or flounder; “fōukasi” eel or muræna; “lēfi” scale fish; “ēphōt” mailed fish, tortoise; “fōtē” or “vōtē” or “vōtē” or “vad” or “ōrēv” pollution, abomination; “vē” to loathe, cause disgust; “sēf” or “saf” or “sōof” or “sōf” or “sōōf” to pollute, be polluted, wantonness; “shlōf” filthy, base; “thōlēv” stain, pollution, to be defiled;—in English “fish-story.” The character occurs from the Third dynasty to the Twenty-sixth (Leps. d. ii. pl. 3 to iii. pl. 264).

 (hawk with expanded wings, signifying wind, Horap. ii. 14); “phōrtsh” or “phōrtsh” to expand, stretch forth; “ōuēf” lungs; “nivē” or “nifē” or “nif” wind, to inspire, blow; “nif” or “nifē” clouds; “ēphlēōu” or “phlēōu” futile, in vain, idle;—in Hebrew “nphh” to blow, “aph” nostrils or nose, “owf” to fly: in Greek “nēphēlē” cloud. The character occurs under the Third dynasty, also in the Book of the Dead, and continues in use under the Persian emperors (Leps. d. ii. pl. 6, and k. pl. 24 to 49).

 “phōi” bench on which the Orientals are accustomed to recline in shops and temples; “phōūēi” from afar; “phiri” narration: “phanishlōf” out of employment, to no purpose; “phōtsh” to be many, to stretch out; “phōrtsh” to strew, spread, recline; “phanitshōfth” ribaldrous, base, empty; “tshlōf” or “tshlaf” base, turpitude; “phōoutsh” to prattle, trifling talk; “phēnh” or “phōnh” or “phōnh” to turn, pervert: “phahōu” backwards.—The character occurs under the . . . dynasty (Champ. dict. 255).

 “fikōhi” weaver's cylinder; “phapilas” or “phapilaps” instrument acuminate like a tongue; “phapilas” weaver's implement, implement with which anything is sharpened; “phimōlia” Armenian stone; “sēvtshōv” or “tshōvtshēv” or “tshēvtshōv” to whet or sharpen.—The character occurs as early as the Twelfth dynasty (Leps. d. ii. pl. 121). A second form  occurs under the Fourth dynasty (Leps. d. ii. pl. 98).

 “athav” or “atkōv” unleavened; “phas” or “phēs” or “phōsi” or “phisi” to cook, “han-phisi” cooked cakes, dainties; “nōf” or “ōnōf” joy; “phōlj” immoderate joy;

"phanitshfó" delirium, to be out of one's wits. — The character occurs in the pyramid at Dashour, under the Twelfth dynasty (Vyse iii., and Leps. k. pl. 42).

 (mouse signifying abolishing, also criticism; for among different kinds of bread it selects the best, Horap. i. 47); "pin" or "pein" or "phin" mouse; "phěřj" or "phōřj" or "phōřj" separation, to separate, "ōu-phōřj ěvōl" to distinguish; "phag" or "phōg" or "phah" to rend in pieces; "phěljě" or "phěłji" or "phōłji" rags; "phěnj" or "phōnj" or "phōnj" subversion, to overthrow; "phōt" to obliterate; "ōuōsf" abrogation; "ōuōjf" or "ōuōjp" to destroy, cut off; — in English "fine, refinement." — The character occurs under the Tenth dynasty (Leps. d. ii. pl. 150). A second form  occurs from the Nineteenth dynasty to the Roman conquest (Leps. d. iii. pl. 140 and 199 to iv. pl. 47.)

The *mouse*, *Mus musculus*, known therefore in Egypt at the time of the invention of writing: — is figured entire in an Egyptian caricature, probably later than the Twentieth dynasty; is mentioned in the *Batrachomyomachia*, by Herodotus; and among Roman writers, by Plautus. From Europe, was unintentionally introduced into America; and afterwards into the Hawaiian, and other frequented islands of the Pacific.

 (fly signifying impudence, for when continually driven away, it nevertheless returns, Horap. i. 48); "af-nōuhōr" biting fly; "ōřf" to avoid; "ōřf ěgōun" to circle around; "attshphit" or "atval" impudent; "mntatval" impudence; "tshōp" effrontery; "shafē" confidence; — in Hebrew "orv" biting fly, "orv" Arabia. — The character occurs under the . . . dynasty (Champ. dict. 85).

The *biting fly*, *stomoxys*, known therefore in Egypt at the time of the invention of writing: — the "orv" was one of the plagues induced by Moses in Egypt (Ex. viii. 16, "kunōmuia" 21 and 22 of Sept. translation); is mentioned also in Psalm lxxviii. 45 and cv. 31. The "kunōmuia" is mentioned by Homer il. xxi. 394, Philo vit. Mos. i. p. 401, Tertullian adv. Marcion. i. 14, and Athenæus iii. 37 and iv. 74; and the "cynomyia," by Pliny. By European colonists, the biting fly was unintentionally introduced into North America, where it has become frequent in houses: but I did not meet with it on the islands of the Pacific.

 (ant signifying knowledge, because man cannot hide away anything from it, and in all its wanderings it never loses the way home, Horap. i. 49); "jafjif" or "japjip" or "shajiv" or "shajif" ant: "phōh" to anticipate, bring about. — Foresight was attributed to the ant in the days of Solomon prov. vi. 6 to 8; and Pliny xi. 36 adds, that ants alone of all animals except man, bury their dead. The character occurs in the Book of the Dead, also under the . . . dynasty (pap. Burt. 120, and tabl. Belm. 15. 571).

The species referred to by Horapollo, is clearly the *house ant*, *Formica* . . . ; known therefore in Egypt at the time of the invention of writing. — By European colonists, this small troublesome insect was carried to North America, where it has become frequent. I did not meet with it on the islands of the Pacific.

 "vi" or "fi" to tolerate; "fai" or "fěi" to bear; "fari" to burden; "phěh" ripe; "phōh" end; — in Greek "phěř," in Latin "fero," to bear. The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 19 and 23, and Rosetta stone).

 w, in Greek ōu, its pervading meaning awry, wrong. The exclamation whew! (oryx signifying uncleanness, because it bellows indignantly at the rising moon and sun, and pollutes water-holes in the Desert, Horap. i. 46); "ōua" blasphemy; "ōuēm" threatening countenance; "ōuētsh" or "ōuōtsh" or "ōuatsh" will, to will; "hōōu" wicked; — in English "war." The character occurs under the . . . dynasty (Champ. dict. 126).

The *oryx*, a large African antelope, well known if not already domesticated in Egypt at the time of the invention of writing: — is figured under the Third dynasty (Leps. d. ii. pl. 3); and under the Fourth and Fifth dynasties, as appears from monuments examined by myself, was kept in herds, like other cattle. Horapollo also speaks of the oryx being used for riding or sitting upon by the "ancient kings."

 (wolf and stone, signifying consternation, Horap. ii. 70); "ōurtshě" or "ōūřtshi" watch night-watch; "ōuōnh" apparition, vision; "ōuōnh" or "ōuōnh" or "ōuanh" to be manifest; "ōuēh" to be revealed; "ōuōntsh" or "ōntsh" wolf; "ōutshsně" or "ōutshshně" suddenly; "ōuah" to invade, make irruption; "ōōřj" earnest; "ōuōshě" or "ōūji" or "ōji" cheek, unjust; — in English "wolf" and "wan" and "watch." The character occurs under the . . . dynasty (Champ. gram. 72).

The *wolf*, *Canis lupus*, known therefore in Egypt at the time of the invention of writing: — to the present day (according to Clot-Bey) the "dyb" or wolf occurs there, differing however somewhat from the Northern kind. The "zab" of Genesis xlix. 27, Isaiah xi. 6 and lxxv. 25, Jeremiah v. 6, and Zephaniah iii. 3, is clearly the wolf. The wolf was well known in Switzerland during the Stone period, as appears from debris of the earliest villages (Rutimeyer, in Troyon p. 272 and 442); the

"lukōs" is mentioned by Homer, and other Greek writers; and in Italy, the "lupus" or wolf was connected with the founding of Rome, is mentioned also by Terence, and Pliny.

 (kicking a wolf's track, signifying abortion, Horap. ii. 42); "ōuōnhf" or "ōuōmf" or "ōuamf" stable; "ōuēhsōi" or "ōuahsōi" roof; "ouō" rumour; "ōuēinē" to be agitated; "ōuan" or "ōuōn" who, a certain one; "ōuahēv" to mutter or growl; "nōutshp" consternation; "ōhōim" trampling upon; "ōōt" to groan; "ōōtē" womb, "ōuēthmēsīō" to act as midwife; "ōuhē" or "ōugē" or "hōuhē" or "ōuhōuhē" or "ōuhōuhē" abortion; "ōuēi" or "ōuēiō" to repudiate. — The character occurs  from the Eleventh dynasty to the Twenty sixth (Leps. k. pl. 11 to 48). A second form  (donkey's leg) occurs under the Twelfth dynasty (Leps. d. ii. pl. 121).

 "ōilē" or "ōili" or "ōili" ram; "ōuōi" onset; "ōuāi!" or "ōuai!" or "ōuēi!" or "ōuōlē" or "hōuhē" or "ōuōi!" woe!; "hōē" flock; "ēsōū" or "ēsōū" sheep; "ōuōlē" or "ōuōlē" or "ōuōlē", abundance, to abound; — in Greek "ōuai!", in Latin "vae!". The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 67).

 (herb "kōnuzan" signifying spendthrift, through slaughtering his sheep and goats, Horap. ii. 75); "kiōū" amaranthus; "kiōū" gore, blood mixed with dust; "ōētsh" or "tshōētsh" or "ouan" dust; "mōūt" to slaughter; "ōsht" or "ōsht" or "ouosht" to strangle, suffocate; "ōuōsh" or "ōuōsh" or "ōuēshouōsh" or "ōuōjōūj" to chew; "ōuēshp" or "ōuōshp" to break; "ōuōtshē" or "ōuōtshp" or "ōuētshē" or "ōtshē" to consume; "ōuētv" or "ōuōtv" to carry away, remove, change, "ōuōtv ēvōl" be sacrificed. — The character occurs from the Fifth dynasty to perhaps the end of hieroglyphic  writing (Leps. d. ii. pl. 49, 102, and 129, and Rosellin. mon. civ. xxvii. 6). A second form occurs  under the . . . dynasty (Champ. dict. 217 and gram. 112, 122).

Matthiola livida of Egypt. Called in Egypt "nægeisi" or "schudjara" (Forsk.), and the "kōnuzan" killing by inducing thirst (Horap. ii. 75) may be compared: *M. livida* fatal to goats "capris funestissima," and employed by the inhabitants as a strong purgative, was observed by Forskal p. 119 along the margin of cultivated ground in Lower Egypt; by him also, and Delile, farther inland in the Desert.

Inula crithmifolia of the shore of the Mediterranean and Atlantic as far as Britain. Possibly the "kōnuzan" in question: — the "kōnuza" was known to Athenaeus x. 67 in Egypt; and *I. crithmifolia* was observed there by Forskal p. 149, and Delile, in the maritime sand of the Mediterranean border. Farther North, the "kōnuzēs thusōsmōu" is described in 1 Morb. mul. 108 and 2 Morb. mul. 63 as resembling "sūlinō ōulō" curled parsley, growing in sandy places near the sea and its odour barely endurable; *I. crithmifolia* was observed by Sibthorp, and Chaubard, on rocks exposed to the sea around the Peloponnesus and the Greek islands. Westward, is described by Cæsalpinus f. 61; is termed "aster maritimus folio tereti crasso tridentato" by Tournefort inst. 483; and is known to grow along the Atlantic as far as Britain (Pers., and Engl. bot. pl. 68. See *Inula viscosa* and *I. graveolens*).

 (hawk signifying superiority, also victory, Horap. i. 6); "ōou" or "ōōu" or "ōōōu" glory; "oualē" to increase; "ōuōtv" or "ōuotv" excelling, mightier; "ōuēt" to excel; "ōulē" or "hōuēt" or "hōuit" leader, chief; "hōuad" first. — The character occurs under the Third dynasty (Leps. d. ii. pl. 2, and Champ. dict. 137).

 (vulture signifying limit, in its flight defining beforehand the battle-field and place of greatest slaughter, Horap. i. 11); "auēr" or "ōuēr" how much; "mōri" or "nourē" or "nōuri" vulture; "mōrē" or "mōr" or "mōur" to gird, tie around; "mōōtshē" or "mōōtsht" to traverse around, examine, depart; "mōjg" or "mōujg" or "mōujh" belt, girdle; "nōuōshē" limit; — The character occurs under the Ptolemies (Leps. d. iv. pl. 12).

 "ōuamē" digging implement; "ōuōi" or "ōuōēi" or "ōuōi" peasant; "ōuōtōri" ancle-bone; "ouah" or "ōuēh" or "ōuōh" or "ōuōh" adherent, to adhere, add to, follower; "ōua" or "ōuat" one, "ōuata" many; "ōuōn" any one, rest of the multitude, "ōuōnīm" everybody; "ōuatōu" or "ōuōtsh" or "ōuōtsh" of their own accord, spontaneously. — The character occurs under the Fifth dynasty (Leps. d. ii. pl. 42).

 "ōuēitē" or "mōōunk" or "mōunk" to diminish, fall away, eclipse. — The character occurs as early as the . . . dynasty (Champ. dict. 14).

 ("ōtis" *bustard* signifying pursued by a more powerful enemy, because it hastens away at sight, Horap. ii. 47); "ōuōs" quickly; "ōuōj" thief; "ōuēōu" or "ōuōs" to flee, recede far off; "ōuē" or "ōuēi" distance, afar off; — "ōuēinīn" Ionia; in English "away." The character occurs from the Fifth dynasty to the Twenty-second (Leps. d. ii. pl. 68, and k. pl. . . . to 46).

 "ōimē" or "ōimi" or "ōimi" hook; "ōuōhē" or "ōuōhē" or "ōuōhē" or "ōuōhē" fisherman, the catch; "ōuōntsh" or "ōntsh" end, to make an end. — The character occurs under the Third dynasty (Leps. d. ii. pl. 3). A second  form occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 21, and k. pl. 25 to 62). The same implement is often figured in the hands of gods and kings as one of the emblems of ruling; seems in fact a scepter in the

form of a shepherd's crook: I found however this pattern of cane used in Eastern Arabia, in contradistinction to the hoopoe-headed cane of the West.

sh or zh, its pervading meaning shame: inspiration through the teeth on feeling the thrust of a sharp instrument. — The Hebrew letter "shyn" or "shn," meaning tooth; the French "ch" pronounced sh, and French "j" pronounced zh.

(stairs or ladder signifying siege, on account of the inequality, Horap. ii. 26); "shlōshē" or "shlōshē" or "shlōshē" ladder or stairs; "shōlē" to encompass; "shōl" to invest, besiege. — The character occurs in the Book of the Dead, also under the Seventeenth dynasty (Leps. d. iii. pl. 5 and 84).

"shēpē" or "shēpē" haste, to hasten; "hashē" noose; "jōrj" or "jōrjs" or "jōrj" or "shōrsh" or "shōrshs" noose, to lie in ambush, to ensnare; "shēp" or "shōp" or "shōpē" or "shōpi" to capture, lay hold of; "shēp" to be captured, defendant; "shlēv" a muzzle, to muzzle; — in English "sheepish." The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 3, 19, and k. pl. . . . to 66).

("pēristēran" pigeon with raised crest, signifying borrowing gall, Horap. ii. 45); "shlōt" liver; "shnēn" irritation; "shstshnt" to be indignant; "shnēt" anger; "nōushs" anger, bitterness of mind, to grow angry; "shnau" delay; "shnat" to murmur; "shjir" spittle; "shalp" fist. — In colloquial English "dander rising." The character occurs in the Book of the Dead, also under the Nineteenth dynasty (Leps. d. iii. pl. 151).

"shē" or "shē" therefore; "shnrat" to investigate; "shnarkē" to accuse, condemn; "shaēiō" condemnation, obnoxious; "shōlp" bundle of reeds; "shērōf" or "shērōv" or "shērōv" or "sharōm" or "shēni" rods; "shat" to pay, quality, quantity, so much; — in English "sheriff." The character occurs from the Fourth dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 18, 24, 73, and k. pl. 5 to 63).

"shlēmōm" or "shlēmōm" or "shlēmōm" or "shlēmōm" to entangle, fold together; "shōlp" to form, bind fast; "shnōuf" iron mallet. — The character occurs as early as the Fourth dynasty, also in the Book of the Dead (Leps. d. ii. pl. 21, 25).

"shlōvi" shears; "shōi" curls; "shōp" or "shōp" or "tshōp" to shave, be shaven. — The character occurs under the . . . dynasty (Champ. dict. 363).

"shari" or "shōt" or "shējshōj" or "shōjshēj" or "shōjshj" to beat; "shnōōu" threshing; "shlak" punishment. — The character occurs from the Fifth dynasty to the Twelfth (Leps. d. ii. pl. 47, 107, 138).

("trugōna" turtle-dove, signifying fond of music and dancing, Horap. ii. 51); "shrmptshan" or "shrmptshal" turtle-dove; "fosh" or "vōsh" or "vōshē" or "shiphēi" or "shōsjēs" or "shōshhēs" or "shōshs" or "sphēi" to skip, dance; "shak" or "shask" to applaud, clap hands; "shas" or "shēs" or "shisi" to be elated; "shrō" victory, to conquer. — The character occurs from the Fourth dynasty to the Twelfth (Leps. d. ii. pl. 19 to 145).

(wolf with tip of tail lost, having bitten himself loose, signifying escape from persecution, Horap. ii. 69); "shimkah" to be afflicted, in distress; "saphla" narrowness, pressure; "shēu" narrow; "shōōu" to be straitened; "shīē" extreme or border; "shra" extreme part of the body; "ships" extremity of skin of eyes and ears; "shisak" to be reduced to extremity; "shōth" or "shōlk" or "shrē" to dig; "ēshau" or "ēshōu" forceps or nippers; "shilapsi" or "shōlpsi" to bite; "sham" or "shōm" strength; "shēmsham" or "shmschōm" to have strength; "shōshn" or "shētshōt" to pare off, cut off; "shinē" to find, "shinēi ēvōl" egress. — The character occurs in the Book of the Dead, and from the Twelfth dynasty to the Ptolemies (Leps. d. ii. pl. 128, iii. pl. 141, and k. pl. 32 to 51).

"shōrtē" or "tshlish" sword, knife; "shīērgōt" or "shīērgōt" or "shipē" to wound, be wounded; "shānah" maimed, mutilated; "tshōōshē" or "tshōshē" or "tshōōshē" wounds, to make blind, mutilate; "ōshē" to wound, make sick; "shōs" or "ōshr" congealed, "ōshr" to shiver, quake; "ōshv" or "ōshēv" cold, to grow cold; "shahshēh" or "shahshh" teeth-chattering. — The character occurs under the Third dynasty (Leps. d. ii. pl. 3). A second form occurs under the Nineteenth dynasty (Leps. d. iii. pl. 139).

"shalē" or "tshal" lame; "shra" thigh; "shalaj" or "shalōj" foot; "shimē" or "shimē" dizziness, satiety; "shōft" or "shēvvē" to grow weak; "shlj-pat" or "klj-pat" genuflexion, to bend the knee; "shnējō" to subject, subdue, "shnōn njō" to be subjected; "shōtp" or "shōt" to be conquered, subjugated. — The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 6 to iv. pl. 27, and k. pl. to 37).

("phassan" wood-pigeon holding a laurel leaf, signifying restored to health through response of oracle, Horap. ii. 43); "shlōj" or "shlōsh" bed; "shvvē" or "shōōv" or "shōv" or "shōj" or "shōjv" or "shajē" weak, debilitated; "shinōunai" wretched; "shitshtshēn" or "shitsshēm" or "shitsshōm" augury; "shini" to draw omens, to divine; "shōrp" or "shōlp" to reveal, revealing;

"shin-ōūōtshv" response; "shaimē" bird; "shv" or "shōvē" or "shōōvē" leaf. — The character occurs under the Third dynasty (Leps. d. ii. pl. 5). The lower portion resembling a leaf, occurs in the same hieroglyphic inscription under the Third dynasty.

The *wood-pigeon*, *Columba oenas*, though well known throughout Europe, has not perhaps been observed in Egypt. — The "phassa" of Homer *il.* xv. 238. and Aristophanes *av.* 303, is referred here by some writers; as also the "palumbes" of Cato, Nigidius, and Virgil, described by Pliny *viii.* 41 and *x.* 35 as healing themselves with laurel leaves (see above), as departing from Italy in the winter season, whither they go, being unknown, and as breeding only twice a year.

Laurus nobilis of the Northern shores of the Mediterranean. Called in Britain *bay* or *sweet bay*, but by Chaucer "laurer," in France "laurier" (Prior pop. names), in Germany "lorbeer," in Italy "alloro" or "lauro" (Lenz), in Greece "thaphnē" (Sibth), in which we recognize the leaf in question, laurel leaves having been imported into Egypt possibly as early as this date: — leaves and branches of "thaphnē" were carried in the coronation-procession of Ptolemy II. (Callixen., and Athen.); laurel leaves are enumerated by Alpinus as used medicinally in Egypt, and were ascertained by Forskal *mat. med.* to be imported from Greece. Among the Greeks, the "thaphnē" was sacred to Apollo (Plin. *xii.* 2), is mentioned by Hesiod *op.* 435, Homer *od. i.* 183, Ibycus, Theophrastus, and Dioscorides; and *L. nobilis* was observed by Forskal, Sibthorp, Bory, and Fraas, from Crete and the Peloponnesus to Constantinople. Westward, the consul Postumius Tubertus in the first triumphal procession at Rome was crowned with "laurus" for his bloodless victory over the Sabines, and Pliny *xv.* 38 and *xvii.* 11 further speaks of the tree as growing in Italy on the mountains and besides cultivated: *L. nobilis* is known to grow also in Spain (Pers.), is termed "l. vulgaris" by Tournefort *inst.* 597; is cultivated throughout middle Europe, and its aromatic leaves and berries continue to be employed medicinally (Lindl.).

 "shōvshōvē" an incurved wooden shaving that inverts upon a bird; "shi" to take, obtain; "shrōmpē" or "shrōmpi" or "shrōompē" or "shrōmpi" pigeon; "shalē" or "shal" or "shalol" or "shalō" or "shōilē" to commit, place in charge; "shajē" ear-ring; "shrēji" or "shrēshē" dowry or nuptial present; "shaēiēu" delivered up; "shaamē" or "shōōush" prevaricator, to prevaricate; "shagēm" or "shōgēm" impurity, unclean; "shi" to marry. — The character occurs as early as the Third dynasty (Leps. d. ii. pl. 3 to 6, Champ. *gram.* 77 and 381, and Buns. and Birch).

There seems included allusion to the custom — mentioned in Deut. *xxii.* 14 to 21. The healing bird among the peasantry of Egypt was ascertained by myself to be the *domestic pigeon*, *Columba vulgaris*, adapted to the purpose from its silence under captivity: detested therefore by the Jews, and held sacred to Venus by the Greeks. Apart from hieroglyphic writing, the pigeon is figured at Sakara under the Fifth dynasty (Leps. d. ii. pl. 70); but elsewhere on the monuments I was unable to find distinct representations. The "ywnē" was sent out from the ark by Noah (Gen. *viii.* 8); is mentioned also in Levit. *v.* 7, and Cant. *ii.* 14 to *iv.* 1; a pigeon from Egypt was connected with the founding of the oracle at Dodona (Herodotus); "pēristēra" and "pēristērēon" pigeon-houses are mentioned by Aristophanes *lys.* 755, and Plato *theæt.* 198; and the "columba" by Pliny *x.* 74 as breeding several times in a year. Eastward, the pigeon is mentioned in the *Sama Veda* (transl. Stevenson); was observed by myself lingering in numbers about the secluded and long-abandoned cave-temples at Adjunta; and according to Mason, is well known in Burmah. By European colonists, was carried to Northeast America, where it has become abundant, and if naturalized, keeping notwithstanding in the vicinity of dwellings.

 ("hēnalōpēka" Egyptian goose signifying offspring, son, Horap. *i.* 50); "shētshē" goose; "tshmtshēshē" hissing; "tshōutshits" hissing (of serpents, Edw.); "shjē" or "tshjē" grasshopper or locust; "shi-tshipi" or "shi-tshōtsh" or "shi-tshōtsh" confusion, shame, to be disgraced; "shrōsh" or "shrōōsh" fruit, offspring; "shmōh" end, consummation; — in Hebrew "shrk" or "lhsh" to hiss. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 6, and k. pl. 5 to 66). That the character represents the "hēnalōpēx," appears also from Herodotus *ii.* 72, and Aristophanes *av.* 1295.

The *Egyptian goose*, *Anser chenalopex*, is an indigenous species that does not appear to have been domesticated: — apart from the hieroglyphic writing, flocks are captured in nets under the Fourth and Fifth dynasties at Gizeh: and at Benihassan under the Twelfth dynasty, the bird is separated from the domestic goose. In Middle Egypt, Feb. 2d, the living *A. chenalopex* was observed by myself in immense flocks on the sand-bars near Gebel Shekh Embarak; when disturbed, flying away in files or lines, some of them plicated and wedge-like after the manner of our *A. Canadensis*.

The articulation *z* seems wanting in the Egyptian language; — though in use among the population of the present day, the *domestic goose* being called "ouizzah." An ancient form of the Phœnician letter "zyn" , clearly taken from a goose's neck, is continued in Etruscan, and Oscan (Gesen. *monum. Phœnic.*); in Greek also, though often reversed, and possibly transferred to sigma, a differ-

ent sibilant. This reversed form constitutes the S of the Romans and the alphabets of Western Europe.

h, its pervading meaning held: The exclamation "hush !."

 arms with the thumb pointing downward; "halök" or "hamēr" or "amēr" breast, arms; "hértshé" cubit, fathom; "hföt" or "hpöt" fathom; "hētēn" or "hētōu" thumbs; "hrak" or "hrök" or "hēri" or "hōrou" to quiet, hush, make still; "hrōur" or "hōurōou" or "harō" or "harō" to keep silence, hush; "tahnō" or "tshōtsht" prohibition, to prohibit; "hmōōs" or "hmsō" to cause to sit. — The character occurs from the Fourth dynasty to the Thirteenth (Leps. d. ii. 81, and k. pl. 7 to 14).

 cow-bell; "harikiōn" bell; "has" although; "hěljě" kind; "ha" or "has" to permit; "hiěv" or "hiěv" lamb; "hē" to be, to remain; "hatm" or "hatn" or "hahtn" or "hahtn" or "hahtē" with; "hah" many. — The character occurs as early as the . . . dynasty (Champ. gram. 372 and 373).

 "ōhě" or "ōhi" herd or flock; "ěiōhě" or "ōhě" or "ōhi" fold or sheepfold; "ōhi" to tarry; "hēnōufě" or "hinōufi" tranquillity, abundance; "hōr" or "hōr" to milk; "hrě" or "hrē" food; — in Hebrew the eighth letter "hyd" supposed to signify sheepfold; in English "enough." The character occurs from the Fourth dynasty to the Roman conquest (Leps. d. ii. pl. 23, and k. pl. 7 to 58).

 (*cuttle-fish* "sēpian" signifying, in striving to do well, meeting with misfortune; the animal escaping capture by discharging a black fluid, Horap. ii. 107); "hōrpi" to try; "hihōur" declivity; "htōp" or "hě" or "hěi" disgraceful fall; "hulē" or "lōihě" or "lōihi" mire; "htōp" an offence; "hapōu" where; "hamnai" here; "ha-mnē" there; "hēn" near; "hamōi" as yet; "hathē" or "hatē" or "hihě" or "hihē" before; "phahōu" or "pahōu" or "hipahōu" behind, afterwards; "hasiě" to be submerged; — in Latin "hic," in English "here." The character occurs under the Twelfth dynasty (Leps. d. ii. pl. 140). A second form  occurs in the Book of the Dead, and from the Twelfth dynasty to the Eighteenth (Leps. d. ii. pl. 125, and k. pl. 29).

 "hōjps" to shut, stop; "tathō" to hold, bind; "sōnh" prisoner; "hēētě" or "hēitēs" behold!; "hnhě" to be overtaken, circumvented; "hōls" or "hōlsh" to be encompassed. — The first character occurs from the Eighteenth dynasty to the Roman conquest (Leps. d. iv. pl. 25, 27, and k. pl. 28 to 59). The second character occurs under the . . . dynasty (Champ. gram. 459).

 "hatēr" pestle; "mjaht" or "harōji" a mortar; "hatě" to bruise, "hōhlěl" bruising; "hiōu" or "hiōuě" to beat; "hiōli" public flagellation; "hiōni" or "hiōni" or "hiōnē" to stone. — The first character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 30, 98, and k. pl. 7 to 66). The second occurs under the Nineteenth dynasty (Leps. k. pl. 36). The third occurs under the Ptolemies (Leps. k. pl. 53).

 "alěh" or "arěh" custody, prison; "ěnauh" or "snauh" bonds, fetters; — The character occurs from the Twelfth dynasty to the Ptolemies (Leps. d. ii. pl. 121, 138, and k. pl. 56); and seems the origin of the following forms of the Phœnician letter "hyd," , continued in the Greek "ēta," and Roman H.

The character seems besides a modification of the stocks. — The stocks are mentioned in the English version of Prov. vii. 22; "sth" in Job xiii. 27 and xxxiii. 11; and were observed by myself in common use among the Arabs of Zanzibar. In Italy, the "numella," confining the neck as well as feet, is mentioned by Plautus (Ainsw.).

 "hlal" yoke; "hihōh" to upbraid; "hōōutsh" reviling, contumely; "hila" to be calumniated. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 22 and 102).

 "hěvi" or "hvvě" or "hěvi" a plough; "hěvě" or "hěvi" or "hěvi" or "hěvě" grief; "hva" sad, unwilling; "hěhlilě" grief, trouble; "hětsh" or "hěj" or "hōjhěj" or "hějhěj" to be afflicted; "lōjh" or "lōjh" affliction; "hlěplōp" or "hlōplp" to be in a strait; — in English "heavy" and "to come to grief." The character occurs from the Fourth dynasty to the Persian emperors (Leps. d. ii. pl. 98 and k. pl. 49).

 "hēt" heart, mind; "hēt" to trust to, confide in; "r-hēt" to repent, ponder; "hēt-hēt" inside of the heart; "hēt" womb; "hěts" or "hě" or "hōuad" or "hōuit" or "hōuěit" or "hōuěitě" beginning; — the name is continued in the Greek "ēta," supposed to have been originally pronounced h. The character occurs from the Third dynasty and the Book of the Dead to the Roman conquest (Leps. d. ii. pl. 2, and k. pl. 5 to 59).

 (ibis signifying "karthian" heart, mind, reason; the bird being dedicated to Mercury, the master of all thinking and reasoning, Horap. i. 34); "haviōui" or "hip" or "hippēn" ibis; "hrai" or "hm" or "hn" in; "hōun" or "hihōun" within; "t-hihōun" in the interior, the intellectual faculties; "hak" wise, intelligent; "hōuě" wiser; "hōp" to think; "hap" or

the "nmr" or leopard is mentioned by Habakkuk i. 8, and Jeremiah v. 6. The "pardos" of "Africa and Syria," are mentioned by Pliny viii. 23. Equatorial Africa appears to have been the original home of the leopard; and skins were doubtless imported thence into Egypt at a very early period. At Mocha, I found them for sale, forming a regular article of traffic.

 (swan signifying old musician, Horap. ii. 37); "hunōn" (or "halēt nlōupō," ms. Par.) swan; "hlō" or "hēlla" old man or woman, "el-hella" to grow old; "hēmsēoud" familiarity; "kabs" custom, habit; "haš" or "haē" or "haēuē" the last. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 98).

t, its pervading meaning toil.

 "tōts" a tablet; "tnēvē" or "taivē" or "taivi" a chest; "ōtshd" or "tēkm" to draw or drag; "rahts" prostrator; "tēvnē" or "tvnē" quadruped. — The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 49). A second form  occurs under the Twelfth dynasty (Leps. d. ii. pl. 129).

 (baboon "kunōkēphalōn" sitting, signifying the two equinoxes, day and night being then equal, Horap. i. 16); "tēōn" os sacrum; "tērtōr" fixed; "tōts" or "tōts" seat, to be fastened in; "talō" or "talē" sitting; "hōd" a balance or balance-scales; — "tōri" a gnomon. The character occurs under the . . . dynasty (Champ. dict. 117, Sharpe 73. 3. 14). The following combination occurs under the . . . dynasty (Champ. text 206, Buns. and Birch); and illustrates Horapollo's account of the Egyptians placing an image of the cynocephalus on water-clocks.

 "phat" foot; "rat" foot, legs; "ratphat" hairy-foot or hare; "garēshōōts" (jerboa, Lacroz); — in Bali the learned language of China "bat" (Laloub., and Tattam); in English "foot." The character occurs under the Third dynasty (Leps. d. ii. pl. 3, Bonom., and Buns. and Birch).

Two species of *jerboa*, *Dipus hirtipes* and *D. sagitta*, are known to inhabit the Desert around Egypt; — and Clot-Bey ii. 68 further states, that when captured they cannot be kept in wooden cages on account of their powerful teeth. The "thipōthas" of Lybia, are mentioned by Herodotus iv. 192: and a figure of the jerboa is given by Paul Lucas ii. p. 58.

 "tats" sole of foot; "tah-ērat" to stand; "tajrēu" firm, stable; "tjra" standing, firmness; "tajro" the firmament; — in English "stand." The character occurs under the Fourth dynasty, also in the Book of the Dead, and continues in use under the Twelfth (Leps. d. ii. pl. 30 and 118); the second form occurs under the Seventeenth dynasty (Leps. d. iii. pl. 12).

 leading-string; "tasthō" rope by which a ship's sail is directed; "tasthō" to turn aside, avert; "tahtēh" to incline, convert; "tōujō" to keep, to liberate; "tnau" or "thnau" when. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 10 to 61).

 (two feet joined together and walking, signifying course of the sun in the Winter solstice, Horap. ii. 3); "tōk" to confide, trust; "tphē" or "tphō" to dismiss, send away, take leave; "ratf" or "tatsi" or "tashē" foot-tracks; "trahōs" pair of compasses; "tētrr" or "tōtēr" steps or stairs, an instrument graduated into minute divisions. — The character occurs from the Third dynasty to the Roman conquest (Leps. d. ii. pl. 3, 23, and k. pl. 5 to 57).

 "tatshō" to weigh down, to be lame; "tahē" or "thigi" or "dhē" drunkenness, to be drunk. — The character occurs in the Book of the Dead.

 "stōt" or "stōt" or "strtr" or "tōt" shuddering, fright, tremor. — The character occurs as early as the . . . dynasty (Champol. mon. i. 98 and iii. 336).

 "slad" or "slaatē" to slip, fall; "slatlēt" a slip, false step, fall; "pah" or "pōht" to fall prostrate; "rōht" epilepsy; — in English "slide." The character occurs under the . . . dynasty (Champoll. gram. 370).

 "trimōs" or "raktik" or "mētshōd" or "mētshōt" or "metshtshōt" plains; "tōē" or "tōi" or "tēr" a portion, a part; "taj" sod; "tōuōt" green; "tēshnē" or "tēshmēs" or "tēsh" herb, herbage; "tarinōn" a bed of young sprigs; "tōs" or "tōsi" dry, to become dry; "tmmi" hair or wool. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 66).

 "tēsh" or "tēshē" or "tishē" or "tōsh" or "tōshē" or "tōji" plantation, to plant; "tōng" arise; "tōōun" or "tōn" or "tōēis" to rise up. — The character occurs under the . . . dynasty, and continues in use under the Ptolemies (Champ. dict. 213, and Leps. k. pl. 51).

 (hand signifying desirous of building, Horap. ii. 111); "tōt" or "tōōt" hand; "tē" or "tiōu" the number five; "tōvs" or "tēvs" or "tvs" to instigate. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 7 to 66).

 "trēsīs" cheek, part of the upper jaw projecting under the eyes (cheekbone); "tassē" or "smnts" to bargain, make an agreement; "tarkē" or "tarkō" to bind by oath,

swear, adjure; "tama" or "tamē" or "tamō" to declare, make known. — The first character occurs in the Book of the Dead, also under the . . . dynasty (Buns. and Birch). The second character occurs in the Book of the Dead, and from the Twelfth dynasty to the Ptolemies (Leps. d. ii. pl. 129, and k. pl. 44 to 58).

 (finger signifying measurement, Horap. ii. 13); "tēv" or "tēv" or "tēvē" or "tēēvē" finger; "tēvs" ring, seal-ring, stamp, seal, mark; "tēv" or "tōv" or "tōvs" or "tōps" or "taōv" to sign; "tēvi" or "tēpi" prescribed labour. — The character occurs in the Book of the Dead, also under the Eighteenth dynasty (Leps. d. iii. pl. 77). To the present day, I found everything in Egypt done by contract, prominent persons in general wearing a seal-ring.

 "tōvi" or "tōvi" brick; "tōvē" or "tōōvē" or "tōūēiō" recompense; "tōh" or "tōh" straw. — The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 5, and k. pl. 49 to 55 and 62). The character presents additional evidence to that above given, that *dobi* or sun-dried brick were in use when writing was invented.

 "tōvi" receptacle; "tahō" or "tōhō" to place. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 15). Apart from the hieroglyphic writing, the implement is employed in bricklaying under the Eighteenth dynasty (Leps. d. iii. pl. 40).

 "tōm" wall; "tōmi" contiguous, joined together; "tōr" or "tōsh" or "tōm" or "tōm" or "tōmi" or "tēm" confederate, to adhere to, join together; "tashs" to cement, agglutinate; "tashash" to continue; — in Hebrew "tyrē" wall. The character occurs from the Third dynasty and the Book of the Dead to the Twenty-first (Leps. d. ii. pl. 7, and k. pl. 42).

 "tēuntrōm" a columnar whirl of dust; "tōunēs" or "tōunōs" or "tōunas" to excite, stir up, place together upon (superimpose); "kēt" or "ket" or "kōt" or "kōt" to build; "tēk" strong; "tenē" great, strong. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, 147, and k. pl. 5 to 61).

 "tēnc" a bridge; "tlō" scala portabilis; "tnōm" or "tōm" furrow, vale. — The character occurs under the Fourth dynasty (Leps. d. ii. pl. 20). A modification  occurs under the Fifth dynasty (Leps. d. ii. pl. 43).

 "tōthē" track, footpath; "mōēit" or "mōit" road, way; "mitōōui" paths, roads; "pēt" or "phēt" or "phōt" to run, flee; "ērat" to, unto. — The character occurs as early as the Fourth or Fifth dynasty (Leps. d. ii. pl. 13). A modification  occurs from the Fifth dynasty and the Book of the Dead to the Ptolemies (Leps. d. ii. pl. 65 to iv. pl. 14, and k. pl. 12).

 "tal" hill; "talēu" elevated place; "tau" or "tōū" or "tōūēiē" mountain, mountainous region, Desert; "tōū" to migrate, change sides; "tōūēiō" separation, divorce; "tēnh" or "tūih" or "tēnh" or "tnh" pinnacle; "tēf" summit, tip; "talē" to ascend. — The character occurs from the Third dynasty and the Book of the Dead to the Ptolemies (Leps. d. ii. pl. 2, and k. pl. 24 to 58).

 (muræna or speckled eel signifying intercourse with foreigners, Horap. ii. 104); "tēlmōnia" spotted serpent; "tēh" or "tēh" or "tōh" to mingle, hold communion; "tēu" to buy; "tēi" or "tōūē" or "taaf" or "taā ēvōl" to sell; "tēif ēvōl" sale; "tmō" or "tēmmō" or "tē" to feed; — in Hebrew, the ninth letter "tyd," said to mean serpent, or according to others convolute (Gesen.). The character occurs under the . . . dynasty (Champ. dict. 171). Horapollon speaks of the "murainau" coming out of the water to mingle with serpents; and this was the belief among the common people of Italy in the days of Pliny ix. 35 to 39.

 "tar" sail-yard, branch; "tōrē" ship's oar; "trp" or "tarp" or "tōrp" or "tōrp" to rob, spoils; "tahth" or "tartr" to disturb. — The character occurs in the Book of the Dead xxxvi. 99, 17 (Buns. and Birch).

 "taktōn" inverted, entangled, involved; "tō" turning; "toki" a knot, braid; "tanai" or "taithē" so; "tōn" where; "trē" or "tōn" or "tnnō" to be worried; "tēnōu" or "dnōu" now; "mtō" or "emtō" or "takō" to perish, perdition. — The character occurs from the Sixth dynasty to the Ptolemies (Leps. d. ii. pl. 76, 150, and iv. pl. 25).

 "taktē" greaves, knee-hose; "tahēm" or "talm" or "tēhm" to call; "tēl" or "tēr" all; "tnnō" or "tnōu" or "taō" or "taōuē" or "tau" or "taua" or "tōuē" to send; "takta" or "taktē" or "taktō" to place around, compass about; "tīhē" to be hunted, hunter; "taaps" intense desire; "tanhē" or "tanhō" or "tangō" to preserve alive; "tōuja" or "tōujē" to save. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 7 to 66).

 (wolf or dog turned away signifying aversion, Horap. ii. 21); "tasthō" to be averse; "taktō" to bring back; "tōv" or "tphō" or "taphō" or "taphē" to restore. — The character occurs under the . . . dynasty (Champ. dict. 116).

 ("tivōus" *Pistia stratiotes*, Syn. Diosc.); "tvvō" or "tōuvō" purification; "tvvē" or "tōuvē" to cleanse, purify; "talshō" to desist, make an end; "tōtsh" or "tenē" limit, end. — The character occurs under the . . . dynasty (Champ. gram. 77).

Pistia stratiotes of Equatorial Africa. A floating lettuce-like plant called in Egypt "hay a'lem el-ma" water-houseleek (Del.) and used medicinally against menorrhagia (Alpin.), by the prophets "aima ailōrou," in Egyptian "tivōus" — (Syn. Diosc.): the "mnasiōn étēron" growing in pools of the Nile is described by Theophrastus iv. 8. 6 as leafy with the root not reaching the soil, leaves side by side as if in a double series, and employed medicinally in fractures and menstrual affections: the "pōtamiōn stratiōtēn" according to Dioscorides grows without root on the top of the water, its leaves resembling those of the "aēizōōu" houseleek but larger, refrigerating, and restraining hemorrhage from the kidneys: *P. stratiotes* was observed by Calliaud in Sennaar; by Grant, in "floating rosettes" carried in flood down the Nile from the Equator "to about 13° N., beyond which scarcely one is visible"; was observed also by Adanson in Senegal. Eastward, is called in Sanscrit "koombhika," in Bengalee and Hindustanee "taka panna," in Telinga "neeroo boodooke" (Lindl.) or "antarei-tamara," in Tamil "agasatamaray" (Drur.); was observed by Rheede xi. pl. 32 in Malabar; by Graham, "common throughout the Concans," but by myself chiefly in artificial reservoirs; by Roxburgh, and Drury, in other parts of Hindustan, and used medicinally by the natives; by Mason v. 504, in Burmah, occasionally transferred to tubs of water near public buildings, said "to keep the water fresh"; by Loureiro, in Anam; by myself, apparently indigenous throughout the Malayan archipelago; by Blanco, called on the Philippines in Tagalo "guiapo," in Ylocano "loloan." Westward from Africa, may have floated without human intervention across the Atlantic to the West Indies, observed by Browne frequent at Jamaica, and known to occur in Florida; but possibly carried to Peru, where I found it only around Callao on the Pacific.

i, in Greek "ai," its pervading meaning I, self.

the all-seeing eye; "ai" to be, exist; — in Hebrew, the sixteenth letter "iyn," meaning eye, fountain. The character occurs on the Gliddon mummy-case, and from the Fifth dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 67).

(sun and moon signifying "aiōna" perpetual, eternal, Horap. i. 1); "sou-ai" first day of the new moon or month; "ōuaitsh" or "ōuaitsh" time, "ōuaitsh nim" always; — in Hebrew "iylm" or "iylwm" eternity; in Greek "aēi" always, ever; in English "ever and aye." The character occurs from the Nineteenth dynasty to the Twenty-sixth (Leps. d. iii. pl. 171, and k. pl. 49). A second form ☉ occurs under the . . . dynasty, and continues in use under the Ptolemies (Champ. dict. 14, and Leps. d. iv. pl. 47).

(lion's head signifying sentinel, watchful, the lion closing its eyes while watching and keeping them open in sleep, Horap. i. 19; eye the sentinel of the body. Diodor. iii.; "iri" eye, Plut. is.); "arēh" to guard; — in Hebrew "iyr" or "iwr" keeper, sentinel, watchful. The character occurs from the Eleventh dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 150, iii. pl. 152, and k. pl. 23 to 63).

(eagle signifying isolation, for it builds its nest in uninhabited places and flies higher than other birds, Horap. ii. 53); "jaie" or "jaie" or "jaie" or "jaie" or "tshaiē" the Desert, solitary; "raih" free; "aiōōu" or "ēšaiōōu" swift; — in Hebrew "iyt" rapacious bird, eagle; in Greek "aētōs" or "aiētōs." The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 5 to 67). Further connection is found in the adoption of the *eagle* as the bird of Jupiter among the Greeks.

(hawk able to rise perpendicularly upwards, Horap. i. 6; and towards the East rising upwards, signifying winds, Horap. ii. 14); "tshai" nose, nostrils; "tshai" the East, to spring up; — "the breath of life," Gen. ii. 7. The character occurs as early as the . . . dynasty (Champ. dict. 236).

Arnopogon picroides of Egypt and the Mediterranean countries. Hawk "iēraka" signifying the sun, for alone among birds it can gaze on the sun: and hence the "iērarkia" herb is used in maladies of the eyes (Horap. i. 6): "thrimithōs" is the Egyptian name — of the "hieracium growing in Egypt" (Edw.); and *A. picroides*, having a yellow flower somewhat resembling the sun's disk, was observed along the Mediterranean border by Hasselquist, Forskal, and Delile. Farther North, the "iērakiōn" is mentioned by Cratevas (Plin.), and Aetius, and the "iērakiōn tō mēga" of Dioscorides is referred here by Gesner, and Fraas; *A. picroides* is termed "sonchus asper laciniatus creticus" by Tournefort inst. 474. was observed by Sibthorp, Chaubard, and Fraas, frequent in waste ground especially near the sea from the Peloponnesus throughout the Greek islands. Westward, hawks were supposed by the Romans to make use of the "hieracium" herb (Plin. xx. 26); *A. picroides* is known to grow in Italy (Lenz), and was observed by Forskal on Malta and near Marseilles (Lam. ill. pl. 646, and Pers.).

|| "ai" or "mmai" or "ēlai" myself, I; "ōuai" the numeral one; "ōuaēēt" or "ōuaēt" single, alone; "aiai" or "aiāēi" or "aiāēi" increase, to augment, grow, be magnified; "jai" or "jaiō" or "jaiōōu" sad. — The character occurs by itself and as a numeral under the Third dynasty, and continues in use until the end of hieroglyphic writing (Leps. d. ii. pl. 4, and k. pl. 6 to 67): is clearly

the origin of the later form I of the Greek letter iota, the Roman letter I, and as a numeral continues in use among nations generally to the present day.

 (seeking protection, Horap. ii. 48) ; "aëið" wooden peg ; "haivs" or "haivés" or "thaivés" shadow, protection. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 7 to 67).

phantom of the imagination, griffin ; "tarah" to indulge in, be disturbed by vain imaginings. — The character occurs as early as the . . . dynasty (Champ. gram. 497). The same figure occurs at Benihasan under the Twelfth dynasty, but whether in the hieroglyphic text I do not now remember. The "gryps" or "gryphus" as described by Virgil, and Pliny, entirely corresponds: the imaginary monster "himaira" chimera, is mentioned by Homer il. 179 to 181.

 (voice of the air or thunder signifying voice from afar called "ōuaiē," Horap. i. 29) ; "hrōū" voice ; "hrōū-vai" or "hrōū-vvai" thunder ; "mainē" or "maēin" or "maēinē" a sign ; "haiō" yea. — The character occurs as early as the Tenth dynasty (Leps. d. ii. pl. 149). A second form occurs also under the Tenth dynasty at Hamamat (Leps. d. ii. pl. 149). The form  of the Phœnician letter yod, and the original form  of the Greek letter iota, seem also taken from the zigzag line of lightning. Compare Homer's  sign from Jupiter.

y consonantal, its pervading meaning you.

"iō" or "tōiō" to be weaned ; "iōrh" pupil of the eye ; "ianōs" iris ; "ēiērh" or "ēiōrah" aspect. — The character occurs in the Book of the Dead, lxxix. 164, 13 (Buns. and Birch).

"iēhrai" peers, nobles ; "iōnam" right hand ; "aōuð" or "ēōuð" a pledge, "aōuð" to pledge ; "aōuðt" or "ēiōhē" or "iōhē" hall, abode ; "iōhi" or "iōhē" field, vineyard, flocks ; "ēiōmē" mud (see bank swallow, and Horap. ii. 29) ; — in Hebrew "ymyn" right hand, pledge. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3 and k. pl. 5 to 67).

The geographical names of many places around Egypt inhabited by the White race, appear to have been framed in reference to the inherent meaning of consonantal y : as, "iantōōu" hill country, — "iantōōu" (or "iantōōu," Mingar. p. 73, or "ianhōōt" or "ēiahōōut," ms. Par.) or "ēiantōōu," onager or wild mule (of Palestine). In facing the North, Yemen is on the right hand : and we find transmitted in Hebrew and Greek, "Yrthn," in Greek "Iōrthanēs ; Yphw," in Greek "Iōppa ; Ybnē," in Greek "Iamnia ; Ybk" of Numb. xxi. 24 ; "Yrhw," in Greek "Iērihō ; Ywbb" of Gen. x. 29, in Greek "Iōvav ; Yizr," in Greek "Iazer ; Ybws" and "Yrwshlym," in Greek "Iērōusalēm ; Yēwth," in Greek "Iōuthain ; Ywn," in Greek "Iōnia" ; and of names of nations or families, "Yphid," in Greek "Iapētōs ; Yikb," in Greek "Iakōv ;" and "Yshral," in Greek "Israhēl."

(crocodile's eyes emerging from the deep, signifying sunrise, the East, Horap. i. 65) ; "iēvt" or "ēiēvt" or "ēiēft" or "ēiēft" or "pēiēvt" the East, sunrise ; "iēv" or "iēp" or "iōpē" or "ēiōpē" or "iōppē" manufactures, arts ; "iōp" artisan ; "ēiōpē" to spin. — The character occurs under the Third dynasty (Leps. d. ii. pl. 7). A second form  occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 17, and k. pl. 5 to 63).

(dew falling from heaven, signifying instruction ; for it falls on all, but profits only the susceptible, Horap. i. 35) ; "iōtē" or "iōtē" or "iōd" or "ēiōtē" dew ; "iatē" or "iad" or "iōd" or "iōt" or "ēiōt" father, forefathers ; "ēiat" or "ēiaat" or "iat" or "niat" attention, to observe, mark, consider, perceive. — The character occurs under the Nineteenth? dynasty (Rosellini. m. real. 108).

"iōt" or "iōt" barley ; "iēs" or "iōs" quick ; "iēthē" profiting, to progress, advance. — The character occurs as early as the . . . dynasty (Rosellini. m. civ. 23).

Hordeum vulgare of the Tauro-Caspian countries. Called in Britain *barley*, in Anglo-Saxon "barlych" or "bærlic" or "bær-cræs" or "bere" (Prior), in Germany "gerste" (Grieb), in France "orge" (Nugent), in Italy "orzo" (Lenz), in Greece "krithari" (Fraas), in Egypt and Yemen "shayr" (Forsk.), and cultivated at the time of the invention of writing : — standing crops, distinguished by the inferior height and stouter beardless spikes, are figured under the Fifth (Leps. d. ii. pl. 47, and Champ. 417), Seventh, and Seventeenth dynasties : the "shoirē" is mentioned in Leviticus xxvii. 16, Ruth ii. 17, Joel i. 11, and Job xxxi. 40 ; H. vulgare was observed under cultivation in Egypt by Forsköl, Delile, and Clot-Bey ; and by Forskal, and myself, in Yemen. Northward, the "krithē" or "kri" is mentioned by Homer, Aeschylus ag. 1625, Herodotus, Thucydides, Theophrastus, and others ; the "hordeum," by Virgil, Columella, and Pliny ; H. vulgare was cultivated in Switzerland during the Stone Age, relics occurring in debris of the earliest villages (Heer, and Troyon) ; was observed by Forskal, Chaubard, and Fraas, under cultivation in Greece ; is known to be cultivated throughout Europe to "Lat. 70°" in Lapland, farther North than any other kind of grain (A. Dec.), succeeding equally within the Tropics, as witnessed by myself under the burning climate at Mocha. is derived by Berosus from Babylonia ; by Moses of Chorene, from the Kur flowing into the

Caspian; was observed by Olivier, Chesney, Koch, and Kotschy, in Mesopotamia, Persia, and along the Caspian. Eastward from Persia, was found by Alexander under cultivation in Hindustan (Theophr.); is mentioned in the Sama Veda (transl. Stevenson) and Institutes of Menu (transl. Deslonch.); has a Sanscrit name (Pidd., and Royle ill. him. p. 418), is called in Bengalee "jab," in Hindustanee "jau" (D'roz), in the environs of Bombay "jow satoor," but sometimes "sheer" (Graham), indicating introduction by the Arabs. Farther East, is enumerated by Mason as "exotic" in Burmah; was observed by Kaempfer, and Thunberg, under cultivation in Japan and called "o muggi." By European colonists, was carried to America, where in our Northern States it continues extensively cultivated.

 "čuni" millstone, mill. — The character occurs as early as the Thirteenth dynasty (Leps. d. ii. pl. 149).

 (ass-headed man "ōnōkēphalōn" signifying untravelled; because knowing nothing of history, nor of other countries, Horap. i. 23); "čō" or "čīō" or "jō" donkey; "iar" not sagacious, noseless; "iai" to fear. — The character occurs in the Book of the Dead, also under the . . . dynasty (pap. Ath. xv. 3, Buns. and Birch).

The *donkey*, *Equus asinus*, probably already domesticated at the time of the invention of writing. Its Egyptian name is given as "čō" or "čēu," signifying also beast of burden, as though the earliest beast of burden known to the Egyptians: — apart from the hieroglyphic writing, the donkey is figured under the Third dynasty (Leps. d. ii. pl. 5); was observed by myself, kept in droves on monuments of the Fourth dynasty at Gizeh, caparisoned as a beast of burden under the Fifth in the beautiful tomb at Sakara; and to the present day in Egypt, the usual mode of journeying is on donkeys. The current name there of the donkey is however "hemar;" from the Hebrew "hmwr." In Palestine, the donkey is mentioned in the history of Abraham (Gen. xxii. 3); and under the name of "hmwr," in Gen. xlix. 14, and Ex. xiii. 13. In Greece, the "ōnōs" is mentioned by Aristophanes nub. 1273 and pac. 4, and others: while in Italy the transported name "onus" signifies burden, a new name "asinus" being given to the animal, mentioned by Cato, Varro, and Pliny. In regard to the Western origin of Hindu institutions, bramins riding donkeys are mentioned in the Institutes of Menu (Braminical and Deslongchamps versions); donkeys continued in Hindustan to be used for riding in the days of Arrian; but throughout that country, I was unable to discover figures of the donkey in the cave-temples, and cannot recollect meeting with the living animal. From Europe, the donkey was carried to America by Columbus (F. Columb. 45 and 53).

 (two hippopotamus hoofs facing downwards, signifying unjust, ungrateful, unfilial, Horap. i. 53); "ičv" or "iēv" or "ēiv" hoof; "čūō" debtor; "čuma" or "čūsōp" together; "čīōiō" to be morose; "jōū" a swelling, to swell; "jōrēm" to be amazed. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 2, and k. pl. 5). A second form  occurs also under the Fourth dynasty (Leps. d. pl. 26).

 (water and fire signifying purity, because all purification is accomplished through these elements, Horap. i. 41); "čīōōuē" water, "mōuē" fire, "iōm" the sea; "iamēn" lake, pool; "čia" or "niau" linen garments; "ja" or "jōi" or "čīō" or "čīē" or "čīaa" or "čīa" washing, to wash; "čīa-tōōt" to wash hands, abdicate; — in Hebrew "ym" sea, river. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 66). In the process of washing at Mocha, I remarked the clothes universally twisted in the above form.

 "čīal" ointment-vase; "čia" or "ia" or "iaau" valley; "čīa" torrent, bed of torrent; "čīōōr" or "čīērō" or "jērō" or "iarō" river; "iōr" to pass over; — in English "to pass over Jordan." The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 7 to 66).

 (ape followed by a smaller ape, signifying, a hated child will inherit, Horap. ii. 62); "čīē" therefore, truly. — in English "yea." The character occurs under the . . . dynasty (Champ. gram. 42, 68, Salvolini., and Leps. ausw. 2).

 "ial" or "čīal" mirror; "čīōrm" or "čīōrm" or "jōrēm" or "jōrēm" to fix the eyes, gaze intently; "čīērē" or "čīōrh" or "čīōrh" to see, contemplate. — The character occurs from the Third dynasty to the Twentieth (Leps. d. ii. pl. 3, 98, iii. pl. 53 and 207, and k. pl.). A second form  occurs as early as the . . . dynasty (Champ. gramm. 77, and dict. 237).

ē long or ee, its pervading meaning we.

 (two men wearing the insignia of magistrates, signifying of the same mind, Horap. ii. 10); "mēōōui" or "mēōōui" or "mēōōui" to think; or "mēōui" to be of opinion, way of thinking; "ōuēllē" or "ōuēllē" tuning, musical chord; "nsē" or "sē" yes. — The character occurs as early as the . . . dynasty (Champ. text. 379); and as an emblem, is placed over royal ovals and on the head of gods from the Seventeenth dynasty until the end of hieroglyphic writing (Leps. k. pl. 5, 23, and 28 to 67).

// (two lines signifying unity, Horap. i. 11); "ēp" or "dēp" companion, partner; "tshvēēli" or "tshvēērē" or "tshvēr" or "tshphēr" companion, friend; "ēp" to number; "ēpē" or "ēpi"

number; "ēi" two, a pair; "sēnd" two; "sēt" double; "hēn" near; — in Greek "ēmēēs" we; in Latin "ii" and "eae." The character occurs from the Ninth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 138, 149, and k. pl. 7 to 67). Two upright lines, possibly forming a hieroglyphic character, occur as early as the Fifth dynasty (Leps. d. ii. pl. 58); and two ibis-feathers (corresponding to two fives even in Greek) occur often in hieroglyphic writing.

"ēri" quail; "ōui" mine, together; "dōui" to draw near, come; "dōui dōui" each; "ērēu" or "ērēou" one another, each other; "ōuēr" how many; "thē" she; "tē" or "pē" he; "tēu" or "nē" they; "nēt" or "nētē" these; "sēpē" or "sēpē" or "sēpi" or "sēpi" the rest, remainder. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 67).

From the highly finished painting on the Gliddon mummy case, the chick is found to be that of the *red-legged partridge*, *Perdix Graeca*: known to be indigenous in Egypt: but I did not meet with it, neither can I speak of the voice of the young.

(one straight line bent over upon another, signifying ten even lines, Horap. ii. 28); "mētē" or "mētē" or "mēd" midst; "mēt" or "mētē" or "med" ten; — in Hebrew the tenth letter "ywth" representing the number ten; as does the derived "iōta" of the Greeks, though only the ninth letter; in English "meet, meeting." The above character occurs under the Third dynasty, and continues in use as a numeral until the end of hieroglyphic writing (Leps. d. ii. pl. 3).

(ostrich-feather, signifying administering impartial justice, the wing feathers of the bird being all equal, Horap. ii. 110); "tshetsh" equal; "mēi" just, true; "mētsh" or "mētshē" or "mētshē" or "mētshē" or "mētshē" multitude, many. — The character occurs in combination as early as the Third dynasty (Leps. d. ii. pl. 3, 44, 56); and separately, from the Twelfth dynasty to the Ptolemies (Leps. k. pl. 12, and 25 to 57).

The *ostrich*, *Struthio camelus*, having extended itself into the Syrian Desert, must have come by way of the Isthmus, and have once ranged the Sahara to the shore of the Mediterranean. — Under the Twelfth dynasty at Benihasan, is figured with clusters of the eggs and feathers, at this time clearly articles of traffic. Under the Eighteenth dynasty, similar clusters in the Tribute-processions show distant if not foreign traffic. But our Nubian boat-captain informed me, that the ostrich breeds to the present day about two hundred miles South and East of the First cataract.

(harp signifying attracting and retaining, Horap. ii. 108); "ōuōini" harp; "ini" or "hētēn" or "hētēn" thumb; "mē" or "mēi" or "mēi" or "mērē" or "mērē" to love; "mēni" or "mēnē" or "mēnē" day by day; "mēr" tied or bound; "ōūci" because; — in English "win." The character occurs as early as the . . . dynasty (Champ. gram. 345). Apart from the hieroglyphic writing, harpers are figured under the Fourth dynasty (Leps. d. ii. pl. 36), and as observed by myself, under the Twelfth dynasty at Benihasan, and under the Twentieth at Bab-el-meluk.

"ēlp" or "ērp" wine; "hlēli" flower, bloom; "hlēji" or "hlēshē" sweetness. — The character occurs under the Third dynasty, and continues in use, more or less modified . . . (Leps. d. ii. pl. 7).

The only woody creeping plant familiarly known in Egypt is the grape-vine, and hence the following linguistic result; from "ērp" — we have in Greek "ērpō" to creep, "ērpētōn" reptile; in Latin "repo" and "repto" and "serpo" to creep, "serpens" serpent; and in English "serpent, reptile, creep."

Vitis vinifera of the Tauro-Caspian countries. Called in Britain *wine* and the fruit *grape*. in France "vigne" (Prior), in Germany "weinstock" (Grieb), in Italy "vite" and the fruit "grappolo" or "grappo d'uva" (Lenz), in Greece "klema" or "agriampēlōs" (Sibth.), in Egypt and Yemen "enab," and cultivated at the time of the invention of writing: — vineyards and full details of wine-making are figured under the Fourth, Seventeenth, and Eighteenth dynasties; vineyards and wine "yyn" are mentioned in the history of Noah (Gen. ix. 20 to 24); but at the present day in Egypt, the fruit only is eaten. Farther North, "ōinōn" and the "ampēlōēis" are mentioned by Hesiod op., Homer il. iii. 184. Herodotus, and the "ampēlou agrias" by Theophrastus ix. 20; "vinum" and the "vitis," by Plautus, Varro, and Columella: *V. vinifera* is known to be cultivated in Italy, Spain, and as far as middle Europe; was observed by Forskal, Hawkins, Chaubard, and Fraas, under cultivation and seemingly wild along river-banks from the Peloponnesus to Constantinople; appears to be really indigenous towards and along the Caspian (Ledeb., and A. Dec.). Eastward from the Caspian, has long been cultivated in Cashmere and Northern Hindustan (Royle); was observed by Bunge under cultivation in Northern China; by Kaempfer, and Thunberg, in Japan and called "foto," or usually "budo" or "iebi." Southward and Eastward from Egypt, was observed by Forskal under cultivation on the mountains of Yemen, and grapes of excellent quality were found by myself in market at Aden and Muscat; is called in Sanscrit "draksha" (A. Dec.), in Bengalee "drakhya," in Hindustanee "angur" or "tak" or "inab" (D'roz.), and according to Graham is "successfully cultivated" on the Deccan; is known in Burma and called "sa-byeet" (Mason); but in general within

the Tropics I have found the fruit inferior in quality, and did not meet with an instance of successful wine-making. By Columbus, was carried to America (F. Columb.), where in Chili and California its cultivation seems successful: by European colonists also was carried to Austral Africa and Australia.

{ "jiiri" or "mah" pod; "nēji" or "nēshē" belly; "mah" or "mēh" or "mēh" or "sēou" or "sēu" full, to be full; "mōh" or "tsiē" or "tsiō" or "sēi" or "si" fulness, satiety; "sim" herb, esculent herb (Gen. ix. 3); "nēshē" or "nēji" green. — The character occurs from the Fifth dynasty to the Thirtieth (Leps. d. ii. pl. 74, and k. pl. 30 to 50).

Trigonella foenum-græcum of the Mediterranean countries. A small annual called in Britain *fenugreek* (Ainsw.), in France "fenugrec" (Nugent), in Germany "bockshorn-klee" (Lenz), in Greece "tēli" (Sibth.), in Egypt and Yemen "hæbe" or "helbeh" (Forsk. and Del.), in Egyptian "itasin" (syn. Diosc.), and the above long-beaked pod — seems to correspond: (the "ishb" herb of the field of Gen. iii. 18 may also be compared): *T. foenum-græcum* was observed by Forskal, Delile, and Clot-Bey ii. 34, extensively cultivated in Egypt, and the whole herb eaten either crude or cooked. Farther North, the "tēlis" or "vōukēras" is mentioned by Diocles, Theodorus, Damon, and Theophrastus; is identified in Syn. Diosc. with the "aigōkērōs" or "karpōs" or "lōtōn" (see *Loto-phagi*): *T. foenum-græcum* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Asia Minor and Cyprus, in the wild state only and no longer cultivated; was observed by myself to be a favourite article of diet among the Parsees, and may therefore prove the "triphullōn" of their forefathers mentioned by Herodotus i. 132. Westward, the "tēlis" is identified in Syn. Diosc. with the "phainōum graikōum" of the Romans; and "foenum græcum" or "siliqua" or "silicia" is mentioned by Columella ii. 10, 33, Pliny xviii. 39 and xxiv. 120, and Palladius: *T. foenum-græcum* is termed "f. sylvestre et sativum" by Tournefort inst. 409; and is known to grow wild or seemingly wild in Italy and Southern France (Hall. helv. 379, Pers., and Lenz). Southward and Eastward from Egypt, was observed by Forskal under cultivation in the plains and on the mountains of Yemen: by Graham, in Hindustan, "commonly cultivated during the cold season and used as greens by the natives" under the name "maitee" or "meetee-bajee"; was observed by myself abundantly cultivated on the Deccan, and by the Parsees called simply "bajee."

 (lapwing "ēpōpa" and "athiantōn" herb, signifying curing one's self of a surfeit of grapes, Horap. ii. 89); "arēou"  or "ēvēl" or "imēd" unless; "trimi," *adiantum*; "ēmēr" or "mēr" over, beyond; "arēj" or "arēj" end. — The character occurs under the Third dynasty; and its upper portion continues under the Twenty-second (Leps. d. ii. pl. 3 to 102, and k. pl. 45).

Adiantum capillus-veneris of Europe and the adjoining portion of Asia. A fern called in Britain *maidenhair* or *Venus' hair* (Prior), in Germany "frauenhaar" (Grieb), in France "capillaire" (Nugent), in Italy "capelvenere" or "adianto" (Lenz), in Greece "pōlutrihi" (Sibth.), in Egypt "kuzbare el-byr" coriander of cisterns (Del.); known in Egypt at the time of the invention of writing, and besides "trimi" called in Egyptian "ēpiér" — (Syn. Diosc.) or "askōlōnōvtiōn" (Kirch.): *A. capillus-veneris* was observed by Forskal, and Delile, in artificial localities in Lower Egypt. Farther North, the term "athiantōs" unwetted is used by Simonides, and the "athiantōn" plant that cannot be wetted is mentioned in the Hippocratic treatise *fistul.*, Theophrastus vii. 13, Nicander ther. 846, and is identified in Syn. Diosc. with the "kōriōn ēnugrōn" water coriander or "kallitrihōn" or "pōlutrihōn": *A. capillus-veneris* was observed by Sibthorp, Chaubard, and Fraas, on wet walls and rocks and in moist shady places frequent from the Peloponnesus throughout Greece. Westward, the "adianto" or "polytrichon" is mentioned by Pliny xxii. 30: *A. capillus-veneris* is termed "a. foliis coriandri" by Tournefort inst. 543, and is known to grow in Italy and throughout middle Europe as far as Britain (Engl. bot. pl. 1564, and Lenz). The rhizoma according to Lindley "is considered pectoral; but the decoction if very strong is reported to be emetic: mixed with syrup it forms *capillaire*."

k terminal or ck, its pervading meaning echo, racket.

 "aik" or "ēk" dedication, dedicatory festival; "mōki" vase, bowl; "lōk" a measure of liquids; "lakōn" pitcher, bottle; "nōuk" or "nak" or "lak" you, to you; "pōk" or "phōk" yours; "anōk phōk" I am yours; "rēkrikē" or "rēkriki" nodding the head, winking; — in Hebrew "lg" a measure of liquids; in Greek "lakkōs" or "lakōs," in Latin "lucus," in English "lake." The first character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 20, and k. pl. 28 to 60). The second character occurs from the Fourth dynasty to the Twelfth (Leps. d. ii. pl. 98, 147).

 (salamander signifying a man burning in the fire, Horap. ii. 58); "aik" or "ōēik" or "ōik" bread, provisions; "lakh" cake; "ēmēk" or "ōmk" or "ōmk" to devour, swallow down; "sōmk" to suck, give suck; "mōnk" or "mōunk" to consume, be consumed, eclipse; "thik" or "dk" spark; "rakhē" or "rakhi" or "rōkhē" or "rōkhē" coals, a firebrand quenched; "rōkh" or

"rōkh" consumption, burning; "lakh" or "lōkh" or "rakh" or "rēkh" or "rōkh" or "kōk" or "thōk" to burn, conflagration. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 22).

 (tadpole signifying "aplastōn" mal-formed, candid, Horap. i. 25); "svōk" or "svōk" diminished, lacking; "mikē" weak; "takr" pure, limpid; "pōk" soft; "lēk" or "lēklōk" or "lōklēk" soft, softness, to soften. — The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 22, iii. pl. 5, 39, 238, iv. pl. 28).

 (tadpole signifying reluctant to move, Horap. ii. 97); "ēt-tēk" or "ak-tōkt" coagulated; "tōlk" to pull off; "ankoki" ring-finger; "ōnk" to arise, get up. — The character occurs under the Nineteenth dynasty (Leps. k. pl. 35).

 "hōlk" or "hōlk" a braid; "tshōlk" or "tshōlk" to plait, twist; "jōlk" or "jōlk" or "shōlk" or "shōlk" to continue, extend; "hōk" talk; "sōk" sterility; "sōksēk" yawning; "makmēk" or "mōkmēk" thoughts, reasoning; "sōk" to protract, provoke; "ōnk" to increase in height, assume a lofty style; — in English "talk," the phrase "spinning a yarn" used among sailors. The character occurs from the Twelfth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 122, and k. pl. 47 to 65).

 end of bench; "shask" or "shak" or "jak" to applaud, clap hands; "atshkak" or "tshkak" or "jitshkak" or "hitshkak" clamour, to exclaim, cry out; — in Hebrew "zik" or "tsik" clamour, to cry out. The character occurs from the Third to the Twelfth dynasty (Leps. d. ii. pl. 4, 39, and 147); and in second form  from the Twelfth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 147, and k. pl. 23 to 67). Seems besides the origin of the form  of the eleventh Hebrew letter "cph," and K of the Greek letter "kappa." As according to Quintillian K does not properly belong to the Latin language, its presence in Etruscan, Oscan, Celtiberian (Gesen. mon. Phœn.), and in the languages of Northern Europe, affords confirmation of Cæsar's statement, That the Druids of Gaul used the Greek alphabet. The Latin C hard, is however derived apparently from the Etruscan and Umbrian .

 (frog signifying shameless and sharp of vision, for it has blood only in the eyes, Horap. ii. 96); "kak" hairless eyebrows, suffusion; "kak-val" bloodshot eyes; "hak" ready; "jōkr" or "jōkēr" ready, sharp; "jēkjōkt" stubborn, "jōkjk" contumacy, "jakjēk" contention; "jōksi" crepitus. — The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 27, 142, iv. pl. 77, and k. pl. 27 to 32).

 (one hand holding a shield and the other a bow, signifying the front of battle, Horap. ii. 5); "hōk" belt; "gēk" or "gōk" or "hōk" or "hōk" armour, to make war; "hak" fellow-combatant; "hōk" or "phōk" corslet. — The character occurs from the Fourth dynasty and the Book of the Dead to the Nineteenth (Leps. d. ii. pl. 97, 75, and k. pl. 32).

 mallet; "mētsh" anvil, "mētsh" or "matsh" to strike; "mētshak" whether, perhaps; "mētshak" again. — The character occurs from the Eighteenth dynasty to the Ptolemies (Leps. d. iii. pl. 119, and k. pl. 52 to 57).

 "sōtf" tool; "sōtfēf" chisel for quarrying; "ōnk" or "phōnk" sculptured work, to sculpture; "mōnk" a thing formed. — The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 2, 44, and k. pl. 5 to 59); and is often represented in the vertical position from the Eighteenth to Twenty-sixth dynasty (Leps. k. pl. 28 to 48).

 "hakklf" or "hakēlf" or "hamklf" or "hanklf" land-crocodile; "hamklē" coppersmith, blacksmith; "mankhat" silversmith; "tshēk" or "tshēk" or "tshōk" or "tshōk" or "tshōkh" or "tshōk" depth, deep, to dig; "jōlk" or "jōlk" or "shōlk" to precipitate, be immersed; "jēkh" or "jōkh" to fasten upon, bite; "sak" or "dsak" to molest, be molested. — The character occurs from the Twelfth dynasty to the Nineteenth (Leps. d. ii. pl. 138, iii. pl. 171).

The *land-crocodile*, Varanus, is a large kind of lizard occurring along the Nile; — described by Clot-Bey ii. 92 as very timid, uttering a shrill hiss on the approach of a supposed enemy, and called "ouaran el bahr." The medicinal use of the imported flesh of the "skigkōs," is mentioned by Apelles, and Sextius; the "skigkōs" is identified by Dioscorides ii. 71 with the land-crocodile; and according to Pliny viii. 38 and xxviii. 30 belongs to the Nile and is not so large as the ichneumon. The "largest kind of scincus" is mentioned by Pliny as imported from India, and is a different species.

 "alak" or "halak" ring, collar, ox-yoke; "nak" for thyself; "hōk" or "hōkm" to bind, tie fast, tie together; "makh" neck; "hōki" to choke, to scourge; — in English the interjection "alack!" The first character occurs from the Fourth dynasty to the Eighteenth (Leps. d. ii. pl. 9, and k. pl. 27). The second character occurs from the Eighth dynasty to the Nineteenth (tabl. Abyd., and Leps. d. iii. pl. 138).

 "thōk" or "thōk" ship's mast; "sēksēk" to collect, number; "sēk" or "sēk" or "sōk" to walk, go before, to draw; "ouk" to draw, drag; "sōksēk" exaction, to exact; "mēkh" or "mōkh" or "mōkhs" ill treated, to be tormented; "sōk" sackcloth; "jōk" or "jōk" end. — The character occurs in the Book of the Dead xxxvi. 99. 11 (Buns. and Birch).

sk, its pervading meaning task.

"skuli" to hasten; "sk" or "ōsk" or "ōsk" delay, to delay, loiter, waste time; — in Greek "shōlazō" to loiter, "shōlē" leisure, idleness, in Latin "schola," in English "school." The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 31, and k. pl. 29 to 63).

"skēn" or "iskēn" shore, "skēn" along, close along; "skitali" river-brink. — The character occurs under the Eleventh dynasty (Leps. d. ii. pl. 150). A possible modification  occurs as early as the . . . dynasty (Champ. mon. i. pl. 22).

"skēphalis" door-post; "shinōn" order. — The character occurs from the Seventeenth dynasty to the Ptolemies (Leps. d. iii. pl. 9 to 255, and Rosetta stone).

(two human feet in the water signifying a writer, Horap. i. 62); "shi" writing-case; "sgē" to write; "shai" or "sgai" or "sgēt" or "sgi" writing, letters; "sgōui" scribe. — The character occurs in the Book of the Dead, also under the Twelfth dynasty (Leps. d. ii. pl. 143, k. pl., and Buns. and Birch).

shuffling-pan (compare "kōskinōn" of Horapollo i. 36); "skōrkr" wallowing-place; "skērkr" or "skērkr" or "skarkir" or "skrkōr" to roll to, roll back, consider. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 67). I found the shuffling-pan in use at Mocha, for separating by rotary motion impurities from coffee, gum arabic, and all articles of commerce having the form of granules.

"skē" to reserve, lay aside; "sklē" purse, little coffer; "sknōuh" cord; — "skitē" or "kitē" drachma (piece of money); in Greek "shōinis" or "shōinōs" small rope, rope made of rushes. The character occurs from the Fourth dynasty to the Tenth (Leps. d. ii. pl. 96, 49, 145).

"skah" or "skai" or "skēi" or "shai" or "shēts" to plough; "skuthis" practise, study; "shēm" or "shim" or "shimōn" gray hairs. — The character occurs under the Fifth dynasty (Leps. d. ii. pl. 70).

(dead crow signifying a full lifetime, for the bird lives four hundred years, Horap. ii. 85); "sklē" or "slē" coffin, bier; "skunōma" carcasses; "lōsk" to become putrid; "skap" old, of yesterday; "shōur" or "shōūr" or "shōūr" to execrate, curse; — in English "skip." The character occurs from the Nineteenth dynasty to the Ptolemies (Leps. d. iii. pl. 146, and k. pl. 58).

"shara" coat of mail; "shrōm" stupor. — The character occurs under the . . . dynasty (Champ. gram. 53, and rect. sarc. Brit. mus.).

"skara" vine-shoot bowed; "skara-kirntshō" sandy; "shin" softness of skin, tender, lenity. — The character occurs from the Fourth dynasty to the Persian conquest (Leps. d. ii. pl. 18, and k. pl. 11 to 48).

(fish signifying unlawful, Horap. i. 42); "kask" or "kōskēs" or "haskēk" whispering, to whisper. — The character occurs in the Book of the Dead, also under the Sixth dynasty (Leps. d. ii. pl. 67).

l, its pervading meaning to learn through flagellation.

"maklivi" a whip, scourge; "ēl" or "ēl" to be, to do, receive as pupil, suffer punishment; — in Hebrew "mlmth" ox-goad, the twelfth letter "lmth" meaning to chastise, learn; in Greek the letter "lamvtha," also "lamvanō" to suffer punishment, receive, seize; in vulgar English "lam" to flog. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 59 and 62). The character of an arm holding a whip  was observed by myself at Benihasan in the name of a king preceding the Twelfth dynasty, and continues in use until the end of hieroglyphic writing (Leps. d. ii. pl. 151, and k. pl. 14 to 66). The detached whip  occurs as early as the . . . dynasty, and continues in use under the Roman emperors (Leps. k. pl. 63, 64); is clearly the origin of the form  of the Phœnician letter "lmth" and Greek "lamvtha." of the Roman and Western L, and has  proved perhaps the most permanent of alphabetic forms, being traceable even in Arabic.

(worms signifying a coming multitude of mosquitos "kōnōpas," Horap. ii. 44); "shōlmēs" or "tshōlmēs" mosquito; "lēlēm" or "lēhlēm" a mosquito-like insect; "lēh" solicitude, care; "la" doors, windows; "laēsi" bites; "lōlēhēmi" or "lēlēhēmi" or "lalēhēmi" black spots, scars; "laji" or "mntlash" importunity. — The character occurs from the Fourteenth dynasty to the Twenty-sixth (Leps. k. pl. 15 to 34, 37, and 48). A second form,  occurs from the Eighteenth dynasty to the end of hieroglyphic writing (Leps. k. pl. 30 and 32 to 67).

One or more species of *mosquito*, *Culex*, if not indigenous in Egypt, known there at the time of the invention of writing. — Mosquito-curtains are called "kōnōpēiōn" in the Septuagint. The "kōnōps" is also mentioned by . . . and other Greek writers; and the "culex," by Horace, and Pliny.

"alōli" or "ēlōlē" or "ēlēlē" grapes; "latshiē" aspiring to, looking wistfully upon; "ēlēl-hmj" or "ēlēl-hēmj" unripe grapes, sour grapes; "lōuk" wry mouth;

"lktsha" or "ēlktsha" or "elk-tshai" to contract the nose, deride; "lavē" disorderly; — in English "laugh, look." The first character occurs from the Third dynasty to the Seventeenth (Leps. d. ii. pl. 3, iii. pl. 5). The second character occurs also under the Third dynasty (Leps. d. ii. pl. 3). A modification  occurs under the . . . dynasty (Champ. gram. 79, and text 373).

 (hippopotamus signifying "ōran" opportunity, the hour, Horap. ii. 19); "laishi" or "lōishē" or "lōiji" pretext, occasion; "lētshē" or "lēmētshē" or "lēmēētshē" champion, powerful; "lētshj" to shake, make to tremble. — The character occurs under the Twelfth dynasty (Leps. d. ii. pl. 143).

The *hippopotamus* is known to inhabit the lakes and rivers of Equatorial Africa; abounding in the Upper Nile, but seldom — at the present day, descending into Egypt proper. Menes the first king of Egypt, was killed by a hippopotamus (Maneth.). The animal is figured apart from the hieroglyphic writing under the Sixth dynasty (Leps. d. ii. pl. 77): and through Egypt became known to the Greeks and Romans. A living hippopotamus was first brought to Rome by M. Scaurus (Plin. viii. 40).

 "lōigi" noose; "lēlōu" or "lilou-tshem" or "alōu" child; "lajlēj" or "lējlōj" or "lōjlēj" weakness, binding with thongs; "latvēs" junction, uniting, seam; — in Hebrew "lwy" loops; in colloquial English "lily" as applied to a child called for punishment. The character occurs on the Gliddon mummy-case, and from the Fourth dynasty to the Fourteenth (Leps. d. ii. pl. 2, 64, and k. pl. 15). A second form  occurs under the . . . dynasty (Burton excerpt. 34, Buns. and Birch).

 "alōj" or "alōj" thigh; "ēllēt" promise, vow; "ōlk" to make oath, swear; — see Gen. xxiv. 2 and xxxii. 25; in English "allege." The character occurs from the Third dynasty to the Persian emperors (Leps. d. ii. pl. 3, and k. pl. 24 to 49).

 "lēl" bracelet; "lalē" or "lalō" or "lalō" or "lōlē" to besmear, gild; "lalēōut" ointment, unction; "lam" or "laam" splendid, shining; "laam" soiled, dirty; "lōjt" to agglutinate, adhere, stick; "lōihē" or "lōihi" mire; — in English, the colloquial phrase "to put one's foot in it." The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 23). A second form  occurs under the Fourth dynasty (Leps. d. ii. pl. 15, and Champ. dict. 362).

 (tongue signifying perpetual moisture of the productive Nile, Horap. i. 21); "las" or "lēs" tongue; "lōk" or "lēklōk" or "lēklēk" soft, softness; "lēk" moist, green; "lēk" moist, tender; "lōk" to grow green, begin to flourish; "lējh" or "lōjh" or "lōjt" or "lōshh" to lap or lick; "lēmhē" free; "lapt" half a thing; "laau" something, nothing; — in English, the phrase "green as a leek." The character occurs as early as the Fourth dynasty, also in the Book of the Dead (Leps. d. ii. pl. 98). A second and more simple form occurs from the Eighteenth dynasty to the Ptolemies (Leps. k. pl. 28 to 60).

 (tongue and "uphaimōn" bruised or blood-shot eye, signifying to relate, tell, Horap. i. 27); "lunōs" red portion of the eye, white of the eye; "saji" a speech, to narrate, "lasaji" tongue, loquacious; "laōuai" such a one; "mlah" or "mlag" or "lag" dispute, wrangling; "llev" or "llēf" scurrility; "lai" or "dlai" or "lōulai" to utter the war-shout; "lōl" war-shout, cry of victory; "tel" exultation; — in Greek "lalia" talk, "alalagma" war shout. The character occurs in the Book of the Dead, also under the . . . dynasty (Rosellin. mon. stor. ii. pl. 1). A second form  occurs from the Seventeenth dynasty to the end of hieroglyphic writing (Leps. d. iii. pl. 203, and k. pl. 23 to 66).

 "tshōl" a bundle; "lahm" or "lahmē" kneading-trough, to subject, break; "lēlkēmē" a blow, wound; "lōht" to beat; "lōf" to break; "las" or "lēs" or "lōs" to bruise; "slōshlēš" or "slēshlēš" or "slējlēj" to polish, levigate; "aliki" or "liki" culpable, blamed; "lōili" buttocks, severe reprover, uncle; "lōili" to bear, endure; "louj" or "lōj" or "lō" or "la" to cease, leave off; — in vulgar English "lick" to flog. The character occurs under the . . . dynasty (Champ.).

 "vini" crucible: "tlil" portable oven; "laves" or "liji" cooking pot or pan; "lēvēs" a caldron; "halikin" or "lakēnt" frying-pan; "sēlhō" or "slhō" warm; "laplēp" ebullition; "lōvtsh" or "lōvtsh" or "lōj" to burn; "la" injustice. — The character occurs on the Gliddon mummy-case, and from the Fourth dynasty to the Twenty-sixth (Leps. d. ii. pl. 23, iii. pl. 266). A second form  occurs under the Fourth dynasty (Leps. d. pl. 21). A third form  occurs from the Nineteenth dynasty to the Persian conquest (Leps. k. pl. 35 to 40).

 (crocodile and scorpion signifying matched by your enemy; the scorpion further signifying destroyed slowly, Horap. ii. 33); "shlē" (or "slē, Edw.) scorpion; "sla" summer (compare sun in constellation Scorpio); "shlēmlōm" or "shlōmlēm" or "shlmlōm" to grapple, come in collision; "shl" armed warrior, to be destroyed; "shilk" pierced by an arrow; "shlak" punishment, torture; — in Arabic . . . scorpion; in English "sulk" (stinging yourself), "slay." — The character occurs under the Twelfth dynasty (Leps. d. ii. pl. 121, and Champ. dict. 108 and 170).

("pělekāna" signifying "anōē" and "aphrōna" imbecile, silly, Horap. i. 51); "ēlshōv" or "ēljōv" or "ēljōv" heron, ("laupō" white bird, ms. Par.); "lōf" to become insipid; "lōtēs" idiot; "hēlōlī" silly; "shōl" lie, false; "la" slander, slanderous; "lōsh" or "kōlp" or "kōlp" or "shēl" or "shōl" steal;—in Hebrew "ēwllē" foolishness; in English "folly." The character occurs as early as the . . . dynasty (Champ. dict. 162). A suffering sea-bird was pointed out to me by a Mocha Arab as having "swallowed too large a fish."

The *small white heron*, Ardea . . . , frequent in Egypt, was observed by myself to differ from the usual habits of its tribe in walking about picking up substances at a distance from the river-brink. "laōu" or "lavō" ship's sail; "lēš" extremity. — The character occurs from the Fourth dynasty to the Twenty-sixth (Leps. d. ii. pl. 23 and iii. pl. 260). A second form occurs in the Book of the Dead, also under the Twelfth dynasty (Leps. d. ii. pl. 126).

m, its pervading meaning reform.

"makrō" or "mēran" bath-tub, bathing place, fish-pool; "mōumē" or "mōumi" fountain or well; "mau" or "mōōu" or "mōu" or "mōōu" water; "mtōn" or "ēmtōn" or "ēmtan" quiet; "ēmai" innocent;—in Hebrew "my" water, the thirteenth letter "mym" waters; in Abyssinian the letter "mai" water; in Greek the letter "mu." The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 23 to 66).

"lēmēn" or "lumēn" likeness, image; "mthō" face; "mē" or "mēi" or "thmēi" truth; "mnē" or "mau" or "ēmau" there;—in Hebrew "amd" truth; in English, the phrase "truth in the bottom of a well." The character occurs under the . . . dynasty, and continues in use until the end of hieroglyphic writing (Champ. mon. iii. pl. 270, and Leps. k. pl. 66). A second form occurs under the Twenty-second dynasty (Leps. k. pl. 44, 45, and Champ. dict. 269).

"mēttshai" sunrise: "mōōui" or "mōūē" splendour, effulgence; "mēn" or "mōnt" to continue; "ēfmēn" always; "mēn-ēvōl" or "mōun-ēvōl" eternal. — The character occurs from the Eighteenth dynasty to the end of hieroglyphic writing (Leps. d. iii. pl. 73, and k. pl. 53 to 60). A second form occurs under the . . . dynasty, and continues in use under the Ptolemies (Champ. gram. 377, and Leps. k. pl. 53 to 62).

(mole "aspalaka" signifying a blind man, the animal having no eyes, Horap. ii. 59); "amiliōn" mole; "mpa" or "ēmpa" or "mpatē" before. — The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 3, 25, and k. pl. 23 to 57). A reverse or receding form occurs under the Fifth dynasty (Leps. d. ii. pl. 58).

hand-plough or hoe; "ēmě" plough; "mētsh" or "matsh" to touch, strike; "ēmi" or "ēimi" or "ēimē" or "imi" intellect, to understand, perceive; "rēm" perceiving. — The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 7 to 66).

"ērman" pomegranate; "ērmē" or "ērmēiē" or "ērmōōui" or "rmēiē" or "rmēiōūē" tears; "rimē" or "rimi" or "limi" mourning; "rōmē" or "rōmi" or "lōmi" a man. — The character occurs as early at least as the . . . dynasty (Champ. dict. 216). A second form occurs under the Eighteenth dynasty (Champ. gram. 389 and dict. 71, Leps. d. iii. pl. 79). A third form occurs under the Nineteenth dynasty (Leps. d. iii. pl. 136).

Punica granatum of the Southern border of the Caspian. Called in Britain *pomegranate*, in France "grenade" (Nugent), in Germany "granat" (Grieb), in Italy "granato" (Lenz), in Greece "rōa" or "rōthia" (Sibth.), in Egypt and Yemen "rumman" (Forsk.) and cultivated at the time of the invention of writing: — the fruit is figured under the Fourth or Fifth dynasty (pointed out to me at Gizeh by Mr. Bonomi); the tree with fruit and foliage, under the Seventeenth (Rosellin. ii. pl. 68): the "rmwn" was longed for by the Israelites in the Desert (Numb. xx. 5), is mentioned also in Canticles iv. 3; and *P. granatum* was observed in the gardens of Egypt by Forskal, and Delile. Farther North, the "rōa" or "rōia" is mentioned by Homer od. vii. 115, Theophrastus, and Dioscorides; the "granatum" or "malum punicum," the best growing around Carthage, by Columella, and Pliny xiv. 19; *P. granatum* is termed "p. sylvestris" by Tournefort inst. 636; was observed by Sibthorp, Chaubard, and Fraas, frequent both cultivated and seemingly wild from the Peloponnesus throughout the Greek islands: is known to occur also under cultivation and seemingly wild in Italy, Algeria, and throughout Southern Europe (Munby, A. Dec., and Lenz). Eastward from Greece, is mentioned in the *Zendavesta* (Reynier econ. arab. p. 474), is called in Turkish "nar" (Forsk.), in Persian and Hindustanee "anar" (Ainsl., and D'roz.), and according to Burnes trav. ii. 126 grows in whole woods in Mazenderan; was observed by Bunge p. 28 under cultivation in Northern China; by Kaempfer, and Thunberg, in Japan also, and called "dsjakurgo" or usually "sakuro." Southward and Eastward from Egypt, is known in Abyssinia (A. Rich.): was observed by myself under cultivation on Zanzibar, in Yemen by Forskal, but the best or only good pomegranates I have met with

were at Muscat: is called in Sanscrit and Bengalee "darimba" (Roxb., and D'roz.), was observed by Graham "common in gardens" around Bombay, but the fruit "of very inferior quality to that brought from Muscat and Persia": is enumerated by Mason as "exotic" in Burnmah and called "tha-lai." By European colonists, was carried to Northeast America, where it continues in our greenhouses cultivated for its ornamental flowers. The root in the East is employed against tape-worm, and medicinal uses of other parts of the plant are enumerated by Lindley.

 "môu" mortal; "môout" or "maôu" to die; "maôut" dead; "mhau" or "mhaau" or "mhauuê" or "êmhau" tomb; "miôlôn" or "mêôlôn" body inclosed; "mêui" or "mêëuê" memory; — in Greek "mnêia" or "mnêmê" memory, "mnêma" memorial, tomb. The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 96, and Rosetta stone). For the hieroglyphic character of the pyramid or great tomb, see Ouénéphês.

 (bull signifying sobriety with manliness, Horap. i. 44); "masi" or "mési" bull; "amahi" or "êmahi" might; "nômd" or "nômtê" strength; "môd" or "mad" or "môd" or "mout" neck, sinew; "mêttattshili" fortitude, manliness; — in English "mad." The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 24 to 65).

 "mêtrêftshi" measurement; "mahi" or "mpai" flax; "môjh" or "môujh" or "môujg" belt; "môur" or "mrrê" or "mêrrê" band, chain; "môui" or "tshimê" series; — in Hebrew "mthê" extension, length, measurement; in Sanscrit "ma" or "mad" to measure; in Zend "meete" or "mate"; in Greek "mêtron" and "mêthimnôs"; in Latin "metior" and "meta"; in Gothic "mitan"; in Anglo-Saxon "metan"; in German "messen." The character occurs under the . . . dynasty (Rosellin. mon. cul. 62).

 "mahê" or "mahi" or "mah" a cubit measure; "mêri" or "mêri" or "mêëré" or "amêri" noon, a day; — in Greek "êmêra" day. The character occurs from prior to the Tenth dynasty to the Ptolemies (Leps. d. ii. pl. 127, iv. pl. 27, and k. pl. 7).

 "mênt" bushel, a measure; "môuki" repository, vase; "môuh" or "mêh" or "mah" full, to fill. — The character occurs under the . . . dynasty (Leps. d. ii. pl. 103):

 "mamrana" great tortoises, leaves of a book; "mamad" mystery; "mê" or "mêtsht" or "mêtshtë" or "mêtsht" to go around, seek, explore; "ma" where; "sôtshm" or "sôtshêm" to be ardent; "môtshi" or "môit" the way; "môh" or "môuh" to burn, light up with flame. — The character occurs under the Nineteenth dynasty (Leps. d. iii. pl. 171).

The soft-shelled tortoise of the Nile, *Trionyx* . . . , is described as of large size, attacking and devouring the young of the crocodile, — and is called "tyrseh" (Clot-Bey ii. 92).

 "ôuamitê" or "ôuôômtê" or "mêstôl" or "shôm" turret, fortress; "ma" or "mai" or "mê" the place; "amônê" habitation; "amôuni" hidden things (compare Plut. is. & osir. 9); "amôni" to contain, inclose, prohibit; "mêr" or "êmnai" or "mnai" here. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 30). A second  form occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 30, and k. pl. 5 to 66).

 "mous" or "môusêr" or "môusêr" thongs; "môni" or "môônê" or "amôni" or "amôônê" to reign, act as shepherd; "mjihô" having no respect of persons; "mas" young one; "môônê" pupil, nursing; "môni" arrived; "amê" or "amôu" or "amêitn" or "amôitên" or "amôini" come; "amôï" come to me; "môud" or "tahn" or "thahêm" to call, be called; "môurk" to vanish, bring to an end; — in Latin "moneo" admonish, "monitor." The character occurs on the Gliddon mummy-case, and from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 3, and k. pl. 7 to 59).

 "mankanôn" potter's wheel; "dsênd" to found; "sênd" or "sênd" or "sêntê" basis, foundation; "snt" or "sênt" or "sônt" or "sônt" to create; "sênd" or "sêntê" or "snau" two. — The character occurs as early as the . . . dynasty (Champ. dict. 34). A second form occurs  under the . . . dynasty (Champ. mon. 20).

 (bundle of paper-reed, the primitive aliment, signifying ancient origin; words and leaves, or a sealed book, signifying the highest antiquity, Horap. i. 30 and ii. 25); "nas" or "nês" ancient; "nashnêhi" or "nêvahi" length of days, long continuing; "êhi" or "ênêh" an age, eternity, "nêch" or "ênêh" eternal; "ôun" or "ôuôn" to be. — The first character occurs under the . . . dynasty (Champ. gram. 77, and Rosell. m. civ. 35). The second character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 11 to 63. See Papyrus antiquorum).

 (snake with a house in the middle, signifying "vasilêa kôsmôkratôra" ruler of the world, Horap. i. 58); "nshi" the; "nitshd" elder, greater; "nôulê" leader; "naa" or "naaa" or "nash" or "nôsh" or "nôj" great; "nêv" lord; "nêv-êi" lord of the house; "nou" to intend. — The character occurs from the Seventeenth dynasty to the  end of hieroglyphic writing (Leps. k. pl. 25 to 67). The united crowns of Upper and Lower Egypt are worn by a hawk under

the Third dynasty, and continue as a separate hieroglyphic character  on the Rosetta stone (Leps. d. ii. pl. 2, and Champ. dict. 281). The crown of Upper Egypt occurs as a hieroglyphic character from the Tenth dynasty to the end of hieroglyphic writing (Leps. k. pl. 10 to 67).

 ("nōun" inundation of the Nile, Horap. i. 21); "nōun" abyss, depths of the sea; "nōun" or "nōn" the deep; "nōn" cessation, rest; "nōni" to be cast out; "nēj" or "nēj" or "nōj" or "nōuj" or "nōujē" to be cast out, recumbent. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 5 to 67). The form  of the Phœnician letter "nwn" appears to be an abbreviation of this character; as also the forms  and  of the Greek letter "nu"; the last and latest form becoming the  of the Romans and the West.

 ("narkēn" torpedo or electric fish signifying saving many in the ocean; for seeing a multitude of fishes unable to swim, it succours and saves them, Horap. ii. 99); "mōnmēn" concussion, earthquake, tempest; "nēh" or "nōuhē" or "nōēin" to shake, cause to vibrate; "nōini" stupefaction, tetanus; "nōtshs" striker; "nōutshs" benumbed; "nēvi" or "nēēvē" or "nēvē" or "nēvi" or "nēēvē" to swim; "nēvi" ship, sailor; "nēf" or "nēēf" or "nēēv" or "nēēv" sailor; "na" or "nai" or "nēēi" compassion, to pity; "naēt" compassionate; "natstē" or "natshd" helper, deliverer; "ēnatshē" or "natshē" many; "nēh" or "nahēm" or "nōhēm" or "nōuhm" or "tanhē" or "tanhō" or "tangō" saving, to save, rescue; — in Hebrew the fourteenth letter "nwn" meaning fish; in Greek "naus" and "nauphi" ship, "nautēs" sailor; in Latin "nauta" and "navita" sailor, "navis" ship; in English "navy." The character occurs under the Third dynasty (Leps. d. ii. pl. 3); and seems to agree best with *Silurus electricus* of the Nile.

 "nōh" or "nōuh" or "nōūd" rope; "nōhi" rope-maker; "nahrn" or "nēm" to; "nai" or "nēi" to me; "niats" attention, expectation, hope; "nahtē" to hope; "nōh" eyelids; "nahtē" or "nahd" or "tanhēt" or "tanhit" or "tanhōut" to believe, trust; "nahd" faith; — in English the phrase "To hang on by the eyelids." The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 5, and k. pl. 7 and 44 to 64).

 "hōn" or "hōnhēn" decree, command; "hōn" or "hēnhōn" or "hēnhēn" to command, bid; "hōn" or "hōn" or "hōnt" to draw near. — The character occurs under the . . . dynasty (Champ. dict. 112). A second form  occurs under the Twenty-sixth dynasty ("coffin of queen of Amasis," Buns. and Birch).

 "n" or "na" or "ēn" to conduct, bring, lead; "ini" or "ēinē" or "ēini" to bring, lay hands upon; "ēinē" manicles; "nōui" or "nēu" or "nēōu" to come; "na" to go, "na" belonging to; "ntēi" or "nōui" mine; "ntak" or "nōuk" thine; "nē" or "nēk" to thee. — The character occurs from the Third dynasty to the Nineteenth (Leps. d. ii. pl. 3, and k. pl. 10 to 32).

 "nau" a thing seen in a dream, a vision, a form or figure; "nkōt" sleep; "nēu" to see; "ēnuē" form; "nōrj" or "nēhtshlf" or "nēhtshlhf" or "nēh-tshlh" horror, shuddering, to dread; "nōtshp" or "nōutshp" to be threatened, terrified; "nōd" perspiration; "nēhsē" or "nēhsi" to awaken. — The character occurs from the Twentieth dynasty to the end of hieroglyphic writing (Leps. d. iii. pl. 232 to iv. pl. 58).

 "ōuōtn" or "ōuōtn ēvōl" or "ōuōtēn ēvōl" spondist or libation-pitcher, libation; "nēh" oil; "nau" the hour; "tēnōu" or "nōu" now; — in Greek "spēnthō" to pour out a libation, "spōnthē" libation, "spōnthulōs" vertebra or joint of back-bone, "nun," in Latin "nunc," in English "now." The character occurs on the Gliddon mummy-case, and from the Eleventh dynasty in successive modifications to the Ptolemies (Leps. k. pl. 10 to 59).  A second form occurs under the . . . dynasty ("mummy at Leeds," Buns. and Birch). Libations were made by Jacob (Gen. xxviii. 18 and xxxv. 14); and were enjoined by Moses (Ex. xxix. 40).

 "navi" or "nau" a spear; "navi" or "navē" or "nōvi" or "nōvē" sin; "nēh" or "laēin" sharp edge or point; "nōuj" or "nnōuj" or "nōji" falsehood, thieving. — The character occurs from the Third dynasty to the Seventeenth (Leps. d. ii. pl. 3 and 30, and iii. pl. 8).

 "nēvē" loins; "natstē" or "natst" or "ntshōt" vehement; "ēhnē" or "nhē" will; "nōmd" or "nōmtē" strength; "nōēitsh" or "nōitsh" spleen; "n" or "an" or "ēn" or "nnē" or "ēnnē" or "mmōn" or "ēmmōn" or "ēmmēn" no; "nēh" to renounce; — in Hebrew "nwa" to refuse; in Greek "nē" or "nē," in Latin "ne" or "non," in English "nay" or "no" The character occurs under the . . . dynasty, and continues in use until the end of hieroglyphic writing (Champ. mon. iv. pl. 314, and Leps. k. pl. 66).

 "nēiaau" or "niau" or "niaau" flax, linen, tow; "nōulix" veil, covering; "nōriōn" or "nariōn" garter; "tshēntō" linen, fine linen; "tshthēn" or "tshtēn" tunic; "anatsh" or "anētsh" vow, oath; — in English "knowledge." The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 63). In the hieroglyphic writing and

elsewhere on the monuments, white garments are exclusively worn by the Egyptians, and distinguish them from foreigners. The Gliddon mummy-case is composed of layers of linen; the whole process of spinning and weaving is figured under the Twelfth dynasty at Benihasan; and mummies (with the possible exception of some of the most recent) are found inwrapped in white linen. "Atwn" or fine linen, is mentioned in Proverbs vii. 16; has been identified with the "ōthōnē" of Homer il. iii. 141, Aristophanes acharn. 1176, Luke xxiv. 12, and Acts x. 11; and already in the days of Pliny, the linen manufacture had extended down the Rhine to the Batavi or Hollanders. Eastward in Hindustan, where flax is cultivated for its capsules and seeds only, linen cloth is nevertheless mentioned in the Institutes of Menu (Deslongchamps translation): and farther East in Burmah, where the plant is unknown, "linen garments" are enumerated as "among those which priests are permitted to wear" (Mason v. p. 517).

Linum usitatissimum of the Uralian plains. Called in France "lin" and the prepared fibre "filasse" (Nugent), in Holland "vlas," in Britain *flax* or *live* or *linseed* (Prior), in Germany "flachs" or "lein" (Griebel), in Slavonian "flachs" (A. Dec.), in Bohemian "len" (Baubin), in Celtic "llin" signifying a thread (Theis), in Italy "lino" (Lenz), in Greece "linari" (Sibth.), in Egypt "kittan," but the oil from its seeds "zeyt har" (Del.) : cultivated in Egypt at the time of the invention of writing, — and fragments found by Unger in a brick of the pyramid at Dashur belonging to the Twelfth dynasty (acad. Vienn., and Journ. sc. Lond.): the "hwr" is mentioned in Isaiah xix. 9, and Esther i. 6 and viii. 15. and *L. usitatissimum* was observed by Forskal, Delile, Clot-Bey, and myself, extensively cultivated for cloth-making in Egypt. Farther North, the "linōn" is mentioned by Homer il. ii. 529 and xviii. 570, Aeschylus suppl. 127, Herodotus, Theophrastus, and Dioscorides; the "linum" by Plautus, Cicero, Virgil, Columella, and Pliny: *L. usitatissimum* is termed "*L. sativum*" by Tournefort inst. 339; was observed by Sibthorp, Chaubard, and Fraas, under cultivation from the Sperchius throughout Greece; by Lenz, in Italy; is known to be cultivated throughout middle Europe as far as Britain (Curt. lond. v. pl. 22); and according to Ledebour, grows as if wild on the plains North of the Black Sea and Caspian. Southward and Eastward from Egypt, is called in Abyssinia "telba" or "entatieh," and is cultivated exclusively for the seeds which are roasted and eaten (A. Rich. fl. abyss. i. p. 52): is called in Sanscrit "ouma" or "matousi" or "atasi" (Pidd.), in Bengalee "shan" or "koshta," in Hindustanee "san" or "atasi" or "tisi" (D'roz.), in the environs of Bombay "ulsee" or "jowas-ulsee," the "unripe capsules" used as food by the natives (Grah., and Gibs.), was observed by myself under cultivation on the Deccan, but in general throughout Hindustan is cultivated solely for the oil yielded by the seeds (Roxb., and Royle ill. p. 82). By European colonists, was carried to Northeast America, where it continues under cultivation and is sometimes found springing up spontaneously; was also carried to the Mauritius Islands (Boj.). Is enumerated by Lindley among medicinal plants, on account of the emollient properties of the infusion, the meal of the seeds used for cataplasms, and the oil with lime-water applied to burns.

rosary; "kunari" necklace; "vnōni" or "kēvnōni" gem. — The character occurs under the Third dynasty (Leps. d. ii. pl. 4, and k. pl. 6). A second form occurs under the Fourth dynasty (Leps. d. ii. pl. 96, and Champ. dict. 235). Strings of beads, possibly for rosaries, are brought by foreign delegates in the Tribute-procession to Tetmes III.

The *rosary* or string of prayer beads as early perhaps as the invention of writing, — and I have seen rosaries worn not by Catholics only, but by Muslims and Oriental Jews.

(stork signifying father-loving, the bird never separating from its fathers unto extreme old age, Horap. ii. 55); "nōuri" stork; "nsa" after, "nsōdu" henceforth; "ēnhōt" or "nhōt" or "nhōtē" or "nhōtē" faithful; "nōunē" or "nōuni" root, to take root. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 19).

The *stork*, Ciconia, inhabits Egypt at least during the winter season; — when the bird was seen there by myself. Among the Greeks, the "pēlargōs" is mentioned by Plato alc. i. 135, and others. Pliny x. 31 states, that the "ciconiae" leave Italy annually, but whither they go or whence they come is unknown; that they return to the same nests and cherish the old age of their parents, "nidos eosdem repetunt genetricum senectam invicem educant."

(cicada signifying initiated and devoted to sacred things, for it yields music from its back, Horap. ii. 52); "nahvi" or "nahv" or "nēhvē" yoke, neck; "nahv" part of the back; "nōtēm" sweet sounding; "nōtm" conversion; "nōtm" musician attracting others to the dance; "sēnsēn" to sound, resound; — in Greek "nōtōs" back; in English "note" (in music). The character occurs from the Fourth dynasty to the Seventeenth (Leps. d. ii. pl. 34 to iii. pl. 12). A second form occurs under the Eighteenth dynasty (Leps. d. iii. pl. 38).

(heart pendant from the fauces "pharuggōs," signifying mouth of a good man, Horap. ii. 4); "anai" beauty; "nēsō" or "ēnasō" or "ēnēsē" or "ēnēsō" beautiful, pleasing; "nanē" or "nanōu" or "ēnanōu" good; "nōf" joy, "nōufi" good, useful; "nōērōs" prudent, wise; "naēiat"

or "naiat" or "naiēt" blessed, happy; "nō" model;—in Hebrew "nawē" decorous, beautiful; in English, the phrase "carries his heart in his mouth." The character occurs as early as the Sixth dynasty (Leps. d. ii. pl. 112). A second form occurs as early as the Tenth dynasty (Leps. d. ii. pl. 146). A third form occurs from the Tenth dynasty to the Persian emperors (Leps. d. iii. pl. 35 to 246, and k. pl. 11 and 14 to 49).

 *guitar*: "nafti" or "nōfrē" or "nōvrē" or "nōufrē" or "nōfri" profit, utility, useful; "tntn" or "tntōn" or "tēntōn" to resemble, imitate; "ēinē" or "ōni" or "inē" like, similar; "ēini" imitator, mimic; "ini" likeness, image; "ēn" ape; "nōuōshē" or "nēat" limit, extremity. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 61). A second form occurs from the Sixth dynasty to the Twentieth (Leps. k. pl. 5 and 6 to 41).

x or ks, its pervading meaning example.

X (lion eating an ape to recover health, Horap. ii. 72); "thēkōs" male ape; "xōpina" suddenly, unexpectedly; "mōkhs" troubles, pain, foes; "tkas" grief. — The character occurs from the Fourth dynasty and the Book of the Dead to the end of hieroglyphic writing (coffin of king Menkera, Leps. d. ii. pl. 2, and k. pl. 10 to 63). That the cross-mark of rejection is the origin of the twenty-second Greek letter "hi" or **X** further appears from the Greek word "hiadz," to mark with a cross spurious coins and writings. At the Western extreme of the Mediterranean, the Greek pronunciation of the letter **X** continues in the Spanish alphabet: while in Italy in the Latin alphabet, though corresponding in position **X** retains its normal sound "ks," as also in Northern Europe.

 (pregnant bear signifying rude and not yet shaped; for the animal brings forth a mass like a clot of blood, and holding this between her thighs, licks it with her tongue into shape, Horap. ii. 79); "arx" a bear;—in English, the phrase "unlicked cub." The character occurs under the Third dynasty (Leps. d. ii. pl. 3, bronze situlus Brit. mus., Buns. and Birch).

The *Syrian bear*, *Ursus Syriacus*, known therefore to the Egyptians at the time of the invention of writing; although the animal does not appear to have ever inhabited Egypt, — and in fact, Pliny viii. 83 states, that bears do not occur in Africa. Apart from the hieroglyphic writing, a bear led by Northern delegates is figured in a tribute-procession under the Eighteenth dynasty. In neighbouring Palestine, the "thwb" killed by David (1 Sam. xvii. 34 to 37) is admitted to be a bear; and the "thwb" is also mentioned in 2 Sam. xvii. 8, Prov. xvii. 12, 2 K. ii. 24, and Hosea xiii. 8. The above account of the parturition of the bear transferred to Northern species, is repeated by Pliny respecting the "arktōs" of the Greeks and "ursus" of the Romans (*U. arctos*).

 "akēs" axe; "xala" vine-plantation; "kēks" bark; "kēks" scales or plates;—in Greek "axinē," in Latin "ascia," in English "axe." The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 63). That the implement represented is really an axe, appears from its use in the hands of a carpenter under the Seventh dynasty at Sauiet el Meitin (Leps. d. ii. pl. 108).

 "laxē" segment, angle; "ēlks" angle, corner. — The character occurs under the Third dynasty (Leps. k. 5). A second form  occurs from the Eighteenth dynasty to the Twenty-sixth (Leps. d. iii. pl. 69, 167, and 232 to  276). A third form  occurs under the Twenty-sixth dynasty (Leps. d. iii. pl. 276).

 "kērax" pick-axe; "lōux" or "lōx" or "lōks" or "lōks" to bite (as a serpent), prick, fix. The character has been already noticed as presenting evidence of the *Stone period* having existed in Egypt, — and occurs on the Gliddon mummy-case. The metallic adze  occurs under the Fourth and Fifth dynasties; and apart from hieroglyphic writing, is used by a carpenter under the Seventh dynasty at Sauiet el Meitin (Leps. d. ii. pl. 3, 34, 49, and 108). A fourth form  occurs under the Twelfth dynasty (Leps. d. ii. pl. 131). A fifth form  occurs from the Fifth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 44, and k. pl. 23 to 62): an intermediate form is found in the large adze held with both hands by a carpenter under the Seventh dynasty at Sauiet el Meitin.

 "smōt" or "smōd" similitude, example; "sōōtē" or "sōtē" or "sad" arrow; "x" or "sé" sixty. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 3, 24, iii. pl. 139, 251, and iv. pl. 4). The bundle of arrows may have given rise to the form  of the Greek letter "ksi"; and the correspondence with one form  of the Phœnician "smk," seems to indicate that the Phœnician letter once had the sound of ks: the letters agree in position, numerical value of sixty, and confirmation is found in the above Egyptian name. The facility with which ks is converted into S, is illustrated in English by the word "example" changed into "sample."

 "shiks" handful of wool or tow on distaff. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 97).

 "sad" to spin or twist thread; "sōtē" thread. — The first character occurs under the Fourth dynasty; the second, under the Fourth or Fifth (Leps. d. ii. pl. 10 and 83).

 "jaks" to border or fringe; "jëkas" or "jëkëës" so that; "xëlsöl" or "sëlsöl" to ornament, adorn; "sëlsöl" or "sëlsöl" or "sëlsël" to be comforted; "öuxas" consolation. — The first character occurs in the Book of the Dead xxxvi. 99. 11. The second character occurs under the . . . dynasty (Champ. dict. 18).

 "xöur" ring; "körks" ring, chain; "askis" fetter; "xalös" timid; "thax" or "thöks" or "thoux" to pierce, fix firmly in. — The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 66 and 79).

 "xömē" or "xönē" dish, platter; "xiraks" barley-gruel; "tëks" to cook, add into; "tshlōx" a spit or pole; "lix" secret place. — The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 3, and k. pl. 7 to 56). A second form  occurs under the Twelfth dynasty (pyramid at Dashour, Vyse iii.).

o, its pervading meaning open; the exclamation o! or oh!, uttered on enlightenment.

 "söuhē" or "söuhi" egg, "söouhē" probation; "öó" or "öös" to conceive; "ö" or "ö" or "öi" to be, "dö" or "döi" I am; "önh" or "önah" or "önh" or "öng" to live; "örj" inclosed; "öüh" or "öüh" to cover, dwell; "önh" habitation; "orf" or "örv" or "örév" or "örév" to guard; "ösa" contempt; "övtsh" or "öptsh" to neglect, contemn; "ötp" seclusion; — in Greek "öön," in Latin "ovum," egg. The character occurs from the Seventeenth dynasty to the end of hieroglyphic writing (Leps. d. iii. pl. 25, and k. pl. 25 to 67).

 "öütsht" interval of time or space; "hrö" or "krö" beach, shore; "öuöstn" or "öuötshts" breadth, to dilate; "phöji" or "phög" or "pööh" or "öuötsht" fissure, to burst, be cloven; "öuötsht" or "öuötsht" hole; "öuötsht" or "öuötsht" or "öuötsht" to perforate, go through; "öntsh" to make an end, finish; "öü" to evacuate. — The character occurs under the Eighteenth dynasty (sarcoph. of king Her, Champ. dict. 449, tomb Brit. mus., Buns. and Birch).

 (hare "lagöön" signifying "anöixin" act of opening; for the animal has its eyes always open. Horap. i. 26): "öuön" or "öuön" to open, "öuön" act of opening. — The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 62).

The hare, *Lepus timidus*, is remarkable among small defenceless quadrupeds for avoiding concealment; passing its whole life on the open plain. Is enumerated by Clot-Bey as called "arneb" in Egypt, and differing "by the colour of its fur and length of its ears and hind feet" from the hare of Europe.

 (eaglet signifying roundish "kuklöethön" and producing males, Horap. ii. 2); "söuhi" crown of the head; "ölk" gibbous or convex, "ölk" to be incurved, bowed down; "öuöj" whole, safe; "öuötsht" incurving, adoration, to adore; "ötsht" to vow, invoke, promise; "öuötsht" or "ötsht" voluntary; "örf" religious; "jö" hymn or song, "jö" to pipe or sing. — The character occurs under the Fourth dynasty, also in the Book of the Dead, and continues in use under the Twenty-ninth (Leps. d. ii. pl. 28, and k. pl. 29 to 50).

 (the sun called "öros" by the Egyptians, because it rules the hours, Horap. i. 17); "rē" or "rē" sun; "öunöüē" or "öunöüē" hours; "töüi" in the morning; "öuöēin" light; "höü" day; "hō" or "thō" aspect; "ö!" or "oh!"; — in Hebrew "awr" light, to illuminate, shine; in Greek "ö!", in Latin "oh!", in English o! or oh!. The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 66): is also an ancient if not the original form of the sixteenth Phoenician and Hebrew letter "iyn," the Greek "ö-mikrön," and the Latin and Western O.

 "önh" demonstration; "öuönh" to shine, "öuönh" to be made manifest. — The character occurs under the Third dynasty (Leps. d. ii. pl. 5).

 "öütsht" like as, the same, "öütsht" crude, uncooked; "öütsht" or "öütsht" pottage; "örvē" cake of bread; "öēik" or "ööēik" or "öik" bread; "jöj" unleavened bread; "jöj" or "shösh" or "jēfjōi" or "jōfjēf" to cook; — in English, the phrase "the egg is full of dough." The character occurs as early as the . . . dynasty, and continues in use until the end of hieroglyphic writing (Leps. d. iv. pl. 54). A second form  occurs from the Nineteenth dynasty to the end of hieroglyphic writing (Leps. k. pl. 35, and 56 to 64).

Eryum lens of the Uralian plains? Called in Britain *lentil*, in France "lentille" (Nugent), in Germany "linse," in Italy "lente" (Lenz), in Illyrian "sociovika," in Russian "tschetschevitza" (A. Dec.), in Greece "phake" (Sibth.), in Egypt "a'ds" apparently from the Egyptian "öütsht" pottage, the plant being called in Egyptian "artshin" or "artshan" — (transl. Ezek. iv. 9, ms. Borg., and Zoeg. p. 651): E. lens continuing abundantly cultivated in Egypt, the general use of red lentil pottage, such as caused Esau to be called Edom (Gen. xxv. 30 to 34) is very striking: the "ötsht" is also mentioned in 2 Sam. xvii. 28, xxxiii. 11, and Ezekiel iv. 9. Farther North, the "phakös" or "phakē" is mentioned by Aristophanes vesp. 821, Theophrastus, Dioscorides, and Athenaeus iv. 47; is identified in Syn. Diosc. with the "lëntēm" or "lëntikōulam" of the Romans; the "lentim" or "lens" is mentioned by Cato 34, Virgil, Columella, Pliny, and the "lenticula" by Palladius vii. 3: E.

lens is described by Rivinus tetr. irr. pl. 35; is termed "*l. vulgaris*" by Tournefort inst. 390; was observed by Georgi in Southern Russia (Ledeb.); by Sibthorp, and Fraas, under cultivation in Greece and springing up spontaneously in cultivated ground; by Lenz, under the same circumstances in Italy; as throughout middle Europe (Pers., and Koch), where it is regarded by A. Decandolle as not indigenous. Eastward, was unknown in Hindustan at the time of Alexander's visit (Theophr. iv. 4), has no Sanscrit name (Roxb., and Pidd.); but is cultivated at present even in Bengal (A. Dec.), is called in Hindustanee "moth" or "adas" or "masur" (D'roz.), in the environs of Bombay "mus-soor" (as though brought from Egypt) but continuing "commonly cultivated" (Graham). Imported lentils are occasionally sold in Northeast America, but I am not aware of any attempts at cultivation. "*E. nigricans*" was observed by Fraas indigenous in Greece.

ooo (pregnant hawk signifying dismissing children on account of poverty; for the bird lays three eggs and breaks two of them, being unable from losing its nails to rear three young, Horap. ii. 94); "tshōñē" or "tshōñi" or "mētjōv" or "mēthōv" infirmity; "mēthō ēvōl" dismissal; "ōuōd" separation; "ōlēm" to be affected with sorrow, compunction; "ōkēm" or "ōkm" or "ōkēm" or "ōkm" sadness, having a sad countenance; "ōl" or "ōl" or "ōli" or "ōlp" to take away, lead, embark; "hōl" to depart; "ōuōtēv" to pass over, migrate. — The character occurs under the Fourth or Fifth dynasty (Leps. d. ii. pl. 99).

⤵ (horn of the male bullock signifying work; of the female, penalty, Horap. ii. 16 and 17); "tap" or "tōp" extremity, horn; "hōp" horn; "hōf" or "hōv" work, business; "ōsē" or "ōsi" penalty, loss; "ōpt" or "ōpt" to bear; — in English, "the two horns of a dilemma." The character occurs as early as the Fourth dynasty (Leps. k. pl. 7). A second form  occurs under the Eighteenth and Nineteenth dynasties (Leps. d. iii. pl. 55, 144). A third form  occurs under the Twenty-second dynasty (Leps. k. pl. 44).

 (seven marks inclosed by two fingers signifying inexperienced, also destiny, also music, Horap. ii. 27); "ōvia" near; "ōp" lot, allotment, accounts, vote; "hi-ōp" to cast lots; "han-ōp" betrothed; — in English, "the two horns of a dilemma." The character occurs as early as the Fourth dynasty (Leps. k. pl. 7). A second form  occurs under the Eighteenth dynasty; together with a third  (Leps. d. iii. pl. 55). A fourth  form occurs from the Nineteenth dynasty to the Ptolemies (Leps. d. iii. pl. 148, and iv. pl. 13).

⤵ "ōsr" or "ōuōsr" or "vōsēr" oar; "ōn" again; "ōuōhm" again, to do again; "ōuōhē" or "ōuōōhē" or "ōuōhē" or "ōuōhi" or "ōhi" fisher; "ōjēr" to hold on, persevere; "ōōrj" or "ōrj" diligent, diligence; "ōjēn" unremitting; "ōms" or "ōms" to drown; "ōsht" or "ōjh" suffocate; "ōjēv" or "ōshv" or "ōrtsh" or "ōrtsh" cold, to grow cold; "ōjn" to perish; "ōjp" or "ōuōjp" or "ōuōjp" destruction. — The character occurs from the Fifth dynasty to the Greek conquest (Leps. k. pl. 5 to 60): the Latin word for oar "remus," has been derived from "ramus" branch; and branches of trees similar to the above figure, were observed by myself used for rowing *rafts of earthen jars* on the Nile.

— "ōssh" plain, Desert; "kōi" plain, field; "hōi" or "hōid" farm; "ōhi" or "ōhē" or "ōōhē" or "iōhi" or "ōuiōhi" field, flocks, cattle-fold; "sdōhē" or "sdōhē" cultivated field; "ōuōi" or "ōuōi" or "ōuōiē" or "ōuōiē" cultivator, tiller of the soil. — The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 10, and k. pl. 5 to 66).

 (baboon "kunōkēphalōn" standing with hands raised and the emblem of royalty on the head, signifying the moon rising; for both sun and moon have a share in light, Horap. i. 15); "iōh" or "ōōh" or "ōōu" moon; "ōnk" to rise, increase. — The character occurs as early as the . . . dynasty (fig. Brit. mus., Buns. and Birch).

 "ōgiōn" or "pōgiōn" oesophagus; "tshōuōvē" or "tshvōvi" throat; "ōmk" or "ōmk" to swallow; "ōji" limit, end. — The two characters occur as early as the . . . dynasty, also in the Book of the Dead and on a sarcophagus now in the British museum (Buns. and Birch).

p, its pervading meaning practical. The interjection poh!
 "pashē" segment, table; "pinaz" or "vinaj" dish, board; "pēri" victuals, food; "pahs" wild game; "patsh" a hunt; "pisē" or "pēs" to cook; — in Greek "pēra" wallet or provision-pouch, "pinax" a table or board; in Latin "paro" to provide. The character occurs from the Fourth dynasty to the Eighteenth (Leps. d. ii. pl. 28, iii. pl. 67). A second form  occurs under the . . . dynasty (Champ. dict. 255).

 "pēnnē" door; "pēnnē" or "pēi" or "phēi" flea; — in Greek "pulōs" door, in Latin "pulex" flea. The character occurs under the Third dynasty (Leps. d. ii. pl. 3). A second form  occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 25, and k. pl. 5 to 67).

The *flea*, *Pulex irritans*, already in Egypt at the time of the invention of writing, — continues well known there. In Palestine, the "phrish" or flea is mentioned in the history of Saul (1 Sam. xxiv.

14); in Greece, the "psullōs" is mentioned by Aristophanes *nub.* 145 and 831, Dioscorides, and Lucian; and in Italy, the "pulex" by Columella, Pliny, and Martial. Eastward from Asia, the flea was found by myself aboriginally introduced throughout the inhabited islands of the Pacific; was also aboriginally introduced throughout America to the shores of the Atlantic in New England (R. Williams key, 6), having in the last two instances evidently accompanied the dog.

 "paganōs" head-quarters, or palace; "tshtōp" inn; "prētsh" or "pōrs" mat; "pōrtsh" or "pōrtsh" or "prtsh" to spread out, strew; — in English "preach," and "porch." The character occurs on the Gliddon mummy case. A second form  occurs under the Third and Fourth dynasties (Leps. d. ii. pl. 3 and 27, Champ. mon. iv. 325,  326).

 "pat" knee; "pōht" or "paht" to fall down before, prostrate one's self; "pēht" to bow down; "aspē" or "aspi" or "sapi" tongue, speech; "saps" or "sēps" or "sōps" or "sēpsōp" or "sōpsp" or "sōpsōp" to beseech, supplicate. — The character occurs under the . . . dynasty (Champ. gram. 343, and Rosellin. mon. cul. 38).

 "pōōné" or "pōōné" or "pōōni" or "pēñē" migration, to remove; "pēt" or "pōt" or "phōt" or "phēt" to run, flee; "sēpē" swiftness; "pōlsh" or "pōlsh" to be delivered from, liberated. — The character occurs under the Seventeenth dynasty (Leps. d. iii. pl. 5), is perhaps the origin of the form  of the seventeenth Phœnician letter "pha," and of the earliest form  of the Greek letter "pi." The *Nubian throwing-club* is besides figured under the Twelfth dynasty at Beni-hassan (Champ. mon. pl. 395); was found by Bonomi *ninev.* iv. 1 and pl. 41 employed by the Bishareen as a missile principally for capturing game; the pattern, as observed by myself, continuing unchanged.

Acacia Nilotica of the Southern border of the Sahara as far as Arabia. Called in Yemen "soul" or "saelam" in Egypt "sánt" (Forsk.) or as heard by myself "sōnt": in which we recognize its original Egyptian name "sōnd" or "tshōnd": the Nubian throwing-clubs according to my Dongola attendant are made of "selem" wood, and were ascertained by Bonomi to be of "sunt" — the river-barges in use at the time of the invention of writing may also have been of this timber, — as in the time of Herodotus ii. 96, and to the present day (Clot-Bey ii. 2. 29): the tree with its marked foliage is figured at Beni-hassan under the Twelfth dynasty (Champ. d. ii. pl. 18): the "akakia" of Egypt is described by Dioscorides as yielding a black "stupikēn" astringent gum, mentioned also by Pliny *xxiv.* 65, Rhazes, and the mode of procuring it described by Abdallatif i. 2: A. Nilotica, whose pods are besides used for tanning (Clot-Bey), was observed by myself planted and naturalized around villages throughout Egypt to the end of my journey at Assouan; beyond, according to Lepsius *eg.* and *sin.* p. 129 to 170, is distinguished by the Nubians as "the tree," and was observed by him indigenous in Upper Nubia. Eastward, was observed by Forskal indigenous along the base of the mountains of Yemen, the bark used for tanning; by myself, under cultivation only at Muscat; is called in Sanscrit "burbura," in Bengalee "babula" or "babool," in Telinga "nella-tooma" (Lindl.) and the "babool" tree, planted through the suggestion of Gil son, has become "common in the Deccan" (Graham), principally as observed by myself for its shade along roadsides.

A hieroglyphic character  (possibly representing the rib) agrees at least in shape with the *Mesopotamian throwing-club*. — The character is painted red on the Gliddon mummy-case, occurs also under the Third, and down  to the Seventeenth dynasty (Leps. d. ii. pl. 3, and iii. pl. 5). A throwing-club of similar shape is held by an Egyptian under the Seventeenth dynasty, by the Asiatic strangers at Beni-hassan under the Twelfth dynasty (Leps. d. iii. pl. 9, and ii. pl. 131), and by individuals on the Assyrian monuments.

 "pōms" scurrility; "pashē" or "patsē" spittle. — The character occurs in the Book of the Dead, also under the . . . dynasty (Champ. gram. 9, 42, 154, and Buns. and Birch).

 (ichneumon signifying weakness, succoured by others; for the animal calls others to its assistance before resisting a serpent, Horap. ii. 31); "pakēn-hēt" pusillanimous; "pēnhēt" poor, destitute; — in Greek "pēnēs" poor; in Latin "penuria," penury, "pauper." The character occurs in the Ritual, also under the . . . dynasty (Buns. and Birch).

The *ichneumon*, although belonging to a Tropical genus is known to inhabit Egypt along the Nile; — was in ancient times protected by law, is at present called "nems," and although very destructive to all smaller animals is sometimes domesticated (Clot-Bey ii. 66). As inhabiting Egypt is mentioned by Aelian, Pliny, Lucan, and other Greek and Roman writers.

 mantis or praying-insect; "pētd" (one of the insects enumerated in transl. Levit. xi. 22);  "pētd" corslet; "pētd-tot ēvōl" fishmonger. — The character occurs under the . . . dynasty (Champ. dict. 168).

 stand of balance-scales; "pēsh" to be at variance; "pōlj" or "pōrj" dissension; "patshē" half; "shijapi" to be in suspense, waver; — in English "to halt between two opinions." The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 2). A second form occurs from the Seventh dynasty to the Eighteenth (Leps. k. pl. 6 to 27). And a third from the Eighteenth dynasty to the Twentieth (Leps. k. pl. 28 to 41).

(hyæna signifying unstable; hyæna turned to the right, signifying conquering, Horap. ii. 65 and 67); "pêrêthia" vicissitude, occasion; "pōh" or "pōh" to come, go; "pōtshs" or "pōhs" to wander; "pahs" prey; "pōuni" tribute or income, variegated; — in Greek "pōikilōs" checkered or variegated; in English "living from hand to mouth." The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 21).

The *hyæna* is well known in Egypt where it is called "dabeh," extending besides throughout North Africa and into Syria (Clot-Bey ii. 58). — Apart from hieroglyphic writing, is figured under the Fourth dynasty at Gizeh in a seemingly reclaimed or semidomestic state (Leps. d. ii. pl. 10). Its flesh, I was informed by Mr. Birch, is sometimes represented on the monuments as served up at feasts: and to the present day, Bayard Taylor centr. Afr. 35 found the flesh of the *hyæna* eaten by the people along the Upper Nile

(pewit or lapwing "ēpōpa" prognosticating abundant vintage, Horap. ii. 88); "karapipi" or "pētēpēt" lapwing; "pētēp" profit, interests; "ēpē" or "ēpi" number; "ōp" or "ōp" or "ēp" to number, reckon, estimate; "platikōs" ease, relaxation of mind. — The character occurs under the Fourth dynasty; and the single lapwing, from the Fifth to the Seventeenth (Leps. d. ii. pl. 18, 48, and iii. pl. 16).

The *lapwing*, Vanellus, was observed by myself to be frequent in Egypt, at least during the winter season. — North of the Mediterranean, the "ēpōps" is mentioned by Aeschylus (Plin. x. 44), Aristophanes av. 47, and Plato phaed. 85: but by many writers is referred to the *hoopoe*; in fact the description of the "upupa" by Pliny, belongs in part to the hoopoe.

"pōshē" or "shōp" sole of the foot, basis; "shōp" or "shōpē" or "shōpi" to gain possession; — in Greek "pōus" foot; in English "position." The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 28). A second form } occurs in the Book of the Dead, and from the Twelfth dynasty to the Ptolemies (Leps. d. ii. } pl. 138, iii. pl. 5, and k. pl. 27 to 57). A possible combination occurs under the . . . dy } nasty (sepulchr. tablet Brit. mus., Buns. and Birch).

"pē" or "pē" or "phē" celestial, the heavens, firmament; "pitē" or "phēttē" or "phid" bow, rainbow; — in Greek, the name "pi" of the sixteenth letter; in English "pity." The character occurs as early as the Fourth dynasty, also in the Book of the Dead, and continues in use until the end of hieroglyphic writing (Leps. d. ii. pl. 36, 98, and k. pl. 14 to 63): is besides the possible origin of the flat-topped form ¶ of the Hebrew letter "pha," and Greek Π "pi" (compare also the round-topped form).

"spēr" or "spir" or "sphir" the side; "pira" soul, life; "pōk" or "pē" or "pēk" or "pētēn" your; "pai" this; "pa" or "pōi" mine; "panikirōs" quiet, placid, mild; "pēraōū" arrival, meeting; "pattshēlēt" or "pattshēlēt" bridegroom; — in Latin "spiritus" air or life or soul, "spirans" living or breathing; in English "aspire, inspire, respire, expire." The character occurs under the . . . } dynasty (Champ. dict. 50). A second form occurs from the Twenty-first dynasty to the Ptolemies (Leps. d. iii. pl. 246 to iv. pl. 41).

(tongue on teeth signifying taste not perfected, Horap. i. 31); "pōk" soft; "pōkinōs" desire, love; "pōuēi" fervour; "paitshē" remedy. — The character occurs in the Book of the Dead, also under the . . . } dynasty (papyri, tablet Brit. mus., Buns. and Birch).

(beginning of the mouth signifying taste "gēusin," Horap. i. 31); "dpē" or "tēipē" taste; "tōp" or "tōp" to taste; "tōp" beginnings or extremities; "spōtōu" or "sphōtōu" lip; "pēi" or "pi" or "phi" a kiss; "dpē" or "dpi" or "dphi" to kiss; "pōlh" to be wounded; "spšēp" to propitiate, be appeased; "ēhnē" or "pētēhnē" or "pētēh" will. — The character occurs under the . . . } dynasty (Champ. dict. 71).

ts or tz or ds or dz, its pervading meaning courtship. fish-spear; "tshats" perforation; "kōts" entanglement, craftiness; "dsō" or "dsa" to spare; — in Hebrew, the eighteenth letter "dz," "dzwth" or "dzyth" hunting, fishing; in Greek, the name "zēta" of the sixth letter. The character occurs from the Fourth dynasty to the Twenty-sixth (Leps. d. ii. pl. 10, iii. pl. 26). A second form occurs in the Book of the Dead, also under the Eighteenth and Nineteenth dynasties (Leps. d. iii. pl. 153, and k. pl. 28 and 68). A third form } occurs under the Twenty-second dynasty (Leps. d. iii. pl. 257). The fish-spear is said to be the origin of the eighteenth Phœnician and Hebrew letter tsadi, some of whose forms } present decided confirmation.

"dsaēit" or "dsōēit" or "dsōōu" or "dsōit" to praise, celebrate, glorify; "rahts" pros-trator. — The character occurs in the Book of the Dead, also under the Twentieth dynasty (Champ. gram. 387, and Leps. d. iii. pl. 237).

"dsa" or "tsanō" or "sanō" beauty, to render beautiful, adorn; "tsana" or "tsanēu" becomingly, gracefully; "tsamiēu" ornamented. — The character occurs under the Third dynasty (Leps. d. ii. pl. 3, and Champ. dict. 285). A second form } occurs under the . . . } dynasty (Champ. dict. 285).

 the heavens falling; "dsak" to be molested, plagued; "shašīō" or "tshašīō" or "tshaiē" condemnation; "tsvkē" or "tsvkō" to make lower, dismiss; "tstō" to reject, treat with scorn; "tstō" to come back, return. — The character occurs as early as the . . . dynasty, also in the Book of the Dead (Buns. and Birch).

 "tsahōul" to muzzle, curb. — The character occurs under the Fourth dynasty (Leps. d. ii. pl. 15). A second form  occurs under the Twenty-first dynasty (Leps. d. iii. pl. 246). A third, under the Persian conquest (Champ. gram. 142, 38, 48, and Buns. and Birch).

 "sō" or "tsē" or "tsēi" or "tsō" or "tsō" to pour out water, to drink. — The character occurs under the . . . dynasty (Champ. dict. 427).

 "tsiē" or "tsiō" to be satisfied; "tōōts" a double seat. — The character occurs in the Book of the Dead xxii. 53. 4. 21, also under the Seventeenth dynasty (Leps. d. iii. pl. 5).

 hand hanging down; "hēts" extremity of foot or hand; "niatstē" tender, weak; "niats" attention, expectation, hope. — The character occurs as early as the . . . dynasty (Champ. dict. 459).

q or kw, its pervading meaning question.

 "kōihi" nerve; "kōd" questions, to interrogate; "kōrtsh" or "kōrētsh" to supplicate, ask; "kolj" or "kōlj" to bend, incurve; — in Hebrew "kwsh" to be incurred, "ky" whether? when; in Sanscrit "kas? ka? kim?"; in Greek "kōiē" in what manner?; in Latin "quaestio, quaero, qua, qualis, quam, quamdiu, quamdudum, quamobrem, quampridem, quando, quantus, quapropter, quare, quatenus, queisum, quemadmodum, qui, quianam, quicum, quid, quidnam, quidni, quidum, quin, quis, quisnam, quo, quoad, quomodo, quonam, quorsum, quot, quoteni, quoties, quotum, quovis, quousque, quum"; in English "inquire, quietus." The character occurs in the Book of the Dead, and continues in use under the Twenty-sixth dynasty (sarcoph. queen of Amasis, Buns. and Birch).

 "kōēih" or "kōih" or "kōhi" scabbard; — in Greek "kōlēōs" or "kōulēōs" scabbard. The character occurs from the Nineteenth dynasty to the Twenty-second (Leps. k. pl. 31 to 45).

 "kōrvi" knife; "kōrj" or "kōrj" or "kōōr" to cut off, be cut off: "kōōns" or "kōns" or "kōns" slaughter, to slay; "kōvh" or "kōvh" cord, sinew, "kōvh" to cut the sinews; "kōlp" or "kōlp" thieving, to steal; — in Hebrew "kwz" to cut, "kwi" to incise or dig, "kwr" to dig, "kwz" or "kwt" to disdain; in Greek "kōura" a young woman, "kōura" a shearing. The character occurs from the Third dynasty to the Twenty-second (Leps. d. ii. pl. 5 to iii. pl. 255).

 "kara" head or skull; "kahi" head of book or chapter; "pērkōti" male ape; — in Hebrew, the nineteenth letter "kwph" back of the head, occiput; "kwph" monkey, in Sanscrit "kapi," in Greek "kēpōs" or "kēvōs"; in old English "cop" top or head. The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 25, and k. pl. 7 to 63): is besides the origin of the form ϕ of the obsolete Greek letter "kōppa"; which transported to Italy became the Roman q, and the later and Western (j). The form P of the Phœnician and Hebrew letter "kwph" is not unlike a side view of the occiput; and is continued in the Etruscan, later Roman, and our Western q.

 (headless man walking, signifying "athunatōn" impossibility, Horap. i. 55); "at-jōm" or "at-shōm" impossible; "kōmtsh" or "kōmtsh" to laugh at, deride. — The character occurs from the Third dynasty to the Nineteenth (Leps. d. ii. pl. 7, and k. pl. 35).

 (leopard-skin joined to a hyæna-skin, signifying vanquished by an inferior, Horap. ii. 67); "kōōvēf" feeble, weak; "kōōvē" or "kōōvē" compelling; "kōōfē" or "kōōvē" prohibiting; "kōōu" or "kōōu" or "kōōu" strangers, others. — The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 19, 144, and k. pl. 50 to 56). The following modification  occurs under the Eighteenth dynasty, and continues in use under the Thirtieth (Leps. d. iii. pl. 52, and k. pl. 50).

 (star and sun with its disk cut in twain signifying a betrothed woman; star sometimes signifying soul of a male human being, also destiny, Horap. i. 13, ii. 1 and 13). "kōrtsh" to sweeten. — The character occurs under the Third dynasty (Leps. d. ii. pl. 5).

 "kōh" or "kōōh" corner, summit, precipitous or abrupt; "kōūklē" apex; "kōōns" or "kōōs" or "kōs" or "kōōs" corpse, to prepare for burial; "kōlēm" or "hōlēm" quickly or to hasten. — The character occurs from the Fifth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 58, 98, and k. pl. 15 to 61. For "hōirōn" pig, signifying lost or ruined, Horap. ii. 35, see pig). r, its pervading meaning "rushing on" (Plato).

 "rō" or "rō" mouth; "rō" door; "ēiērō" or "ēiōr" or "iarō" or "iērō" river; "rōth-ēiōn" torrent; "ra" river-mouth; "rōōutsh" loquacity, conversation; — in Hebrew "yor" the Nile (Buns. and Birch v. p. 749); in Greek the seventeenth letter "rō," also "rēō" to flow, "rōē" stream, "rumē" rushing on, current, "hēimarrōs" winter torrent; in Latin "rivus" river, "rivulus" rill, "ruo" to rush, "curro" to run, "cursus" course, "rapidus" rapid. The character

occurs on the Gliddon mummy-case, and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 67).

 "rēpōtia" winnowing-fan, "ripid" sacred fan; "rak" or "raki" or "rēk" or "rēkt" or "rikē" or "riki" to bow down, incline; "riki" or "rēkrikē" or "rēkriki" nodding, inclining the head; "tsharō" or "rōf" or "rrēt" or "ērēt" promise, vow; "ērēu" or "ērēou" mutual; "mōur" bond, to bind — The character occurs as early as the . . . dynasty (Champ. mon. iii. 219).

 the cottage; "ērvi" or "ērshō" or "ērsō" habitation. — The character occurs on the Gliddon mummy-case, and from the Third dynasty to the Seventeenth (Leps. d. ii. pl. 3, 110, and k. pl. 24).

And seems a figure of the cottage in fashion at the time of the invention of writing. The flat roof indicates a rainless climate; the material of the walls being probably mud suffered to dry in the sun. The window has at least the form of the *arch*; and it may be, that *dobi* or mud-bricks were already in use. — "Tombs with vaulted roofs made of mud-bricks as far back as the time of the pyramids," are mentioned by Lepsius Eg. and Sin. p. 74.

 "raōuē" or "rauē" bedroom, bed; "rōm" or "ērōm" couch; "rōtēv" to recline; "tshēlī" or "tshar" or "tshaar" hide or skin; "tshairi" or "tshairē" nuptial couch; — in English "room, chair." The character occurs from the Eleventh dynasty to the Ptolemies (Leps. d. ii. pl. 149, 118, and k. pl. 57). A second form occurs from the Nineteenth dynasty to the end of hieroglyphic writing (Leps. k. pl. 32 to 63).

 "tshairē" or "rōt" or "ērōuōt" or "ōurōt" or "ratshi" hilarity, festivity, joy; "ratshi" or "ratshē" or "ōurōt" to rejoice; "raitē" guests; "rōuhē" or "rōuhi" evening; — in Greek "hairē" rejoice, greeting; in English "rout" festive assembly or crowd. The character occurs as early as the . . . dynasty (Champ. dict. 30). A possible modification occurs from the Seventeenth dynasty to the end of hieroglyphic writing (Leps. k. pl. 23 to 67). A wedding among the rural population of Upper Egypt witnessed by myself, was attended by men standing in a row and clapping hands.

 "sistra" sistrum; "rōōunē" virginity; "rana" to be admired; "ran" or "ēran" agreeable, pleasing, to accept; "ratsh" or "rētsh" or "rōtshē" or "rōtshi" sufficient, to be content; — in English "sister." The character occurs from the Tenth dynasty to the Twenty-second (Leps. k. pl. 10 to 45). A second form  occurs under the Ptolemies (Leps. k. pl. 52). A third form occurs under the Twenty-eighth  dynasty (Leps. k. pl. 49). The *sistrum* was known to the Romans as an Egyptian musical instrument (Propert., Ovid amor. el. 8); the Egyptians being further characterized as "sistrata turba" by Martial xii.

 (half of snake signifying king over only part of the world, Horap. i. 60); "ratsh" or "rēnpah" to divide; "rē" or "rē" part; "rra" or "rrō" or "ērra" or "ērrō" or "ōurō" king; "rrō" queen, "rrōū" kings; "ōurit" or "rit" keeper, governor; "ōurad" keepers; — in Hebrew the twentieth letter "rash" or "rysh" head; in Arabic "rāis" captain. The character occurs under the Third and Fourth dynasties (Leps. d. ii. pl. 3 to 31); and seems the origin of the form **ϣ** of the Phœnician and Hebrew letter "rash," **Ρ** of the Greek letter "rō," continued even in Celtiberian, and **Q** of the Umbrian and Oscan *r*.

 "rē" or "rē" sun; "rasd" or "rastē" morrow; "tshōrp" in the morning; "phōr" or "rasōu" or "rasōui" dream; "rōht" trance; "rōan" or "ērtshan" when; — in Hebrew "bkr" morning, "mhr" morrow, in Greek "auriōn," in Latin "cras." The character occurs from the Eighteenth dynasty to the Ptolemies (Leps. d. iii. pl. 152, and k. pl. 29 to 58).

 "rōōuē" or "rōōui" or "arōōuē" harvest-remains or stubble; "sēsrit" gleanings, ears of grain that escape the sickle; "srit" to collect the remains; — in Hebrew "hrb" laid waste, "hrgl" or "arbē" locust; in Greek "akris" grasshopper; in Latin "calamitas" calamity, from the Greek "kalamē" straw or stubble. The character occurs as early as the "Twentieth" dynasty (Buns. and Birch, Champ. gram. 41, 105, and dict. 178). A second form  occurs under the Twenty-sixth dynasty (Leps. d. iii. pl. 262).

The *locust*, *Gryllus migratorius*, is a large Tropical species of grasshopper belonging properly to the Desert; from the mouth of the Red Sea (where it was observed by myself) Northward to Syria and the shores of the Mediterranean, and in migratory bands sometimes crossing from Africa into Italy — (Plin. xi. 35). The "arbē" or "arvē" was one of the plagues of Egypt in the Jewish Exodus x. 4; and with occasional years of devastation continues to abound there (Clot-Bey ii. 90).

 (lion and torches signifying passion chastised or restrained by fire, Horap. ii. 71); "ragt" or "rēgt" or "rōgt" to excoriate, destroy; "raht" or "rēht" or "rōht" to chastise, strike; "rautsh" or "rēmrautsh" or "rēmratsh" tame; — in English "a burned child dreads the fire." The character occurs under  the Fourth and Fifth dynasties (Leps. d. ii. pl. 21, 29, 78). The combination occurs under  the Fifth dynasty (Leps. d. ii. pl. 64).

 (sting-ray "trugōna" hooked signifying expiation and penitence, for the fish when captured casts its sting, Horap. ii. 105); "rami" skate or ray; "ēr-thmaïō" to expiate; "pahré" or

 (crow-nestlings signifying uneasy, restless, Horap. ii. 92 and 24); “jōtjēt” or “mah” or “mōh” nest; “shinō” pregnancy; “tshōtē” or “tshēmēr” leaven; “ji-thav” or “shī-tshēmēr” to ferment; “tshpit” or “tshphit” or “tshipē” or “tshipi” confusion or shame; “tshēmt” or “tshōmt” or “tshōmnt” three;—in colloquial English “to feel cheap.” The character occurs in the Book of the Dead and from the Sixth dynasty to the Ptolemies (Leps. d. ii. pl. 80, “coffin of Soter” in Brit. mus., Buns. and Birch).

 “tshlit” knife, “tshlish” knife, sword; “phētsh” or “phōtsh” division; “phatshi” or “patshi” half; “phatsh” or “phētsh” or “phētsh” or “phōtsh” or “phōtsh” or “pētsh” or “pētsh” or “pōtsh” or “ratsh” to divide into portions; “thatsh” separation; “tshatsh” or “tshōtsh” equal, to make equal.—The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 64). A second form occurs  also under the Fifth dynasty (Leps. d. ii. pl. 44, Rosell. m. civ. ii. 4, Buns. and Birch).

 “tshlij” butcher’s knife; “tshat” or “tshēt” or “tshōt” or “tshēt” to cut; “tshōt” to cut off; “tshōp” or “tshōp” or “tshōf” or “tshōv” to shear or shave; “tshatsh” or “tshētsh” to cut or break into pieces;—in English “chop, chip.” The character occurs in the Book of the Dead (Buns. and Birch).

 “tshio” cooking-pot or pan;—in English “to keep the pot boiling.” The character occurs under the Third dynasty (Leps. d. pl. 5): a modification  under the Sixth (Leps. d. ii. pl. 108); and a second modification  from the . . . dy  nasty (tabl. Brit. mus. 199, Buns. and Birch).

 “tshmōu” or “tshmōuē” spoon; “tshōuōvē” or “tshvōvē” throat; tshōtshpi” or “tshōtshpi” stomach, “tshōptsh” or “kmiji” bird’s crop; “tshastē” aliment, food; “tsha” or “tshai” or “tshaiō” or “tshēi” or “tshōps” feast, festival.—The character occurs from the Fourth dynasty to the Ptolemies, usually either inverted or in the horizontal position (Leps. d. ii. pl. 85, and k. pl. 7 to 53).

 “phaji” or “phatshi” or “shivshiv” or “tshautshau” crumbs, fragments, morsels; “tshma” or “tshēm” or “tshēmshēm” or “tshōm” or “tshōmē” comminuted, minute.—The character occurs as early as the . . . dynasty (“tablet 148,” Buns. and Birch).

 “tshné” or “tshnē” net; “hēntshēm” fishing-net; “patsh” to capture by hunting; “tshap” or “tshēp” or “tshōp” or “tshōp” to take; “tshalh” or “tshōlh” mark, private mark.—The character occurs as early as the . . . dynasty (Champ. dict. 359).

 “tshnēhiōui” dredge; “tsharkē” penury; “tshaat” needy, poor.—The character occurs from the Third to the Fifth dynasty (Leps. d. pl. 3 and 74).

 “tshē” a hundred; “tshēšōtē” a hundredfold.—The character occurs as a numerical sign from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing (Leps. k. pl. 25 to 67). Among the Greeks, “samphōras” signified a horse branded with the Doric “san,” anciently written C: Herodotus ii. 131 to 140 states, that the proper names of Persians invariably end in the Doric “san”; which as pronounced by the Parsees of Hindustan I found to be dsh or j. The same character C transferred to Italy, became the third letter of the Latin alphabet, retaining however the numerical value of a hundred in accordance with the Egyptian word, and therefore in like manner pronounced tshē: or rather, the third Latin letter represented two distinct sounds, tsh and k; as in English, although a superfluous letter, it represents k and s. The sound tsh has long disappeared from Egypt, is unknown also in Syria and Arabia; but is said to occur among the more Eastern Arabs, beyond the Euphrates.

 “tshēvtshē” or “tshvtshē” or “tshēvtshi” shield; “tshōvtsh” or “tshōvtsh” or “tshōptsh” arm (the strong arm); “tshaēij” or “tshōēij” or “tshōij” or “shōij” wrestler, warrior, strenuous.—The character occurs under the . . . dynasty (Champ. dict. 342).

 chest; “tshēnd” pack-saddle; “tshōt” bundles; “tshōt” or “tshōt” merchandise;  “tshaar” to be valued; “tshatd” or “tshōd” merchants; “tshēviē” or “tshēviō” or “tshvviō” remuneration; “tshōm” tribute.—The character occurs from the . . . dynasty (Ritual, Brit. mus., and Buns. and Birch).

 (bust “prōtōmē” with a sword, signifying impiety, Horap. ii. 18); “tshōft” fist; “tshōft” or “tshōft” or “tshōfi” to trespass, error; “tshōp” audacity; “tshaft” or “tshaft” adulterer; “tshavtē” or “tshaitē” or “tshaft” impious, impiety; “tshēl” or “tshōl” or “tshōl” to plunder, spoils.—The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 15, and k. pl. 5 to 64).

 “tshō” a thousand; “tsha” thousands; “tshō” or “tshō” sand; “ōtsh” or “ōtsh” many;  “tshaē” or “tshai” or “tshō” or “tatsha” or “tatshē” or “tartshō” numerous, many, to be multiplied; “atshai” or “atshē” or “atshē” multitude; “tshitsh” or “tshaitsh” or “tshōitsh” or “tshōitsh” dust.—The character, clearly but not exclusively a numerical sign, occurs under the

Fourth dynasty (Leps. d. ii. pl. 38). Another  and perhaps the original form occurs under the Third dynasty (Leps. d. ii. pl. 3). A third  form occurs from the Twenty-sixth dynasty to the Thirtieth (Champ. mon. i. 331, iii. 219 and  331, Leps. k. pl. 47 to 50).

Nymphaea coerulea of the Nile. A blue water-lily in aspect Tropical and probably derived from seeds floating down the river to Egypt, where it is called "bachenyn a'raby," and its root "byarou" (Del.); the root is said to have been pointed out as esculent by Isis — or by Menes (Diodor. i. 2. p. 41): throughout the Egyptian monuments, even in highly-finished representations, I found the margin of the leaves invariably entire; flowers are figured among offerings under the Fourth dynasty (Leps. d. ii. pl. 10), and in an instance under the Twentieth I found them distinctly painted blue: garlands of the "kuanëan" water-lily were seen by Callixenus at Alexandria (Athen. iii. 1. p. 72); the "bisnin el-Arabi" is distinguished by Ebn Baitar (Alpin. iii. 10. p. 163); *N. coerulea* was observed in Egypt by Savigny, Delile, and Clot-Bey, its root cooked and eaten and regarded as preferable in quality.

 "tshôtsht" or "tshôtsht" key, bolt; "tshôtsht" to hinder, prohibition; "tshik" or "tshôtë" well, pit; "tshats" pit, window; "tshôtsht" window, passage; "tshéuni" granary; "tshtam" or "tshtham" or "tshōtēm" or "tshōtm" or "tshōtēm" or "tshōtm" or "jōth" to lock, close, shut up; "tshōnt" or "tshōt" hard, "ēr-tshōt" to harden; "tshōp" or "tshōp" to buy, possess; "tshivé" or "tshivi" or "tshivt" or "tshivd" or "tshévt" or "tshōv" or "tshōvt" to change, changing; — in English "shop." The character occurs from the Fourth dynasty to the end of hieroglyphic writing (Leps. d. pl. 10 and k. pl. 24 to 66).

 vine-prop; "tshtshēr" or "tshōnd" prop or support; "tshēlh" or "tshlh" vine-branch; "tshimi" basis, foundation. — The character occurs from the Third to the Fifth dynasty, also in the Book of the Dead (Leps. d. ii. pl. 7 to 72).

 "tshēvi" or "tshēuë" column; "tshēm" or "tshōi" altitude, lofty; "shōsë" tall; "shisi" exaltation; "shas" or "shës" to exalt, extol, magnify; "tshōm" eminent. — The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 22, and k. pl. 31 to 52).

 hand without thumb; "tshōp" palm of the hand, a palm or handbreadth; "tshit" to measure; "tshi" a measure, to measure; "tshōui" or "tshiaëi" or "tshiai" extension, length; "tshië" length, a cubit; "tshōi" long; — compare Judg. i. 7. The character occurs as early as the Fourth dynasty (Champ. dict. 98).

 "jō" face, head, altitude; "jōj" head, chief; "tsha" or "tshantë" until; "shōsi" or "jōsë" highest; "tsharp" or "tsharpi" or "tsharëp" or "tshōrp" first; "tshév" baldness; "j" end; — in Greek "képhalë," in Latin "caput," in English "chapter, chief." The character occurs on the Gliddon mummy-case and from the Fourth dynasty to the Ptolemies (coffin of Menkera, and at Esneh, Buns. and Birch).

 "tshvôt" or "tshvöd" sceptre. — The "papyrus sceptre signifying Lower Egypt" occurs from the Third dynasty to the Roman conquest (Leps. d. ii. pl. 3, k. pl. 53, and Champ. dict. 329). The "lotus sceptre signifying Upper Egypt" occurs from the Fourth dynasty to the Roman conquest (Leps. d. ii. pl. 22,  k. pl. 14 to 61, and Champ. dict. 329).

 its pervading meaning support. "tōōts" or "tōts" or "tōts" seat, throne; "hëmsi" or "hmsō" or "thmsō" or "t-hëmsi" to sit; "sōi" winking or sign with the eyes; "t-hëmsō" or "smënts" or "smnts" or "smnt" or "smn" to appoint, establish, ordain by law; "sōōutn" or "sōūtën" or "sōūtön" to direct; "sōūtën" or "sōōutën" equity, uprightness; — in Latin "sedes, sedile, sella, situs, solium"; in English "site, seat, sit," and (through the Arabic) "sultan." The character occurs from the Gliddon mummy-case and the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 67).

 "sapt" or "sōpt" or "sōtp" superior, elect, chosen; "sëtp" to elect. — The character occurs from the Fifth dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 44, and k. pl. 23 to 62).

 (keeper of the house signifying "pastōphōrön" carried about in a shrine, Horap. i. 39); "smôt" or "smöd" model; "smōtë" similar; "smaat" blessed; "hōs" timbrel or drum; "hōs" song, to sing, celebrate; "smōu" praise, to praise; "statë" to applaud; "sōvsëv" or "sōpsëp" adulation; "sai" or "si" or "sëi" satiety; — in vulgar English "soap" flattery. The character occurs under the  Seventeenth dynasty (Leps. d. iii. pl. 25, and Champ. gram. 404 and dict. 306). A second form  occurs under the . . . dynasty (Champ. dict. 252).

 flyflap; "satō" or "satō" fan for raising a breeze; "satōthë" dirt, rabble; "satōunōs" to send forth; "satōt" at once, forthwith. — The character occurs under the . . . dynasty (Champ. dict. 318).

 "shahsë" or "shahsi" or "shōhsë" or "shhōs" gazelle; "sōunrōuhë" the evening star, (the star Capella or Little goat, ms. Par.); "sa" or "sai" or "saië" beauty, grace; "saië" or "saiōou" beautiful, graceful; "sait" or "sōit" renown; "saëit" or "sōit" or

"sōcit" or "dsōcit" illustrious; "sētsōt" or "sdēlli" to shine forth; "sētē-vrēj" lightning. — The character occurs under the . . . dynasty (Champ. dict. 126, 261).

The *gazelle*, *Antilopa*, is known to be frequent in Egypt, along the initial portion of the Desert, sometimes at night venturing upon the river-flat; — is called at present "gazel," and according to Clot-Bey ii. 61 multiplies in the semi-domestic state; was observed in court-yards by myself.

 "sōkmaji" a long table; "tōts" conclave; "sēōuh" or "sēuh" or "sōuk" or "sōōuh" or "sōōuh" to assemble; "sōōuh" or "sōōuhs" assembly; "sōki" to collect; "satēm" or "sētēm" or "sētm" or "sōtēm" or "shi-smē" to hear; "smē" or "smai" rumours, clamour; "smēt" obedient; "sōtēm" or "sōtm" obedience, to obey; "sōshni" consultation, counsellor; "sahō" or "sōhē" or "sōhi" or "sōōhē" or "sōōuhē" to argue, reprove; — in Latin "sessio," in English "session." The character occurs under the Third dynasty (Leps. d. ii. pl. 3). A possible modification occurs  under the Fifth dynasty, also in the Book of the Dead (Leps. k. pl. 5, pap. Sams 15, Buns. and Birch).

 string of beads; "hōs" or "hōs" necklace; "sōn" or "sōn" brother; "snēu" or "snēōu" brothers; "sōni" or "sōni" or "sōnh" sister; "sōnn-tshōu-snau" relative, cousin; "snaf" or "snōf" or "snōōf" or "snav" or "snōv" blood; "sēnh" or "sōnh" or "sanah" or "sōnh" bound, tied together; "snauh" or "snēuah" chain, bond. — The character occurs under the . . . dynasty (tomb at Memphis, Bonomi).

 "sai" or "sōi" rafter or beam; "sōi" or "sōi" or "shisi" back; "sōuēt" or "sōuthōn" straight, upright; — in Hebrew the fifteenth letter "smk" signifying prop, to sustain: in Greek the eighteenth letter "sigma" sometimes signifying table, "sagma" load of a beast of burden. The character occurs on the Gliddon mummy-case and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 5 to 67). The implement represented is the back of a jar-stand; as appears from the following hieroglyphic character  which occurs under the . . . dynasty (Champ. dict. 285). The form  of the Phoenician letter "smk" may also be compared.

 "sōr" collections or contributions; "sōr ēvōl" or "sōr ēvōl" or "sōōr ēvōl" or "sēr ēvōl" to distribute; "sasa nim" or "sasē nim" on all sides, all around; "sōōuvēn" or "sim" or "smēh" herbs, fodder; "sma" or "smah" clusters, grapes; "sahni" supply; "sōmk" to suck; "sat" or "sēt" or "sitē" or "sid" to sow; "sid" seed; — in Greek "spēirō," in Latin "sero" and "semino," in English "to sow"; in Greek "spērma" and "spōrōs," in Latin "semen," in English "seed." The character occurs from the Fourth dynasty to the Roman conquest (Leps. d. ii. pl. 98, and k. pl. 5 to 59).

 "sili" hole in the shuttle from which the thread is drawn out; "sēōuk" or "sōk" traction, to draw, draw out or protract; "sad" to spin; "sankap" or "sōgi" weaver; "sōhi" or "saht" woven work. — The character occurs under the . . . dynasty, and continues in use (Rosellin. mon. cul. li. 4. 12, and lxxvii. 10).

 "sah" or "sahf" an auger; "sōuōtēn" to perforate; — in English, the figurative expression "to bore." The character occurs in the Book of the Dead and from the . . . dynasty to the Twenty-sixth (sarcoph. queen of Amasis, Buns. and Birch).

 (eel "ēghēlun" signifying hostile to everybody, Horap. ii. 98); "salouki" eel; "fōukasi" eel or "muræna"; "hēllōs" enemy; "at-sēmni" enemy of peace; "sankots" perverse; "sōhi" or "sōhi" crimination, censure, refutation; "sēuhi" or "sahōu" or "sahōui" imprecation; "s-hōur" or "s-hōuēr" or "s-hōuōr" to curse; "s-hōuōrt" or "s-hōuōrt" cursed; "sōtsh" or "sōtsh" or "sōtshn" to revile, treat contemptuously. — The character occurs under the . . . dynasty (Leemans xiv. 55. 9).

"tshōōs" or "tshōs" or "tshōtsh" or ("sōs" of Manetho in Jos. c. A. i. 14) shepherd; "sart" or "sōrt" wool; "sa" region, part; "sa" towards, to, from; "sap" or "sēp" or "sōp" or "sōōp" by turns; "sōp" rebellious; — in vulgar English "into your wool." The Asiatic foreigner, dwelling in or beyond the Sinai peninsula,  is figured under the Third-dynasty (Leps. d. ii. pl. 2), and, as a hieroglyphic character as  early at least as the Twelfth (Leps. d. ii. pl. 131).

"sad" or "sōtē" or "sōōtē" arrow; "sēt" or "sōt" to redeem, ransom; "sōd" or "sōtē" redemption, price of redemption; "sōtt" appalled, fear. — The character occurs under the . . . dynasty (Champ. gram. 76).

 (crocodile signifying pillager, or furious, or having numerous offspring, Horap. i. 64); "msah" or "ēmsah" or "ēmsōōh" or "sōhi" or "sōuhi" crocodile; "sōōuhi" egg; "sani" or "sōni" or "sōōnē" robber; "sōni" or "sinōōui" robbers; "sura" or "sēra" to drag away, to take by violence; "sihi" insanity; "sihē" to be insane, furious; "svētē" or "sphid" foam, to foam; "salēs" or "sōj" or "sōsh" insane, foolish; — in Greek "surō" to drag along. The character occurs in the Book of the Dead and from the Twelfth dynasty to the end of hieroglyphic writing (Leps. k. pl. 13 to 65). To the present day the crocodile is called "temsah" in Egypt (Clot-Bey ii. 92), or as pronounced by my Nubian attendant "tūmsah."

"sarh" or "sērḥ" or "sēhr" to brush, sweep; "sat" or "sēt" tail; "sēpē" celerity; "aas" slap; "aas" dishonour; — in Greek "sairō" or "sarōō" to sweep, "sarōs" broom; in Latin "sario" to weed, hoe, harrow. The character occurs under the Third dynasty (Leps. d. ii. pl. 5). A second form occurs under the Fourth dynasty (Leps. d. ii. pl. 22 and 97). A third form occurs also under the Fourth dynasty (Leps. d. ii. pl. 23, and k. pl. 7).

th hard, the Greek theta, its pervading meaning through.

⊖ bird-trap closed; "ēgthai" or "gthai" or "gath" or "gathai" or "hath" or "hthai" thick, thickness, fat; — in Hebrew the ninth letter "thyd," by some regarded as meaning rolled together, "thwē" to roll together or envelope; in Greek the eighth letter "thēta" denoting nine; in English "thick." The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 19, 98, and k. pl. 6 to 56): and seems the origin of the later form Θ of the Greek letter "thēta."

bird-trap taken from the ground and carried away (compare Amos iii. 5): "athah" or "hiathah" burden, carrying a burden: — in English "thin." The character occurs in the Book of the Dead xviii. 21.

(eagle with crooked beak signifying old and perishing of hunger; the beak becoming crooked in old age until the bird dies of hunger, Horap. ii. 91); "ēthvē" on account of; "at" or "ath" without; "ath-ōuōm" fasting; "thōhthēh" necessity; — in Hebrew "thwd" fasting, "thwsh" to dart upon prey. The character occurs as early as the "Sixth" dynasty (Leps. k. pl. 6 to 35).

"thōt" to think, be of opinion; "thōt-het" to be confident, consoled; "thnō" or "thnōō" to pound, "thnēu" or "thnnēu" triturated, trite; "athēr" hammer, "athēr" hammer for breaking stone; "tharmi" mallet or club; — in English "To cudgel one's brains." The character occurs from the Fourth dynasty to the Twentieth (Leps. d. ii. pl. 2, iii. pl. 61, 204, 239, and Champ. gram. 103).

"theōu" wind; "thōu-rēs" South wind; "nthē" oration, discourse; — in Greek "thēōria" in English "theory." The character occurs as early as the . . . dynasty (tablet Brit. mus. 574, Buns. and Birch).

"thrans" or "thrap" awl, shoemaker's awl; "tshtēōut" pricking or puncture, hindered; — "thēkthōk" marking with points or tattooing; in English "thorn." The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 20). The modification occurs also under the Fourth dynasty (Leps. d. ii. pl. 27, 22).

"mntōp" or "man-thōrp" needle; "thērp" or "thōrp" to sew, sew together; "tshtōd" "tshtōt" thread; "thōd" little cords, fringe. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 8). A second form occurs under the . . . dynasty (Rosellin. mon. lxiv. 4).

"thmē" or "thōm" mat; "thōm" wicker carpet or covering; "thōm" or "thōm" in closure or wall; "thvō" garment, covering; "tshtēh" tunic; "thōuraji" sacred cloak. — The character occurs under the Third dynasty (Leps. d. ii. pl. 3). A possible modification occurs under the Twelfth dynasty (Burton excerpt. hierogl. 26, Champ. dict. 25 and 274, and Leps. d. ii. pl. 131).

(mouse "mun" signifying disappearance and destruction; for the animal corrodes, pollutes, and renders everything useless, Horap. i. 47); "thoolē" or "tholē" or "hoōlē" or "hōlē" or "hōli" cloth-moth; "thōlēv" stain, pollution, to be defiled; "sōs" to subvert "sōs" to destroy; — in Hebrew "ss," in Greek "ses" cloth-moth. The character occurs as early as the . . . dynasty (Champ. dict. 185 and 186, Rosell. m. civ. 77, and sarc. Brit. mus.).

One or more species of *cloth-moth* therefore known in Egypt at the time of the invention of writing. — In Palestine, the "ish" is mentioned in Psalm xxxix. 11, Hosea v. 12; and garments eaten by the "ish," in Job xiii. 28, and Isaiah li. 8: the "ss" is distinguished and separately mentioned in Isaiah li. 8; and the name is continued in the Greek "sēs," mentioned in Matthew vi. 19, Luke xii. 33, and as eating garments, in James v. 2. In Greece, the "ses" that eats garments" is mentioned by Aristotle, Theophrastus, and Menander; and in Italy, the "tinea" is mentioned by Plautus cistell. i. 73, and Pliny xi. 41 and xxvii. 28. Three species of cloth-moth are distinguished by naturalists, *Tinea tapetzella*, *T. pelionella*, and *T. sarcitella* (J. F. D. in Kitt. cycl. bibl.). By European colonists, one of these was carried to Northeast America, where it has extensively multiplied.

"thōk" or "thōk" razor; "thē" like unto, "thu" as; "thēt-hēt" or "thēthet" to argue, persuade; "thērtshō" to argue, blame; "thōm" to be sharpened, hardened, blinded; "thnē" or "thnō" to hire, "thnō" wages. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 15).

(shark or dogfish or *Silurus* "ēnuthrōn galēōn" signifying insatiable, disgorging and swallowing again, Horap. ii. 104); "thagi" or "thigi" drunkenness; — in English "to drink like a fish." The character occurs from the Twenty-third to the Twenty-sixth dynasty (Leps. d. iii.

pl. 259). A possible modification  occurs from the Nineteenth dynasty to the Twenty-second (Leps. d. iii. pl. 123, 254, and Rosellin. mon. stor. iii. p. 263).

In regard to Horapollo's statement, that the "ēnuthrōn galēōn" produces young from its mouth, some of the Siluridæ are known to carry their ova within the cavity of the mouth.

 "anthōus" house lizard or gecko; "thōi thōi" variegated, spotted; "thōi" black mark on the face; "thōi" or "thōi" freckle or natural blemish; "thōuthōu" to be warty, infested with warts; "tshthōuit" calumny, false accusation; "thav" leaven; "thōh" to mix, "thōt" mixed; "thēt" or "thōt" mixture; "thōōu" heap; — in Hebrew "thv" calumny, "thlwa" spotted, "lthaē" house lizard; in English "thatch." The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 3, and k. pl. 27 to 57).

The house lizard or gecko is well known in Egypt. — The "lthaē" is mentioned in Leviticus xi. 30; and the "shmyd" that "taketh hold with her hands and is in kings' palaces" (Prov. xxx. 28), translated "kalavōtēs" in the Septuagint, is admitted to be the house lizard. Farther North, the "skalavōtēs" or "askalavōtēs" is mentioned by Aristophanes nub. 170, and Aristotle animal. ix. 29 as inhabiting Greece: the "stellio" by Pliny viii. 49 and xxx. 27 as inhabiting Italy and Sicily, imported besides in the prepared state for medicinal use.

 "tshthēh" street; "thō" throng, multitude, all the world; "tshtham" obstruction; "thōuēt" or "thōuēt" or "thōuēt" or "thōūd" to congregate; "thōh" or "thōh" or "thōg" or "thōg" or "thēgthōg" or "thēgthōg" to disturb, make disturbance; "thōōu" or "thō" an evil, great evil; "thōtē" fear; "sthērtēr" tremor, to tremble; "sthērtēr" or "thrtshō" to terrify; "ēthautsh" Ethiopia, "ēthōtsh" or "ēthōtsh" Ethiopian. — in Greek "aithiops," in Latin "aethiops," in English *Ethiopian*. The character occurs in the Book of the Dead vii. 15. The "ōnōkēntaurōs" of the Greeks, may also be compared.

 (armed man shooting arrows signifying a tumult, Horap. ii. 11); "sōthnēf" a bowshot; "tshthōrtēr" or "tshthērtshōr" tumult, sedition, to trouble, disturb; "thēd" to rebel; "tha-tēu" or "hatēu" or "sara-thēōu" tempest, storm; "thi" or "thiō" or "thiēu" to overthrow, cause to fall. — The character occurs from the Fourth dynasty to the Ptolemies (Leps. d. ii. pl. 19, and k. pl. 6 to 58).

Arundo donax of Arabia. Called in English *reed* or *cane*, in French "roseau" or "canne" (Nugent), in German "pfeilrohr" (Fraas) or "pfahlrohr," in Italy "canna montana" or "canna domestica" (Lenz), in Greece "kalamōs" (Sibth.), in Egypt and Yemen "kasab" (Forsk., and Del.), and probably furnishing the arrows in use at the time of the invention of writing: — Nubian archers with arrows are figured at Gizeh under the Fourth dynasty (Leps. d. ii. pl. 19); somewhat later, arrows of both Nubians and Egyptians are marked at intervals like joints (Rosellin. ii. pl. 117 and 118), and there is no evidence of subsequent change in the material; the arrows too of the Asiatic strangers at Benihassan under the Twelfth dynasty seem also from the reed: the Eastern world to the days of Pliny was governed by the arrow, rain and windy weather interfering with battles and sometimes compelling peace, the plant being extensively cultivated in Egypt; arrows continued in use as late as the visit of Baumgarten i. 6, but change in the mode of warfare leading to neglect of cultivation the reed became rare, was seen however by Forskal p. 24 in ditches at Rosetta: by Delile, planted for garden hedges. Farther North, the "thōnax" or reed-arrow is mentioned by Homer il. xi. 583; the "kalamōs" producing arrows, by Theophrastus, and Dioscorides; the "arundinetum," by Cato vi. 3, and Columella, and the superior quality of the "calamus" arrows grown in Italy, by Pliny xvi. 65: A. donax is described by C. Bauhin theat. pl. 271, is termed "a. sativa quae donax Dioscoridis" by Tournefort inst. 526; was observed by Forskal, Sibthorp, Chaubard, and Fraas, under cultivation, as well as seemingly wild in wet situations from the Peloponnesus to the Dardanelles; by Lenz, cultivated and seemingly wild in Italy; by Forskal, near Marseilles; is known to occur also in Carniolia and Barbary (Pers.); and judging from importations, is largely cultivated at present for fishing-rods. Southward from Egypt, was observed by Forskal in inundated places and along streams in Yemen, its probable place of origin.

 "thōōui" or "tōōuē" slippers; "thivs" heel; "thōls" to trample; "t-hēmō" or "t-hmō" or "thmō" or "hēmō" to oppress, tyrannize; "sthētōn" oppressor; "thaēu" or "thaiēu" or "taēiēu" or "taiēiēu" or "taie" or "taiēu" or "taiēout" illustrious, honourable, most honourable; "taiēiē" or "taauē" or "taia" or "taiē" or "taiō" honour, praise, to honour; "thlōm" or "thlōm" furrow, trench. — The character occurs from the Fourth dynasty to the Tenth, sometimes only one slipper represented (Leps. d. ii. pl. 98, 150, 148, and Champ. dict. 288).

 "thēvi" sharp stake or grave-stone; "thulōs" column; "thōuōd" pillar or stela; "thax" or "thōux" or "thōks" or "tōks" to drive in or infix; "thōums" or "thōms" or "thōms" to bury; "thal" or "thēl" hill, mound; "thva" mound or tomb. — The character occurs from the Third dynasty and the Book of the Dead to the end of hieroglyphic writing, usually in the horizontal position (Leps. d. ii. pl. 2, and k. pl. 10 to 66).

"thmai" or "thmaiō" or "thmēi" justification, to justify, just and true; "thahs" or "thōhs" unction, to anoint; "thlē" or "thlēi" or "thōstēf" to distil by drops. — The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 5, iv. pl. 36, and k. pl. 5 and 7).

"tshthōm" or "thaēit" or "haēit" porch, gate, door; "thōuai" or "thvai" threshold, cell; "hthēs" or "thōus" top; "thaē" end; — in Hebrew the fourth letter "thld" meaning gate or door. The character occurs under the . . . dynasty (sepulchr. tablet Brit. mus., Buns. and Birch). ps, its pervading meaning to lapse.

"shaps" shoulder-blade or shoulders; "haps" of necessity, it must needs be; "shatps" failing, maim. — The character occurs in the Book of the Dead, also under the . . . dynasty (Buns. and Birch). The substitution of the ram  occurs in the Book of the Dead, and from the Seventeenth dynasty to the Ptolemies (Leps. k. pl. 25 to 36 and 57).

The *dorcas antelope* is besides figured entire as a hieroglyphic character — (Champ. dict. 126); and the living animal may probably inhabit Egypt on its borders.

(*Octopus* "pōlupōtha" signifying having consumed the sustenance of others and his own; for in the absence of other food the animal eats its own arms, Horap. ii. 106); "ships" wrinkles of the brow, extremity of the skin of the eyes and ears; "laps" any one; "shilapsi" or "lapsi" to bite; "lapsi" or "lēpsē" morsels; — in colloquial English "crow-feet." The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 18, and k. pl. 5 to 58).

sledge: "aps" number, "daps" to number; "psit" or "psis" nine; "jp-psitē" the ninth hour. — The character occurs from the Fourth dynasty and the Book of the Dead to the Twenty-fifth dynasty (Leps. d. ii. pl. 98, and k. pl. 24 to 47).

(crocodile incurved signifying going down, Horap. i. 66); "psanē" waves; "saps" or "sēps" or "sōps" supplication, prayer. — The character occurs in the Book of the Dead, and from the . . . dynasty to the end of hieroglyphic writing (Champ. gram. 74 and dict. 176, Rosellin. mon. stor. ii. 25, 7, and titles of Vespasian, Buns. and Birch).

u long or ū, in Greek ōu, its pervading meaning a truce. (moon with its horns turned upward in the beginning and first half of the month, Horap. i. 4); "ōutē" between; "ōuōtsh" interval; "aōuō" covenant. — The character occurs under the . . . dynasty (Sharpe pl. 16, Buns. and Birch). A second form  occurs under the Twentieth dynasty (Leps. d. iii. pl. 227).

(bull tied with wild fig signifying made wise by misfortune, Horap. ii. 73); "ōuēm-hēt" or "ōuōm-hēt" to chew one's heart, repent; "sat-ōuēm" or "sathmi" rumination, "sathmi" to ruminate. — The character occurs under the . . . dynasty (tablet biblioth. Paris, Buns. and Birch).

(eagle carrying a stone signifying safely dwelling in town; for the bird carries a stone to its nest, rendering it more stable, Horap. ii. 46): "ōuēhsōi" or "ōuahsōi" roof; "ōuahmi" or "ōuahmē" upper chamber, floor or story; "vōuka" city; "ouēh" or "ouēh" or "ōuōh" or "ōuōh" to sojourn, dwell; "phōōui" or "ētpō" or "ōuētpō" burden, "aōuin" ship's lading; "ōuaji" or "ōuōj" or "ōuōj" safe; "ōujai" safety. — The character occurs as early as the . . . dynasty (Champ. gram. 111). A second form  occurs under the Eighteenth dynasty (Luxor obelisk, Champ. mon. iv. pl. 320).

(quail's bone "ōrtugōs ōstēōn" signifying permanence and security, the bone of this animal being insensible to pain, Horap. ii. 9); "mōun" to bear patiently, endure; "mōun-evōl" to continue, permanence; "mētōuvēh" baldness. — The character occurs under the Third dynasty and perhaps the same under the Fourth (Leps. d. ii. pl. 3 and 17).

(scarus "skarōn" signifying gluttonous; being the only kind of fish that ruminates, devouring all small fishes that come in its way, Horap. ii. 103); "ōuisi" to swell; "ōualē" to increase; "ōuētshsi" breadth, "ōuōtshs" breadth, big fish; "ōuōmt" fat; "ōuam" or "ōuēm" or "ōuōm" to eat; "ōōushōuēsh" to chew; "ōuēm-mētsh" voracious, eating many; "rēf-ōuōm" glutton; "ouōōlē" or "ōusia" riches; "nōuf" or "nōuv" gold. — The character occurs from the Fourth dynasty and the Book of the Dead to the Eighteenth dynasty (Leps. d. ii. pl. 28, iii. 32, and papyri, Buns. and Birch).

The *scarus* of the ancients has been identified, and is known to inhabit the Eastern portion of the Mediterranean. — The account of the "skarōn" ruminating, is also given by Aristotle, and Pliny ix. 29; and the latter states, that the living fish was successfully introduced along the Italian coast by Optatus Elipertius in the reign of Tiberius Claudius.

"sōusōu" moment; "ōunōu" or "ēunōu" hour; "ōunōōuē" or "ōunōōui" hours; "rōuhē" or "rōuhi" evening; "ōutshē" or "ōuōtshē" or "ēutshē" night; "haōu" or "hōōu" or "ēhōōu" day. — The character occurs in the Book of the Dead v. 15, 29, and lxv. 146.

(moon with its horns turned downward signifying month, Horap. i. 4 and 63); "ōōu" or "ōōh" or "iōh" moon; "sōua" or "sōuai" new moon or month. — The character occurs from the beginning of the Seventeenth dynasty to the Persian conquest (Leps. k. pl. 23 to 49).

 (a woman or Isis signifying year; Isis being the dog-star, by the Egyptians called "sôthis," Horap. i. 3); "sôu" or "siôu" star; "siôd" or "shiôd" or "soun-hôôr" the dog-star or Sirius; "siôth" or "sôthis" dog; "rômpi" or "rômpê" year, "rmpôouë" years; — compare also the name of the city of "Siôut" or "Siôout" or "Siôouth" or "Siôout," to the present day called Siût, but by the Greeks (Strab. xvii. 1. 40) translated "Lukôpôlis." The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 44 to 64). A second form  occurs from the Seventh dynasty to the Ptolemies (Leps. k. pl. 6 to 54).

 ("kôukôupha" hoopoe, and hoopoe-headed sceptre, signifying gratitude, the bird alone among animals taking care of its parents in their old age, Horap. i. 52); "kôukôuphat" hoopoe; "hmat" or "hmôt" or "tênhout" grace, favour; "ôurôt" to give thanks. — The character occurs on the Gliddon mummy-case and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 25 to 61). A staff agreeing with the above figure, was found by myself on the pilgrim route near Suez; and on being shown at Mocha, was recognized as of the pattern in vogue in Western Arabia.

The *hoopoe*, *Upupa epops*, was observed by myself frequent in Egypt; at least during the winter season.

 (stag's horn signifying long-lived; for the animal renews its horns yearly, Horap. ii. 20); "ëiôul" or "ëiëiôul" or "ëiôul" stag; "taiôu" fifty; "pëstaiôu" or "pstaiôu" or "stau" ninety; "nôutf" to be reconciled. — The character occurs under the Third dynasty (Leps. d. ii. pl. 5).

The *stag*, *Cervus elaphus*, known therefore to the Egyptians at the time of the invention of writing: — apart from hieroglyphic writing, the stag is figured under the Twelfth dynasty at Benihasan in hunting scenes belonging perhaps to a more Northern climate, for according to Pliny viii. 51, Africa does not produce stags: this or an allied species is however known to inhabit Barbary; and Wilkinson anc. Eg. iii. p. 23 was informed, that stags are sometimes seen near the Natron Lakes in Egypt. In Palestine, the "ayl" is mentioned in Deut. xii. 15, xiv. 5, Psalm xlii. 1, Cant. ii. 9 and 17, Isai. xxxv. 6; and the "aylê" or female, in Gen. xlix. 21, 2 Sam. xxii. 34, and Cant. ii. 7. In Greece, the "ëlaphôs" is mentioned by Homer il. i. 225, Sophocles aj. 178, Euripides iph. t. 1114, and Xenophon anab. i. 5. 2; and according to Pliny viii. 50, "cervi" sometimes swim in companies from Cilicia in Asia Minor to Cyprus. As inhabiting Italy, the "cervus" is besides mentioned by Ovid; the "cerva aeripes," by Virgil; and the "cerva silvicultrix," by Catullus. Farther North, the stag abounded in Switzerland during the Stone period; as appears from debris of the earliest villages (Heer, in Troyon p. 270).

 (cobra with the tail covered by the remainder of the body, by the Greeks called "vasiliskôn," by the Egyptians "ôuvaion," signifying an age or lifetime "aiôna," Horap. i. 1); "ôviôn" serpent; "ôurô" or "rrô" king; "ôuaëitsh" or "ôuaïtsh" or "ôuôëitsh" or "ëuôëitsh" or "sëu" or "sëou" time, period of time; "môuh" to fill, "si" or "sëou" or "sëu" filled; "nôuôshë" bounds; "nôu" to expect; "nôu" now; — in Latin "aevum" an age or lifetime. The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 62).

shgh (shibboleth of Judges xii. 6), its pervading meaning harvest.

 "ôsg" or "ôgs" or "ôhs" or "ôsg" sickle, harvesting; "shaiôsg" reapers; "ëhs-kam" to cut reeds; "sëhsms" to collect spikes of grain; "ôuôitsh" fissure or cleft. — The character occurs from the Third dynasty to the Greek conquest (Leps. d. ii. pl. 2, and k. pl. 5 to 50).

 "gëms" or "gëms" ear of corn; "hëms" ripe standing wheat; "sôuô" wheat; "ôsg" or "ôsh" or "ôhs" or "ôhs" harvest; — the sound shgh is preserved in Egypt, being the only sound that the camel will obey, and therefore learned by camel-drivers; traces may also be found in the Hebrew "shbld" spike of grain; and in English, in the manner in which some persons pronounce "shkat!". The character occurs as early at least as the Eighteenth dynasty, and continues in use (Leps. d. iii. pl. 97, and Champ. dict. 228 and gram. 370).

Triticum turgidum of the East Mediterranean countries. *Downy wheat* is distinguished in Egypt and called "qamh a'rabî" or "qamh sebaqeh" the strongest (Del.), and may prove the kind cultivated at the time of the invention of writing: — standing crops of bearded wheat are figured under the Fourth dynasty at Gizeh (Leps. d. ii. pl. 9), but nowhere on these nor on subsequent monuments with the minute accuracy required for distinguishing species: the "qmh" is mentioned in the history of Abraham (Gen. xviii. 6), and in the legislation of Moses (Numb. v. 15): the "olura" in the days of Herodotus was the favourite food of the Egyptians, is mentioned besides by Homer il. v. 196, and Dioscorides as cultivated among the Greeks, by Pliny xviii. 19 as confined to Greece, Asia Minor, Syria, and Egypt: seeds unrolled in mummies were recognized by Decandolle phys. veg. 694 as those of *T. turgidum*; the living plant was observed by Forskal, and Delile, abundantly cultivated in Egypt; by Bory, under cultivation in the Peloponnesus; according to Koch, occurs at Constantinople, Trebizonde, and in the Tschoruk country; but appears to have continued unknown in and

beyond Hindustan. Westward from Egypt, according to Loiseleur-Deslongchamps cereal. p. 75, was cultivated in the days of Pliny at Rome (A. Dec.); is termed "t. spica villosa quadrata brevior et turgidior" by Morison viii. pl. i. f. 14, and seems well known in France and middle Europe (Linn., and Pers.). By European colonists, was carried to America, but to what extent it may be cultivated I am not aware; I remarked spikes intermixed with other kinds of wheat distributed in Oregon. (See T. vulgare).

(crocodile's tail signifying "skôtōs" darkness, the shades of death; the animal having power chiefly in the tail, with which it kills its prey, Horap. i. 67); "stshnē" or "ōutshsnē" or "ōutshshnē" suddenly; "stsh" or "tshsha" or "tshjap" stroke, "tshshōtf" to strike or crush in; "shshōr" smoke; "shōrh" nocturnal, "shōrah" night; "shōmshēm" or "shōmshm" or "shōsm" darkness, the shades of death; "tshshē" to wipe away, abolish; "sshrēht" or "sshraht" or "sjrēht" rest, silence; — "ōshs" to cover with pitch; in Hebrew "shhwr" or "shhr" black, "shhr" dawn. The character occurs as early at least as the . . . dynasty (Champ. gram. 120 and dict. 75).

o guttural or ōr or aw, the Greek "omēga," its pervading meaning awe.

(lion's head signifying awe "phōvéron," Horap. i. 20); "au" were, mark of past time; "nōrj" or "hōur" terror, horror; "hōur" to be terrified. — The character occurs from the Eleventh dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 150, iii. pl. 132, and k. pl. 23 to 63). The form Ω of the Greek letter "omēga" may be compared with a front view of the lion's head.

(black pigeon "pēristēran" signifying widow; solitary crow "kōrōnē" presaging widowhood, Horap. ii. 30 and i. 8); "ōrv" or "ōrév" or "ōrēv" to close, shut up; "ōrj" closed; "mauaat" or "mmauat" alone; "alhōria" solitary bird; — in Hebrew "orv," in Sanscrit "karawa," in Greek "kōrax" and "kōrōnē," in Latin "corvus" and "cornix," in French "corbeau" and "corneille," in English "crow." The character occurs from the Third dynasty to the Ptolemies (Leps. d. ii. pl. 3, and k. pl. 5 to 52).

The hieroglyphic character is clearly *Ibis cristata*; a Madagascar bird, so far as known, not inhabiting the countries on the Nile.

"auhē" to be conquered; "ōms" falling headlong, to descend into the depths; — in English "fall." The character occurs from the Seventeenth dynasty to the Nineteenth (Leps. d. iii. pl. 5 to 165, k. pl. 32, papyri Brit. mus., Buns. and Birch).

"aulē" hall; "auēt" dwelling; "au" or "auis" or "auēis" to reach; "hau ēvōl" to reveal; — in Hebrew "awlm," in Greek "aulē," in Latin "aula," in English "hall." The character occurs in the Book of the Dead 50 a 48. 35. c.

(serpent watching or keeper of the world, signifying watchful king, Horap. i. 57); "ōrf" to guard, keep; "aurēj" end. — The character occurs in the Book of the Dead, and from the Twentieth dynasty to the end of hieroglyphic writing (Buns. and Birch, and Leps. d. iii. pl. 226, and k. pl. 61 to 67).

ūr or ūm, humming, the sound uttered with closed lips or the musical element of the voice, its pervading meaning knowledge; the interjection "hem!" or "humph!" or "mum!"

(owl "nuktikōrax" signifying death: for the bird attacks nestlings unexpectedly in the night, as death comes unexpectedly, Horap. ii. 24); "vōm" or "vōn" or "mōulaj" or "mōulōuj" nycticorax or owl; "krmr̄m" or "krmrēm" or "hrēm̄rēm" murmuring; "mōuōut" or "mōōut" or "mōōut" to kill, to die; "maout" dead; "mōu" death; "ēmi" knowledge; — in Hebrew "ēmē" murmuring or humming; further, in Hebrew "myd," in Sanscrit "mid" and "medh" and "meth" and "mith" and "math" and "muth" and "mri," in Zend "mrete," in Pehlevi "murdeh," in Malay "mita," in Spanish "mata," in Greek "mortōs," in Latin "mors," in German "mord," in French "mort," in English "mortal" and "murder;" also the owl regarded among the Greeks as the "bird of wisdom." The character occurs on the Gliddon mummy-case and from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 3, and k. pl. 5 to 62).

The species selected, as appears from coloured figures on the Gliddon mummy-case, and from the outline figure under the Third dynasty (Leps. d. ii. pl. 3) is the *barn owl*, *Strix flammea*; — a bird known to inhabit Egypt, as well as Europe, Asia, and North America.

(soul "psuhēn" long delaying in this life, represented by the phoenix bird, Horap. i. 32); "psuhē" life, soul; — in Hebrew "nshmh" soul. The character occurs as early as the Fourth dynasty (Leps. ii. pl. 96); is further traceable in the Phœnician alphabet; and the butterfly is well known to have been a symbol of the soul among the Greeks.

Various species of *butterfly* are known to inhabit Egypt — (Clot-Bey ii. 90): and apart from hieroglyphic writing, one or more apparently exotic species are figured under the Twelfth dynasty at Benihasan.

(phœnix signifying returning home after long journeying, Horap. i. 33: also renewal after a long interval, the dead phœnix being buried by the Egyptian priests, Horap. ii. 54); "thēms" or "thōms" or "thōms" or "tamēs" or "tēms" or "toms" or "tōms" to bury; "thēmīō"

dust; "kērmī" or "kērmēs" or "krmēs" ashes; "ōmē" or "ōmī" mud or clay. — The character occurs as early as the Fifth dynasty (Leps. d. ii. pl. 43, Champ. gram. 76, and Sharpe pl. 12).

 "mōuki" or "ōumōuki" granary. — The character occurs in the Book of the Dead xlvii. 125, also under the . . . dynasty (papyr., and Buns. and Birch).

 d, in Greek "nt," its pervading meaning end.

 panegyry-festival; "dēau" or "dēōū" or "dōū" or "dlōulai" or "dsōū" or "dsōit" or "dtaīō" to praise, glorify; "ōūd" to rebuke. — The character occurs under the Third dynasty, and in modified forms continues to the Ptolemies (Leps. d. ii. pl. 6, k. pl. 60, Leemans 22, Buns. and Birch).

 (hyæna skin signifying intrepid until death, Horap. ii. 68); "hōid" hyæna; "dōui" or "dōuōēi" or "dōuōi" or "d-ōuōi" to advance, make a stand; "d-ējēn" or "d-ēhrēi" or "d-ēhrēn" or "d-ēgōun" or "dōuvē" (or "d-ouvē") to resist, carry on war; "d" contest. — The character occurs from the Fourth dynasty to the Eighteenth (Leps. d. ii. pl. 21, 61, and k. pl. 26). The combination

 occurs in the Book of the Dead, also under the . . . dynasty (Champ. gram. 379, 436, dict. 342, tab. Brit. mus., Buns. and Birch); and the modification  under the Roman conquest (Leps. k. pl. 60).

 "d" or "dd" or "taa" or "tēi" or "tō" giving, to give; "ēmhou" or "mhau" sepulchre or tomb; "d-mhau" interment; "thōuōd" pillar or stela; — in Hebrew "dnē," in Greek "thōma" and "thōsis" and "thithōd" and "thithōmi," in Latin "do" and "donum," in English "donation." The character occurs from the Third dynasty to the end of hieroglyphic writing (Leps. d. ii. pl. 5, and k. pl. 11 to 66). The gift above figured is clearly a piece of the money current in Egypt before or under the Third dynasty; in later modifications the gift is pointed and pyramidal in shape; and hence apparently the later pyramidal form Δ of the Greek letter "thēlta."

 "taktōn" inverted; — in Hebrew "dhd" underneath. The character occurs in the Book of the Dead, also under the . . . dynasty (Champ. gram. 369).

 "hōd" or "hōid" or "hōd" tribute; "d-hēmi" to give passage-money; "hōt" to navigate. — The character occurs as early as the Fourth dynasty (Leps. d. ii. pl. 104). A second form  occurs under the Seventeenth dynasty (Leps. d. iii. pl. 12 and 83).

 "ripid" sacred fan; "ēmēnt" or "ēmnt" the West; "amntē" or "amēnt" Hades (the place of departed spirits); "d-hap" to judge. — The character occurs on the Gliddon mummy-case and from the Fifth dynasty to the end of hieroglyphic writing (Leps. k. pl. 5 to 63). The combination

 occurs under the Fourth dynasty (Leps. d. ii. pl. 98, Champ dict. 255). The lower portion of this combination  occurs separately under the Third dynasty; and is surmounted by a hawk  under the  Fourth or Fifth (Leps. d. ii. pl. 3 and 82).

Hyphæne cucifera of Abyssinia. A branching palm called in Egypt and Yemen "doum" or "dom" (Forsk.); and flag-shaped fans plaited from its fronds, together with matting, brought down the Nile as early as the invention of writing: — the palm occurs at regular intervals in a garden figured under the Seventeenth or Eighteenth dynasty (Champ.-Figeac pl. 55); the "kōukiōphōrōn" is mentioned by Theophrastus i. 10 to iv. 2 as resembling the date-palm, but the trunk branching, the timber superior in quality, the fruit large enough to fill the hand and in part edible; Egyptian "kōk-kina" matting is enumerated by Strabo xvii. 2. 5; the "cuci," by Pliny xiii. 18 as resembling the date-palm, its fronds employed for plaited work; mats and bagging of fronds of *H. cucifera* according to Delile are made in Upper Egypt; and I witnessed the plaiting both of mats and flag-shaped fans at Mocha. In ascending the Nile, *H. cucifera* made its first appearance in Lat. 27° 25', and continued scattered on the river-flat clearly exotic to the end of my journey at the First cataract; beyond (according to Delile, and Greville), it grows on the Desert margin in Nubia as far as the border of Abyssinia, sheltering the development of thickets in some instances to the extent of rendering the soil fit for cultivation; an encampment at Atbara, the tents made of mats from its fronds, was visited by Burckhardt. Farther East, *H. cucifera* was observed by Forskal under cultivation along the base of the mountains of Yemen; and by myself, near Mocha, evidently planted. By European colonists, was carried to Hindustan in 1828, and again in 1837 (Graham).

 "nōit" or "nōēit" or "nōut" meal; "nōut" mill, to grind; "nōutēm" bountiful; "nōutē" or "nōud" God; — a word current in Egypt in the days of Joseph and written "nd" in Hebrew letters in Gen. xli. 45; compare also the Hebrew words "thhn" to grind, "thhnn" and "thhnē" hand mill, and the twenty-third and last letter "dw" meaning mark (Ezek. ix. 4 to 6). The character occurs on the Gliddon mummy-case and from the Third dynasty to the Roman conquest (Book of the Dead xlvii. 125. 29, Leps. d. ii. pl. 6, 10, and k. pl. 33 to 57); is the probable origin of an early form  of the Phœnician letter "dw;" and is identical with the form  of the same letter in later Phœnician, in Hebrew, Abyssinian, Etruscan, Umbrian, and Celtiberian. In fact, the form  of the Greek letter "tau," and of the same letter in Latin, Oscan, Celtiberian, and throughout Western Europe, seems only a modification (see the figures in Gesen. mon. Phœnic.).

Thôt's invention may have been at first communicated to but few individuals, serving as a means of gaining a living, — like the profession of a writer in Eastern countries to the present day.

3811 B. C. (= 3649 + "162 years" of Gen. v. 18, Sept. vers., Jos., Theoph., and Afr.), Jared.

The writings called the "Books of Thôt" were composed before the reign of Menes (Diodor., and Clem. Alex.). The inventor of writing may not have been himself an author, but the work named after him probably included some *præhistoric literature*: — for various nations unacquainted with the art of writing are found to possess annals, legends, and poetry, orally transmitted; in some instances by regularly appointed guardians.

Fifteenth generation. Jan. 1st, 3800, among living men :

The same year (= 3802 in calendar years = 3055 + "198 + 297 + 252" in the Euseb.-Maneth. table), a date possibly marking some event.

In Upper Egypt, the city of This already in existence, for Menes was born there. — Abydos, by some writers regarded identical, is mentioned as a distinct city on a coin of Hadrian, and by Stephanus Byzantinus; situated however in the same neighbourhood.

Potamogeton crispus of the Temperate portions of the Eastern continent. Called in Italy "potamogeto" (Targ., and Lenz), in which we recognize the "potamogeton" used in Egypt for protection in hunting crocodiles (Plin. xxvi. 33 and xxxii. 19) as early perhaps as this date: — *P. crispus* was observed by Delile in Lower Egypt, from Cairo to Rosetta. Farther North, was observed by Sibthorp, and Fraas, from Thessaly to Constantinople; is known to grow also along the Taurian mountains and as far in Siberia as the Angara (Bieb., and Gmel.). Westward, is termed "*p. foliis crispis sive lactuca ranarum*" by Tournefort inst. 233; is known to grow in Italy and throughout middle and Northern Europe as far as Sweden and Iceland (fl. Dan. pl. 927, Curt. Lond. v. pl. 15, and Hook.). Is known to grow also in the Southern Hemisphere, in Australia (Wats., and A. Dec.).

Potamogeton natans of Temperate climates. Called in Britain with other species *water spike* (Prior), in Italy "verniera" (Lenz), in Greece "nērōphulli" (Fraas); and possibly the "potamogeton" in question and Egyptian "ēthēgis" — of Syn. Diosc. . *P. natans* has not been found in Egypt, but was received by Fresenius from Abyssinia, was observed by Forskal in watery places among the mountains of Yemen, and is known to grow in Hindustan (A. Dec.). Farther North, the "pōtamōgēitōn" growing according to Dioscorides in pools and watery places, the leaf beet-like and incumbent or slightly eminent upon the water, is referred here by writers: *P. natans* is known to grow in Siberia (Wats.), and was observed by Sibthorp, Chaubard, and Fraas, in the rivers of Crete and the Peloponnesus. Westward, the "pōtamōgēitōn" or "stahuitōn" is identified in Syn. Diosc. with the "phōntilis" or "phlōuminalis" of the Romans, and Pliny's description of the "potamogeton" seems chiefly taken from Dioscorides: *P. natans* is described by Fuchsius p. 651; is termed "*p. rotundifolium*" by Tournefort inst. 233; is known to grow in Italy, Barbary, Madeira, the Azores, and throughout Europe as far as Lapland and Iceland (fl. Dan. pl. 1025, Hook., Desf., Lemann, and Wats.). Farther West, is known to grow from the Atlantic coast of North America to Arkansas (A. Gray, and Nutt), and to Norfolk Sound on the Pacific (Mert.). And in the Southern Hemisphere, in Chili, New Zealand, Tasmania, Australia, and Austral Africa (Gay, and A. Dec.).

Salix subserata of the Upper Nile. A *willow* called in Egypt "safsaf balledi" (Forsk.), in Egyptian "thōr" or "thōri" (transl. Sept., and Kirch.) and its timber "vō thōri" or "vō ntōré" — (ms. Borg.) clustering young shoots to all appearance indigenous were observed by myself on the river-brink near Shekh Saïd, in about Lat. 26° 20', and the species was recognized by my attendant as frequent in Dongola, his native country. Was observed by Forskal to be sensitive to cold "impatiens frigoris" no farther North than the gardens of Lower Egypt; where also it was seen by Delile.

III. THE KINGS OF THE EARTH, OR EARLY KINGS OF EGYPT.

3769 B. C. (= 3770 in calendar years = 2953 + 30 + "66 + 63 + 29 + 214 + 302 + 26 + 18 + 26 + 20 + 23" years in the Afr.-Maneth. table = 2498 + "203 + 448 + 198 + 297 + 252 - 60 - 27 - 39" years in the Euseb.-Maneth. table), the date assigned to the fourth king of Egypt, but probably marking the accession of the first king Menes. — "Sixty-two" years are assigned to his reign in the Afr.-Maneth. table, and by Eratosthenes; "sixty" in the Euseb.-Maneth. table; and he is mentioned by Herodotus, Josephus, and other Greek writers. No contemporaneous monuments are known; but his name occurs in genealogical tablets of later times, at Sakkarah, Thebes, and in the Turin papyrus; also on amulets.

The canal Bahr Yusuf (according to Wilkinson Theb. and Eg. p. 341) is also called "El Menhi" or "Menhee," apparently from Menēs: an instance of permanence in a proper name altogether unexampled. (Compare Herodot. ii. 99).

Mēnēs led an army beyond the frontier of Egypt, and "acquired renown:" — confirmation is

found in the hieroglyphic oval of his successor; one of the characters being clearly a national emblem or standard. It does not seem probable, that the first military campaigns extended any great distance beyond the Sinai peninsula.

Sixteenth generation. May 1st, 3767, among living men :

The founding of the city of Memphis is also attributed to Menes — (Herodot. i. 105) : and some confirmatory evidence will be remarked under the succeeding reign.

"3761, vernal equinox" (Nicolas, one mode of reckoning the birth of Jared corresponding very nearly, $3348 + "187 + 65 + 162 \text{ years}"$ of Gen. v. 18 to 25 and Josephus = 3762), the *Mundane era* of the Jews : their *civil era* beginning in the following October. — The *Mundane era* (according to Steinschneider ii. 10) is first mentioned by Sabbatai Donolo. The current reckoning corresponds ; the "Feast of the Passover" being celebrated in A. D. 1857 "on the evening of the 8th" of April, "which is the 15th day of the Jewish month Nisan, of their year 5617" (Boston newspaper), $+ 1 - 1857 = 3761$ B. C. (See Hillel Hanassi).

3741 B. C. (= 3742 in calendar years = 3715 + "27" = 3055 + "198 + 297 + 252 - 60" of the Euseb.-Maneth. table), Menes succeeded by his son Athōthis, second king of Egypt : — to whose reign "fifty-nine" years are assigned by Eratosthenes. No contemporaneous monuments are known : — but the hieroglyphic oval of king Athot occurs in the genealogical table in the Turin papyrus (Leps. k. pl. 5 and 9).

Seventeenth generation. Sept. 1st, 3734, among living men :

Athōthis built a "royal mansion" at Memphis (Maneth.) ; whether of wood, broken stone, or of *dobi* (sun-dried brick), we are not informed ; probably, of the last-named material. — The change in cottage-architecture to windowless dome-shaped mud huts, took place prior to the invention of the Phoenician alphabet (compare the letter "thld" or "dalēth"). A possible connexion may be found in the Hebrew name of Memphis "mph" (Hos. ix. 6), which seems the origin of "mapalia" (Lucan iv. 684, and Hieronym. prolog. at Amos.) the Roman name of these dome-shaped mud huts, built to the present day by the general population of Egypt.

King Athothis was of the medical profession, and wrote on *anatomy* — (Maneth.). Of the "Sacred Books" of the Egyptians known to Clemens Alexandrinus, "six" treated of *medicine*. And the Egyptian physicians continued in high repute in the time of Herodotus.

The healing art being practised, *traffic* by land was in existence for procuring *drugs* : — the drugs or medicines of Egypt. are pointedly alluded to by Homer ; and to the present day, Egypt continues in a good measure the centre of the drug trade.

The procuring of *perfumes* and valuable *gums*, would naturally fall into the hands of the same traders : — direct evidence of the importation of gums under the Tenth dynasty, is found in the lining of a mummy-case described by Birch (in Glidd. ot. Egypt. Lond. 1849).

The procuring of *gems*, may also have been included ; though these were derived in some instances from more distant countries : — different kinds of gems or precious stones are figured (according to Champollion-Figeac anc. Eg. 208) in Tribute-processions under the Eighteenth dynasty ; are also mentioned in the Hebrew Scriptures.

3714 B. C. (= 3715 in calendar years = 3684 + "31" of the Afr.-Maneth. table = 3055 + "198 + 297 + 252 - 60 - 27" of the Euseb.-Maneth. table), Athōthis succeeded by his son Kēnēnēs, third king of Egypt. In Eratosthenes' List, he is called "Athōthis II." with — "thirty-two" years assigned to his reign.

Eighteenth generation. Jan. 1st, 3700, among living men :

3683 B. C. (= 3684 in calendar years = 3661 + "23" of the Afr.-Maneth. table), Kēnēnēs succeeded by his son Ouēnēphēs, fourth king of Egypt.

"In the reign of Ouēnēphēs" (Maneth.), a famine.

Ouēnēphēs built pyramids at Kōhōmēn — (Maneth.) : and these pyramids appear to have continued a chronological landmark in after times. (The village of Lahoum, not far from the Labyrinth, presents at least some similarity in name).

According however to Mariette 76, the terraced pyramid at Sakkarah was built by Ouēnēphēs. It is nearly 394 feet square at base, by 196 feet high, has seven steps (like the Babylonian towers), is "constructed of calcareous stone and granite" without "the minute care and finish of the pyramids of the later dynasties," and "a sarcophagus and some other remains were discovered in it when opened" (Birch).

The hieroglyphic sign of the pyramid  probably not earlier than the reign of Ouēnēphēs : — it occurs under the Fourth dynasty, and continues in use under the Twelfth (Leps. d. ii. pl. 17, and k. pl. 5 to 12).

Nineteenth generation. May 1st, 3667, among living men :

3660 B. C. (= 3661 in calendar years = 3641 + "20" of both Maneth. tables), Ouënéphēs succeeded by his son Ousaphaithōs or Ousaphaēs, fifth king of Egypt. The name of king Hesep has been found on subsequent monuments, and "some religious and medical works are referred to the period of his reign" (Birch).

3649 B. C. (= 3584 + "65 years" of Gen. v. 21, and Josephus a. J. i. 3. 4.), Enoch.

3640 B. C. (= 3641 in calendar years = 3615 + "26" of both Maneth. tables), Ousaphaithōs succeeded by his son Miëvithōs or Niëvaēs, sixth king of Egypt. In Eratosthenes' list he is called "Thiavaēs" — with only "nineteen" years assigned to his reign. The name of king "Imhotep" occurs at Hamamat, also the names of two of his sons (Leps. d. ii. pl. 115 and k. pl. 6).

Twentieth generation. Sept. 1st, 3634, among living men :

3614 B. C. (= 3615 in calendar years = 3597 + "18" of both Maneth. tables), Miëvithōs succeeded by his son Sēmēmpsēs, seventh king of Egypt. In Eratosthenes' list, he is called "Pēmphōs" — with "eighteen" years assigned to his reign.

"In the reign of Sēmēmpsēs" (Maneth.), many signs or prodigies, and a great pestilence.

Twenty-first generation. Jan. 1st, 3600, among living men :

3596 B. C. (= 3597 in calendar years = 3571 + "26" of both Maneth. tables), Sēmēmpsēs succeeded by his son Viēnēhēs or Oviēnēhēs, eighth king of Egypt.

3584 B. C. (= 2615 + "969 years" of Gen. x. 27 = "187 + 182 + 600 years" of Gen. v. 25 to 28 and vi. 6), Methuselah.

3570 B. C. (= 3571 in calendar years = 3533 + "38" = 3055 + "214 + 302" of the Afr.-Maneth. table), Viēnēhēs succeeded by Vōēthōs or Vōhōs, head of a new dynasty; also a Thinite dynasty.

A tomb of the squared soft stone of Lower Egypt, discovered between Abusir and Saccara by Lepsius, is regarded as the oldest inscribed monument known: the archaic form of many of the hieroglyphic characters implies a date hardly later than that last-named. The locality — was pointed out to me in Egypt, and the removed tomb was examined by myself in the museum at Berlin.

Among the inscribed hieroglyphic characters are numerals (Leps. d. ii. pl. 3), implying knowledge more or less advanced of *arithmetical*.

Also *trees* (Leps. d. ii. pl. 7); of course introduced into Egypt and maintained by cultivation.

Figures also of a man and woman,  corresponding to Adam and Eve, (the Egyptians, as appears by the above-given coincidence in date, believing in Adam).

Apart from the hieroglyphic inscription, tribute or presents are brought by men of the Barabra or *Ethiopian race*; already in contact with and a distinct nation from the Egyptians: — Nubians are unequivocally figured at Gizeh under the Fourth dynasty, and at Benihassan under the Twelfth (Leps. d. ii. pl. 4, 19, and Champ. mon. pl. 395).

That the strangers are really Nubians, appears from the head-rest or *neck-pillow*  in the hand of one of them; — the Nubian neck-pillow makes its appearance as a hieroglyphic character under the Fourth dynasty (Leps. d. ii. pl. 98); was doubtless as among Nubians to the present day made of *wood*.

The practice among the Egyptians of *animal sacrifices* is also demonstrated; the offerings including the head of the *ox*, and the head and neck of the above-mentioned large species of *crane*.

An ambiguous figure (Leps. d. ii. pl. 5), imperfectly preserved on the original tomb examined by myself, is possibly intended for the *pig*, — and a similar figure occurs under Ptolemy VII. (Leps. d. iv. pl. 26). I looked in vain for distinct figures of the pig at Gizeh and Benihassan, and was unable while in Egypt to discover any prior to those at El Kab under the Seventeenth dynasty.

Twenty-second generation. May 1st, 3567, among living men :

"In the reign of Vōēthōs" (Maneth.), a chasm opened at Bubastis and many persons perished. The city of Bubastis therefore in existence: situated in Lower Egypt, — and at the present day called "Tel-Bustak."

Twenty-third generation. Sept. 1st, 3534, among living men :

3532 B. C. (= 3533 in calendar years = 3494 + "39" of the Afr.-Maneth. table), Vōēthōs succeeded by Kaiēhōs or Hōōs, second king of the Second dynasty. The name of king Kaka — occurs in tombs at Gizeh; and in the "Twenty-sixth" he is placed before Horakau (Leps. d. ii. pl.).

"In the reign of Kaiēhōs" (Maneth.), deification of the *bulls*, Apis at Memphis and Mnevis at Heliopolis, and of the Mendesian *goat*. A polytheistic system of *mythology* therefore in existence; and if not already established, *animal-worship* inaugurated. — The Egyptians do not appear to have at any time become worshippers of images made with hands; yet the Idolatry of other nations, is

perhaps a result of hieroglyphic writing. On the Egyptian monuments, figures of gods apart from hieroglyphic writing, occur under the Fourth dynasty; but continue rare until the Sixth.

The city of Heliopolis, therefore in existence: — Heliopolis is mentioned under the name of "Awn" or On in Gen. xli. 45 to xlv. 20, and Ezek. xxx. 17; "Byd-shmsh" or Beth-shemesh, in Jerem. xliii. 13; and to the present day, its well known site is called "Ain-shems."

The city of Mendes, also in existence; situated in Lower Egypt: — ruins, supposed to be those of Mendes, occur near the village of "Achman-tanah" (Champoll. Eg. ii. p. 122).

Twenty-fourth generation. Jan. 1st, 3500, among living men:

3493 B. C. (= 3494 in calendar years = 3447 + "47" of the Afr.-Maneth. table), Kaiēhōs succeeded by Vinōthris or Viōphis, third king of the Second dynasty.

"Under Vinōthris" (Maneth.), an enactment, permitting females to ascend the throne.

Twenty-fifth generation. May 1st, 3467, among living men:

3446 B. C. (= 3447 in calendar years = 3430 + "17" of the Afr.-Maneth. table), Vinōthris succeeded by Tlas, fourth king of the Second dynasty. — The name of Th-th-lōs has been found on the monuments by Lepsius k. pl. 7, with evidence that he preceded the Tenth dynasty.

"Atlas, son of Lybia" (according to Pliny ii. 6 and vii. 57), founded "astrologiam" astronomy; and ascertained "sphaeram ipsam," that the earth is spherical in shape. — Horapollon i. 10 speaks of the ball rolled by the scarabæus as having the form of the world. (See Prometheus.)

Twenty-sixth generation. Sept. 1st, 3434, among living men:

3429 B. C. (= 3430 in calendar years = 3389 + "41" of the Afr.-Maneth. table), Tlas succeeded by Sēthēnēs, fifth king of the Second dynasty. No contemporaneous monuments are known. — The name of king "Sent" has been found on later monuments by Lepsius k. pl. 7, with evidence that he preceded the Tenth dynasty.

Twenty-seventh generation. Jan. 1st, 3400, among living men:

3397 B. C. (= 3584 — "187 years" of Gen. v. 25), Lamech.

Part of the tomb of a prophet attached to the personal adoration of king Sent is now in the Ashmolean Library at Oxford; and "in style, character, and treatment," "does not differ in any essential particular" but "closely resembles similar sculptures of the period of the Fourth dynasty" (Birch).

3388 B. C. (= 3389 in calendar years = 3372 + "17" of the Afr.-Maneth. table), Sēthēnēs succeeded by Hairēs, sixth king of the Second dynasty.

3371 B. C. (= 3372 in calendar years = 3347 + "25" of the Afr.-Maneth. table), Hairēs succeeded by Nēphērhērēs, seventh king of the Second dynasty.

Twenty-eighth generation. May 1st, 3367, among living men:

"In the reign of Nēphērhērēs, as is fabled, the Nile flowed mixed with honey eleven days" (Maneth). The pyramid of Meydoun is referred by Birch to about this period.

3346 B. C. (= 3347 in calendar years = 3299 + "48" of the Afr.-Maneth. table), Nēphērhērēs succeeded by Sēsōhris, eighth king of the Second dynasty; described as in "height five cubits by three palms." — The name of Neferka-Sekar occurs in the Turin papyrus (Birch), that of Neferseka in the Tablet of Abydos, and that of Nefer-sekra in the chamber of kings at Karnak (Lepsius k. pl. 10 and 11).

Twenty-ninth generation. Sept. 1st, 3334, among living men:

Thirtieth generation. Jan. 1st, 3300, among living men:

3298 B. C. (= 3299 in calendar years = 3269 + "30" of the Afr.-Maneth. table), Sēsōhris succeeded by Hēnērēs, ninth king of the Second dynasty. — The name of king Ka-en-ra occurs in the Tablet of Abydos; and in a dynasty anterior at least to the Tenth (see also Lepsius k. pl. 7). Two princes, a son and grandson bearing the name of "Raenkau," are given by Lepsius k. pl. 7 as having lived before the end of the Third dynasty.

3284 B. C. (= 3649 — "65 — 300 = 365 yrs" of Gen. v. 21 to 24), "and walked Enoch with God after he begat Methuselah three hundred years" . . . "and he not, for took him God."

3268 B. C. (= 3269 in calendar years = 3241 + "28" = 3055 + "214" of the Afr.-Maneth. table, the Euseb.-Maneth. table giving 3902 — "252 — 297" = 3353 and 2498 + "203 + 448 + 198" = 3347), Hēnērēs succeeded by Nēhērōphēs or Nēhērōhis, head of a new dynasty; a Memphite dynasty. The name of king Nebka, or possibly Nebka-ra (see Lepsius k. pl. 7 and d. ii. pl. 39), occurs on a contemporaneous stone fragment at Abusir.

The hieroglyphic character *A* occurs on the same stone fragment: and according to Horapollon i. 5, the quarter of an "arōura" or Egyptian acre signifies the instituted year; on account of the fourth year intercalation. The so-called "Julian year" used therefore at this early date in Egypt. The character occurs besides under the Fourth dynasty at Gizeh, — and continues in use until the end of hieroglyphic writing (Lepsius d. ii. pl. 19 and 39, and k. pl. 12 to 67).

The "arōura" is further described by Horapollon as a measure of land containing a hundred cubits: *land-surveying* therefore practised at this early date in Egypt.

Thirty-first generation. May 1st, 3267, among living men:

"In the reign of Nēhērōphēs" (Maneth.), revolt of the Lybians (Westward of the Nile); but "alarmed at the moon increasing unexpectedly, they surrendered."

3240 B. C. (= 3241 in calendar years = 3212 + "29" of the Afr.-Maneth. table), Nēhērōphēs succeeded by Tōsōrthrōs or Sēsōrthōs, second king of the Third dynasty; and by the Egyptians esteemed as or called "Aesculapius on account of his medical skill." The name of king Seser-en-ra occurs in tombs South of the Seventh, Eighth, and Ninth pyramids (Glidd. analect.).

Thirty-second generation. Sept. 1st, 3234, among living men:

Hewn or *squared stone* first employed in building by Tōsōrthrōs (Maneth.). For squaring the harder kinds of stone, metallic tools are indispensable; and the nearest source of supply is the *copper* at Wadi Maghara in the Sinai peninsula, already mentioned.

Tōsōrthrōs also bestowed care on or improved the *writing* (Maneth.). As in all subsequent improvements, the result was probably increased facility.

In painting hieroglyphic characters, the animals may at first have been distinguished by their natural colours, — as in a mummy-case found by Gliddon at Sakkarah; but as early as the Fourth dynasty, hieroglyphic characters have conventional colours (see Leps. d. ii. pl. 19 to 22).

3211 B. C. (= 3212 in calendar years = 3205 + "7" of the Afr.-Maneth. table), Tōsōrthrōs succeeded by Turis, third king of the Third dynasty. — The name of "Tures" occurs on monuments of the Seventeenth dynasty (Leps. k. pl. 24).

3204 B. C. (= 3205 in calendar years = 3188 + "17" of the Afr.-Maneth. table), Turis succeeded by Mēsōhris, fourth king of the Third dynasty.

Thirty-third generation. Jan. 1st, 3200, among living men:

3187 B. C. (= 3188 in calendar years = 3172 + "16" of the Afr.-Maneth. table), Mēsōhris succeeded by Sōuphis, fifth king of the Third dynasty. — The accompanying oval is referred here in Poole's *hor. Æg.* p. 221; and was observed by myself under the Twelfth dynasty at Benihasan. A hieratic papyrus (in the possession of Lepsius *Æg.* and *Sin.* p. 395) containing the names "of Chufu and Snefru of the Third Manethonic dynasty, and three other kings probably belonging to the same dynasty, all cited as dead."

3171 B. C. (= 3172 in calendar years = 3153 + "19" of the Afr.-Maneth. table), Sōuphis succeeded by Tōsērtasis, sixth king of the Third dynasty.

Thirty-fourth generation. May 1st, 3167, among living men:

3152 B. C. (= 3153 in calendar years = 3111 + "42" of the Afr.-Maneth. table), Tōsērtasis succeeded by Ahēs, seventh king of the Third dynasty.

Thirty-fifth generation. Sept. 1st, 3134, mostly beyond youth: "Hapenmat" mother of king Snofru (Leps. k. pl. 5).

3110 B. C. (= 3111 in calendar years = 3081 + "30" of the Afr.-Maneth. table), Ahēs succeeded by Sēphōuris, eighth king of the Third dynasty. The name of king "Snofru" has been found on contemporaneous monuments. — He is the earliest king mentioned in the sculptures of the necropolis at Gizeh (Leps. d. ii. pl. 2, 16, and 17 . . .); and precedes Sehura in the series of kings at Karnak.

King Snofru carried on war in or beyond the Sinai peninsula: as appears from his name and portrait at Wadi Maghara, representing him in the act of smiting a bearded foreigner belonging to the *White Race*, as already mentioned. Mines of *turquoise* occur at Wadi Maghara, — and according to Brugsch continue to be worked (*bibl. Orient.* ii. 177).

"3102, midnight Feb. 17th to 18th" (. . . Burgess), beginning of the last kali-yug of the Hindus. — The "year 4900" of the kali-yug "ended on the 12th of April 1799" (*Bentley as. res.* viii. p. 212).

The above date is possibly to be regarded as the real commencement of *Hindu historical record*, for the "one hundred and fifty three" kings anterior to Sandracottus (*Megasth.*, and *Arrian ind.* 9) will give an average reign of more than eighteen years.

Thirty-sixth generation. Jan. 1st, 3100, mostly beyond youth:

Building by Snofru of one of the great pyramids at Dashur (Leps. k. synops. 4). Its construction may afford evidence of knowledge of *geometry*. In fact, the leading truths in *mathematical science* appear to have been nearly all found out. Further evidence of knowledge of geometry has been given under this dynasty in the hieroglyphic character of the quarter-acre: — and Herodotus ii. 109 (writing before the time of Euclid) expresses the opinion, That the Greeks obtained their knowledge of geometry from the Egyptians.

A *calendar* also in use, as appears from "signs of the seasons and their months" on stones

of this pyramid (Leps. chron.). The hieroglyphic character of the date-palm with four leaves (according to Horapollon i. 3), should represent a four-months period, and therefore an Egyptian season. It continues in use — until the end of hieroglyphic writing (Leps. d. ii. pl. 2, and k. pl. 5 to 67). The four-years period or “olumpias,” may however be compared; especially as the word “olumpias” is said to be Egyptian.

The division of the day into “hours, minutes, seconds, and 60ths of a second,” may also have been in use: according to Lepsius, this division was known to the Egyptians from an early period.

3080 B. C. (= 3081 in calendar years = 3055 + “26” of the Afr.-Maneth. table), Sēphōuris succeeded by Kēphērēs, ninth king of the Third dynasty. — The name of king Khuf-ra occurs in hieratic characters (Leps. k. pl. 7).

Thirty-seventh generation. May 1st, 3067, mostly beyond youth:

3054 B. C. (= 3055 in calendar years = 2498 + “203 — 100 + 6 + 448” in the Euseb.-Maneth. table), Kēphērēs succeeded by Sōris, head of a new dynasty; another Memphite dynasty. The name of king “Sor” on the monuments is identified with Sōris by Lepsius k. pl. 5.

Thirty-eighth generation. Sept. 1st, 3034, mostly beyond youth:

3025 B. C. (= 3026 in calendar years = 3055 — “29” of the Afr.-Maneth. table), Sōris succeeded by Sōuphis II. or Cheops, second king of the Fourth dynasty. The name of Chufu occurs at Wadi Maghara, and in the necropolis at Gizeh; where he follows Snofru and precedes all the other kings mentioned there: — his name occurs also Shech Said, and on later monuments and genealogical tablets (Leps. d. ii. pl. 2, 10, 16, 18, 50, 55, 76, and 112).

Having selected Gizeh for the site, Chufu commencing the Great pyramid, 746 feet square at base, by 450 feet high (Birch). The necropolis around appears also to have been planned, and some of the tombs constructed during his reign.

The internal passages and chambers of the Great pyramid are of *sienite*, procured of course at the First cataract of the Nile, and floated in barges all the way down the river.

The base of the Great pyramid is said to conform to an exact *meridian* line; and other details in the construction, are given as evidence of advancement in *astronomical science*.

“On monuments of the Fourth and Fifth dynasties,” the length of the cubit was ascertained to be “five hundred and twenty-four millimetres:” the standard *weights* and *measures* being those — known in later times among the Babylonians and Persians.

From the contemporaneous tombs at Gizeh, the wealthier Egyptians are found in good part devoted to *pastoral* pursuits. *Agricultural* occupations are however represented; with persons engaged in curing fish. Burdens are carried by a balance-beam on the shoulder: — as to the present day among the Polynesians.

Hornless *cattle*, *Bos taurus*, now make their appearance, figured in herds under the Fourth dynasty — (Leps. d. pl. 22 and 9): figures continue on the monuments under the . . . dynasty. I have sometimes seen hornless cattle in America, but do not know, whether they constitute a distinct breed. (See Socotra).

A wooden statue of the time of the Fourth dynasty and remarkable as a work of art was found by Mariette 77 to have been originally covered with a thin layer of “stuc.” The smooth hard stucco called around the Indian Ocean *chunam* was observed by myself to have been in use in Egypt from the commencement of Monumental history; — and to the present day well known along the coasts of Arabia, employed even for sheathing ships; well known also from ancient times in Hindustan, being the material on which the paintings in the Adjunta cave-temples were executed.

In an inscription enumerating offerings by king Chufu, mention is made of images worked in *ivory* (Mariette 77). The material was of course procured from the *African elephant* on the Upper Nile.

The skull of Prince Merhet, of Chufu’s family, — discovered with evidence of its identity by Lepsius (Eg. and Sin. p. 62).

Sōuphis II. succeeded by Sōuphis III., third king of the Fourth dynasty. The name of king Chnemu-chufu occurs in contemporaneous tombs at Gizeh; and in this necropolis, — and on the subsequent monuments, he is invariably placed next after Chufu (Leps. d. ii. pl. 50).

Chnemu-chufu carried on war in or beyond the Sinai peninsula; as appears from his name and portrait at Wadi Maghara, where he is represented in the act of smiting the above-mentioned bearded nation belonging to the *White Race* (Leps. d. ii. pl. 2).

The name of Chnemu-chufu occurs in quarry-marks on stones of the Great pyramid; in one instance, accompanied by the name of his predecessor. Chnemu-chufu therefore completed the Great pyramid; and apparently, from the central chamber upward.

These original quarry-marks rudely drawn with *red chalk*, further demonstrate: That *hieroglyphic writing* was in general use, was rapidly executed, and was the only kind of writing known.

Thirty-ninth generation. Jan. 1st, 3000, mostly beyond youth:

Allium Ascalonicum of the East Mediterranean countries. Called in Britain *scallion* or *shalot*, in France "echalote" (Nugent), in Germany "schalotte," in Italy "scalogno" or "ascalonia" (Lenz), in Greece "gēthuōn" (Zalikogl.), and figures in different tombs at Gizeh, agreeing always in the bulb hardly swelling,—appeared to me to belong here (compare Leps. d. ii. pl. 36 and 98); the same figures doubtless correspond to the "krōmmua" and "skōrōtha" of the interpretation to Herodotus of the inscription on the Great Pyramid: A. Ascalonicum was observed in Egypt by Alpinus; and by Hasselquist in Palestine (Linn.). Farther North, the "gēthuōn" is mentioned by Phrynichus, Anaxandrides, Alexis, Epænetus, and Theophrastus; A. Ascalonicum was observed by Bory and Chaubard in stony places in the Peloponnesus; by Visiani, under cultivation in Dalmatia; and according to Koch, has become naturalized near Fiume on the Adriatic (A. Dec.). Farther West, is termed "cepa sterilis" by C. Bauhin; is described by Morison iv. pl. 14; is known to occur in Italy (Lenz), and under cultivation throughout middle Europe. Eastward from Egypt, has been long known in Hindustan (Roxb., and D'roz.), and was observed by Graham "cultivated" around Bombay; by Mason, "exotic" in Burmah; and by Loureiro, under cultivation in Cochinchina. By European colonists, was carried to Northeast America, where I have found it cultivated to some extent in our Middle States.

2982 B. C. (= 2983 in calendar years = 2920 + "63" of the Afr. Maneth.-table), the accession of Shafra, fourth king of the Fourth dynasty, may be placed provisionally at this date. His name occurs in contemporaneous tombs in the necropolis at Gizeh:—and in the "Eighty-sixth" tomb (Leps. d. ii. pl. 8 to 13), he precedes Menkera.

The small temple of "alabaster" (stalagmite?) and "syenite," situated behind the Great Sphinx, was built by Shafra (Birch). Shafra also built a pyramid, as appears from the sign of one accompanying his name: and (according to Herodotus, and Diodorus i. 64. 1) the Middle pyramid at Gizeh was built by king Kēphrēn or Havruēn. A statue of king Shafra, also remarkable as a work of art,—is now in the museum at Paris (Mariette 77).

One of the tombs at Gizeh, is supposed to be that of the "architect" employed by king Shafra.

Fortieth generation. May 1st, 2967, mostly beyond youth:

Apart from the hieroglyphic writing, a *monkey*, *Cercopithecus*, is figured in tombs at Gizeh; having of course been brought from Equatorial Africa beyond the Desert:—the species continues the same throughout these tombs (Leps. d. ii. pl. 13 and 36): but under the Twelfth dynasty at Beni-hassan, other species make their appearance, all of them African. Throughout the monuments, I was unable to discover any connexion of monkeys proper with the Egyptian mythology; a marked distinction from the Hindu system.

Typha angustifolia of the Mediterranean countries and the shores of the Atlantic as far as Northeast America. A smaller kind of *cat-tail flag* called by the Greeks "tōsazi" (Forsk.), and possibly that figured among offerings in tombs at Gizeh—(Leps. d. ii. pl. 14, 36, and 68): *T. angustifolia* was observed by Delile on the Mediterranean border of Egypt near Rosetta. Farther North, was observed by Forskal from Smyrna to Constantinople, having "two female spikes" and used for feeding horses; by Sibthorp, and Fraas, in the marshes of Greece. Westward, is known to grow in Italy (Lenz), and along the Atlantic as far as Britain (Curt. lond. iii. pl. 62): and farther West, has been observed by myself only in the submarine pools of Massachusetts Bay in New England.

Typha latifolia of Northern climates. Called in Britain *cat's tail* or *reed-mace* or *bull-segg* or *pool-sedge* (Prior), in Germany "rohrkolbe" (Grieb), in Italy with other species "tifa" or "sala" or "mazza sorda" (Lenz), in Greece "psathē" (Sibth.): agreeing better with the above figures on the monuments, the root besides edible—(Linn.), but not met with by modern visitors in Egypt. Farther North, "psiathōs" mats are mentioned by Aeschylus ag. 1521, and Aristophanes ran. 567; the "tuphē," by Theophrastus i. 8, growing according to Dioscorides in the stagnant water of marshes; and in these situations *T. latifolia* was observed by Sibthorp in Greece. Westward, is described by Tragus (Spreng.); is termed "t. palustris major" by Tournefort inst. 530; and is known to grow in Italy, Algeria, Portugal (Brot., Desf., and Munby), and throughout middle and Northern Europe to the border of the Arctic region (fl. Dan. pl. 645, Fries, and A. Dec.). Eastward from the Mediterranean, is known to grow about Caucasus, the Caspian, the Altaian mountains, and throughout Siberia (Gmel., Pall., Bieb., and Ledeb.). Farther East, was observed by Drummond on the Saskatchewan in Lat. 54°, by Nuttall on the Arkansas, and is known to grow along the Atlantic from Lat. 51° in Newfoundland to and beyond 31° in Florida (Lapylaie, Ell., Baldw., Chapm., and myself): "flags" were gathered by the aboriginal women of New England to make mats for their dwellings (W. Wood prosp. ii. 20); and the poorer settlers of Virginia were "very fond" of the plant "because it has a sweetish taste" (Forst. cat.).

2960 B. C. (= 2952 + his "9th year" in an inscription, Chabas), accession of Mēnhērēs fifth king of the Fourth dynasty. The name of king "Menkaura" occurs in contemporaneous tombs at Gizeh;—and in the "Eighty-ninth" (Leps.), he is placed after Shafra and before Aseskef. His name occurs also in the genealogical tables of later times, and in sacred writings and prayers: for his memory appears to have been long venerated by the Egyptians.

2952 B. C. (= 2953 in calendar years = $1413 + 1540 = 2210 + "16 + 43 + 185 + 100 + 100 + 0.75 \text{ d.} + 203"$ of Euseb.-Maneth. continued in Afr.-Maneth. + " $9 + 7 + 22 + 25$ " + 33 or "31 years" of Mōshērēs in Eratosthenes = 2498 + " $203 + 448$ " of Euseb.-Maneth. continued in Afr.-Maneth. — " $29 - 63 - 66$ " — 38 or 39th year of Mēnhērēs), end of the first Great Year. (The "heliacal rising of Sirius in the ninth year of Menkeres" is however placed by Biot "between 3007 and 3010 B. C.," Boston Transcript for Friday, May 5th, 1876).

The Third pyramid at Gizeh is connected with this event; was attributed to "rōthōpis" (a phoenix according to C. Muller fragm. Maneth. p. 520 to 555) when Herodotus ii. 100 was in Egypt; to "nitōkris" by Manetho, though misplaced under the Sixth dynasty; "vōkhōris" is made the successor of Mēghērīnōs or Mukērīnōs by Diodorus i. 65; and the pyramid is known to have been built by Menkaura. Though the smallest of the three, it must have been very costly, being exclusively of *sienite* brought from the First cataract (in entire accordance with the account of Herodotus ii. 134).

In one of the contemporaneous tombs at Gizeh (Leps. d. ii. pl. 36), men probably of the *Negro Race* are represented; at least, if we may judge from their wearing the three-lobed emblem. — At Benihasan (Champoll. pl. 361), this emblem is clearly a black writing-style:

Iris sisyrinchium of Egypt and the Mediterranean countries. Called in Greece "agriōkrinōs" (Sibth.), in Egypt "zambak" (Forsk.), and in other instances seems the three-lobed emblem, the flowers agreeing in form and to some extent in colour — (the Ethiopians being termed "kuanōi" by Homer), and the growing plant occurring as a hieroglyphic character from the Seventeenth dynasty to the Ptolemies (Leps. k. pl. 51): *I. sisyrinchium*, the only species known to grow wild in Egypt, is described by Forskal p. 12 as a flower "plurimæ dignitatis" in colour "violaceus medio petalorum croceo"; was observed by him, and Delile, on the Desert-margin from the Pyramids to Alexandria. Farther North, was observed by Sibthorp, Chaubard, and Fraas, on hills along the sea from Cyprus to the Peloponnesus; is known to grow also in Barbary, Spain, and Portugal (Tourn. inst. 365, and Pers.).

Anona Senegalensis of Tropical Africa. A small tree called in Unyoro "mtaotao" (Grant); and as early doubtless as this date its hard twigs used for rubbing fire by Negro tribes on the Upper Nile, — as at the present day witnessed by Schweinfurth vi to xii: *A. Senegalensis* was observed also by Grant from " 2° to 3° N." on the Nile, its fruit eaten, and wood made into hoe-handles; was received by Jussieu from Senegal (Pers.).

Forty-first generation. Sept. 1st, 2934, mostly beyond youth:

The name of king Menkaura occurs on his own wooden coffin, discovered within the Third pyramid. The inscription containing the name, is alleged by Birch to be an extract from the "Osiris-myth"; a sacred drama, whose high antiquity is thus demonstrated.

Cedrus Libani of the Lebanon and Taurian mountains. The *Cedar of Lebanon* is called by the Syrian Arabs "arz" (Royle in Kitt. bibl. cycl.). in Egyptian "tshēnsēifē" or "tshēnsēvē" or "tshēnsifi" (transl. Sept.), and is possibly the "kind of cedar" of which this coffin is made, there being no Coniferous trees large enough for the purpose nearer than Palestine: — the "arz" is prescribed by Moses for purifying the unclean and in leprosy (Lev. xiv. 4, and Num. xix. 6); was brought for building from Tyre to Jerusalem (2 Sam. v. 11, and 1 Ki. vi. 9 to 20); is mentioned as growing on Lebanon in Psalm xxix. 5, xcii. 12, and Jer. xxii. 7 to 23; as a lofty tree by Amos ii. 9, Isaiah ii. 13, and Ezekiel xxxi. 3; is also mentioned in Cant. i. 17, Zeph. ii. 14, Job xl. 17, Zech. xi. 1, 1 Esdr. iv. 48, and Sirach xxiv. 13; and the "cedrus magna" or "cedrelaten," by Pliny xiii. 11 and xxiv. 11 as yielding resin, having fruit like "cupresso," and incorruptible timber employed for images of the gods: *C. Libani* has become rare on Lebanon, but a grove continues to be shown to travellers, and trees have been found in unfrequented portions of this mountain-range by American missionaries (Kitt. bibl. cycl., forest).

The tree selected for the coffin was in all probability felled in Syria, and seems to imply the existence of *navigation* upon the Mediterranean: — river-barges, larger than any now used on the Nile and propelled by numerous oars, are figured at the beginning of the Fifth dynasty in the beautiful tomb at Saccara.

2919 B. C. (= 2920 in calendar years = $2953 - 33 = 2983 - "63"$ of the Afr.-Maneth. table), accession of Ratōisēs, sixth king of the Fourth dynasty; — to whose reign "twenty-five" years are assigned. The name of king Ratatef occurs on the monuments (Leps. k. pl. 7), and is referred here by Birch.

Forty-second generation. Jan. 1st, 2900, mostly beyond youth:

2894 B. C. (= 2895 in calendar years = $2920 - "25"$ of the Afr.-Maneth. table), Ratōisēs succeeded by Vihērīs, seventh king of the Fourth dynasty; — to whose reign "twenty-two" years are assigned. The "vōkhōris" of Diodorus i. 65, may be compared (see above, Mēnhērēs): a judicial decision attributed to Vokhoris is preserved by Clemens Alexandrinus Strom. iv. 18.

2872 B. C. (= 2873 in calendar years = 2895 — “22” of the Afr.-Maneth. table), Viheris succeeded by Sēvērhēres, eighth king of the Fourth dynasty; to whose reign “seven” years are assigned. The name of king “Aseskaf” occurs in contemporaneous tombs at Gizeh: — and in the “Eighty-ninth” he is placed after Menkaura and before Useserkaf (Leps. d. ii. pl. 41, 50, and 55). Asychis according to Herodotus succeeded Menkaura.

Forty-third generation. May 1st, 2867, mostly beyond youth:

Some time after the building of the Great pyramid (Leps. trav. 28 and 52 to 118) but before the close of the Fourth dynasty (Birch), a *canon of proportions* first adopted in representations of the human form. — This canon continued unchanged throughout the “Twelfth dynasty.”

2865 B. C. (= 2866 in calendar years = 2873 — “7” of the Afr.-Maneth. table), Severheres succeeded by Thamphthis, ninth king of the Fourth dynasty: — to whose reign “nine” years are assigned. The name of king Tha-mēd has been found on the monuments by Lepsius (k. pl. 7); with evidence, that he preceded the Tenth dynasty.

As the sphinx possibly indicates taxation, the earliest representation becomes a point of interest. The above headless figure occurs under the Fourth dynasty at Sakara (Leps. d. ii. pl. 96), but is not free from ambiguity; and Lepsius eg. and gin. p. 67 states, that the image of the sphinx is “not in general met with in the Pyramid period.” — Heads of sphinxes were found in the tomb of the mother of the first king of the Seventeenth dynasty; and from this time, representations of the sphinx become frequent: forming besides a hieroglyphic character  from at least the Nineteenth dynasty to the Greek conquest (Leps. k. pl. 32 to 50).

2856 B. C. (= 2857 in calendar years = 2866 — “9” of the Afr.-Maneth. table = 2210 + “16 + 43 + 185 + 100 + 100 + 0.75 d. + 203” of the Euseb.-Maneth. table), Thamphthis succeeded by Ousērhērēs, head of the Elephantinite dynasty. To whose reign “twenty-eight” years are assigned. The name of king Usesurkaf occurs in contemporaneous tombs at Gizeh: — and in the “Eighty-ninth,” he is placed after Aseskaf and before Sehura. His name occurs also at Shech Said (Leps. d. ii. pl. 40, 48, and 112).

A tomb at Sakara containing the name and constructed during the reign of Usesurkaf, may be regarded as vindicating in the beauty of the sculptures the judgment of Herodotus: in placing certain Egyptian works of art on a par with any in Greece.

Khumhotep was priest of the king's pyramid, — which has not as yet been identified (Birch).

Forty-fourth generation. Sept. 1st, 2834, mostly beyond youth:

2828 B. C. (= 2829 in calendar years = 2857 — “28” of the Afr.-Maneth. table), Ousērhērēs succeeded by Sēphrēs, second king of the Fifth dynasty: to whose reign “thirteen” years are assigned. The name of king Sehura occurs at Wadi Maghara, and in contemporaneous tombs at Gizeh: — and in the “Eighty-ninth,” he is placed after Usesurkaf; and in the “fifteenth,” after Chufu and before Nofrikara (Leps. d. ii. pl. 39, 47, 50, 55, and 74). His name occurs also in the genealogical tables of later times, as in the chamber of kings at Karnak.

Sehura carried on war in or beyond the Sinai peninsula: his portrait at Wadi Maghara representing him in the act of smiting the before-mentioned bearded nation belonging to the *White Race* (Forty days in the Desert pl. 12).

Sehura built the North pyramid at Abusir; his name occurring in red quarry-marks on one of the component blocks of stone.

2815 B. C. (= 2816 in calendar years = 2829 — “13” of the Afr.-Maneth. table), Sēphrēs succeeded by Nēphērhērēs, third king of the Fifth dynasty: to whose reign “twenty” years are assigned. The name of king Nofrikara occurs at Sakara, and in contemporaneous tombs at Gizeh: — and in the “Fifteenth,” he is placed between Sehura and Raensesur; but by a rare inconsistency, before Sehura in the “Seventeenth” tomb (Leps. d. ii. pl. 47, 50, 55, and 59).

A *porcupine*, *Hystrix cristata*, is figured in one of the above tombs (Leps. d. ii. pl. 46). The original may have been imported from beyond the Euphrates: — for I have met with the animal only in Hindustan, where quills are occasionally found throughout the country; the possible origin of the legend mentioned by Pliny viii. 53, that the porcupine shoots its quills. Pliny however attributes “hystrices” to both India and Africa; showing at least, that the animal became known to the Romans through Africa.

Nofrikara built a pyramid: and several functionaries of his reign were buried in the tombs at Gizeh (Birch).

Forty-fifth generation. Jan. 1st, 2800, mostly beyond youth:

2795 B. C. (= 2796 in calendar years = 2816 — “20” of the Afr.-Maneth. table), Nēphērhērēs succeeded by Sisirēs, fourth king of the Fifth dynasty: to whose reign “seven” years are assigned. The name of king Raensetur occurs at the “pyramid at Reggah” (Glid. analect.), also at Wadi Maghara, Sakkarah, and in contemporaneous tombs at Gizeh: — in the “Fifteenth” and “Seventeenth” tombs, he is placed after Sehura and Nofrikara (Leps. d. ii. pl. 55, 57, 59, and 152).

His surname “An” (Birch) occurs in the tombs at Gizeh; and in the “twenty-seventh” (Leps. d. ii. pl. 76) is placed after Chufu and before Tankara; — in the chamber of kings at Karnak, is placed after Sehura and before Asesa; occurs also in other genealogical tables; and under the Twelfth dynasty, on a “fragment of a granite statue” (C. Mull. fragm. Maneth. p. 548).

Raensetur built the middle pyramid at Abusir; as appears from his name in “red ochre” quarry-marks on some of the component blocks of stone.

2788 B. C. (= 2789 in calendar years = 2796 — “7” of the Afr.-Maneth. table), accession of Hēirēs, sixth king of the Fifth dynasty: to whose reign “twenty” years are assigned. The name of king Horakau occurs in contemporaneous tombs at Gizeh: — and in the “Twenty-sixth,” he is placed after Sehura and Kaka. The same name quadrangularly enclosed, occurs in the “Twenty-seventh” tomb (Leps. d. ii. pl. 74 and 76).

2768 B. C. (= 2769 in calendar years = 2789 — “20” of the Afr.-Maneth. table), Hēirēs succeeded by Rathōurēs, seventh king of the Fifth dynasty: to whose reign “forty-four” years are assigned.

Forty-sixth generation. May 1st, 2767, mostly beyond youth:

Forty-seventh generation. Sept. 1st, 2734, mostly beyond youth:

2724 B. C. (= 2725 in calendar years = 2769 — “44” of the Afr.-Maneth. table), Rathōurēs succeeded by Mēnhērēs II., eighth king of the Fifth dynasty: to whose reign “nine” years are assigned by Manetho; but “eight” only, in the Turin papyrus. The name of king Menkauhor occurs at Wadi Maghara: — and on monuments of later times (Leps. d. ii. pl. 39, and k. pl. 5).

A slab containing a portrait of Menkauhor — was found in excavating the Serapeum at Memphis (Birch).

Menkauhor built a pyramid: — which has not as yet been identified (Birch).

2715 B. C. (= 2716 in calendar years = 2725 — “9” of the Afr.-Maneth. table, the Egyptian Chronicle giving 2497 + “217 years” = 2714), end of the reign of Mēnhērēs II. He was succeeded by Tanhērēs, ninth king of the Fifth dynasty: to whose reign “forty-four” years are attributed by Manetho; but “thirty-eight” only, in the Turin papyrus. The name of king Tankara occurs at Wadi Maghara, Sakkarah, and in contemporaneous tombs at Gizeh: — where, in the “Twenty-seventh,” he precedes Asesa (Leps. d. ii. pl. 39, 63, 65, and 76).

His surname Assa (Birch) occurs at Sakkarah; and in the necropolis at Gizeh is inscribed in the “seventeenth, twenty-sixth, twenty-seventh,” and “thirty-fifth” tombs. — A different form of apparently the same name, occurs subsequently in the chamber of kings at Karnak (Leps. d. ii. pl. 67, 74, 76, 78, and k. pl. 6).

2712 B. C. = “fourth year of Assa” (Birch), commissions sent to Wadi Maghara, “to examine the state of the locality and excavations.”

Forty-eighth generation. Jan. 1st, 2700, mostly beyond youth:

A papyrus written by an officer under king Asesa (discovered in Thebes by Prisse) is described by De Rougé as having the characters slightly *cursive*; the initial stage therefore of hieratic writing.

2671 B. C. (= 2672 in calendar years = 2716 — “44” of the Afr.-Maneth. table), Tanhērēs succeeded by Onnōs, tenth king of the Fifth dynasty: to whose reign “thirty-three” years are assigned by Manetho; but only “thirty,” in the Turin papyrus. The name of king Onas occurs in the “Twenty-sixth” tomb at Gizeh (Leps. d. ii. pl. 75), on a vase procured in Egypt by Abbott (Glid. analect.), and on other movable articles in the museums of Europe (Birch).

Evidence that the name and title of Onas were identical is given in Leps. k. pl. 5; and, with the two exceptions above given, single ovals appear to have been to this time employed by the Egyptian kings.

Forty-ninth generation. May 1st, 2667, mostly beyond youth:

Of the above-mentioned tombs at Gizeh, several were pointed out to me by Mr. Bonomi, others besides not later than the Fifth dynasty, and on the walls I remarked figures of three additional plants:

Cynara scolymus of the Mediterranean countries. Called in Britain *artichoke*, in France “artichaux,” in Spain “artichofa” or “alcachofa,” in Italy “articiocco” (Prior), in Germany “artischoke,” in Greece “agkunara” (Fraas) or “agriōkunara” (Sibth.), in Egypt “charsjuf”

(Forsk.) or "kharchouf" (Del.), and figures in one of the tombs, possibly intended for the lettuce, more resemble floral heads of the artichoke:—the "kinara" was found by Ptolemy III. Euergetes on the river Lethon in Lybia (Athen. ii. 84); and *C. scolymus* was observed by Forskal, Delile, Clot-Bey, and myself, abundantly cultivated in Egypt. Farther north, the "kinara" is mentioned by Hecataeus, Sophocles, Sopater of Paphos, and Galen al. fac. ii. 51; *C. scolymus* was observed by Sibthorp, and Chaubard, abounding throughout the Peloponnesus, but according to Fraas is only seemingly wild. Westward, the "cinara" is mentioned by Columella xi. 3. 14, Scribonius, and Pliny viii. 41; is described by Lobel pl. 2. 6; is termed "*c. sylvestris latifolia*" by Tournefort inst. 442; is known to occur as a weed in cultivated ground in Italy, Sicily, Barbary, Portugal, Southern France, and is besides regularly cultivated as far as middle Europe (Pers.). Eastward from Egypt, is called in Bengalee "haticak" (D'roz.), in the environs of Bombay "kingin" and "cultivated in Deccan gardens" (Grah.); was observed by Ainslie mat. ind., and Roxburgh, under cultivation in other parts of Hindustan. By European colonists, was carried to America, where I have found it sparingly cultivated for its edible calyx-leaves in our Middle States.

Cucumis flexuosus of Equatorial Africa. The long *curving cucumber* called in Egypt "güttēh" (as heard by myself), "cucumber longissimus" in Egyptian "shōpi" (Edw., "cucumber" being "tshplōk" or "tshplōk," Kirch.) agrees with the long green slightly-curved fruit figured in tombs at Gizeh—as well as under the Seventeenth or Eighteenth dynasty: the "htē" is mentioned in Ex. ix. 32; the "kathe" by Rhazes, Abd-allatif, and Alpinus: *C. flexuosus* was observed in Egypt by Hasselquist; by myself, the fruit only, curving to the length of three or four feet, and devoid of papillæ. Farther North, the "*cucumis anguinus*" is mentioned by Varro i. 2. 25, Columella vii. 10. 5, and Pliny.

Citrullus vulgaris of Equatorial Africa. Called in English *watermelon*, in German "wassermelone" (Grieb), in French "pastèque" (Nugent), by the Greeks "karpōusia" (Fraas) and by the Turks "carpus" (Forsk.), in Russia "arbus" (Erman i. p. 235), in Persia "hinduanach" (Ainsl.), in Egypt "batykh" (Del.), in Egyptian "pēlēpēpōn" (Sept. transl. Num. xi. 5) or "pēlpēn" (Kirch.), and agreeing in shape and relative size with a green fruit figured in tombs at Gizeh—as well as under the Seventeenth and Eighteenth dynasties: the "abatyhym" of Egypt were longed for by the Israelites in the Desert; the "batykh" is mentioned by Serapion Ebn Baitar, and Abd-allatif; and *C. vulgaris* was observed by Forskal, Delile, Clot-Bey, and myself, under cultivation in Egypt. Farther North, "melopeponas" are mentioned by Columella, and Pliny xix. 23; the "mēlōpēpōn," by Florentinus (Geopon. xii. 20), and is distinguished by Galen alim. ii. 5 by its internal substance that contains the seeds being edible; *C. vulgaris* is described by Matthioli p. 369, Lobel obs. pl. 641, and Dalechamp p. 625; was observed by Forskal in gardens at Constantinople, but in general seems little known in Western Europe. Southward and Eastward from Egypt, the fruit was observed by myself in market at Mocha and Muscat: *C. vulgaris* is called in Sanscrit "chaya pula" (Ainsl., and Pidd.), in Bengalee and Hindustanee "tarbuj" (D'roz.), in the environs of Bombay "tarbooz," and "extensively cultivated" (Graham, and myself). Farther East, was observed by Mason v. p. 456 "exotic" in Burmah, cultivated by both Karens and Burmese, and called "pha-rai;" by Loureiro p. 730, in Cochinchina and China; by Rumphius v. pl. 146, in the Malayan archipelago (A. Dec.); and by Thunberg, under cultivation in Japan and called "suikwa." By European colonists, was carried to Brazil and the West Indies (Marcgraf p. 22, and Sloane i. p. 226); to Northeast America, where it continues abundantly cultivated; to the islands of the Pacific, as ascertained by myself on the Hawaiian, Samoan, Tongan, and Feejeean groups, and as far as New Zealand and Australia.

Of the plants thus far mentioned, those displaced by the hand of man came principally from Northern climates. Nine however are decidedly Tropical: the *date-palm*, possibly from Hindustan beyond the Persian Gulf; but the remainder, the *doum-palm*, *Papyrus*, *Arundo donax*, *fig*, *watermelon*, *curving cucumber*, *Acacia Nilotica*, and *Nymphæa coerulea*, all from either Tropical Arabia or the Upper Nile.

King Onas was buried in the Mastabat-el-Faraoun, a long building at Sakkarah inscribed with his name and constructed of enormous blocks of limestone, anciently inlaid with hard stones:—and it appears from a total in the rubric in the Turin papyrus, "that his reign was one of those fixed points from which the ancient Egyptians computed the chronology of the old monarchy" (Birch).

The above oval will be found to correspond with the Babylonian account of Oannes; who came out of the Persian Gulf, and taught mankind the art of writing with other branches of learning, all mechanical arts, the building of cities and temples, geometry, agriculture, law-making, and everything essential to the well-being of society:—since which time, nothing new or at least nothing better has been found out (Beros.). Oannes is represented on the Assyrian monuments as having the

body of a fish with the human face and feet; and is mentioned also by Apollodorus (Euseb. i. p. 8, and Syncell. p. 28).

4
44

2638 B. C. (= 2639 in calendar years = 2672 — “33” of the Afr.-Maneth. table), Onnōs succeeded by Othōēs, head of the Sixth dynasty, a Memphite dynasty. The name of king Athi occurs at Hamamat (Leps. d. ii. pl. 115).

“2637 B. C.” (Chin. chron. table, Amyot, and Pauth.), the *Chinese era*, the initial point of — chronological reckoning among the Chinese. To all appearance derived from Babylon and the West: and therefore, the approximation or possible coincidence in dates is worthy of notice (see Fou-hi).

Fiftieth generation. Sept. 1st, 2634, mostly beyond youth:

2620 B. C. (= 3397 — “182 — 595 = 777 yrs” of Gen. v. 28 to 31), death of Lamech. The words, “This shall comfort us concerning our work and concerning toil of our hands because of the ground which hath cursed it Jehovah,” are attributed to Lamech.

In regard to the condition at this time of the human family, mention is made of “mighty men which were of old, men of renown. And God saw that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was only evil continually.” The “earth also was corrupt before God, and the earth was filled with violence” (Gen. vi. 4 to 11). Historical notices of the antediluvian period, have also been transmitted through Greek writers.

2615 B. C. (= 2015 + “600 years” of Gen. vii. 6, Samar. edit., Sept., Jos., Theoph., and Afr.), Noah. The date for the Deluge given by Josephus a. J. i. 6. 5, differs one year only (1623 + “70 + 120 + 132 + 130 + 130 + 134 + 130 + 135 + 12 years” = 2616).

Pinus pinea of wooded shores of the Mediterranean. The imported nuts are called in Germany “pinie” and other species of the tribe “kiefer” (Grieb): in Italy the *garden pine* is called “pino” or “pino domestico” (Lenz), in Greece “kōukōunaria” (Sibth.), and the same in Egyptian for the tree and nuts (ms. Par.): the “gphr” pitch trees of which the ark was made — (Gen. vi. 14) may be compared: *pine-nuts* were known to Athenaeus in Egypt, and doubtless continue to be imported. Farther North, the ship Argo was built of “pitusin” (according to the dedicatory inscription preserved by Dio Chrysostom); the tree was felled on the mountains of Greece for ship-timber in the days of Homer il. xiii. 390, but its cultivation may have commenced subsequently; the “pitus” is mentioned in connexion with Miltiades (Herodot. vii. 37), and by Cratinus, and Theophrastus; sculptured fruit of “pituōs tēs ēmērōu” in the hand of statues by Ptoleuchus and Calamis, was seen by Pausanias . . . ; “kōkkalōi” are mentioned by Hippocrates vict. acut. 409, and pine-nuts by Mnesitheus, Diocles, Alexander Myndius, Nicander, and Galen alim. fac. ii: *P. pinea* was observed by Forskal in gardens at Constantinople; by Sibthorp, and Chaubard, in the Peloponnesus, in maritime sand, becoming rare inland, its timber excellent for ship-building. Westward, the “pinus in hortis” is mentioned by Virgil ecl. viii. 65; the “pinea,” by Columella; is enumerated by Pliny xvi. 16 and xvii. 11 as “peregrinae” foreign to Italy, directions for planting “pineae nucleis” also given; the smoke rising from the eruption of Vesuvius witnessed by the younger Pliny is compared by him to this tree: *P. pinea* is termed “p. sativa” by Tournefort inst. 585; is known to occur seemingly wild in Italy (Lenz), and its umbrella-shaped top was observed by myself everywhere conspicuous in sailing along the coast of Southern France and Spain. By European colonists, was carried to Madeira (Lemann, and A. Dec.): its nuts were found by myself largely imported into Spanish colonies in America.

Olea sylvestris of Persia and the shores of the Caspian. Called in English *olive*, in Germany “olivenbaum” or “oelbaum” (Grieb), in France “olive” and “olivier” (Nugent), in Italy “oliva” and “olivo” (Lenz), in Greece “ēliēs” or “agrōēlia,” but by the Turks “jaban zeitan Agagi” (Forsk., and Sibth.), in Egypt “zeytoun” (Del.), in Egyptian “jōit” or “jōēit” (transl. Sept.), in which we recognize the “zyd” leaf brought to Noah — (Gen. viii. 11), the tree itself occurring in Palestine and the neighbouring countries in the time of Moses (Ex. xxvii. 20 and Levit. xxiv. 2), Jotham (Judg. ix. 9), and Micah vi. 15: the “zaitun” is mentioned by Ebn Baitar: the “ēlaia” in the days of Theophrastus iv. 3 was cultivated in Cyrene; in the days of Pliny at Thebes in Egypt, but has since disappeared from the vicinity; lower down in the Fayoum are olive trees older than the Muslim conquest, plantations having been established only recently under Mohammed Ali (Clot-Bey ii. 29), but single trees were observed by Forskal in gardens at Cairo. Farther North, a tree attributed to the time of king Argus was standing at Argos in the days of Pliny xvi. 89: the “ēlaia” was regarded as introduced at Athens by Minerva (Plut. is. and osir., Paus. i. 24. 3 and vi. 26. 2), is mentioned by Hesiod, Homer, Aeschylus, Euripides, and the “ēlaia ēmēra” distinguished by Dioscorides; *O. sylvestris* was observed by Forskal, Sibthorp, and Fraas, cultivated as well as seemingly wild throughout Greece and the Greek islands. Eastward, its oil was not used by the Persians of the time of Herodotus . . . , and to the present day its fruit is disliked by the Turks (Forsk. p. 202); the tree is described by Persian medical writers, and is known to grow in sheltered situations along

the Caspian (Ledeb.) : is said by Strabo ii. 1. 14 to be unknown in Bactria, but was observed by Elphinstone p. 46 seemingly wild in Cabul, devoid however of a Sanscrit name (Pidd., Royle, and A. Dec.). Westward from Greece, prior to the reign of Tarquinius Priscus was unknown in Italy, Barbary, and Spain (Fenest.); its oil was employed by Hannibal (Liv. xxi. 54); the "olivina" is mentioned by Plautus; the "oliva" or "olea" and its culture, by Cato, Varro, Cicero, Horace, Virgil, Columella, and had reached Gaul and Spain before the time of Pliny; *O. sylvestris* was observed by Bontier in "1403" on the Canary Islands, and is even regarded by Buch, and Webb, as indigenous. By European colonists, was carried prior to "1560" (Vega 391, and Holmes) to Peru, in which country as well as in Chili I met with fresh fruit of good quality; in "1837," was carried from Egypt to Hindustan (Graham).

By Noah, an *altar* built: on which, "of every clean beast and of every clean fowl," he "offered burnt offerings" (Gen. viii. 20).

Until the sounding of Babylon, of the city and tower of Babel, "the whole earth was of one language and of one speech" (Gen. xi. 1 to 9). This language was of course that of the Egyptian hieroglyphics, the so-called "Coptic" language: certainly at this date in existence, while no other known language can be traced so far back. — The fact is further confirmed by the Chinese having retained a monosyllabic form of language; by the secondary or triliteral form of the Shemitic or Chaldaic; while yet further syllabic addition characterizes the Sanscrit and Ind-European class of languages. Confirmation is also found in the order of affiliation: many Hebrew and many Sanscrit words having been taken from the Egyptian language, while with the possible exception of names of foreign animals and plants, no Egyptian word has been borrowed from either the Hebrew or Sanscrit; many Greek words have been borrowed from the Hebrew, but no Hebrew word from the Greek; many Latin words from the Greek, but no Greek word from the Latin; and many English words from the Latin, but no Latin word from the English.

The poetical account of Lamech and his two wives, in which the seven-fold vengeance protecting Cain is mentioned (Gen. iv. 23 and 24), is regarded as "most probably the oldest specimen of *Hebrew poetry extant*" (Kitt. bibl. cycl.). The poetical curse on Canaan, in which Shem and Japheth are mentioned (Gen. ix. 25 to 27), is attributed to Noah himself. — Poetry, it should be noted, can be transmitted without the aid of writing.

The tomb of Abeba, an officer who accompanied king Athi "in his voyages to the edifice of the South," has been found at Sakkarah (Birch).

The presence of the name of king Athi on the road leading to the port of Kosser, is evidence of the existence of *navigation* upon the Red Sea, of *maritime commerce* with Arabia and countries beyond. The harbour of Abu Zelimah in the Sinai peninsula (according to Lepsius eg. and sin. p. 305), was "a position of great importance long before the time of Moses."

Vessels from the Red Sea probably visiting Hindustan as early as this date; following Desert shores to the new aspect of nature beyond the Persian Gulf.*

Dilivaria ilicifolia of the Tropical seashore from Hindustan throughout the Malayan archipelago. One of the first objects to attract attention on landing, — a maritime shrub from its foliage called *sea-holly*, but in Burmah "kha-ya" (Mason); in Pampang "dulavari," in Tagalo "diliuario" or "doloariu" or "laguio laguio" or "tingloi," in Bisaya "tiotic" (Blanco): observed by Graham about Bombay, growing "abundantly in salt marshes;" by Rheede ii. pl. 48. in Malabar; by Roxburgh, along the Eastern side of Hindustan; by Mason, on the seashore of Burmah, its root according to the natives "a cure for the bite of poisonous snakes;" by myself, abounding throughout the Malayan archipelago to the Philippines, where also it was observed by Blanco.

2608 B. C. (= 2609 in calendar years = 2857 — "248" dynastic years of the Afr.-Maneth. table, the Euseb.-Maneth. table giving 2498 + "203 — 100 + 6" = 2607), Othoes or Athi put to death by his own guardsmen, and succeeded by Phiōs. The name of king Pepi occurs at Wadi Maghara, Sauiet el Meitin, Shech Said, Hamamat (Leps. d. ii. pl. 110 to 116), and beyond Dongola as far up the Nile as Napata (Glidd. analect.), — also on monuments of later times, as the chamber of kings at Karnak.

Pepi clearly has two hieroglyphic ovals; a title or surname apart from the name. The *cobra* or asp projecting from the forehead, also now designates a king (compare Horap. i. 57 to 60).

2607 = "second year of Pepi," the inhabitants of the Sinai peninsula reconquered — (Birch).

Tamarix Africana of the Desert and its Northern border from the Atlantic to Hindustan. Called in English *tamarisk* (Prior), in Greece "murikia" or "armurikia" (Fraas) or by the Turks

* In the following pages, the horizon of Egypt includes the nearest portion of Hindustan; the line of demarcation separating plants growing farther East that even through their commercial products continue unknown to the Egyptians.

"il ghin" (Sibth.), in Egypt "tarfæ" (Forsk.), in which we recognize the Egyptian "trvæin" or "trvëin" or "tërvëin" (transl. Sept., and ms. Par.) identical with the "tshë-n-ösi" mischief-wood (Kirch.); also the "murike" a most ancient plant, coronary among the Egyptians in religious processions, — and among the Magians of Media, according to Metrodorus: *T. Africana* was observed by Forskal, and Delile, in the Egyptian Desert, affording inferior charcoal; by myself, on the Desert-margin in Upper Egypt and around Mocha. Farther North, the "murikë" was used even among the Scythians by soothsayers, the Apollo on Lesbos holding a branch (Alcaeus, Herodot., Dinon, and schol. Nicand. ther. 613); is mentioned by Homer *il. vi. 39* and *x. 466* as growing around Troy; by Hecataeus, Theophrastus, Strabo; and the "myricen" by Pliny *xxiv. 41* as "infelicem arborem" never planted in Italy: *T. Africana* was observed by Sibthorp, Chaubard, and Fraas, frequent in the Peloponnesus and other parts of Greece; by Desfontaines *i. p. 269*, in Algeria; by Forskal, near Marseilles; is termed "*t. narbonensis*" by Tournefort *inst. 661*, "*t. gallica*" by Linnæus; is known to grow also in Italy and Spain (Pers., and Lenz). Eastward from Arabia, was observed by Deacon abounding "on the banks of the Indus and throughout Cutch and Scinde, where it is commonly used for fire wood" and is called "jhaoo" (Graham); according to Thunberg, grows also in Japan and is called "iione." By European colonists, was carried to Northeast America, where it continues an ornamental plant in gardens. The bark according to Lindley "is slightly bitter and astringent." (See *T. Germanica*).

In the Sinai peninsula, "an abundance of a white sweet gummy substance resembling manna" is collected from *Tamarix Africana*; ascertained by Seetzen, Burckhardt, and Ehrenberg to be an exudation produced by an insect, *Coccus manniparus* (Spreng., and Lindl.). Beyond the Euphrates and a little farther South, Persian manna called "gen" (see above) was observed by Frederick to be "formed by an insect in that way," but "only on the larger branches covered by those minute insects, and none is formed near wounds or cracks in the bark;" agreeing with another "traveller who saw it in the same country both on a tamarisk and on the small oak of Kermanshaw" (Malcolmson).

Alhagi Maurorum of the Desert, from North Africa to Hindustan. The *camel's thorn*, a hard-stemmed plant a foot or two high growing in loose beds in the Desert, is called in Egypt "aghul" (Forsk.), in Egyptian "ali" (lex. Oxon.), the same word meaning to take — (transl. Sept.); and its exudation is regarded by some writers as the "mn" manna of the Israelites: the "thrösömeli" or "aëroméli" of Lebanon, procured by shaking the branches of a plant, is mentioned by Galen *fac. al. iii. p. 739*; the "shirchashak" described as the best kind of manna by Eltamini, and Ebn Baitar, is referred by Sprengel, and Sontheimer, to *A. Maurorum*; the chief source of the "manna of the Arabs," as ascertained by Rauwolf, and Tournefort *trav. i. p. 247*, collected "by merely shaking the branches" (Lindl.): the plant, much relished by camels, was observed by Forskal *p. 136*, Delile, and myself, frequent in the Egyptian Desert. Farther East, is called in Persia "shooturk," in Sanscrit "yasa" or "yavasa," in Hindustanee "juwasa" (Lindl.); was observed by Burnes throughout Scinde; and by Law, "common in Guzerat and S. M. country" (Graham).

Artemisia inculta of the Egyptian and Syrian Desert. Called in Egyptian "hrim" (ms. Copt., and Edw.), while a word perhaps not distinct means interior of the Desert — (transl. Sept. Ex. iii. 1): the Greek word "ëřēmōs," if not the Hebrew "hrm," may therefore be derived from this plant: in the days of Dioscorides, the "sëriphōn" or "apsinthion thalassion" was substituted for olive branches in Isis-processions at Taphosiris (West of Alexandria): *A. inculta* is described by Delile, as observed by him toward the Red Sea in the Desert, with marks of having been cropped by cattle. Farther North, the "sëriphōn" or "apsinthion thalassion" employed as a vermifuge, is further described by Dioscorides as an herb with slender branches resembling the "avrötōnð mikrø," and abounding along the Taurian mountains in Cappadocia where cattle fatten on it; an account repeated by Pliny *xxvii. 29* and *xxxii. 31*. Sprengel ascertained by experiment that cattle will feed on various species of *Artemisia*.

Fifty-first generation. Jan. 1st, 2600, mostly beyond youth:

2593 B. C. = "16th year of Pepi," found on the monuments — (C. Mull. fr. Maneth. p. 555).

2591 B. C. = "4th Mesori, 18th year of Pepi," in a tablet at Wady Maghara, examination of the mines there by a commission — (Birch).

An inscription by Una, priest of the pyramid of Pepi, has been found at San or Tanis. — The pyramid was probably "one of the group at Gizeh" (Birch).

The name of king Merenra occurs at Wadi Maghara, Chenoboskion (Leps. d. ii. pl. 113), in a tablet on the Kossor road (Glid. analect.), and in an inscription at Abydos with evidence that he immediately succeeded Pepi — (Mariette 79); also on monuments of later times, as in the chamber of kings at Karnak, and a different form of apparently the same name in the tablet of Abydos.

The priest Una, after holding office under Athi and Pepi, was placed by Merenra in charge of an expedition up the Nile, to procure syenite for the royal pyramid — (Birch).

Merenra himself ascended the Nile, and an inscription at Asouan records his passage and return — (Birch).

The quarries of *granite* and *breccia-verde* at Hamamat, worked under this dynasty; to which belong "nineteen rock tombs" at Zauiet-el-meitin; and a few days farther South, groups of tombs at Schech-Said, El-Harib, Wadi-Selin; and farther on at Qasr-e-Saiat, these being the last in this direction of the "interesting tombs of the Old Monarchy" (Lepsius eg. and sin. p. 16, 22, and 116).

"2577 B. C. = beginning of the Second cycle" (Chinese chron. table, further referred to the "21st year of Chao-hao" but reducing the reigns anterior to 2255 to the limit of possibility, makes the date too early for the commencement of Chinese history).

Fifty-second generation. May 1st, 2567, mostly beyond youth:

Merenra succeeded by his brother Neferkara — (Leps. k. pl. 6, and Birch).

2555 B. C. (= 2608 — "53" = 2496 calendar years + "7 + 53" of the Afr.-Maneth. table). The "nitökris" (= Seventh dynasty of seventy days) is placed "before Neferkara" in the Turin papyrus (Birch).

2554 B. C. = "second year of Neferkara," arrival of a commission to continue the works at Wady Maghara. — (Birch).

Accession of the Eighth dynasty, a Memphite dynasty. The name of king "Snofreka-annu," not found on contemporaneous monuments, — occurs in about this place in the tablet at Abydos.

Alorus, a Chaldean, and regarded by the Chaldeans as their first king (Abyden., Beros. in Alex. Polyhist., Euseb. i. p. 5, and Syncell. p. 39), born in Babylon as early as possible as this date. — Down to the time of the Assyrians, "9 + 40 + 11 + 8 + 10" = 87 kings of Babylon are enumerated by Berossus; the alleged additional "86" may therefore be compared.

The Shemitic or *Chaldean language* and nationality, as early therefore as the time of Alorus. 2548 B. C. (= 2555 — "7 years" of the Afr.-Maneth. table), accession of Phiöps. The name of king "No.reka-pepi seneb," not found on contemporaneous monuments, — is next in order in the tablet at Abydos.

Fifty-third generation. Sept. 1st, 2534, mostly beyond youth:

Alaparus son of Alorus, reigning at Babylon (Beros. in Alex. Polyhist., Euseb., and Syncell.).

The name of king "Nofreka * * *," not found on contemporaneous monuments, — is next in order in the tablet at Abydos.

"2517 B. C. = beginning of the Third cycle" (Chinese chron. table, further referred to the "81st year of Chao-hao"; but reducing the reigns anterior to 2255 to the limit of possibility makes the date too early for his accession).

The name of king "Nofrekara-rerele," not found on contemporaneous monuments, — is next in order in the tablet at Abydos.

Fifty-fourth generation. Jan. 1st, 2500, mostly beyond youth:

2497 B. C. (= 1413 + "348 + 103 + 190 + 443 years" of the Egyptian Chronicle. = 2498 calendar years = "348 + 103 + 190 + 16 + 43 + 185 + 100 + 100" of the Euseb.-Maneth. table, the Afr.-Maneth. table giving 2609 — "100 — 1 — 12" = 2496), a date possibly marking the accession of Aththöes or Alththöes head of the Ninth dynasty, a Heracleopolite dynasty. Aththöes proved "more cruel than any of his predecessors," and "wrought evil throughout all Egypt" until becoming insane he was killed by a crocodile (Maneth.). The name of Nofrekarakhentu, not found on contemporaneous monuments, — occurs in about this place in the tablet at Abydos.

A Chaldean named Almélon or Amelon, of the city of Pantibiblis, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb., and Syncell.).

The name of Tatkarama . . ., not found on contemporaneous monuments, — is next in order in the tablet at Abydos.

Fifty-fifth generation. May 1st, 2467, mostly beyond youth:

Ammenon, a Chaldean of Pantibiblis, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb., and Syncell.).

The name of Nofrekaranebi, not found on contemporaneous monuments, — is next in order in the tablet at Abydos.

"2457 B. C. = beginning of the Fourth cycle" (Chinese chron. table, further referred to the "47th year of Tchou-n-hiu;" but clearly too early for his accession). Fou-hi, founder of the Chinese empire, may have been at this time living.

Hardly earlier than this date the *Sixty-year period* established in China, possibly, as alleged, by Fou-hi (Pauth. p. . .), but clearly derived from Babylonia, *Sexagesimal arithmetic* and knowledge of the Egyptian Division of time being implied. From the time of adoption — the Chinese chronological reckoning has continued uninterrupted; a circumstance without parallel, most nations having yielded to the seductive innovation of counting by centuries.

Castanea vesca of Eastern Asia. Called in Britain *chestnut*, by Chaucer "chastein" (Prior), in Celtic "castan" or "kistin" (Davies, and Legon.), in French "chataigne" or "marron" (Nugent), in Germany "kastanie" (Grieb), in Italy "castagno" and "marone" (Lenz), in Greece "kastania" (Sibth.). Indigenous in Northern China, — relics of the original forest remaining throughout the Tcheou dynasty to the Han "about B. C. 200," the fruit more esteemed than in later times, though the tree continues to be cultivated (Cibot mem. Chin. iii.); was observed by Kaempfer, and Thunberg, in Japan, as far South as Jedo and Miaco, and called "kuri" or "ruts." Westward, is not enumerated among fruits known to the præhistorical Greeks, but was brought from Sardes (Plin. xv. 25), and derived its name, according to Nicander alex. v. 271 and scholiasts, from the city of Kastanithi (in Pontus or that in Thessaly); the "sarthianē valanōs" is mentioned by Diphilus, and Dioscōrides; the "amōta" by Agilochus (Athen. ii. 40 to 43); the "karuōn tō platu" by Xenophon anab. v. 4. 29; the "thiōs valanōs εὐνοϊκῆ" by Theophrastus i. 18 to iii. 10, and the "kastanēia" by Mnesitheus, Heracleon of Ephesus, and Diodorus ii. 50: *C. vesca* was observed by Sibthorp, and Fraas, seemingly wild in Northern Greece and throughout the middle region of the mountains; by Rabbi Schwarz, in Palestine; but the nuts known in Egypt in the time of Athenaeus, and observed there by Baumgarten i. 14 were of course imported. Westward, the "castanea" is enumerated among cultivated trees by Virgil, is mentioned also by Columella, Gargilius Martial, and Palladius; *C. vesca* has become naturalized on the mountains of Southern and middle Europe, and a tree near Tortworth in England, noted for its great size in "1135," continues standing (A. Dec.). By European colonists, was carried to the Canary Islands and Madeira (Buch p. 178, and Lemann); and nuts to Northeast America, where they continue to be sparingly imported, but I am not aware of any attempts at cultivation.

Cannabis sativa of Tartary. Called in Britain *hemp*, in Anglo-Saxon "henep" (Prior), in Germany "hanf" (Grieb), in France "chanvre" (Nugent), in Celtic and Arabic "kanab" (Reyn., Legon., and A. Dec.), in Italy "canape" or "canapa" (Lenz), in Greece "kannavi" (Fraas), in Persian and Hindustanee "bang," in Bengalee "ganga" (Roxb.), in Sanscrit "bhanga" or "gunjika" (Pidd.). Furnishing the cloth originally worn together with furs by the Chinese; — the sign for hemp occurring in alphabetic characters older than the Tcheou dynasty (Hiu chin, and Pauth. p. 43 to 54); the plant mentioned repeatedly in the Chou-King; observed by Bunge around villages on the Northern border of China; by Kaempfer, and Thunberg, cultivated and springing up spontaneously in Japan, and called "ba" or "ma" or usually "asa." Westward, hempen cloth is mentioned in the Institutes of Menu (transl. Deslongch.), was worn by the Thracians in the days of Herodotus iv. 74, fumigation with hemp seed being at the same time practised by the Scythians: *C. sativa* was observed by Loureiro ii. p. 116 in Cochinchina; by Mason v. p. 487, "exotic" in Burmah and called "ben;" is known to grow to all appearance wild in Siberia (Ledeb.) and Northern Hindustan (Roxb.), is besides cultivated throughout Hindustan "for the sake of the intoxicating liquor called 'bhang,' and "the leaves which are smoked to cause intoxication" (Rheede x. pl. 60, and Graham); was observed by Thunberg iii. 4 in Austral Africa, under cultivation by the Caffre tribes, and in one instance by Hottentots, and called "dakkan" (a name indicating introduction by Hindus); is cultivated even by the natives of Western Equatorial Africa, where leaves prepared for smoking were procured by H. McMurtrie (journ. Bost. nat. hist.). Northward, the "kannavis" is mentioned by Ephippus, and Dioscorides; was first made into cordage by king Hiero of Syracuse, who imported the material from the Rhone (Athen. v. 40); "cannabis" cordage is distinctly mentioned by Varro xxv (Gell. xvii. 3), Columella, and Pliny; and the use of the fibre is alluded to in the Mishna (Reyn p. 434): *C. sativa* was observed by Fraas frequent in Attica; by Lenz, in Italy; and is known in at least the cultivated state in Russia and middle Europe. "About six centuries" ago (Lane), its intoxicating properties became known in Egypt, where the plant has since been cultivated under the name of "sjaranek" or "hachych" (Forsk., Del., and Clot-Bey). By European colonists, was carried prior to 1639 (W. Wood) to Northeast America, where it continues chiefly near dwellings, but on the Lower Ohio is regularly cultivated. The stem according to Burnett, and Lindley, furnishes "the best of all cordage," and the seed has the "singular property of changing the plumage of bullfinches and goldfinches from red and yellow to black if they are fed on it for too long a time or in too large a quantity."

For "certain knots made in cords" (the *quippus*), by means of which the Chinese were governed, Fou-hi substituted *writing*; employing for this purpose the "koua symbols" (Confuc. on the Y-King, and Pauth. p. 25); eight in number, consisting of parallel lines variously-broken to signify "heaven, earth, thunder, mountains, fire, clouds, water, wind" — (according to their transmitted forms figured by Pauthier). Evidence exists of the use of these symbols as early at least as the Hia dynasty (Visdelou pantheon litt. p. 138).

2449, Feb. 28th (F. Bailly), *conjunction of the planets* Mercury, Mars, Jupiter, and Saturn . . . ; described in the Chinese annals as of "five planets in the constellation Ing-che."

The stars perhaps already mapped into *constellations*.—Tables of constellations occur in Egyptian tombs under the Twentieth dynasty (Champoll); and certain constellations are mentioned by Homer, and in Job xxxviii. From a remote period, the names of several constellations continue unchanged; translated merely into different languages.

2441 B. C. (= 2442 calendar years = 2609 — “53 — 7 — 100 + 6 — 1 — 12” of the Afr.-Maneth. table), accession of the Tenth dynasty. The name of king Nuantef has not been found on contemporaneous monuments:—but occurs in later times, in the chamber of kings at Karnak.

Fifty-sixth generation. Sept. 1st, 2434, mostly beyond youth:

Amegalarus or Megalarus, of Pantibiblis, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb., and Syncell.).

Nuantef succeeded by his brother Nuantef II.; whose name occurs on contemporaneous monuments — (Leps. k. pl. 10), and on his own coffin (now in the British museum).

Fifty-seventh generation. Jan. 1st, 2400, mostly beyond youth:

“2397 B. C. = beginning of the Fifth cycle” (Chinese chron. table, further referred to the “39th year of Tikou;” but clearly too early for his accession).

Chin-nong, the successor of Fou-hi, may have been at this time ruling China. To his reign, various inventions and improvements are attributed, including *agriculture* and the introduction of the “five kinds of grain:”

Faba vulgaris of Central Asia. Called in Anglo-Saxon and current English *bean*, in Holland “boon,” in Denmark “bonne,” in Sweden “böna,” in Germany “bohne” (Prior), in Slavonian “bob” (Moritz.), in Celtic “fa” or “fio” or “fav” (Legon.), in France “fève” (Nugent), in Italy “fava” or “fava cavallina” (Lenz), in Greece “kōukkia” (Fraas), in Egypt “ful” (Forsk.), at Surat “vackla” or “backla” (Graham). Included among the “five kinds of grain” introduced in the reign of Chin-nong:—observed by Bunge under cultivation in Northern China; and by Kaempfer, and Thunberg, cultivated in Japan and called “sandsu” or usually “sora mame.” Westward, has no Sanscrit name (Roxb., and Pidd.); is regarded as only recently introduced into Hindustan (Ainsl., Royle, Wight, and A. Dec.), continuing unknown in Ceylon (Moon), but is “cultivated at Surat to a small extent” (Graham); was observed by Lerche to all appearance wild on the confines of Persia near the Caspian (Willd.). Farther West, “phwl” were brought to David at Mahanaim (2 Sam. xvii. 28), are mentioned also by Ezekiel iv. 9; the “kuamōs ēllēnikōs,” in Mul. morb. i. 608, and Dioscorides; “fabula” by Plautus, and Gellius iv. 11. 1; “fabalia” by Cato xxxvii. 2; the “faba” by Terence, Varro, Cicero, Virgil, Columella, and Pliny: *F. vulgaris* was observed by Abd-allatif in Egypt, where it continues one of the principal objects of cultivation both for the seeds and stems (Forsk., Del., and Clot-Bey); was observed by Chaubard, and Fraus, under cultivation in Greece; and is known in the cultivated state in Italy and throughout Southern and middle Europe (Brot., Pers., and Lenz). By European colonists, was carried to America, where in our Middle States it continues sparingly cultivated and is distinguished as the *horse-bean*.

Triticum vulgare of the plains around the Caspian. Called in Britain *wheat*, in Anglo-Saxon “hwæte,” in Gothic “hwaiteis,” in ancient Danish “hveiti,” in old High German “hveizi,” in Lithuanian “kwetys,” all meaning white grain (Prior), in Germany “weizen” (Grieb), in France “blé” or “froment” (Nugent), in Italy “formento” or “frumento” (Lenz), in Greece “sitari” (Forsk.), in Egypt “qamh” or “hontah” (Del.), on the mountains of Yemen “burr” (Forsk.), in Guzerat and on the Deccan “mar-ghoom” or “ghawut-gioon” (Graham), in Hindustanee “genhun” or “gandum” or “godhum,” in Bengalee “godhum” or “gom” (D’roz.), in Burmah “gyung-sa-ba” (Mason). Included among the “five kinds of grain” introduced into China under Chin-nong — (Stan.-Jul.): observed by Kaempfer, and Thunberg, under cultivation in Japan, in two varieties and called “ko muggi.” Westward, was observed by Mason “exotic” in Burmah; has a Sanscrit name (Roxb., and Pidd.), was already in Hindustan when invaded by Alexander (Theophr.), and continues to be “cultivated in various parts of the Deccan and Guzerat” (Graham): was observed by Onesicritus wild farther North in the Musciana district; by Berosus, between the Tigris and Euphrates, where also it was found wild by Olivier iii. p. 460; and according to Strabo xi. 7. 2, seeds itself in Hyrcania along the Caspian. Farther West, the “br” was already in Egypt in the days of Joseph (Gen. xli. 35 to 49), is mentioned as cultivated in Palestine in Psalm lxx. 13, Proverbs xi. 26, Joel ii. 24, and Amos v. 11; the “purōs” furnished the straw wrapped around the presents sent by the Hyperborei to Delos (Herodot. iv. 33), is mentioned as cultivated in Greece by Homer il. x. 569 to xiv. 123, Theophrastus, and Dioscorides; the “sitōs” is mentioned by Homer od. ix. 191 to xxiv. 208, Herodotus iv. 109, Demosthenes 310. 1, and Strabo; and the “triticum” by Cato, Varro, Cicero, Virgil, and Columella: *T. vulgare* was observed by Forskal under cultivation on the mountains of Yemen; continues abundantly cultivated in Egypt (Forsk., Del., and Lois.-Deslongch. cereal. p. 98); was

observed by Forskal, Chaubard, and Fraas, under cultivation in Greece; by Lenz, in Italy; already during the Stone Age was cultivated in Switzerland, as appears from debris of the earliest villages (Heer, and Troyon p. 44), and continues under cultivation throughout Europe as far as "Lat. 64°" (A. Dec.). By Columbus, was carried to America (F. Columb. 53), where it has become a main object of cultivation in portions of the United States; was also carried by European colonists to Australia and New Zealand, growing crops in both countries met with by myself. (See *T. turgidum*).

Panicum miliaceum of Central Asia. Called in Italy "mei" or "miglio," in Greece "kēghēi" (Lenz), in Germany "hirse" (Fraas), in Egypt "dokhn" (Del.), in Yemen "miləh" or "kossəjb" (Forsk.), in the environs of Bombay "warree" or "sawee Cheena" (Graham). Probably one of the two kinds of *millet* introduced into China under Chin-noung: — observed under cultivation there by Bunge p. 70 (A. Dec.). Westward, was observed by Roxburgh i. p. 310 in Hindustan, by Graham "a dry grain cultivated" around Bombay. Farther West, the "thhn" (near "thgn" the general name of bread-corn in Gen. xxvii. 28, Num. xviii. 27, Deut. xxviii. 51, and Lam. ii. 12) is mentioned by Ezekiel iv. 9; the "mēlinē," by Sophocles, and Harpocration; as cultivated in Asia, by Herodotus iii. 117, and Xenophon anab. i. 5. 10; is identified in Syn. Diosc. with the "ēlumōs," and the "ēlumōs" is mentioned in 2 Morb. mul. 2, Theophrastus viii. 1, and Strabo; the "miliūm," by Cato, Varro, Cicero, Virgil, Columella, and is described by Pliny xviii. 10 to 24 "comae granum complexae fimbriato capillo curvantur" and the principal food of the "Sarmatarum gentes" who eat the crude meal mixed with mare's milk or even blood, this and barley being the only kinds of grain known to the "Aethiopes": *P. miliaceum* is described by Bauhin theat. pl. 502, is termed "miliūm semine luteo" by Tournefort inst. 514, "miliūm panicum" by Miller, "miliūm esculentum" by Mönch, "p. panic. laxa flaccida" by Persoon; was observed by Hasselquist in Palestine; by Forskal, along the base of the mountains of Yemen; by him, and Delile, occurring spontaneously around Cairo; by Sibthorp, and Fraas, in cultivated ground in Greece; by Pollini, and Lenz, in Italy; and is known to be cultivated in middle Europe (Pers.). By European colonists, was carried to Northeast America, where I have met with it in gardens.

Setaria glomerata of Central Asia. Called in Britain *panic* (Ainsw.), in Italy "panizzo" or "panig" or "panico" (Lenz), in Greece "kēghri" or "Phragkōkēghri" (Fraas), in Hindustanee "kangni" (D'roz), in the environs of Bombay "kala kangnee" or "kora kang" (Graham). Probably one of the two kinds of *millet* introduced into China under Chin-noung: — observed under cultivation there by Bunge. Westward, a species according to Mason perhaps identical is "exotic" in Burmah and called "pyoung-lay-kouk"; and *S. glomerata* was observed by Rumphius v. pl. 75, Roxburgh, and Graham, in Hindustan. Farther West, "phng" was carried from "Judah and the land of Israel" to the market at Tyre in the days of Ezekiel xxvii. 17; the "kēghrōs" (named from resemblance to fig-seeds) was cultivated from Babylon to the Borysthenes in the days of Herodotus, is mentioned also in the Hesiodic scut. herc. 398. Xenophon anab. i. 2. 22, Morb. mul. i. 619, Theophrastus, and Dioscorides: the "panicum" is mentioned by Cato, and Columella, was found by Caesar stored for food by the inhabitants of middle Europe, is described by Pliny xviii. 10 to 25 as "a paniculis dictum cacumine languide nutante," cultivated in Gaul as well as on the Po in Northern Italy, and the favourite article of diet along the Black Sea: *S. glomerata* is figured at Pompeii (Schouw iv.); is termed "p. Italicum" and "p. Germanicum" by Linnæus; was observed by myself under cultivation in both Upper and Lower Egypt; by Fraas, rare in Greece; is known to be cultivated in Italy (Pollini, and Lenz) and as far as middle Europe (Roth, and Kit.). By European colonists, was carried to Northeast America, where it continues under cultivation in our Middle States for its seeds, but in our Southern States for the stems and leaves "as green food for cattle" (Chapm.).

Oryza sativa of Tropical Hindustan. Called in English *rice*, in French "riz" (Nugent), in German "reis," in Italy "riso" (Lenz), in Greece "rizi" or "ruzi" (Fraas), in Egypt "rouz" or "arz" (Del.), in Hindustanee "chawal" or "biranj," in Bengalee "chaul" or "tandul" (D'roz.), in Cingalese "ooruwee," in Sanscrit "arunya" (Pidd), in Burmah "sa-ba" (Mason), in all Malay countries "padi" or "bras" (Crawford). Enumerated as the fifth kind of grain introduced into China under Chin-noung — (Stan.-Jul.); mentioned besides in the Chou-King (Pauth.); and to the present day extensively cultivated: was observed by Kaempfer, and Thunberg, in Japan; by Blanco, and myself, under cultivation on the Philippines; by Loureiro, in Cochinchina; and by Mason, "exotic" in Burmah. Westward, is mentioned in the Sama Veda (transl. Stevens.); was eaten by the Hindus and "ōinōs ōruzēs" manufactured by them when invaded by Alexander (Aristot. an. viii. 25, Aristob., Megasth., Theophr., and Athen. iv. 39); and continues cultivated in numerous varieties (Graham, and myself): "wild rice" is however mentioned in the Institutes of Menu, and a kind called by the Telingas "newaree," growing around lakes in the Circars and the seeds highly prized, is known only in the wild state (Roxb., and A. Dec.). Farther West, was carried at an early date to Madagascar (Ellis) and Equatorial Africa, and (as ascertained by myself at Zanzibar) continues cultivated by

Negro tribes as far inland as the Monomoisy: is mentioned by Hellanicus (Ruel ii. 18); in the days of Strabo xv. was cultivated in Bactriana, Suziana, Babylonia, and Syria, having already reached the Mediterranean; the "ōruza" is mentioned also by Dioscorides, and Galen; the "ἐλεῖογῆνὲς ὄρουζα" by Hesychius; and the "oryza" by Horace satir. 2. 3. 155, and Pliny: (1) sativa was observed by Delile under cultivation in Egypt; by Fraas, in Greece; and by Lenz, in Italy. By European colonists, was carried to America, where it continues extensively cultivated in the marshes of our Southern States.

"Fiftieth year of Nuantef II.," in a tablet in the Assasif at Thebes — (Birch).

The coffin of Nuantef II. was discovered in tombs of kings of this dynasty in the Gurna quarter of Thebes; and is perhaps the earliest evidence of the existence of this city. — The next or Eleventh dynasty, is the earliest Theban dynasty mentioned by Manetho.

In the ornamental work on this coffin, *ivory* is enumerated by Birch (Glid. otia Eg.); procured in all probability on the Upper Nile from the *African elephant*:

Also *obsidian*; brought from some distant country, there being no volcanic district immediately around Egypt:

And *bronze*. — The art of forming this compound metal, known from other evidence to have preceded the historical records of Greece (see Sm. dict. gr. and rom. antiq.).

The *tin* required was probably at first procured in the East, the metal occurring in Drangiana or Eastern Persia — (Strab. xv. 2. 10); its Sanscrit name "kastira" appears to have given rise to the Arabic "kasdir," and Greek "kassitērōs" (see Cassiterides): tin is besides enumerated in the Chou-King (Pauth. 48) among the products of China. On the other hand, no evidence has been discovered of the transportation of tin across Switzerland during the Stone period (compare Troyon p. 254).

Ornamental gilding on the same coffin, — enumerated by Birch: the Egyptian name of *gold* is given as "nōuv" or "nōuf" (Sept., and ms. Borg.); the word "nkbt" meaning gold-washing, occurs in hieroglyphic characters under or before the Twelfth dynasty (Rossellini); the terms in which the gold of Havilah is mentioned in Genesis ii. 12, imply a knowledge in the narrator of gold from other sources: and gold mines worked by ancient Egyptian kings in the mountains along the Red sea South of the Kosseir road, are described in detail by Agatharchides, Edrisi, Abulfeda, Makrizi, and Wilkinson (geogr. soc. Lond. ii. p. 47).

Erythrina Abyssinica? of the Upper Nile. A tree abounding in the Abyssinian province of Kuara, also in Fazoglo, Nuba, and Guba, its seeds used from the earliest times by the Shangalla as a weight for gold — and called "carats," giving rise to the *carats* of gold dealers (Bruce vii. pl. 19). The "kardh" is described by Abu Hanifa as a large Leguminous tree whose seeds are used for weights (Abd-allat.).

The lining of the coffin presents inscriptions in *hieratic writing* — (Birch): known to be cursive hieroglyphics, bearing the same relation to hieroglyphic characters as handwriting does to printed letters.

The name of king Muntuhotep occurs at Assuan; — also, in the chamber of kings at Karnak, and apparently the same name in the series at Gurna (Leps. d. ii. pl. 149, and k. pl. 11 and 20). This name may therefore have occupied one of the six vacant places preceding the Twelfth dynasty in the tablet at Abydos.

Davonus or Daonus, a shepherd of Pantibiblis, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb., and Syncell.).

Fifty-eighth generation. May 1st, 2367, mostly beyond youth:

"2366 B. C. (= 1st year of Ti-tchi," Chinese chron. table; but clearly too early for his accession).

Eodoranchus or Euedorachus, of Pantibiblis, reigning at Babylon. — (Berosus in Alex. Polyhist., Euseb., and Syncell.)

The name of king Nuantef III. has been found on contemporaneous monuments — (Leps. k. pl. 11).

"2357 B. C. (= 1st year of Thang-yao or Yao" in the Chinese chronological table; Du Halde i. 131 further states, that "from the reign of Yau beginning in 2357." Chinese history is regarded as certain: the date is clearly too early for the accession of Yao, but) may mark the founding of a new dynasty by Hoang-ti: who guided by a car "indicating the South," obtained success in military expeditions and extended his empire Southward as far as the river Kiang (Pauth. p. 29). That the *magnetic needle* was first discovered by the Chinese, is regarded by Amyot and writers generally as certain.

"In the reign of Hoang-ti" (topog. Cant., and Pauth. p. 472), arrival in China of a stranger "from the South, journeying upon a *white deer* and offering as tribute a cup and skins" (a description agreeing better with a stranger from the North, with *reindeer* and furs): — in the region North of the Altaian mountains, the "Mecri" (according to Marco Polo 71) "chavauchent les cerf," use

the reindeer for horses. Westward, the "tarandus" of the Scythians is described by Pliny viii. 52; bones of the reindeer, *Cervus rangiferinus*, occur among debris of the "Stone age" in Europe; the animal has been long domesticated in Lapland; and is figured under the name of "rangier" by Gaston Phoebus (Pouchet p. 70).

The name of king Muntuhotep III. occurs in contemporaneous inscriptions in the quarries at Hamamat (Leps. d. ii pl. 149, and k. pl. 11).

"Second year of Muntuhotep III.," in two inscriptions at Hamamat — (Birch).

"2337 B. C. = beginning of the Sixth cycle" (Chinese chron. table; referred there to the "21st year of Yao," but clearly too early for his accession).

The accession therefore of Chao-hao, son of Hoang-ti and uncle of Tchouen-hio (Pauth. 30), not earlier than the last-named date. Chao-hao prescribed dresses to indicate the rank of civil and military officers (Pauth.); — and in his reign, a new kind of music was invented in China.

The seventeenth chapter of the Egyptian ritual or Book of the Dead, the most voluminous work in hieroglyphic writing extant, is inscribed on the coffin of queen Mentuhept (Buns. and Birch v. 89). — Other extracts on coffins have been traced by Birch as far back as the Twelfth dynasty.

"aphōph" or "aphōp" or "aphōphi" giant, mighty man; "phōf" or

"p-hōf" serpent. The character of the slain aphophis occurs in the Book of the Dead, — also under the . . . dynasty (Champ. mon. iv. pl. 320 and 222); and the knives not yet inserted, under the Twenty-sixth dynasty (Leps. d. iii. pl. 26). The character of the free living aphophis occurs as early at least as the . . . dynasty (Rosellin. mon. stor. ii. 24, and Champ. dict. 170). The aphophis wearing the crown of Lower Egypt, , occurs as early at least as the . . . dynasty (Champ. dict. 88). Among the Greeks, Apollo slew the serpent or dragon "puthōn," and hence the name "Pythian" applied to his oracle at Delphi (Homer od. viii. 80 and xi. 581, the Hesiodic Theog. 499, Pind., Aeschyl. choeph. 928, and Herodot. viii. 47).

The above hieroglyphic characters imply knowledge of the gigantic serpents, *Pythons* of Equatorial Africa. — One of these serpents, "thirty cubits" long, was brought alive from Equatorial Africa to Alexandria in the reign of Ptolemy II. (Agatharch., in Diodor. iii. 25).

Fifty-ninth generation. Sept. 1st, 2334, mostly beyond youth :

2329 B. C. The Yang-pao-theou or pigmies who sent tribute to China in the "29th year of Yao" — (according to the Tchou-chou), are referred in the melanges Remusat iii. p. 256 to the Laplanders. The country of the Yang-pao-theou, according to the historical romance called San koué tchi, is situated Northwest of Sogdiana; they were numerous in the time of the 'Wei, according to Tou-chi; and are mentioned by Ma-touan-lin in the Thirteenth century A. D.

Amemphisinus, a Chaldean of Lanchares or Laranchis, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb., and Syncell.).

Tchouan-hio or Tchouen-hio, a "nephew" of Chao-hao, perhaps already "elected" emperor. He reformed the calendar, making the year commence, in accordance with the above-mentioned conjunction of "five planets" with the first lunation of spring. China now extending North to Tartary, East to the sea, West to the sandy Desert, and South to Cochinchina (Pauth.).

Pæonia officinalis of mountains from Italy to Central Asia. Called in Britain *peony* or *piony*, in France "pioine" or "pivoine" (Nugent), in Germany "päonie" or "pfingstrose," in Italy "peonia femina" (Lenz), in Greece "makōs" (Sibth., and Fraas). Employed medicinally by the Chinese throughout all antiquity — (Cibot in mem. Chin. iii. p. 461): observed by Thunberg "in almost every garden" in Japan. Westward, the "paiōnia" or "glukusithē" or "pēntōrōvōs" is considered by Pliny xxiv. 102 and xxv. 10 the earliest known medicinal plant, in use also among the Magians; derived its name from the physician of the gods sometimes identified with Apollo, was employed medicinally by the five Idaei Dactyli and their successors the Curetes and Corybantes, was cultivated in the garden of Hecate (Orph. hymn and argon. i. 916, Strab. Plut. lun., and Spreng.); is identified in Syn. Diosc. with the "ithaiōus thaktulōus" or "aglaōphōtitha" or "sēlēniōn;" is mentioned also by Aeschylus, the comic poet Plato, in the Hippocratic treatises mul. morb. 56 and superf. 20, and by Theophrastus, and Nicander; by Pliny xxvii. 60, as collected on the mountains of Italy, precautions being taken against the "picus martius," and employed medicinally and "faunorum in quiete ludubriis;" the "paiōnia thēlēia" is also distinguished by Dioscorides, and Pliny: *P. officinalis* is described by Fuchsius 202, and Lobel pl. 682; is termed "p. communis vel fœmina" by Tournefort inst. 274; is known to grow in North Italy on the wooded slopes of the Alps (Pers., and Lenz); was observed by Sibthorp, and Fraas, on the loftier mountains of Crete and Greece; is described by Pallas (Steud.); and roots and seeds of the "pæonia" are enumerated by Alpinus, and Forskal mat. med., as imported for medicinal use into Egypt. By European colonists, *P. officinalis* was carried to Northeast America, where it has become frequent in gardens. Its seeds according to Lindley are "emetic and cathartic," and its "root reported to be antispasmodic."

Pæonia corallina of the Altaian mountains. Called in Britain *peony* or *piony* (Prior), in Italy

"peonia" or "peonia maschia" (Lenz), in Greece "lēgōunia" (Sibth.) or "makōs" (Fraas). Also employed medicinally by the Chinese throughout all antiquity — (Cibot): known to grow in Siberia (Pers., Pall., Bieb., and Steud.). Westward, the "paiōnia arrēn" is distinguished by Dioscorides, and according to Pliny xxvii. 60 grows also in the woods of Italy: *P. corallina* is described by Morison xii. pl. 1, is termed "p. folio nigricante splendido quæ mas" by Tournefort inst. 273; was observed by Sibthorp, and Fraas, on the mountains of Greece; by Lenz, in Italy; is known to occur cultivated and naturalized throughout middle Europe, and from "1803" naturalized in Britain (Engl. bot. pl. 1513, Wats., and A. Dec.).

Artemisia vulgaris of Europe and Northern Asia. Called in Britain *mugwort*, in Anglo-Saxon "mug-wyrt" or "mucg-wyrt," in old English "modirwort," in Ælfric's glossary "matrum herba," by Macer Floridus "herbarum matrem" (Prior), in France "armoise" (Nugent), in Germany "mutterkraut" (Grieb), in China "y-tsao," and known there throughout all antiquity, — for medicinal properties so highly esteemed as to be regarded the herb of physicians, employed besides for various novel purposes, and growing in all the provinces (Cibot mem. Chin. v): carried aboriginally to Java (Zoll.) and Hindustan (Dec. prodr. vi. p. 112), but known to grow wild in Northeastern Asia and throughout Siberia (Ledeb., and Wats.). Farther West, the "artemisia" was named after Artemis Ilithya, or according to others its original name "parthenis" was changed in honour of Artemisia (Plin. xxv. 36); the "mētrōas artēmisias" is mentioned by Heras (Galen comp. med. gen. vii. 14); *A. vulgaris* is termed "a. vulgaris major" by Tournefort inst. 460; is known to occur in waste places around Caucasus (Bieb.), was observed by Sibthorp around Bursa and Smyrna and in shaded situations in Northern Greece; is known to occur in Italy (Ten. p. 419), and in waste and cultivated ground as far as Lapland (Pers., and Fries). By European (or possibly Asiatic) colonists, was carried to North America, where it now occurs from the Arctic circle throughout Canada, having reached California before the voyage of Beechey (Hook., and Arn.): was observed by myself naturalized along the Lower St. Lawrence; and by Pursh, and A. Gray, in "waste places near dwellings" in our Northern States. Clearly by European colonists, was carried to Austral Africa (A. Dec.: see *A. arborescens* and *A. campestris*).

The name of king Nuantef IV. occurs on a vase (now in the possession "of Dr. J. Lee"), and on other contemporaneous monuments — (Glid. analact., and Leps. k. pl. 11 and 68): and is in about this place in the chamber of kings at Karnak.

"Second year of Ranebtjer" or Nuantef IV., the latest date in his reign found on the monuments (C. Mull. fr. Man. p. 555).

Sixtieth generation. Jan. 1st, 2300, mostly beyond youth:

"2297 B. C. (= 61st year of Yao," according to the Li-tai-ki-sse, and Pauth. p. 35), the Great inundation. Tikou or Tiko, a grandson of Tchouan-hiu, may have been at this date reigning. He introduced *polygamy* into China: — where the institution continues to the present day (see Pauth.).

Otiartes, a Chaldean of Lancharis or Laranchis, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb., and Syncell.).

After ruling China "ten" years, Ti-tchi dethroned by the principal men. The name of the years changed from "nian" to "tsai" (Amyot, and Pauth. p. 31 and 475).

"2285 B. C. (Chinese chron. table), "Chun associated in the government by Yao." The accession of Yao himself can hardly be placed earlier than this date (see below).

The institution of the *drum* and *tablet* for giving advice to the emperor, established by Yao: — or according to some authorities, by his colleague and successor Chun.

Quotations regarded as belonging to the time of the Chinese emperor Yao have been preserved in the Chou-king (Pauth.); and if genuine, are the earliest *transmitted writings*.

The title of a king whose name remains unknown, occurs in a contemporaneous inscription in the quarries at Hamamat (Leps. d. ii. pl. 150, and k. pl. 11).

"In the time of Thang-Yao" (hist. Cor., and Klapr.), the Koreans having neither chiefs nor king, a supernatural man descended under a "than-mou" or santal tree and was made king. He was called Than-kiun, and resided first at Ping-jang, — but afterwards removed to Pë-yö; where his descendants reigned nearly a thousand years.

"2277 B. C. (= 81st year of Yao and 9th year of the association of Chun," Chinese chron. table), beginning of the Seventh cycle.

On the Egyptian monuments, *animal-headed gods* make their first appearance (compare Leps. d. ii. pl. 119, 144, and 150).

2669 B. C. (= 2210 + "16 + 43 years" of both Maneth. tables), accession of the Eleventh dynasty, a Theban dynasty.

The name of king "Nacht-en-ra," not found on contemporaneous monuments, — occurs in about this place in the chamber at Karnak.

Sixty-first generation. May 1st, 2267, mostly beyond youth:

"2255 B. C. = 1st year of Yu-Chun" (Chinese chron. table, and Pauth. p. 38), Chun now sole emperor. He abolished the practice of mutilating criminals: marking the face, cutting off the nose or feet, or making *eunuchs*; a class at first consisting only of criminals.

The title, chiefly erased, of another king whose name remains unknown, occurs on contemporaneous monuments. — He is placed next in order of succession by Lepsius k. pl. 11.

2250 B. C. = "6th year of Chun" (. . . Pauth. p. 38), visit of the emperor Chun to the four mountains Yo, at the four cardinal points of China, to offer sacrifices to the Supreme Being; there being as yet no temples.

Chun also instituted the "Five immutable rules" or obligations: between father and children, king and subjects, husband and wife, old men and young, and between friends.

Xisuthrus, son of Otiartes, reigning at Babylon — (Berosus in Alex. Polyhist., Euseb. i. p. 5, and Syncell. p. 39).

The name or title of a third king, found on the monuments, — is placed next in order of succession by Lepsius k. pl. 11.

Sixty-second generation. Sept. 1st, 2234, mostly beyond youth:

Deluge of Xisuthrus: and accession of Euechous, a Chaldean, as king at Babylon — (Berosus in Alex. Polyhist., and Euseb. i. 4. p. 18).

"2233 B. C." (= 330 + "1903 years" of Simplicius, Clint. i. p. 282 and iii. p. 505), beginning of the series of Babylonian *astronomical Observations*; — procured on the spot by Callisthenes, and sent by him to Aristotle.

2226 B. C. (= 2210 + "16 years" of the Maneth. tables, the Turin papyrus giving "19 years"), accession of Ammēnēmēs, head of the Twelfth dynasty: also a Theban dynasty. Amunemhat appears to have commenced the temple at Karnak, and his name occurs on contemporaneous monuments, in the quarries at Mokattam and Hamamat — (Birch); also somewhat later, in the Second tomb at Benihasan (observed by myself), and in the chamber of kings at Karnak.

"2224 B. C., Yu associated in the government by Chun" — (Chinese chron. table).

2219 B. C. = "8th year of Amunemhat" on a stela — (now in Paris, C. Mull. fr. Man p. 563).

2218 B. C. = "9th year of Amunemhat" on another stela; the latest date in his reign found on the monuments (C. Mull. fr. Man. p. 563).

Among *proverbs* extant on papyri, some are attributed to Amunemhat. The Egyptian proverbs (according to Lepsius Eg. and Sin. p. 390) somewhat resemble those of Solomon: and (according to Diodorus . . .), the wise sayings and actions of distinguished men, were read aloud to the Egyptian kings.

2217 B. C. = 39th year of Chun, and 8th year of the association of Yu" (Chinese chron. table), beginning of the Eighth cycle.

Manetho's First volume closing with the reign of Ammēnēmēs, indicates at least a chronological landmark. It may therefore be observed: that after excluding the extreme reigns of the Twelfth dynasty, the Turin papyrus gives "213 y. 1 mo. 17 d. — 19 y. — 3 y. 10 mo. 4 d. = 190 y. 3 mo. 13 d.; clearly the "190 years" preceding the Hyksos in the Egyptian Chronicle, and in the Euseb.-Maneth. table.

2210 B. C. (= 1413 + "263 + 518 + 16 = 184 + 453 + 160 years" of the Afr.-Maneth. table = "348 + 103 + 190 years" of the Euseb.-Maneth. table and the Egyptian Chronicle + 1539 × 2 — 1461 × 2; Manetho's general numbers giving 1540 × 2 + "16 — 2300 years" = 2209, and the Euseb.-Maneth. table giving besides 1613 + "103 + 250 + 245 years" = 2211), Ammēnēmēs succeeded by his son Sēsōghōsis or Sēsōghōris, second king of the Twelfth dynasty; to whom "Forty-six" years are assigned in both the Maneth. tables; but "forty-five" only in the Turin papyrus. The name of king Sesurtesen occurs on contemporaneous monuments throughout Egypt and Nubia as far as Wady Halfa: — also on monuments of later times, as in the chamber of kings at Karnak, and in the tablet at Abydos. Papyrus rolls are extant, having the names of Amunemhat and Sesurtesen written in vertical columns (Lepsius. eg. and sin. p. 395).

From Chun whom Yao associated, — to Wen-Wang, "one thousand" years are reckoned by Mencius (Du Halde i. p. 131).

"2205 B. C. = 1st year of Yu," now sole emperor, and head of the new dynasty of the Hia — (Chinese chron. table). An inscription attributed to Yu, is now known to be of much later date (see silk).

The inventor of an intoxicating fermented liquor or of *alcoholic distillation*, banished by the

emperor Yu — (Chinese auth.). The next emperor but one, Tai-kang, is accused in the "Elegy of the five sons" of being too fond of this fermented liquor (Chou-king ii. 3, and Pauth. p. 55); "wine from wheat," and "from rice," are both mentioned in the Chou-king. Spirituous liquors are mentioned in the Institutes of Menu (Deslongchamps version); "wine from rice instead of barley" was seen in Hindustan by Megasthenes (Strab. xv. 153); and the ardent spirit from rice was found by Jean Carpin, Rubruquis, and Marco Polo, in use in Central Asia; and by Borri, in Cochinchina. An intoxicating "vin de zucar" manufactured in Hindustan, is further described by Marco Polo 180. From the first invention in China, some three thousand years elapsed before alcoholic distillation became known in Europe.

The Hong-fan, a treatise on moral and political philosophy, science, and religion, is attributed to the reign of Yu — (Chou-king iv. 4. 3).

Divination with the herb "chi" practised by the emperor Yu (Chou-king i. 3. 18); mentioned also in the Hong-fan.

"2204 B. C." (Graham Munjari tables), beginning of the Treta Yug or Silver Age among the Hindus, and (according to Bentley as. res. viii. p. 226) of *Hindu history*. Atri, the great grandfather of king Pururava, not earlier therefore than this date.*

Chomasbelus son of Euechous, reigning at Babylon — (Berosus in Alex. Polyhist., and Euseb.).

Sixty-third generation. Jan. 1st, 2200, mostly beyond youth :

The same year (= 1976 + "224 years" of Berosus in Alex. Polyhist., and Euseb. i. 4. p. 18), Babylon captured by the Medes under Zoroaster; and the accession there of the Median dynasty : — a succession of "8," or perhaps "8 + 11," Median kings of Babylon.

Zoroaster, founder of Median power though a Bactrian king, is identified (by Berosus in Mos. Choren. i. 5) with the "Zerovanus" who lived after the Deluge of Xisuthris. Zoroaster is also termed a Bactrian by Clemens Alexandrinus, Arnobius, Justinus i. 1, and Ammianus Marcellinus; and is spoken of as the first who "discovered the magic arts, and diligently investigated the principles of the universe and motions of the stars." (See below, Ninus)

"2197 B. C. = 1st year of Ki, of the Hia" or Third dynasty (Chinese chron. table), and a son of Yu; — the succession from this time hereditary, confined to a selection among the king's sons (Pauth. 54 and 60).

A "black granite" fragment of a colossal statue of king Sesurtesen — is now in the museum at Berlin.

His portrait occurs on a stela, or stone slab, recording the conquest of Nubian and Lybian Tribes.

This stela was discovered at the Second cataract of the Nile, near the sanctuary of a temple built by him. In accordance also with his father's plans, Sesurtesen founded or continued the temple at Karnak in Thebes.

By another marked change in monumental history, *obelisks* now make their appearance: as far as known first erected by Sesurtesen; one of *granite* proper (and therefore brought from some unknown quarter) at Heliopolis; another, at Crocodilopolis in the Faium. — From this time, obelisks, bearing apparently dedicatory inscriptions, are placed in front of temples; but occur only in the royal or dynastic cities, those sometimes designated by their tutelar deities: as Memphis by Pthah or Vul-

* *Sapindus rubiginosus* of Tropical Hindustan. A tree called in Burmah "hseik-khyæ" (Mason), and from early times affording sustenance to man in its fruit: — observed by Graham near "Bombay, rare;" by Wight in Southern Hindustan; by Roxburgh cor. i. pl. 62, its timber "very useful for a great variety of purposes, being large straight strong and durable." Farther East, by Mason v. 535 "exotic" in Burmah, and bearing "a small red fruit in bunches that is eaten by the natives."

Elæagnus conferta of the mountains of Hindustan and the Siamese countries. A large scandent shrub called in the environs of Bombay "amgool" or "amgoolee" (Graham), in Burmah "men-gu" (Mason), in Tagalo "alingaro" (Blanco), and from early times affording sustenance to man in its fruit of "an agreeable acid flavour:" — observed by Nimmo common "all along the Ghauts, Southern Concan and about Cochín;" by Roxburgh i. 440 in other parts of Hindustan; and by Hermann (Burm. pl. 39) on Ceylon. Farther East, by Mason v. 450 indigenous in Burmah, cultivated besides by the natives for its edible plum-like fruit; by Loureiro ii. p. 528 in Cochinchina; and by Blanco, along roadsides on the Philippines.

Antidesma paniculata of Tropical Hindustan and Burmah. A small tree called in Burmah "kyet-tha-hen" (Mason), and from early times affording sustenance to man in its fruit: — observed by Nimmo in the "Southern Concan" (Graham), and by Roxburgh iii. 770 in other parts of Hindustan. Farther East, by Mason v. 458, indigenous and frequent "in the neighborhood of Toungoo" in Burmah, bearing "a red sour fruit."

can; Heliopolis by Ra; Elephantine by Num or Agathodæmon; Crocodilopolis by Seb or Saturn; Abydos by Osiris; Tanis by Typhon; Thebes, perhaps by Horus; and it is known, that Sais once possessed obelisks.

"2188 B. C. = 1st year of Tai-kang, of the Hia" or Third dynasty — (Chinese chron. table).

2168 B. C. (= "43d year of Sesurtesen," Birch), death of Ameni, a military officer whose tomb is conspicuous in the series at Benihasan from the columns supporting the entrance: — supposed to have given rise a thousand years later to the "*Doric architecture*" of the Greeks.

In this or another tomb of the same series, all excavated under the Twelfth dynasty, an astronomical date is given: which has been determined by Biot at "about 2200 B. C." — (Champoll. Figeac anc. Eg. p. . .).

The *Indian bullock* (Rosellin. m. civ. pl. 20), distinguished by its hump, is figured in one of the tombs at Benihasan: — and under the Nineteenth and Twentieth dynasties is always in a distant country invaded by the Egyptians, used even for drawing cars (as to the present day in Hindustan). Eastward, the bullock is mentioned in the Sama Veda (transl. Stev.), Institutes of Menu (transl. bramin., and Mason); and though not met with in the Buddhist cave-temples, I found caparisoned Indian bullocks figured in the Braminical cave-temples at Ellora. The voice of the living animal, I often had occasion to remark, is only a sort of grunt, entirely distinct from the lowing of our own domestic cattle. (See Socotra).

As the military expeditions of Sesurtesen were exclusively directed Southward, the above figure seems to imply that Hindu merchants were already settled around the entrance to the Red Sea. — In expeditions under the Nineteenth and Twentieth dynasties, clearly directed Eastward, the humped or Indian bullock is owned by a nation clad in a long narrow scarf wound like a bandage around the body (a Hindu costume observed by myself at Bombay, but at present confined to females): and in the tomb of Ramessu III., the nation wearing this winding scarf represents one of the four geographical divisions of the World known to the Egyptians.

Sixty-fourth generation. May 1st, 2167, mostly beyond youth:

The same year = "44th year of Sesurtesen" (the latest date in his reign found on the monuments) and "2d year of Amunemhat II.," on a stela — now in Leyden (C. Mull. fr. Man. p. 563).

2164 B. C. (= 2210 — "46 years" of the Maneth. tables, the Turin papyrus giving — "45" = 2165), accession of Ammanēmēs, third king of the Twelfth dynasty. "Thirty-eight" years are assigned to his reign in the Maneth. tables; the Turin papyrus being in this place defective. The name of king Amunemhat II. occurs in one of the tombs at Benihasan, and on other contemporaneous monuments: — also in later times, in the chamber of kings at Karnak, and on the tablet at Abydos.

"2159 B. C. = 1st year of Tchoung-kang, of the Hia" or Third dynasty (Chinese chron. table).

"2157 B. C. = 3d year of Tchoung-kang" (Chinese chron. table), beginning of the Ninth cycle.

"2155 B. C." (Li-tai-ki-sse, Chinese chron. table, Gaubil astron. Chin., and Pauth.), *eclipse of the sun*, historically recorded in China. It took place (according to the Chou-king) in "the first years of Tchoung-kang;" and the two astronomers were put to death for not having predicted it.

2150 B. C. = "nineteenth year of Amunemhat II.," in one of the tombs at Benihasan, Khnumhetp appointed chief of the district of Menat-Khufu — or Minieh (Birch).

"2146 B. C. = 1st year of Siang, of the Hia" or Third dynasty (Chinese chron. table); and a "son of Tchoung-kang" (Pauth.).

"2145 B. C. = "24th year of Amunemhat II.," in the tomb of Khnumhetp at Benihasan, mining operations commenced at Sarabit-el-Khadim in the Sinai peninsula — (Birch).

Sixty-fifth generation. Sept. 1st, 2134, mostly beyond youth:

The same year = "35th year of Amunemhat II.," on the monuments — (C. Mull. fr. Man. p. 562).

2126 B. C. (= 2210 — "46 — 38 years" of the Maneth. tables, the "44th year of Amunemhat II.," at Wady Maghara = 2125), Amunemhat II. "put to death by his own *eunuchs*." He was succeeded by Sēsōstris, fourth king of the Twelfth dynasty; to whose reign "Nineteen" years are assigned in the Turin papyrus. The name of king Sesurtesen II. occurs in one of the tombs at Benihasan, and on some other contemporaneous monuments (Leps. k. pl. 12): — and is next in the order of succession in the tablet at Abydos.

2125 B. C. (= 1613 y. 2 mo. + "511 years" of Manetho in Jos. c. A. i. 14), beginning of the Hyksos intrusion:

The first entrance of a body of foreigners into Egypt is represented in the tomb of Khnumhetp at Benihasan; dated (according to Lepsius eg. and sin. 111) in the "sixth" year of Sesurtesen II. (= 2121 B. C.). The strangers, clearly of the *White Race*, are termed "captives" (a point of agree-

ment with the Hyksos of Manetho), use the javelin or throwing-spear, and unlike the Egyptians, wear variegated garments (apparently the oldest known specimen of *Sidonian needle-work*).

That the strangers came from Phœnicia or at least Syria, is indicated by scarlet in their variegated garments, the dye of the *kermes* insect, *Coccus ilicis*: — the “shny” or kermes dye is mentioned in Gen. xxxviii. 28, Ex. xxv. 4, Lev. xiv. 4, Josh. ii. 18, Prov. xxxi. 21, Cant. iv. 3, Isai. i. 18, and Jer. iv. 30; and continues well known in Persia and Northern Hindustan (J. F. D. in Kitt. cycl. bibl.). Northward and Westward from Syria, the “kökkös vaphikös” is mentioned by Ctesias, Theophrastus iii. 16, Pausanias, and Paulus Aegineta; by Dioscorides, as produced in Cilicia, Asia proper, Armenia, Galatia, and Spain; in the days of Pliny ix. 65 and xvi. 12, gathering “coccum” furnished the poor of Spain the means of paying half of their tribute, the best quality coming from Emeritam in Lusitania: and kermes dye continued in general use throughout Europe until superseded by cochineal. The kermes insect is particularly described by Emericus, and Garidel p. 254.

Quercus coccifera of the wooded portion of the Mediterranean countries and Persia. The *kermes oak* on which this insect is known to feed is a shrub or small tree — called in Greece “pīnari” (Sibth.); in which we recognize the “prinōs” alluded to as a shrub by Simonides (Plut. vit. Thes. 17), mentioned also by Aristophanes, Pausanias, and by Theophrastus iii. 8 as affording the “phōinikōun kökkōn;” the “kökkös vaphikc” shrub is described by Dioscorides as growing in Cilicia, Asia, Armenia, Galatia, and Spain; the “coccum,” by Pliny xvi. 8 to 12 as found on “parvæ aquifoliæ ilicis,” one of the two kinds of “ilex,” and procured in Pisidia, Sardinia, and Africa: *Q. coccifera* is termed “scarlet oak” by Gerarde (Ainsw.), “ilex aculeata cocciglandifera” by Tournefort inst. 583; was observed by Sibthorp, and Fraas, from the Peloponnesus throughout Greece and the Greek islands; by Chaubard, perhaps the most frequent little tree in the East and even of the whole Mediterranean region: is known to grow on Sicily and on both sides of the Straits of Gibraltar (Spreng., Guss., Webb, and A. Dec.).

Isatis tinctoria of the Mediterranean countries. Called in Britain *woad* or *wade*, in Anglo-Saxon “wad,” in Old Saxon “wode,” in old high German “weit,” in old French “guesde,” in current French “guède” or “gaide” (Prior), in current German “waid” (Grieb), in Italy “guado” or “glasto” or “isatide” (Lenz), and possibly affording the blue dye in the variegated garments of the strangers: — the “isatis” yielding a dye, is mentioned by Democritus (Schneid. ann. Theophr.); by Dioscorides, as more than a cubit high with plantain-like leaves; is termed “ēmērōs” in Syn. Diosc., and identified with the “arōusiōn” of the prophets; and the “nilaj,” mentioned according to Ebn Baitar by Dioscorides, is referred by Sontheimer to *I. tinctoria*: which plant was observed by Gittard in the Peloponnesus (Chaub.); and by Fraas, wild on the mountains there. Westward, the Britons are described by Cæsar v. 14 as staining their bodies with “vitrum” to look terrible in battle, an account repeated by Pomponius Mela iii. 6. 55, while Pliny xxii. 2 states that the British women stain their bodies with “glastum:” the “isatis” used for dyeing wool, is described by Pliny xx. 25 as resembling in its leaves “lapathos silvestri,” and possessing various medicinal properties; the “waisda” is mentioned in the capitularia of Charlemagne; the “isatis” of the Greeks is identified by Macer Floridus 55 with the “gaisdo:” *I. tinctoria* was observed by Lenz wild in Italy, and is known to grow in other parts of Southern Europe (Pers.): was found by Gerarde p. 394 in Britain only in places where it had once been cultivated, but has since become naturalized (Wats., and A. Dec.). By European colonists was carried to Northeast America, where it continues sparingly cultivated, and sometimes springing up spontaneously. (See *Lycopus Europæus*).

Genista tinctoria of Europe and the adjoining portion of Asia. Called in Britain *base broom* or *greening weed* or *greenweed* or *dyer's greenweed* or *wood-waxen*, in old English “wodewex,” in Anglo-Saxon “wudu-weaxe,” in mediæval Latin “genista humilis” (Prior), in Germany “farbe-ginster” (Fraas): possibly affording the green dye in the variegated garments: — *G. tinctoria* was observed by Sibthorp on mount Athos and in the environs of Constantinople. Westward, the “genista” is termed “lenta” by Virgil geor. ii. 12. 433, is mentioned also by Vitruvius vii. 14, Columella iv. 31, by Pliny xvi. 30 to 69 as springing up to dye garments and used besides for ties: *G. tinctoria* is described by Tragus p. 604 (Spreng.), is termed “*g. tinctoria germanica*” by Tournefort inst. 643; and is known to grow in France and throughout middle Europe as far as Denmark (fl. Dan. pl. 526, Pers., and Dec.). By the first European colonists was carried to Salem in New England, “woad-seed” being enumerated prior to February 1628 in a memorandum of articles to be sent out with governor Endecott; forty years later, “wood-wax wherewith they dye many pretty colours” was found there by Josselyn rar. p. 51; in 1814 within my memory, hardly extended more than a mile from the town; in 1872 had spread in some directions at least three miles, monopolizing the soil on the rocky hills and colouring the district in the season of flowering; not disseminating itself in a scattered manner throughout the country, and as yet I have heard of only two additional localities, “Cambridge” near Boston (Tuckerm. archæol. Amer. iv. p. 186), and “Peekskill” on the

Hudson (A. Gray). *G. tinctoria* according to Lindley is "chiefly employed in dyeing; the whole plant affords a good yellow colour, and with woad a good green."

"2118 B. C. = 1st year of Chao-kang, of the Hia" or Second dynasty (Chinese chron. table); a "son of Siang" (Pauth.).

2117 B. C. "In nine years" (Maneth.), Sēsōstris "subdued all Asia and of Europe as far as Thrace." An account confirmed by Herodotus, and other Greek writers. Sesostriis lived (according to Justin) before the time of Ninus.

2116 B. C. = "11th year of Sesurtesen II.;" the latest date in his reign found on the monuments (C. Mull. fr. Man. p. 562).

In tombs under the "Twelfth" dynasty at Berscheh, the transportation of a colossus is represented; stated in the hieroglyphic inscription to be of *limestone* (Lepsius eg. and sin. 113).

"2107 B. C." (Armen. hist., and Sm. b. dict.), Haïg son of Gathlas and first king of Armenia. Commencement of *Armenian history* — (Klapr. mem. i. 410).

In this year (= 2126 — "19 years" of the Turin papyrus), Sesurtesen II. succeeded by Sesurtesen III., fifth king of the Twelfth dynasty. — The Turin papyrus though partially defective in this place, affords evidence, that the reign of Sesurtesen III. lasted at least thirty years. His name occurs in the sanctuary of the temple at Samneh (Leps. eg. and sin. 120); also on the Kosser road; and he is next in the order of succession on the tablet at Abydos.

In a Third tomb at Benihassan (Champoll. pl. 396), a foreign nation, distinct perhaps from the one last mentioned and wearing only the cincture of warm climates, is represented fighting the Egyptians. The siege of a fortress is also represented. And (according to Lepsius briefe aus Aeg. p. 367), one of these foreigners reduced to servitude. — In the tomb of one of the kings of the Nineteenth dynasty, this foreign nation wears the Bedouin fillet.

Of the principal *arts and trades* of civilized life, a majority already known to the Egyptians, and figured on the walls of these and the remaining tombs at Benihassan.

Most of the domestic and useful animals and plants already mentioned, are again figured at Benihassan, and even in the same peculiar varieties or breeds. The additional kinds, in consideration of the long interval of time, are surprisingly few; and after careful examination, I could distinguish only the following:

Among a variety of wild species, a flock possibly of the *domestic duck*. — Ducks in the artificial pools of a garden, are figured under the Seventeenth or Eighteenth dynasty (Rosselin. ii. pl. 69). "Nēssa" and "nēssariōn," ducks and ducklings, are mentioned by Aristophanes av. 556 and plut. 1011: and "anatum ova" and tame ducks, by Plautus, Varro, Cicero, and Pliny.

Flocks also of the *domestic goose*, Anser . . . ; this Northern bird being clearly now the companion of man: — the "hēn" and "hēnōvōtia," geese and geese-feeding, are mentioned by Homer il. ii. 460, Xenophon, and Plato. Rome in its early history, was saved from a night-surprise by a flock of domestic geese: and the "anser" and "anserculus," goose and gosling, are mentioned by Cicero, Columella, and Pliny.

Albino *rabbis*, Lepus cuniculus, also figured, carried in cages and perhaps regarded as sacred: clearly not the hare, which is figured with longer ears in the hunting scenes. — The above were the only figures of the rabbit I could discover on the Egyptian monuments; and in the time of Athenæus ix. 63, the animal was unknown in Egypt. Alexander captured a city by means of a burrow or mine (.); and the "cuniculus" or rabbit is distinctly mentioned by Polybius, Posidonius, Varro, and Catullus. The rabbit seems properly a Western animal, and according to Leo Africanus, is indigenous in Mauritania.

A *cheeta* or hunting leopard, Felis jubata, led by a cord, and probably brought down the Nile from Equatorial Africa: — the cheeta is also figured in tribute-processions under the Eighteenth and Nineteenth dynasties: but does not appear to have been employed in Egypt for hunting; after the manner practised in Central and Eastern Asia, as described by Marco Polo 75.

Of the hunting scenes at Benihassan, some may be situated in Northern climates: especially as the striped lion (Leps. d. ii. pl. 131) indicates, that accounts of the *tigers* of Hyrcania, along the Caspian, had reached Egypt. — "Sēlēukōu tigris," a living tiger sent to Athens, is mentioned by Alexis, and Philemon.

The wild species of quadrupeds and birds figured are very numerous, as also the species of fishes, and insects: amounting to an important *treatise on zoology*, deserving the careful attention of naturalists.

Momordia balsamina of Tropical Arabia. The *balsam-apple*, called in France "pomme de merveille" (Pers.), in Egypt "ballesan," in Yemen "mokahh" or "moghadd" (Forsk.), is perhaps the Cucurbitaceous plant with deeply-lobed leaves and oblong fruit trained on a trellis — (Champ. pl. 357): *M. balsamina* seems mentioned by Avicenna, and Abd-allatif; was observed by Hassel-

quist, Forskal, and Delile, in the gardens of Egypt; and by Forskal, wild everywhere along the base of the mountains of Yemen. By European colonists, was carried to Northeast America, where it is occasionally seen in gardens.

2102 B. C. = "6th year of Sesurtesen III.;" found on the monuments (C. Mull. fr. Man. p. 562).

Sixty-sixth generation. Jan. 1st, 2100, mostly beyond youth :

The same year = "8th year of Sesurtesen III.," in a tablet at Samneh in Upper Nubia (Birch), Ethiopia being now for the first time conquered by an Egyptian army (Leps. eg. and sin. 245). A statue of the king has been found near by on "Bigehe," and foundations of a gigantic fortress were built in the narrow pass, — afterwards converted into a nilometer (Leps. and Buns.).

"2097 B. C. = 23d year of the usurpation of Han-tsou, and 22d of the detention of Chao-kang" (Chinese chron. table), beginning of the Tenth cycle.

2094 B. C. = "14th year of Sesurtesen III.," in the quarries of basalt at Hamamat — (Birch).

"2093 B. C. = Sixth manwantara" among the Hindus (Graha Munjari tables, and Bentley as. res. viii. 244), Pururava son of Budha, son of Soma, son of Atri, may have been at this time reigning.*

Bambusa arundinacea of Tropical Eastern Asia. The *bamboo* is called in Bengalee "bansh," in Telinga "veduru," in Tamil "mungil," in Malabar "kull-moollah" (Drur.), and the people of Hindustan at first lived on the "kalamōs" † — (Aelian, and Ruel i. 115); the "kalamōs inthikōs" is mentioned by Herodotus . . . , and Theophrastus iv. 11. 13, and was seen in Hindustan by Megasthenes (Strab. xvii. 3. 5) : boundaries according to the Institutes of Manu viii. 247 should be marked by planting bamboos (transl. Deslongch.) : *B. arundinacea* was observed by Graham in the environs of Bombay, but by myself only under cultivation; by Rheede i. pl. 16, in Malabar; by Buchanan, Roxburgh cor. i. pl. 79, and Drury, wild in the interior forests of the peninsula, the seeds gathered for food, the young shoots eaten like asparagus, and the leaves and old stems employed for a great variety of purposes. Farther East, by Mason v. 525 in Burmah, some varieties indigenous, "houses with all their furniture" made of them, fire procured "by rubbing two bits" together, "bellows to blow the fire" also furnished, the joints supplying the place of "cup, spoon, and water-bucket," the leaves used "for plates and dishes and thatch," the "young shoots" eaten as vegetables together with the seeds "in times of scarcity;" was observed by myself planted along road-sides on the Philippines. Westward, is enumerated by Clot-Bey as recently and successfully introduced into Egypt.

"2079 B. C." (Pauth. p. 61), in China, Han-tsou dethroned by the lawful emperor Chao-kang.

Tanaus king of Scythia, before the time of Ninus — (according to Justin, Bonom. Nin. iii. : see Targitaus).

Sesurtesen III. building of dobi or sun-dried brick the small pyramid at Dashur. An inscription (interpreted to Herodotus) claimed superior value over the stone pyramids around, and if an herbarium of selected plants chopped and mixed in mud, its superiority will be vindicated. A single brick examined by Unger has at least led to important results :

Raphanistrum arvense of the Mediterranean countries. The *jointed charlock* is called in Greece "raphanitha" (Sibth.), and imbedded fragments in the brick — identified by Unger (acad. vienn., and journ. sc. lond.) : the plant at the present day seems unknown in Egypt. Farther North, "raphanithas léptas" are commended as purgative by Diocles of Carystus in a letter to king Antigonus (Fabr. xii. p. 588) : and *R. arvense* was observed by Sibthorp not rare in the grain-fields of

* *Prosopis spicigera* of Tropical Hindustan. A large tree called in Tamil "parumbay," in Bengalee "shumee," in Telinga "chamee" (Drur.), on the Northern Circars "tshamie" (Roxb.); and the "sami" by rubbing which king Pururavas brought out concealed fire — (Kalidas. ragh. iii. 9), mentioned also by Susrutas sutr. 46 to kalp. 7, is referred here by Colebrooke as. res. vii. 302 : the "arani" by friction of two pieces yielding the "sacred fire" (Sanhita of the Sama Veda iii. 6 to xi. 10, Stev. præf. iv to vii), mentioned also by Susrutas sutr. 36, is according to Wilford a cubic block of "sami;" and W. Jones as. res. iv. 307 found "sami" wood "extremely hard, used by the Brahmens to kindle their sacred fire by rubbing two pieces of it together." *P. spicigera* was observed by Law "common in Guzerat" (Graham); by flor. ind. pl. 25, Koenig, Roxburgh cor. i. pl. 63, Wight, and Drury, in other parts of Hindustan from Delhi to Madras and Coromandel, its timber close-grained, hard, and durable, stronger than teak, and its pods full of a mealy sweetish substance eaten by the natives.

† *Bambusa (Dendrocalamus) tulda* of Eastern Hindustan. The *Bengal bamboo*, called in Bengalee "tulda bans," in Hindustanee "peka bans" (Drur.), and doubtless included in the "kalamōs" in question : — *D. tulda* was observed by Roxburgh ii. 193 abounding in Eastern Hindustan, being the common bamboo of Bengal, "much used for house-building," and its tender young shoots "eaten as pickles by the natives."

Greece. Westward, is described by Columna ecph. i. pl. 263 as eaten in Southern Italy (Spreng.); is termed "raphanistrum siliqua articulata glabra majore et minore" by Tournefort inst. 230; and was observed by Forskal near Marseilles; is known to occur in cultivated ground in Sicily, Sardinia, and throughout middle Europe as far as Denmark (fl. Dan. pl. 678, Guss., and Moris); and in somewhat wilder situations in Dalmatia, Spain, and Portugal (Brot., Boiss., and A. Dec.). By European colonists was carried to Northeast America, where it continues a weed in grain-fields, and is called as heard by myself *charlock*.

Pisum arvense of the Mediterranean and Tauro-Caspian countries. The *field pea* is called in France "pois de pigeon" or "bisaille" (Pers.), in Greece "pisēli" (mod. Lex.), in Egypt "besilleh" (Del.), and imbedded fragments in the brick — identified by Unger: the plant was observed by Delile under cultivation even in Upper Egypt, and the seeds given to cattle. Farther North, the green "phasēlōs," known to Athenæus in Egypt, constituted the supper of the Spartan warriors (Polemon, and Athen. ii. 46); the "phasēlōs" is also mentioned by Aristophanes pac. 1144, and Demetrius: unless in the above modern name, I am not aware of evidence of the existence of *P. arvense* in Greece (see *P. elatius*), but the plant is known to grow wild along the Black Sea (Ledeb.), was observed by Royle ill. p. 190 along the Himalayas as far as the head waters of the Jumna, under cultivation also, and according to Piddington having a Hindustanee name (A. Dec.). Westward from Greece, the "faselum" is termed "vilem" by Virgil geor. i. 227, and as cultivated in Italy is also mentioned by Columella x. 377; *P. arvense* is described by Lobel ii. pl. 66, and Tournefort inst. 394; continues to be cultivated in France (Pers., and Del. cult. eg.); and is known to grow wild in Southern Spain (Boiss., and A. Dec.).

Vicia sativa of the Mediterranean and Tauro-Caspian countries. Called in Britain *fitch* or *vetch* (Prior), in Germany "futterwicke" (Grieb), in France "vesce" (Nugent), in Italy "veccia" (Lenz), in Greece "vikōs" (Fraas) or "zēa" (Zalikogl.), in Egypt "faurum" Greek bean (Forsk.) or "dehoreg" (Del.), and imbedded fragments in the brick — identified by Unger: the living plant was observed by Forskal, and Delile, around Cairo and Rosetta. Farther North, the "kuamōs" is mentioned by Pherecrates, Aristophanes, Xenophon, Anaxandrides, Heniochus, and Demosthenes; the "kuamōs ēllēnikōs" by Dioscorides, and the Attic "kuamōs" and "arakōn" are identified by Galen alim. i. 36 with the "vikion" or "vikithion": *V. sativa* was ascertained by Fraas to have been formerly cultivated in Greece; was observed by him, and Chaubard, in wild situations in the Peloponnesus, but by Sibthorp, a weed in cultivated ground; is known to grow also in wild situations to the South of Caucasus (C. A. Meyer). Westward, the earliest inhabitants of Latium lived not on bread but "puls" or pottage, and sacred rites "pulte fritill" continued to be celebrated in the days of Pliny xviii. 19 to 46; the "offam" is mentioned by Ennius; the "vicia" by Cato, Varro, Ovid, cultivated as appears from Pliny xviii. 67 partly for fodder, and the "viciarium" by Columella: *V. sativa* is termed "*v. sativa vulgaris*" by Tournefort inst. 396; is known to grow in wild situations in Italy, Algeria, and Spain (Boiss., Munby, and Lenz), but throughout middle Europe occurs chiefly as a weed in grain-fields (fl. Dan. pl. 552, Thuill., and Pers.). Eastward from the Caspian, has various names in Hindustan, none of them Sanscrit (Pidd., and A. Dec.); and was observed by Thunberg at Nagasaki and elsewhere in Japan. By European colonists, was carried to Northeast America, where it continues a weed in grain-fields in our Northern States, observed by myself as far as Lat. 48° on the Lower St. Lawrence: was also carried to the Mauritius Islands, where it has in like manner become a weed in cultivated ground (Boj.).

Euphorbia helioscopia of Europe and Northern Asia. Called in Britain *sun-spurge* (Prior), in Italy "erba rognà" or "erba calenzola" or "titimalo elioscopio" (Lenz), in Greece "galatzitha" or "galahōrtōn" (Sibth.), and imbedded fragments in the brick — identified by Unger: the living plant was observed by Delile in Upper Egypt and also around Cairo. Farther North, the "tithumalōs ēliōskōpiōs" is described by Dioscorides as growing in waste ground and around villages, its root giving out four or five red branching stems full of white juice and a span high, leaves like those of "anthrahnē" but rounder, fruit as though on leaves in an "anēthōēithēs" capitulum that follows the sun and hence the name; is mentioned also by Rufus Ephesius, and Paulus Aegineta: *E. helioscopia* was observed by Sibthorp, and Fraas, from the Peloponnesus throughout Greece in the situations alleged by Dioscorides; but appears to grow in wilder places South of Caucasus (A. Dec.). Westward, the account by Pliny xxvi. 42 of the fourth "herbam lactariam," termed "helioscopion" and having the leaves of "porcilacae," seems in part taken from Dioscorides: *E. helioscopia* is described by Fuchsius 811; is termed "tithymalus helioscopius" by Tournefort inst. 87; was observed by Lenz frequent in Italy, by Forskal near Marseilles, and is known to occur in waste and cultivated ground throughout middle Europe as far as Denmark (fl. Dan. pl. 725, and Pers.). Eastward from the Caspian, was observed by Thunberg along roadsides in Japan and called "susa fri" or "kansui." By European colonists, was carried to Northeast America, where it seems naturalized in our Northern States and as far as Lat. 48° on the Lower St. Lawrence, though chiefly confined to the vicinity of tide-water and waste ground farther inland.

Bupleurum aristatum of . . . Imbedded fragments in the brick — identified by Unger.

Chrysanthemum segetum of the Mediterranean countries. Called in Britain *gules* or *gowles* or *goulans* or *gowan* or *golds* or *goldin* or *goldings* or *corn-marigold* or *yellow ox-eye* (Prior), in Germany "goldblume" (Grieb), in Greece "tzitzimvōla" or "kōukōuvagia" (Sibth.), in Egypt "gahvan" (Forsk.), and imbedded fragments in the brick — identified by Unger: *C. segetum* was observed by Forskal around Alexandria (but Forskal's plant is referred by Delile to *C. coronarium*). Farther North, was observed by Forskal, Sibthorp, and Chaubard, frequent in waste places and cultivated ground from the Peloponnesus to Constantinople; by Grisebach, in somewhat wilder situations, but according to Ledebour becomes rare towards Caucasus, occurring in cultivated ground only (A. Dec.). Westward, is termed "ch. folio minus secto glauco" by Tournefort inst. 492; was observed by Forskal on Malta, everywhere frequent; by Gussone, in open situations and cultivated ground on Sicily; by Moris, in like situations on Sardinia; and is known to occur as a weed in cultivated ground only in Italy, Algeria, Spain, and throughout middle Europe as far as Sweden and Russia (fl. Dan. pl. 995, and A. Dec.).

Chenopodium murale of the Mediterranean countries. A species of *goose-foot* called in Egypt "menteneh" fetid (Del.), and imbedded fragments in the brick — identified by Unger: the living plant was observed by Delile around Cairo; was received by A. Richard from Abyssinia; and by Jacquin rar. ii. pl. 345 from Guinea (Pers.). Northward, was observed by Sibthorp along walls at Constantinople. Westward, is termed "c. pes anserinus secundus" by Tournefort inst. 506; was observed by Desfontaines i. 214 about walls in Algeria; and is known to occur in like situations throughout Europe as far as Sweden and Iceland (Bergeret phyt. pl. . . , Curt. lond. vi. pl. 20, A. Dec., and Wats.). By European colonists, was carried to Northeast America (Wats.), where according to A. Gray, and Chapman, though "rare," it continues to occur about dwellings from Boston and New York to Florida; was also carried to South America (Wats.).

2070 B. C. (= 710 + "1360 years" of Ctesias, or "1000 years" of Ctesias — 877th + 1237 years enumerated = 1360 even in Eusebius, who in i. p. 44 gives 1247 enumerated years + 43 + 776 = 2066), beginning of *Assyrian history*. — The date is confirmed, by "the increasing power of the Assyrians" proving a source of anxiety to the first Hyksos king of Egypt, less than two centuries later (see below).

The same year (= 2126 — "48 — 8 years" of the Maneth. tables). Lahares succeeded by Amērēs, sixth king of the Twelfth dynasty. "Eight" years only are assigned to the reign of Amērēs in the Afr-Maneth. table; but the Turin papyrus though partially defective in this place, affords evidence, that he reigned at least forty years. The name of Amunemhat III. Ma-en-ra occurs at Wadi Maghara, Sarbut-el-Chadem, and Hamamat (Leps. d. ii. pl. 137 and 138): — and in after times, in the chamber of kings at Karnak, and in the order of succession on the tablet at Abydos.

That this king is the Moeris of the Greeks, appears from Diodorus . . . ; who enumerates inclusively "eighty-three" kings from Menes, in entire accordance with Manetho (Leps. krit. .).

In the Afr-Maneth. table, the building of the *Labyrinth* is attributed to the fifth king Laharēs; but in the Euseb.-Maneth. table, to "Lamaris" holding possibly the sixth place. The builder is called "Moeris" (by Lyceas of Naucrates); and (according to Diodorus i. 97) king "Marus" was also called "Menthēs"; while (according to Strabo xvii. 1. 37) king "Imanthēs" built both the Labyrinth and pyramid. According however to Lepsius eg. and sin. p. 14 and 91, the splendid temple built by "Amenemhe" in front of the pyramid, — afterwards became the centre of the Labyrinth: but the statement of Herodotus, That the Labyrinth was built by the dodecarchs preceding Psammetichus, has not been refuted.

2069 B. C. = "2d year of Amunemhat III.," at Wadi Maghara, the mines there still worked — (Birch).

Sixty-seventh generation. May 1st, 2067, mostly beyond youth:

2062 B. C. = "9th year of Amunemhat III.," in the quarries at Hamamat — (Birch).

"2057 B. C. = 1st year of Tchou, of the Hia" or Third dynasty (Chinese chron. table).

The same year = "14th year of Amunemhat III.," commissioners sent to Samneh to examine and mark the height attained by the Nile (Birch). "From the time of Moeris" (according to Herodotus . . .), the annual risings of the Nile were recorded in distinct numbers. The "large foundation" of the temple of Kummeh at Samneh was ascertained by Lepsius to be the earliest *nilometer*; the name of Amunemhat III. occurring in inscriptions marking the highest risings: "eighteen" markings remained, demonstrating that in his reign the river rose there "twenty-six feet eight inches" above the greatest floods of the present day; and that its mean level was "twenty-three feet ten inches" higher than at present. — Farther down the river on the brink of the First cataract, as remarked by Horner, the buildings on Philæ show that the river-bed has continued essentially unchanged for the last "twenty-two hundred" years (Leps. eg. and sin. p. 20 and 509 to 528). Yet farther down the

river at Thebes, the colossi of Amunhotep III. on the river-flat reveal no material change in the river and its inundations: I was only surprised at the slight depth of river-deposit around their base.

2056 B. C. (= 776 + 43 + 1237 enumerated years = "40 + 1240," Eusebius in another place giving 1181 + 877th = 2057 = 2015 + "43d year" of Hieronymus), accession of Belus, sixth lineal ancestor of Ninus, and first king of the Assyrians; a people possessing as yet only local importance — (Abyden., Cast., Cephal., Augustin. civ. D. xviii. 21, and Syncell.). The tomb of Belus opened by Xerxes was found to contain a legible inscription (Ael. xiii. 3).

2054 B. C. (= 1413 + "348 + 103 + 190 years" of the Euseb.-Maneth. table and the Egyptian Chronicle), a date, the Egyptian Chronicle not being exclusively national, possibly referring to the last-named change in Assyrian history.

"2040 B. C. = 1st year of Hoai, of the Hia" or Third dynasty — (Chinese chron. table).

"2037 B. C. = 4th year of Hoai" (Chinese chron. table), beginning of the Eleventh cycle.

Sixty-eighth generation. Sept. 1st, 2034, mostly beyond youth:

Belus succeeded by Babius, fifth lineal ancestor of Ninus, and second king of the Assyrians (Abydenus in Euseb. i. 12. p. 36).

Amunemhat III. Ma-en-ra building the pyramid near the Labyrinth. It contains his name, and is the latest of "sixty-seven" (Leps. eg. and sin. p. 14) known Egyptian pyramids; each of them constructed for a king's tomb.

2029 B. C. = "42d year of Amunemhat III.," on the monuments — (C. Mull. fr. Man. p. 562).

2028 B. C. (= 2015 y. 10 mo. 13 d. + "4 + 8 years" of the Afr.-Maneth. table = 2210 — "46 — 38 — 48 — 8 — 42 years" of the Euseb.-Maneth. table, the "44th year of Amunemhat III." at Wadi Maghara giving 2027, and the Turin papyrus "3 y. 10 mo. 4 d. + 9 y. 3 mo. 27 d." = 2029), Amērēs succeeded by Amēnēmēs, seventh king of the Twelfth dynasty. To whose reign "eight" years only are assigned in the Afr.-Maneth. table, but "9 y. 3 mo. 27 d." in the Turin papyrus. The name of king Amunemhat IV. occurs on a stela, and on other movable articles (now in the museums of Europe): — also in later times, in the chamber of kings at Karnak, and in the order of succession on the tablet at Abydos.

2020 B. C. (= 2015 y. 10 mo. 13 d. + "3 y. 10 mo. 13 d." of the Turin papyrus, or "4 years" of the Afr.-Maneth. table), Amēnēmēs succeeded by his sister Skēmīōphris, now queen of Egypt. She is referred to the Twelfth dynasty in the Turin papyrus, and in the Afr.-Maneth. table: but the title "Ra-sebaknofru," found among the ruins of the Labyrinth (Leps. d. ii. pl. 140), in its changed style indicates change of dynasty. The same title, in different forms, occurs on other monuments: — and in the order of this queen's succession in the chamber at Karnak.

Diospyrus reticulata of Madagascar. If the word "hbnī" in hieroglyphic characters under the Twelfth dynasty (Leps.) is correctly translated *ebony*, this material was already brought to and down the Nile from the Indian Ocean, probably from Madagascar: — the sticks of ebony figured in tribute-processions under the Eighteenth dynasty are in the hands of Southern delegates; "ēbnyṃ" brought with elephants' tusks by the men of Dedan, is mentioned by Ezekiel xxvii. 15; "ēvēnōn" was brought by the Ethiopians on the Nile to Darius (Herodot. iii. 97 to 114), the trees growing beyond Meroe (according to Pliny vi. 35 and xii. 8); the "aithiōpikē" kind is distinguished by Strabo xvii. 2, and Dioscorides; and to the present day, Madagascar continues the main source of the ebony of commerce. *D. reticulata* is described by Willdenow; and according to Tennent i. 117 is the source of "the ebony of Mauritius" (Drury).

"2016 B. C." (= 1589 + "205 + 29 + 30 + 32 + 30 + 34 + 30 + 35 + 4 years" of Gen. x. 22 to xi. 32 = 710 + "1306 years" of Diodor. ii. 28, Agath., Euseb., Syncell., and Clint. v. p.), the *Abrahamic era*, also called the "Assyrian era." (Nicolas p. 24 agrees, but p. 17 places the era at "2015, Oct. 1st," = 710 + "1305 years" of Augustin. civ. D. xviii. 21 = 2070 — "55 years" of Syncell. = 1614 + "402d year" of Clemens Alexandrinus in Euseb. præp. x. p. 497).

The same year (= 2015 y. 10 mo. 13 d. = 2229 — "213 y. 1 mo. 17 d." of the Turin papyrus = 2020 — "4 years" of the Afr.-Maneth. table), end of the reign of queen Skēmīōphris: in what manner is not mentioned, but interference with the established religion is marked by the building of temples — ceasing for nearly four hundred years.

The name of king Sebakhotep, of the Thirteenth dynasty, occurs on the foundation of the temple of Kummeh at Samneh, in inscriptions marking the highest rise of the Nile (Leps. d. ii. pl. 151 and eg. and sin. 20). Also on other contemporaneous monuments: — and he is next in the order of succession in the chamber of kings at Karnak.

"2014 B. C. = 1st year of Mang, of the Hia" or Third dynasty (Chinese chron. table).
Sixty-ninth generation. Jan. 1st, 2000, mostly beyond youth:

1997 B. C. = 2015 y. 10 mo. 13 d. — "19 years" of an obliterated name placed next after Ske-miophris in the Turin papyrus. (Compare Salatis).

The name of king Sebakhoteb II. of the Thirteenth dynasty, occurs on a large stela (now in Paris). — Also in a tomb under the Seventeenth dynasty at El Kab (observed by myself); and his title, partially obliterated, is next in the order of succession in the chamber of kings at Karnak.

Babius succeeded by Anebus, fourth lineal ancestor of Ninus and third king of the Assyrians (Abyden. in Euseb.).

"1996 B. C. = 1st year of Sie, of the Hia" or Third dynasty — (Chinese chron. table).

"1980 B. C. = 1st year of Pou-kiang, of the Hia" or Third dynasty — (Chinese chron. table).

The name of king Nofrehotep of the Thirteenth dynasty, occurs on a statue (now in Bologna) — And in later times, a different form of apparently his title is next in the order of succession in the chamber of kings at Karnak (Leps. k. pl. 14 and 15).

"1977 B. C. = 4th year of Pou-kiang" (Chinese chron. table), beginning of the Twelfth cycle.

1976 B. C. (= 1518 + "458 years" of Berosus in Alex. Polyhist., and Euseb. i. 4), at Babylon, accession of the Second Chaldean dynasty: — a series of "forty-nine" successive kings.

The name of king Sebakhoteb III. of the Thirteenth dynasty, occurs among the ruins at Abydos (Glid. analect.), and on a colossal statue of himself (now in the museum at Paris). — His title is next in the order of succession in the chamber of kings at Karnak.

Anebus succeeded by Arbelus, great grandfather of Ninus and fourth king of the Assyrians (Abyden. in Euseb.).

In ascending the Nile beyond Philæ, the first sculptures in Nubia belonging to the Thirteenth dynasty are on the island of Argo (Leps. eg. and sin. p. 19 and 233).

Seventieth generation. May 1st, 1967, mostly beyond youth:

The name or title of a king of the Thirteenth dynasty — has been obliterated in this place in the chamber of kings at Karnak (Leps. k. pl. 15).

Arbelus succeeded by Chaalus, grandfather of Ninus and fifth king of the Assyrians — (Abyden. in Euseb.).

The name of king Sebakhoteb IV. of the Thirteenth dynasty, occurs among the ruins at Abydos (Glid. analect.). — And an obliterated title occurs in his place in the chamber of kings at Karnak (Leps. k. pl. 14 and 15).

Some time after the "Twelfth" dynasty (Leps. eg. and sin. 28, and 118), a new canon of proportions for the human figure substituted in the Egyptian sculptures. — This second rule or canon continued unchanged until the time of the Psammetichi.

The name of king Sebakhoteb V. occurs on a granite altar at Abydos (Glid. analect.): — and his title is next in the order of succession in the chamber at Karnak.

Seventy-first generation. Sept. 1st, 1934, mostly beyond youth:

1931 B. C. (= 1413 + "518 yrs" of the Afr.-Maneth. table), possible date of the accession of the Fourteenth dynasty.

The partly erased title of a king of the Fourteenth dynasty occurring on contemporaneous monuments — is possibly identical with No. 227 (Leps. k. pl. 15) in the chamber of kings at Karnak, next in the order of succession.

As early perhaps as this date (Graham Munjari tables, and Bentley as. res. viii. p. 244), Ayu reigning in Hindustan.

"1921 B. C. = 1st year of Kioung, of the Hia" or Third dynasty — (Chinese chron. table).

"1917 B. C. = 5th year of Kioung" (Chinese chron. table), beginning of the Thirteenth cycle.

1914 B. C. (= 2016 — "100 — 2 years," Gen. xi. 10), Arphaxad. Beginning of *Hebrew lineage and history*.

The same year (= 1862 + "52 years" of Cephalion, Euseb. i. and ii., and Syncell., see also Abyden.), the date attributed to Ninus; but according to the limit of probability agreeing better with the accession of his father Arbelus II., sixth king of the Assyrians. — From this date, the extant List of Assyrian kings, as seen by Cephalion, contained "no reign of less than twenty years;" and would seem therefore to be genealogical. In fact, Berosus makes his period of "526 years" occupied by "forty-five" Assyrian reigns, where Eusebius has scarcely more than eighteen.

The title of a king of the Fourteenth dynasty not found on contemporaneous monuments, — is next in the order of succession in the chamber of kings at Karnak.

The *sepulchral vases* having the form of "the Four genii of the dead," first used under the Fourteenth dynasty — (Birch).

Mention is made of "beer" (probably the Egyptian beverage *booz*) on mummy-

cases under the Fourteenth dynasty — (Birch): manufactured according to Herodotus ii. 27 from barley, and to the present day well known in Egypt.

Lolium temulentum of Europe and Northern Asia. Called in Britain from the time of Wycliffe, and Shakespeare, *darnel*, by Galfridus pr. pm. "dernel," in the days of Glantvilla 194 "ray" from its French name "ivraie" drunkenness (Prior), in Germany "taumel-lolch," in Italy "loglio" or "loglio inebbriante" (Lenz); in Greece "ēra" (Sibth.), in Egyptian "ēntēj" (transl. Matth.) or "ēntēsh" (ms. Borg), and doubtless mixed in the boza — as to the present day, Alpinus witnessing the adding of "farina loliacea:" the "zizaniōn" is mentioned in Matthew xiii. 25, the "zwnyn" in the Talmud, the "ziwan" by Abu Hanifa, Ebn Baitar, and Forskal p. 199; and *L. temulentum* was observed by Forskal, and Delile, around Cairo and Rosetta. Farther North, the "airas" is mentioned by Pherecrates, Theophrastus, Dioscorides, Galen, and Eustathius; is identified in Syn. Diosc. with the "lōliōum" of the Romans; the "lolium" is mentioned by Plautus, Ovid, Columella, and Pliny, the "infelix lolium" by Virgil, and "farina loliacea" by Varro: *L. temulentum* is termed "gramen loliaceum spica longiore aristas habens" by Tournefort inst. 516; was observed by Sibthorp, Link, and Fraas frequent in the grain-fields of Greece; by Lenz in Italy; by Gerarde in 1597, one of the most frequent weeds in Britain; and is known to occur in fallow ground throughout middle Europe (fl. Dan. pl. 160, and Pers.). Eastward from Syria, was observed by Thunberg in Japan. By European colonists, was carried to Northeast America, where it continues rare in cultivated ground and not as yet naturalized; to Brazil (Kunth, and A. Dec.), Montevideo and Chili (Lindl.); and to West Australia, where it has become naturalized (J. Drummond). According to A. Gray, is almost the only grass known to produce noxious seeds.

Lolium perenne of Europe and Northern Asia. Called in Greece "ēmēra ēra," in Egypt "haschisch el farras" (Forsk.), much resembling the preceding and probably as long known in Egypt, — where it was seen by Forskal, and Delile around Cairo and Alexandria. Farther North, was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent along roadsides from the Peloponnesus throughout the Greek islands to Smyrna. Westward, is termed "gramen loliaceum angustiore folio et spica" by Tournefort inst. 516; was observed by Forskal in the environs of Marseilles; and is known to grow abundantly throughout Europe as far as Britain (Pers., and Engl. bot. pl. 315). By European colonists, was carried to Northeast America, where it has become naturalized and has been found "a pretty good pasture-grass" (A. Gray).

Seventy-second generation. Jan. 1st, 1900, mostly beyond youth:

"The same year = 1st year of Kin, of the Hia" or Third dynasty — (Chinese chron. table).

As early perhaps as this date (Graham Munjari tables, and Bentley as. res. viii. 244), Nahusha reigning in Hindustan.

The title "ra-s-anch-het" of a king of the Fourteenth dynasty, not found on contemporaneous monuments, — is next in succession in the chamber of kings at Karnak.

"1879 B. C. = 1st year of Koung-kia, of the Hia" or Third dynasty — (Chinese chron. table).

The same year (= 1862 + "17 years" of Ctesias, in Diodor. ii. 1), the *Assyrian empire* founded by Ninus or Nimrod: by whom the policy of "continual possession of domination" was inaugurated. Aided at first by Ariaeus an Arab chief, Ninus — in "seventeen" years extended his sway over "Babylonia, Susiana, Persis, Carmania, Hyrcania, Media, Armenia, Asia Minor, Coele-syria, Phoenicia," and even "Egypt." Babel or Babylon, "Erech, and Accad, and Calneh, in the land of Shinar" are included in the dominions of Nimrod in Gen. x. 10.

Pistacia terebinthus of the Tauro-Caspian countries. The *terebinth* tree is called in Italy "terebinto" (Lenz), in Greece "tētramithōs" or "kōkkōrētzā" or "kōkkōrōvithia" (Sibth.), in Syriac "bwtma" (Ges.), in Egypt "botm" and the imported nuts "habbeh khadrah" (Del.). The Persians according to tradition subsisted on the nuts before — becoming acquainted with bread, and hence are termed "tērmīnthōphagūs" by Astryages (Nic. Damasc. fr. 66, Ael., and Belon): "btnym" were among the productions of Palestine brought by Joseph's brethren on their second visit to Egypt (Gen. xliii. 11); the "tērvīnthōs" is mentioned by Josephus b. j. iv. 9. 7 as growing in Palestine; its resin in the days of Dioscorides was exported from Arabia Petraea, Judea, Syria, Cyprus, the Greek islands, and Cyrene; and the nuts of *P. terebinthus* were found by Forskal mat. med. much used in Egypt for mixing compounds. Among the Greeks, "tērvīnthinōs" is mentioned by Xenophon anab. iv. 4. 7; the "tērmīnthōs," in the Hippocratic fistul. 888, and Theophrastus iii. 15, and its edible nuts by Strabo xv. p. 229: *P. terebinthus* was observed by Forskal in gardens at Constantinople; by him, Sibthorp, Chaubard, and Fraas, frequent and seemingly wild from Asia Minor throughout Greece and the Greek islands; yielding according to Lindley *Cyprus turpentine*. Farther West, the "terebīnthus" is mentioned by Virgil aen. x. 136, and Celsus; is described by Pliny xiii. 12 as bearing "folliculos emittentes quaedam animalia ceu culices," the follicular horn-like galls employed in the days of Clusius in preparing a glutinous sanative balsam (Linnæa x. 58 and 442),

and giving rise to one name of the tree "cornocapra:" *P. terebinthus* is termed "t. vulgaris" by Tournefort inst. 579; was observed by Lenz seemingly wild in Italy, by Forskal near Marseilles, and is known to occur in Barbary (Pers.).

Lepidium sativum of Persia. Called in Britain with other species *pepper-wort* or *cress*, by Cotgrave "kars" or "kerse," by Chaucer "kers," in Anglo-Saxon "kerse" or "kyrsys" or "cærs," in medieval Latin "crissonium" (Prior), in France distinctively "cresson alénois" (A. Dec.), in Germany "gartenkresse," in Italy "agretto" or "nasturzio ortense" (Lenz), in Greece "karthamōn" (Sibth.), in Egypt "rechad" (Del.) or "habrasjat," in Yemen "half" (Forsk.), in Egyptian "séméth" (Syn. Diosc.); in which we recognize the "karthamōn" eaten by the Persians before — becoming acquainted with bread (Aelian, and Ruel i. 115); seen by Xenophon cyr. i. 2 to 8 eaten by them; produced of the best quality in Babylon according to Dioscorides; and called in Persian "skaphōs" according to the scholiast of Aristoph. nub. 234: *L. sativum* was observed by Olivier trav. iii. 120 to all appearance wild in Persia. Westward, the "karthamōn" is mentioned by Aristophanes vesp. 455 and 1357, Antiphanes, the Hippocratic writings, Diocles Carystius, Polyænus, and as having acrid seeds by Theophrastus i. 12. 1, and Dioscorides: *L. sativum* was observed by Sibthorp, and Chaubard, in cultivated ground from the Peloponnesus to Cyprus; by Forskal, and Delile, in the gardens of Egypt; and by Forskal, under cultivation in Yemen. Farther West, the "karthamōn" is identified in Syn. Diosc. with the "nastourkiōum" of the Romans, by Cicero with the "nasturtium," mentioned also by Varro, Columella, and Pliny: *L. sativum* is described by Bauhin prodr. pl. 43; is termed "nasturtium hortense vulgatum" by Tournefort inst. 213; was observed by Forskal in gardens on Malta; and is known to be cultivated from Italy throughout middle Europe (Pers., and Lenz). Eastward from Persia, is called in Hindustanee "taratezak" or "halim," in Bengalee "halim" (D'roz); was observed by Graham "cultivated in gardens" in the environs of Bombay, by Wight in peninsular Hindustan; by Mason "exotic" in Burmah, called "s-mung-nee," and its "seeds sold in bazar for medicinal purposes." By European colonists, was carried to Northeast America, where it continues under cultivation in our Northern and Middle States, and is called *peppergrass*.

Cordylocarpus lævigatus of the East Mediterranean countries. Called in Greece "karthamōn" or "karthama" (Fraas), and possibly the "karthamōn" of the Persians: — clearly the "karthamis" identified by Zopyrus, Galen, and Erotian with the "saurithiōn" of Hippocrates ulc. 8, "saurēn" of Nicander, and "saurion" of the Athenians (mentioned by Pliny xix. 54): *C. lævigatus* is termed "eruca chalcensis flore dilute violaceo siliquis articulatis" by Morison i. 3. pl. 25. "erucaria alepica" by Gaertner; was observed by Tournefort trav. i. pl. 35, Sibthorp, D'Urville, and Fraas. frequent from the Peloponnesus to Crete and the Greek islands; by Delile, on the Mediterranean border of Egypt near Alexandria.

The same year (= 1914 — "35 years" of Gen. xi. 12), birth of Salah.

The title of "rahem-smentoti," not found on contemporaneous monuments, — occurs in the chamber of kings at Karnak.

IV. THE HYKSOS OR SHEPHERD KINGS.

"In the reign of Timaus" (Maneth.), "the Hyksos, a people from the East of obscure or ignoble origin, in some unexpected manner acquired possession of Egypt" without fighting; and its rulers being in their power, proceeded to maltreat the people, "killing some, reducing the wives and children of others to slavery," burning cities, "demolishing temples," and at length made one of their number king:

1873 B. C. (= 1613 .. 2 mo. + "49 .. 2 mo. + 50 .. 1 mo. + 61 + 36 .. 7 mo. + 44 + 19 yrs" of Manetho in Jos. c. A. 14), accession of Salatis, the first Hyksos king. He resided at Memphis, and establishing military stations rendered both Lower and Upper Egypt tributary; but chiefly directed his attention to the Northeastern frontier, where he placed an army and fortified the city of Auaris, from jealousy of the increasing power of the Assyrians.

A triangular Military game had commenced between Egypt, the North, and the East, — and continues unsettled to the present day. Geographical position will explain, Why the Persians only after acquiring Asia Minor moved against Egypt, and only after acquiring Egypt moved against Greece; and Why Alexander would not move against Persia without first securing Egypt: the very latest invader on establishing himself in Egypt adopted at once the Egyptian view, and in accordance therewith shaped his measures (see Thiers revol. Franc.).

The Hyksos are termed Phoenicians in the Maneth. tables, and according to Josephus c. A. i. 14 were by some regarded as Arabs; but their long domination did not displace the spoken language of Egypt, as will appear presently. Notwithstanding the enumeration of Hyksos kings in the Maneth.

tables, the hieroglyphic ovals on the monuments seem to belong to legitimate Egyptian kings, who maintained their line of succession together with some authority, especially in Upper Egypt.

Seventy-third generation. May 1st, 1867, mostly beyond youth :

As early perhaps as this date (Graha Munjari tables), Dacsha reigning in Hindustan. — He is mentioned in the Puranas (Bentley as. res. viii. p. 230).

1864 B. C. (= 1413 + "348 + 103 years" of the Egyptian Chronicle and Euseb.-Maneth. table = 1613 .. 2 mo. + "250 yrs" of the same table), accession of the Fifteenth dynasty.

The title "ra * * *" of a king of the Fourteenth dynasty not recognized on contemporaneous monuments, — is in about this place in the chamber of kings at Karnak.

The last war of Ninus; against the Bactrians, and their chief city captured through the agency of Semiramis, who became his wife. The Bactrian king Oxyartes is called "Zoroaster" by Ctesias, Cephalion, and Justinus i. 1 (see above, Zoroaster).

1862 B. C. (= 1820 + "42 years" of Ctes., Cast, Diodor. ii. 20, Euseb. i. and ii., and Syncell.), Ninus succeeded by his wife Semiramis, now Assyrian empress.

Semiramis invading Hindustan was opposed by Stavrovates with war elephants — (Ctes. assyr. ii. 16): the *Indian elephant*, E. Indicus, is figured in the cave-temples at Adjunta used for riding and for killing tigers; also, in Braminical cave-temples; was employed in warfare against Alexander and the Greeks; is mentioned in the Institutes of Manu, and in the Sama Veda (Stev.). Westward, the young elephant led in the Tribute-procession to the Egyptian king Tutmes III., is clearly the Indian species; subsequently by the successors of Alexander imported in numbers for the purposes of warfare in the Mediterranean countries; so that even in Italy, the Romans were obliged to fight against elephants.

Bambusa (Dendrocalamus) ballcooa of Tropical Eastern Asia. The *giant bamboo*, perhaps the "kalamōu" of which the boats on the Indus were made — (Ctes. assyr. ii. 17): boats in India made of a joint of "kalamōu" are mentioned by Herodotus iii. 98: the large kind of bamboo called "kuttung," sometimes "ten inches in diameter," was seen by Temple only on the Deo and Sonar tributaries of the Godavery; and D. ballcooa, "from its size" and strength, is regarded by Roxburgh as perhaps preferable to any other kind for house-building (Drur.). Farther East, a large kind of bamboo is mentioned in the Chou-King as growing in the Southern provinces of China (Pauth. 48); var. "maxima" was seen by Loureiro in Anam; by Mason v. 525, in Burmah, having joints "from twenty to twenty-four inches in length and as much as thirty-six inches in circumference."

Bambusa (Dendrocalamus) strictus of Eastern Hindustan. Called *male bamboo*, in Telinga "sadanapa vedroo" (Drury), and probably furnishing the spears of the army opposing Semiramis: — the male "kalamōs inthikōs" is described by Theophrastus iv. 11. 13 as "stērēōs" solid: D. strictus was observed by Roxburgh cor. i. pl. 80 in Coromandel, growing in drier situations than other bamboos, "very straight," and having "great strength and solidity" much used by the natives "for spears, shafts, and similar purposes" (Stewart punj., and Drur.).

Bambusa (Melocanna) baccifera of mountainous situations in Chittagong. A *bamboo* called there "pagu-tullu," in Bengalee "bish-bansh," in Malabar "beesha," in Travancore "vaysha" or "vay" (Drur.); and probably furnishing bows and arrows to the army opposing Semiramis: — the bows and arrows of the Indian auxiliaries in the army of Xerxes were of "kalamōu" (Herodot. .): the "katthaka" reed bearing fruit to its own destruction, is mentioned in the Dhammapada 164: M. baccifera was observed by Pierard wild in mountainous situations in Chittagong, and in common use for every purpose of building, arrows and bows according to Roxburgh cor. iii. pl. 243 made from the stems by the natives, and pens from the younger shoots; by Drury, "very common on the Travancore hills, growing also in the low country," perishing after yielding its remarkable large pendulous fruit, its leaves placed "on verandahs and roofs of houses to keep away the white ants;" by Rheede v. pl. 60, in Malabar; but only "in 1833," according to Graham, was introduced into the environs of Bombay.

Sanssevera Zeylanica of Ceylon and Tropical Hindustan. The *bow-string hemp* is called in Bengalee "moorga" or "moorgavee," in Tamil "marul" (Royle), in Telinga "saga" or "chaga" (Drury), and may have furnished the string sending the arrow with which Semiramis was wounded — (Ctes. assyr. ii. 19): the sacrificial zone of the military class according to the Institutes of Manu should be of "murva" (W. Jones): S. Zeylanica, affording one of the strongest fibres known, is "common" on Ceylon (Royle fibr.); is known to grow also on the Dindigul hills and as far as Bengal (Drur.); was observed by Garrow "in 1831" growing "wildly and profusely in all the moist woods of the neighbourhood" of Cuttack; is made into paper at Trichinopoly; was observed by Rheede xi. pl. 42 in Malabar; by Law, "on rocks at Badamee" in the Bombay district, but by Graham 218 and 254 only in "gardens." Transported to Europe, is described by Plukenet pl. 256, and Miller.

"1857 B. C. = 23d year of Koung-hia" (Chinese chron. table), beginning of the Fourteenth cycle.

1854 B. C. (= 1873 + "19 years" of Manetho in Jos. c. A. i. 14, and both the Maneth. tables), Salatis succeeded by Bnōn, now second Hyksos king of Egypt.

The title "ra-s-sesur-te-ti" of a king of the Fourteenth dynasty not found on contemporaneous monuments, — is next in succession in the chamber of kings at Karnak.

1849 B. C. (= 1879 — "30 years" of Gen. xi. 14), Eber born to Salah.

"1848 B. C. = 1st year of Kao, of the Hia" or Third dynasty — (Chinese chron. table).

The title "rakamai" of a king of the Fifteenth dynasty, occurs in one of the excavated chambers or tombs at Siut, as verified by myself (see also Leps. d. ii. pl. 150). — And a different form of apparently the same title, is next in succession in the chamber of kings at Karnak (Leps. k. pl. 15).

The Egyptian *soldiers* figured in the same tomb (Champoll. pl. 349) are all on foot; and the military dress and equipments of the Twelfth dynasty at Benihasan continue.

"1837 B. C. = 1st year of Fa, of the Hia" or Third dynasty — (Chinese chron. table).

The title "ra-meri-hem" of a king of the Fifteenth dynasty, not found on contemporaneous monuments, — is next in succession in the chamber of kings at Karnak.

As early perhaps as this date (Graha Munjari tables, and Bentley as. res. viii. p. 244), Danu reigning in Hindustan.

Seventy-fourth generation. Sept. 1st, 1834, mostly beyond youth:

The obliterated title of a king of the Fifteenth dynasty, — is next in order of succession in the chamber of kings at Karnak.

The Armenian prince Anouschavan, son of Ara and surnamed Sos, slain in war against Semiramis — (Mar Apas Catina).

Populus alba of Europe and Northern Asia. Called in Britain *abele* or *white poplar*, by Galfridus pr. pm. "awbel" or "ebelle," in the mediæval Latin of Lambertus Ardensis "albellus," in Holland "ateel," in France "aubel," in Germany "alber," in Italy "albero" or "albera" (Prior), in Germany "silberpappel," in Italy "gattice" or "gattero" or "pioppo bianco" (Lenz), in Greece "lēukē" (Sibth.), in Egypt "hour" (Del.), and the above Armenian surname "sos" — is referred here by writers: the "ahērōis" (from "hour" the current name in Egypt) is mentioned by Hesiod, and Homer il. xiii. 389 to xvi. 482; but the word becoming obsolete, "lēukē" was substituted before the days of Aristophanes nub. 1087, Nicander fragm., Dioscorides, Pausanias v. 13, and Galen, the "lēukē" being expressly mentioned by Theophrastus as occurring in Egypt: *P. alba* was observed by Forskal. Delile, and Clot-Bey in the gardens of Egypt; by Sibthorp, Chaubard, and Fraas, from the Peloponnesus and Greek islands to Constantinople, planted, and besides wild in the forest. Westward, the "*populus alba*" is enumerated by Pliny xvii. 32 and xxiv. 32 as planted in Italy; "*albaro*" planks are mentioned in a chart "A. D. 971" (Prior); *P. alba* is described by Lobel pl. 2. 193; is termed "*p. alba majoribus foliis*" by Tournefort inst. 592; was observed by Lenz wild in Italy, and is known to grow throughout middle Europe as far as Britain (Pers., and Engl. bot. pl. 1618). Eastward from the Caspian, is known to grow throughout Northern Asia, being enumerated by A. Decandolle among plants extending two-thirds around the Subarctic circuit of the Globe. By European colonists, was carried to Northeast America, where it continues sparingly planted in both our Northern and Southern States, but extending by suckers may have acquired firm foothold.

The fortified city of Van in Armenia, is attributed to Semiramis (Samuel Aniensi. i. 7). Also according to other writers, various extensive structures in the region of the Euphrates: as the "walls of Babylon;" meaning possibly the so-called "Median wall," traces of which are found "extending from the Tigris forty miles obliquely to the Euphrates."

1820 B. C. (= 1782 + "38 years" of Euseb. i. and ii., and Syncell.), accession of Ninyas or Zames, son of Ninus and Semiramis, as Assyrian emperor. He is named also by Castor, and Diodorus ii. 1 to 31.

The name of king Sebakem-f, of the Fifteenth dynasty, occurs at Konosso, at Hamamat on the Kosser road (Leps. d. ii. pl. 151), and on a coffin dated in his reign (and now in the museum at London). — His title is next in the order of succession in the chamber of kings at Karnak.

"1818 B. C. = 1st year of Kie-koueï, of the Hia" or Third dynasty — (Chinese chron. table).

1815 B. C. (= 1849 — "34 years" of Gen. xi. 16), Peleg born to Eber. — The Hebrews appear to have derived their name from Eber: the word "phlg" signifies division, and to this day among the Arabs an opposing class claim to be descendants of Peleg's brother, Joktan.

The usual formula relating to the *doctrine of Transmigration*, is inscribed (according to Birch) on the scarabæus of king Sebakem-f — (now in the museum at London).

A king of the Fifteenth dynasty, — is designated by his erased title next in the order of succession in the chamber of kings at Karnak.

1810 B. C. (= 1773 y. 5 mo. + "36 y. 7 mo." of Manetho in Jos. c. A. i. 14), accession of the Hyksos king Apahnas.

Another king of the Fifteenth dynasty — is designated by his erased title next in the order of succession in the chamber of kings at Karnak.

Pteris aquilina of sparsely-wooded districts all over the Globe. Called in Britain *brakes* or *bracken*, in Sweden "braakin" (Prior), in France "fougeraie" (Nugent), in Germany "gemeiner farn" (Fraas) or "adlerfarn," in Italy "felce maggiore" or "felce imperiale" (Lenz), in Greece "ptêris" (Sibth.), and according to Syn. Diosc. by the Egyptians "aima ônoû" — (growing in Palestine), and observed by Forskal on the mountains of Tropical Arabia. Farther North, the "ptêrin" is enumerated by Epicharmus as edible; by Dioscorides as growing in rocky and mountainous situations, stemless without flower or fruit, leaves incised like a wing and on a stalk a cubit high, root longish and black, superficial, somewhat astringent, and given against tape-worm: *P. aquilina* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent in mountainous and certain open situations from the Peloponnesus to Cyprus and Constantinople. Westward, the "ptêris" is identified in Syn. Diosc. with the "philikēm" of the Romans; the "filitum" or "filitum" is mentioned by Columella; the "urenda filix" by Horace; one of the two kinds being according to Pliny xxvii. 55 the "ptêrin" of the Greeks: *P. aquilina* is termed "filix ramosa major pinnulis obtusis non dentatis" by Tournefort inst. 536; was observed by Desfontaines in Barbary; is known to grow on the Canaries, where "a miserable sort of bread is made by mixing the flour" with barley meal (Lindl.); and from Italy throughout middle Europe as far as Sweden (Engl. bot. pl. 1679). Farther West, is frequent in the wooded portion of North America from Canada to Arkansas and the Mexican Gulf (Nutt., Chapm., and myself). In the Tropics and Southern Hemisphere, was observed by myself in many distant parts of the Globe, its rhizoma constituting the principal food of the New Zealanders. The Greek name is derived by Smith from the rhizoma cut across having "a branched appearance, resembling a spread-eagle" (Lindl.).

Plantago media of Europe and Northern Asia Called in Italy "piantaggine media" or "petaciola" (Lenz) in Britain *lamb's tongue* (Prior), and from the character of the leaves deserving the name: possibly the Egyptian "asônth" or "asôëth" (Syn. Diosc.) or "asôut" from "ēsôôu" sheep — (Kirch.), for "P. media?" called "bizr bæledi" was observed by Forskal on the mountains of Tropical Arabia. Farther North, the "arnöglössön mikrön" as described by Dioscorides has narrower softer and more tender leaves; and the "plantago minor" by Pliny xxv. 39 as having leaves "linguae pecorum simillimis:" *P. media* is termed "p. latifolia incana" by Tournefort inst. 126; was observed by Sibthorp in pasture-land around Constantinople; and is known to grow in like situations from Italy throughout middle Europe as far as Denmark (fl. Dan pl. 581, and Pers.; see *P. major*).

Tribulus terrestris of the Desert and its borders from the Atlantic to Hindustan and Lake Baikal. Called in Italy "tribolo" or "tribolo terrestre" (Lenz), in Greece "trivöli," or by the Turks "demio dikieni" (Sibth.), in Egypt "kharchoum el-nageh," or by the Nubians "kenyssa kou" (Del.), in Tropical Arabia "kotaba" (Forsk.), in Egyptian "sêrôji" — (transl. Matth.): the "trivölös" is mentioned in the Septuagint translation of Hosea x. 8, and in Matthew vii. 16, as growing in Palestine: *T. terrestris* was observed by Delile in both Lower and Upper Egypt, by Forskal p. 88 in Tropical Arabia, by Denham in Nigritia, and was received by A. Richard from Senegal and Abyssinia. Northward and Westward from Egypt, the "trivölös" is mentioned by Aristophanes lys. 576; by Theophrastus vi. 5 as having "êrëvinthös"-like leaves; the "trivölös hërsaiös" by Dioscorides as growing about houses and along rivers; the "tribulus" by Virgil. geor. i. 153, and as a weed in gardens by Pliny xviii. 44 to xxii. 12: *T. terrestris* is described by Lobel pl. 84, and Morison ii. pl. 8; is termed "t. terrestris ciceris folio seminum integumento aculeato" by Tournefort inst. 266; was observed by Desfontaines in Barbary; by Lenz in Italy; by Sibthorp, Chaubard, and Fraas, frequent in waste and cultivated ground from the Peloponnesus to the Dardanelles; is known to grow in Southern Russia and from Caucasus along the border of Siberia as far as Lake Baikal (Ledeb.); was received by Fischer from Thibet; and was observed by myself, indigenous on the Deccan. In Austral Africa, may have arrived without European intervention; but clearly by European colonists was carried to the Mauritius Islands (Drège, Boj., and A. Dec.).

Croton (Crozophora) tinctorium of the Northern border of the Desert from Barbary to Arabia. Called in France "tournesol" (Pers.), in Greece "sklaröhörtö" or "agriöphasöulia" (Forsk.) or "agriöphaskia" (Sibth.), in Egypt "ghobbeyreh" (Del.), in which we recognize the Egyptian "höupër" — identified with "cupressus herba" in lex. Oxf. p. 80: *C. tinctorium* was observed by Forskal, and Delile, around Cairo; and according to Clot-Bey ii. 38, oil is made from its seeds. Farther North, is described by Gesner, Lobel, and Camerarius; is termed "ricinoides ex qua para-

tur tournesol Gallorum" by Tournefort inst. 655; was observed by Forskal, Sibthorp, and Chaubard, frequent from the Peloponnesus and Crete to the Dardanelles; is known to grow also in Barbary (Pers.); is besides cultivated in Southern France "for the deep purple dye called *turnsole*," and its seeds ground "and mixed with oil are employed as a cathartic" (Lindl.).

Croton (Crozophora) villosum — described as distinct, and called in Greece "*ēliōtrōpiōn*" (Sibth.); in which we recognize the "heliotropium" worn by the Magians in intermittent fevers, and termed "triccocum" by Pliny xxii. 29: the "*herba solaris*" of Celsus v. 27 may also be compared, as well as the "*solago minor*" of Apuleius 63: *C. villosum* is termed "*ricinoides ex qua paratur tournesol Gallorum folio oblongo et villosa*" by Tournefort cor. 45, and was observed by him, Sibthorp, and Chaubard from the Peloponnesus throughout the Greek islands.

Croton (Crozophora) plicatum of Tropical Arabia. An allied species — called in Hindustanee "*souballi*," in Bengalee "*khoodi-okra*" (Drur.), in Nubia "*qoddeh*" (Del): observed by Delile from Cairo to Nubia, where it is called "*qoddeh*;" by myself, a weed in cultivated ground in Upper Egypt. Eastward, is known to grow in Yemen (Pers.): was received by N. L. Burmann pl. 62 from Hindustan; was observed by Graham around Bombay, "common on rice fields in the cold weather," by myself occurring as a weed only; by Drury, "common in the Peninsula;" by Roxburgh, and Ainslie as far as Bengal and Behar.

As early perhaps as this date (Graham Munjari tables), Vrishaparvan reigning in Hindustan; a grandson of Dacsha — according to the Puranas (Bentley as. res. viii. p. 230).

Seventy-fifth generation. Jan. 1st, 1800, mostly beyond youth:

"1797 B. C. = 22d year of Kie kouei" (Chinese chron. table), beginning of the Fifteenth cycle.

"In the time of the Hia" (topog. Cant., and Pauth. p. 472), arrival in China of "islanders, bringing as tribute garments embroidered with flowers."

Chrysanthemum Indicum of Japan. Called in English gardens *Christmas flower* (Graham) from flowering late, in Egypt "*karaouè*" (Clot-Bey), in the environs of Bombay "*gool daodee*" (Graham), in Japan "*kikoki*" or "*kiku*" (Thunb.), and probably the flower copied on the embroidered garments: * — was observed by Kaempfer, and Thunberg, wild in Japan, cultivated besides around dwellings. Westward, the "*kiu-hoa*" flower was embroidered on dresses of the Chinese empress and ladies of the court under the Tcheou dynasty, is mentioned also in the Chin-nong herbal, Eulhyia dictionary, Tchun-tsieou of Confucius, and in Li-ki (Cibot mem. Chin. iii.): was observed by Mason "exotic" in Burmah; by Rumphius v. pl. 91, in the Malayan archipelago; by Rheede x pl. 44, in Malabar; by Graham "very common in gardens" around Bombay, and by myself, flowers among temple-offerings on the Deccan. Farther West was observed by Clot-Bey in Egypt, where it seems recently introduced, having perhaps previously reached France (Bomatuelle journ. hist. nat. ii. and Pers.). By European colonists, was carried to Northeast America, where it continues frequent in greenhouses and gardens.

"In the time of Oanamuchi-no-mikoto, long before the historical period" (old Jap. legends, and Jap. centen. comm. 59), *pottery* invented in Japan by Oosci-tsumi, — "afterward honored with the divine appellation of Kami."

The title "*ra-chu-te-ti*" of a king of the Fifteenth dynasty not found on contemporaneous monuments, — is next in succession in the chamber of kings at Karnak.

1785 B. C. (= 1815 - "30 years" of Gen. xi. 18), Reu born to Peleg.

"1783 B. C. = 1st year of Tching-tang" — (Chinese chron. table).

1782 B. C. (= 1752 + "30 years" of Euseb. i. and ii., and Syncell.), accession of Arius as Assyrian emperor. He is called Areius by Julius Africanus.

1773 B. C. (= 1712 y. 5 mo. + "61 yrs" of Manetho in Jos. c. A. i. 14), accession of the Hyksos king Apôphis.

The title "*ra-meri-atep*" of a king of the Fifteenth dynasty not found on contemporaneous monuments, — is next in the order of succession in the chamber of kings at Karnak.

Seventy-sixth generation. May 1st, 1767, mostly beyond youth:

"1766 B. C. = 18th year of Tching-tang; who vanquishing Kie," now becomes the

* *Cycas revoluta* of Subtropical Japan. Called "*sotetsu*," three to five feet high, with its palm-like trunk a foot or more in diameter crowned with long feathery fronds, and from early times cultivated in gardens — (Jap. c. c. 35): observed by Cleyer iii. 3. 118 (Sprung), and Kaempfer 897 in Japan; by Thunberg trav. and fl. growing spontaneously and often cultivated, its fruit edible, and its sago-like pith so remarkably nutrient in small quantities that carrying the plant out of the country is prohibited by law. A description however of the "*têtsjoe*" is given by Rumphius i. pl. 24. According to Lindley, "the wounded stem, leaves and fruit, abound in a white transparent mucilage, which hardens into a sort of gum."

head of the new dynasty of the Chang. Tching-tang changed the name of the years to "sse," after the four annual sacrifices at the solstices and equinoxes (Chinese chron. table): and ordered, "that the twelfth moon or month of the Hia should be the first of the civil year of the Chang." — A practice from this time adopted on change of dynasty.

1761 B. C. (= 1413 + "348 years" of the Egyptian Chronicle and Euseb.-Maneth. table, the Afr.-Maneth. table giving 1614 + "151 y" = 1765, and Ramessu II. at San 1366 + "400 yrs" to the reign of the Hyksos king Seti or Saïtes = 1766), accession of the Sixteenth dynasty. The title "ra-s . . -en-ra," by the change in style, seems to indicate a new dynasty: is not found on contemporaneous monuments, — and is next in the order of succession in the chamber of kings at Karnak.

As early perhaps as this date (Graha Munjari tables), Yayati reigning in Hindustan. He married Devayani grand-daughter of Bhrigu, and Sarmishta great grand-daughter of Dacsha. Bhrigu, Yayati, Devayani, and Sarmishta, — are mentioned also in the Puranas (Bentley as. res. viii. p. 244).

"1753 B. C. = 1st year of Tai-kia, of the Chang" or Fourth dynasty — (Chinese chron. table).

The same year (= 1785 — "32 years" of Gen. xi. 20), Serug born to Reu.

1752 B. C. (= 1712 + "40 years" of Euseb. i. and ii., and Syncell.), accession of Aralius or Amvrus, as Assyrian emperor.

The name and title of king Rahotep, of the Sixteenth dynasty, occurs on contemporaneous monuments: — and a different form of apparently the same title, is next in the order of succession in the chamber of kings at Karnak (Leps. k. pl. 15).

"1737 B. C. = 17th year of Tai-kia" (Chinese chron. table), beginning of the Sixteenth cycle.

A third king of the Sixteenth dynasty, — is designated by his obliterated title next in order of succession in the chamber of kings at Karnak.

"1736 B. C. = the Seventh manwantara" among the Hindus (Graha Munjari tables). King Turvasu may have been at this time reigning. He is mentioned in the Sama Veda iii. 9 (transl. Stev.); and as the son of Yayati and Devayani, in the Puranas; his brother Yadu, and half-brothers Druhya, Anu, and Puru, are also mentioned in the Puranas (Bentley as. res. viii. p. 230).

Seventy-seventh generation. Sept. 1st, 1734, mostly beyond youth:

A fourth king of the Sixteenth dynasty, — is designated by his obliterated title next in order of succession in the chamber of kings at Karnak.

Artemisia absinthium of the Uralian plains. Called in Britain *wormwood*, in Anglo-Saxon "wermod" or "wurm-wyrt," in Germany "wermut," in Old High German "werimuota," in Old Saxon "weremede" (Prior), in France "absinthe" (Nugent), in Italy "assenzio" or "assenzio romano" (Lenz), in Greece "apsinthia" (Fraas), in Egyptian "sōmi" (Syn. Diosc.), "shōm" meaning garden — (transl. Sept., and Luke xiii. 19): the "apsinthion" was known to Athenaeus iv. 9. in Egypt; A *absinthium* is enumerated by Clot-Bey as long known there; its alkali "melh afsantin" was found by Forskal mat. med. employed medicinally; and absinth cordial was found by myself well known to the Egyptians. Farther North, the "apsinthid" is mentioned by Euripides, Diphilus, by Theophrastus ix. 18 as growing in Pontus, by Dioscorides as excessively bitter and placed among clothing to keep out moths, employed besides medicinally and mixed in a wine used in Thrace and around the Propontis: A. *absinthium* is known to grow in the Crimea (Lindl.); was observed by Gmelin ii. pl. 63 in Siberia; by Forskal, in the gardens of Constantinople; and by Fraas, seemingly wild on Naxos, Milos, and Santorin. Westward, "absinthium" was employed from the earliest times in the sacred rites of the Romans (Plin. xxvii. 28); is termed "ponticum" by Cato, and Columella; is mentioned also by Lucretius, and Quintilian: A. *absinthium* is mentioned by Macer Floridus, and in *Ortus Sanitatis* 3 (Prior); was observed by Lenz seemingly wild in Italy; is known to occur in Barbary (Lindl.), and in waste places throughout middle Europe as far as Britain (Lam. fl. fr. 45, Pers., and Engl. bot. pl. 1230). By European colonists, was carried to Northeast America, to Newfoundland (Lindl.), observed by A. Gray in our Northern States, along "road-sides, sparingly escaped from gardens." The plant according to Lindley "is a powerful bitter, much extolled as a stomachic," employed also against worms, and said to be added by brewers "to their hops," by "rectifiers to their spirits;" yields "a very bitter alkali called *absinthium*," but the so called *salt of wormwood*, procured usually from this herb, retains "none of its peculiar qualities."

Iris sambucina of the Mediterranean countries. Called in English gardens *flower-de-luce*, in France "fleur-de-lis" (Nugent), in Germany "schwertlilie" (Grieb), in Greece "krinōs," or by the Turks "susen" (Silbth.), in Egypt "zambak" (Forsk.), in Egyptian "tshōtshēn" — (transl. Sept.), a name found besides in hieroglyphic characters by Champollion dict. 392: the "shwshn" was modelled in the ornamental work on Solomon's temple (1 K. vii. 19, and 2 Chron. iv. 5), is mentioned as growing in Palestine in Cant. ii. 1 to vii. 2, and Hosea xiv. 5; and the "krinōn" wild in Palestine, in

Matthew vi. 28: *I. sambucina* was observed by Forskal in the gardens of Egypt. Farther North, the "sōusōn" of the Persians, mentioned by Aristobulus fr. 13, and which seems to have given its name to the city of Susa beyond the Tigris, is identified by Athenaeus with the "krinōn;" the word "sōusinōn" occurs in the treatise 2 *Mul. morb.* 74; the "krinōn" is mentioned by Anacreon, and as springing up from tears falling on the ground by Theophrastus ii. 2. 1 and caus. i. 4. 6: *I. sambucina* was observed by Forskal, Sibthorp, and Fraas, in the open country on Crete, and frequent in cemeteries and about villages throughout Greece as far as Rhodes. Westward, following the example of emperors of Constantinople and certain French kings, Louis VII. in 1137 placed "fleurs de lis" on his escutcheon (Montf.), and hence according to Prior the English name, as though "fleur de Louis;" *I. sambucina* is described by Tabernæmontanus pl. 647: is termed "i. latifolia germanica sambuci odore" by C. Bauhin pin. 31, "i. vulgaris germanica sive sylvestris" by Tournefort inst. 358; is known to grow in Italy and other parts of Southern Europe (Savi, and Pers.); and is cultivated in middle Europe for ornament. By European colonists, was carried to Northeast America, where it continues a favorite flower in gardens. (See *Lilium candidum*).

1723 B. C. (= 1752 — "30 years" of Gen. xi. 22), Nahor born to Serug.

"1720 B. C. = 1st year of Wou ting, of the Chang" or fourth dynasty — (Chinese chron. table).

The Northern language from which certain Greek words were taken, probably at this time in existence.

The Greek word "linōn" (used by Homer and others) is regarded as derived from some Northern language; — possibly from the *Celtic* "llin" meaning a thread, as maintained by Theis gloss. bot. p. 276. (See *Linum usitatissimum*, *Tilia Europæa*, and *Paritium tiliaceum*).

Quercus robur of Europe and the adjoining portion of Asia. Called in Britain *oak*, in Anglo-Saxon "ac" or "æc," in Scotch "aik," in Sweden "ek," in Denmark "eg," in ancient Danish "eik," in Germany "eiche," in Low German "eik" or "eek," in Old High German "eih" (Prior), in France "chene" (Nugent), in Italy "querce commune" or "rovere" (Lenz), in Greece "thēnthrō" the tree (Sibth.) or by the Turks "mesia" or "mesjæ" (Forsk.): the Greek word "akulōs" (used by Homer) was adopted from Northern nations — (according to Plato), and is identified with the *German* "eichel" by Adelung, and Grimm: the "thruōs" at Dodona where the will of Jove is made known (visited by Ulysses according to Homer od. xiv. 327 and xix. 296) seems connected with or the origin of the "druidae" or ancient priests of middle and Northern Europe: the "thrus" is also mentioned by Hesiod op. 228, Aeschylus prom. 834, Sophocles, Theophrastus, and Dioscorides; and *Q. robur* was observed by Forskal, Sibthorp, Chaubard, and Fraas, around Constantinople and on the mountains of Greece. Farther South, oaks at Thebes in Egypt are mentioned by Theophrastus, planted of course, for the grove disappeared before the days of Pliny: oaks according to Clot-Bey continue to be sparingly cultivated in Egypt, but were seen by myself only in the botanic garden at Cairo, apparently *Q. robur*. Westward, the "quercus" and "robur" are mentioned by Cato, Varro, Cicero, Virgil, and Pliny; *Q. robur* furnished piles or posts of lake-villages in Switzerland during the Stone period (Troyn); is mentioned in Britain in Ina's statutes during the Heptarchy; the two varieties are distinguished by Tournefort as "q. latifolia mas quæ brevi pediculo est" and "q. cum longo pediculo;" were observed by Lenz in Italy, by Moris on Sardinia, and are known to grow throughout middle Europe as far as "Lat. 60° 57'" (Martins, and A. Dec.)

A fifth king of the Sixteenth dynasty, — is designated by his obliterated title next in the order of succession in the chamber of kings at Karnak.

1713 B. C. = (1662 y. 4 mo. + "50 y. 1 m." of Manetho in Jos. c. A. i. 14), accession of the Hyksos king Iannas.

1712 B. C. (= 1682 + "30 years" of Euseb. i. and ii., and Syncell.), accession of Xerxes or Baleus, as Assyrian emperor.

The title "ra-f? * * *" of a king of the Sixteenth dynasty, — is next in order of succession in the chamber of kings at Karnak.

Seventy-eighth generation. Jan. 1st, 1700, mostly beyond youth:

The title "s-het * *-en-ra" of a king of the Sixteenth dynasty, not found on contemporaneous monuments, — is next in order of succession in the chamber of kings at Karnak.

1694 B. C. (= 1723 — "29 years" of Gen. xi. 24), Terah born to Nahor.

"1691 B. C. = 1st year of Tai-keng, of the Chang" or Fourth dynasty — (Chinese chron. table).

The title "ra-s-nefru * *" of a king of the Sixteenth dynasty not recognized on contemporaneous monuments, — is next in order of succession in the chamber of kings at Karnak.

1682 B. C. (= 1644 + "38 years" of Euseb. i. and ii., and Syncell.), accession of Amramithes as Assyrian emperor. He is called Armamithres, by Syncellus.

"1677 B. C. = 15th year of Tai-keng" (Chinese chron. table), beginning of the Seventeenth cycle. Also in the reign of Tai-keng (mem. Chin. viii. p. 192), first historical notice of a *language* differing from the Chinese: certain people coming to render homage requiring interpreters (see below, Tai-wou).

As early perhaps as this date the *Greek language* in existence, with the inhabitants in the first stage of society, the Stone Age or so-called "Golden Age," when (according to Hesiod, and Dicaearchus) mankind lived on spontaneous fruits, and dissensions injustice and war were unknown — (much as among the tribes of Interior Oregon when visited by myself).

Quercus pubescens of the Mediterranean countries. Resembling *Q. robur* and equally called in Greece "thênthrō" (Sibth.), in Italy "rovere" though distinguished as "eschio" or "querce gentile" (Lenz): included doubtless in the Greek proverb "alis thruōs" sufficiency in the oak, referred to the Golden Age — by Dicaearchus: the "platuphullōs" bearing excellent acorns but the timber inferior, is mentioned by Theophrastus iii. 8, also by Pausanias viii. 13. 1: *Q. pubescens* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to mount Athos and Constantinople. Westward, the account by Pliny xvi. 8 of the "latifolia" seems chiefly taken from Theophrastus: *Q. pubescens* is described by Clusius hist. i. pl. 18; is termed "q. foliis molli lanugine pubescentibus" by Tournefort inst. 583; and is known to grow in Italy and Sicily (Guss., Philippi, and A. Dec.).

Quercus agrilops of the East Mediterranean countries. Called in Greece "vĕlanithia" (Sibth.), in which we recognize the "valanōi" eaten from the earliest period by the Greeks, — mentioned also by Hesiod op. 228, Homer od. x. 241, and "valanēphagōi" by the Oracle after the death of Lycurgus prohibiting Spartans from warring against Arcadians (Herodot. i. 66, and Paus. viii. 1, 6): the "agrilōps" is described by Theophrastus iii. 8 as the loftiest of the oaks, and bearing the bitterest and worst acorns; and the account by Pliny xvi. 8 seems taken from Theophrastus: *Q. agrilops* is termed "velani" or "q. orientalis castaneæ folio glande recondita in cupula crassa et squamosa" by Tournefort cor. 40 and trav. i. 128, "q. orientalis" by Pococke trav. iii. pl. 87; was observed by Sibthorp, Chaubard, and Fraas, a large and magnificent tree abounding near the sea from the Peloponnesus throughout the Greek islands to Asia Minor, its large acorn-cups exported under the name of *valonia* for dyeing cloth: the acorns notwithstanding their "disagreeable flavour" were found by J. D. Hooker linn. trans. xxiii. eaten in Syria. Westward, *Q. agrilops* is enumerated by Lenz as not indigenous in Italy, and therefore in France and Spain (Pers.) doubtless also introduced.

Quercus cœrris of the Mediterranean countries. Called in Italy "cerro" and the acorn "cerra" (Lenz), in Greece "agria vĕlanithia" or "mikra vĕlanithia" (Fraas), and probably included in the "valanōi" eaten by the earliest Greeks: — the "ēmēris" or "ētumōthrun" described by Theophrastus iii. 8 as not lofty but of a stunted habit with many branches, its acorns second in quality, may be compared: *Q. cœrris* was observed by Fraas in Greece, frequent towards the North. Westward, the "cœrrus" and "cœrrea glans" are mentioned by Nigidius, Vitruvius, Columella, Pliny xvi. 6 to 8, and Palladius i. 9; and *Q. cœrris* is known to grow in Italy, Southern France, and as far as Spain (Duroi ii. pl. 5, Pers., Lam. fl. fr., and Dec. fl. fr.).

Quercus ballota of the Mediterranean countries. Called in Greece "prinari" (Fraas), and producing edible acorns: — the tree called by the Arcadians "smilaka" is described by Theophrastus iii. 16 as resembling the "prinō" but its leaves softer and not prickly; the "iligna glans" is mentioned by Horace, and Virgil ecl. vii. 1; that from the kind that is not prickly is commended by Columella vi. 3; and according to Pliny xvi. 6 to 8, one of the two kinds of "ilex" has leaves differing not much from those of the olive, and by some Greeks is called "smilaces": *Q. ballota* is described by Clusius hist. i. 23; is termed "ilex folio rotundiore molli modiceque sinuato" by Tournefort inst. 583; was observed by J. D. Hooker in Syria (Daub.); by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to the Greek islands, the acorns not eaten habitually as in Spain; by Desfontaines ii. 350, in Barbary; by Webb, and Boissier, on both sides of the Straits of Gibraltar (A. Dec.); but has not been observed by Lenz wild in Italy.

Quercus Tournefortii of the East Mediterranean countries. The "aliphlōiōs" or "ēuthuphlōiōn," one of five kinds of oak producing edible acorns distinguished by the inhabitants of Ida, — further described by Theophrastus iii. 8 as having worthless timber, used only for axles and the like, is referred here by Bosc (Steud.): the "alian thrun" is mentioned by Eupolis, and Plutarch symp. 4. 1; and Pliny xvi. 8 in taking his account from Theophrastus clearly unites the "aliphlōiōs" with the "asprin" of the Macedonians: *Q. Tournefortii* is termed "q. orientalis latifolia foliis ad costam pulchre incisus glande maxima cupula crinita" by Tournefort cor. 40 as observed by him in Armenia (Pers.), was observed also by Olivier trav. ii. 5 in Asia Minor, and either here or in Greece by Sibthorp.

Arbutus unedo of the Mediterranean countries. Called in Britain from the shape and colour of its fruit *strawberry-tree* (Prior), in Germany "erdbeerbaum" (Grieb), in France "arbusier" (Nugent),

at Verona "fraghe de montagna," in other parts of Italy "corbezzolo" or "albatro" or "arbuto" (Lenz), in Greece "lagōmēlia" or "kōumaria" or by the Turks "chogia jemischi" (Sibth.), in which we recognize the "arbutum" fruit eaten in the Golden Age — (Varro rust. ii. 1): "kōmarōphagōi" are mentioned by ancient Greek writers; the "kōmarōs" by Aristophanes av. 621, Amphis, its fruit according to Theophrastus iii. 16 edible and called "mémaikulōn;" and "mémaikula" are mentioned by Crates, Pherecrates, Eupolis, Theopompus, and Amphis: A. unedo was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus throughout Greece and the Greek islands; by Forskal, in gardens at Constantinople, its fruit though edible employed only for feeding pheasants. Farther South, "mimaikula" are enumerated in the Scylacean Periplus 108 among trees planted in the gardens of the Hesperides (West of Cyrene and Barkē on the Tripolitan coast); and were known to Athenaeus xiv in Egypt. Westward, the "comaron" of the Greeks is identified by Pliny with the "arbutus" or "unedo," bearing "fragis" that resemble those growing on the ground, a single one sufficing; the "arbutus" is mentioned also by Virgil, Ovid, and Columella; A. unedo is termed "a. folio serrato" by Tournefort inst. 598; is known to grow in Italy and other parts of Southern Europe, and after a wide interval in Ireland (Pers., and A. Dec.). According to Lindley, "wine is made from the fruit in Corsica, but it is reported to be narcotic, if taken in quantity." (See *Ficus vasta*).

Arbutus andrachne of the East Mediterranean countries. Called in Greece "agriōkoumaria" (Sibth.), and the fruit possibly eaten during the Golden Age: — the "anthrahlē" is described by Theophrastus iii. 16 as resembling in leaf and fruit the "kōmarō" but a smaller tree, its bark smooth and peeling off; the "kōmarōs" of Dioscorides having fruit as large as a plum "kōkkōmēlou" and disagreeing with the stomach when eaten, causing headache, is referred by Sibthorp to A. andrachne; the "adrachne" of the Greeks according to Pliny xiii. 40 and xvi. 33 is a tree growing not in the open country but in the forest and resembling the "unedo," its leaves evergreen and smaller, he also infers, xv. 28 from the two names "comaron" and "memecylon" that there are two species: A. andrachne is termed "a. folio non serrato" by Bauhin, and Tournefort cor. 41 (Pers.); was observed by Sibthorp, and Chaubard, a fine tree on mountains from the Peloponnesus throughout the Greek islands to Cyprus and Smyrna.

Sorbus domestica of the Mediterranean countries. Called in English gardens *service tree* from the Latin "cervisia" but in former times *sorb* (Prior), in Germany "speierbaum" (Grieb), in Italy "sorbo" and its fruit "sorba" (Lenz), in Greece "sōurmpa" or "skarōupa" (Sibth.), and probably included among the "poma" berried fruits eaten during the Golden Age: — the "ōua" of Hippocrates vict. acut. 405, Dioscorides, and Galen, or "ouē ēmērē" and "agria" wild and cultivated of Theophrastus ii. 12, is referred here by writers: S. domestica was observed by Sibthorp, and Fraas, wild on mountains from the Peloponnesus and Greek islands to Athos, and Hæmus; by Forskal, in the gardens of Constantinople, the fruit not ripening on the trees but gathered and protected by a covering of garments. Westward, the "sorbus" according to Mago should be planted in moist cool places (Plin. xvii. 11); is mentioned also by Cato, Varro, Celsus, Columella, Martial, Apicius, and the kind with pear-shaped fruit "turbiniatio piri" by Pliny xv. 23: perry or fermented cider "fermento atque acidis imitantur vitea sorbis" by Virgil geor. iii. 380: "cervisia" was known to Pliny xxii. 82 as a fermented drink used in Gaul and other provinces, is mentioned also by Isidorus: S. domestica is termed "s. sativa" by Tournefort inst. 633; is known to grow wild in Italy (Lenz) and other parts of Southern Europe (All., Jacq. austr. pl. 447, and Pers.); and according to Evelyn sylv. 15 "beer brewed with these berries, being ripe, is an incomparable drink."

The title "ra * * *" of a king of the Sixteenth dynasty not recognized on contemporaneous monuments, — is next in order of succession in the chamber of kings at Karnak.

Seventy-ninth generation. May 1st, 1667, mostly beyond youth:

"1666 B. C. = 1st year of Siao-kia, of the Chang" or Fourth dynasty — (Chinese

chron. table).

1663 B. C. (= 1613 y. 2 mo. + "49 y. 2 mo." of Manetho in Jos. c. A. i. 14), accession of the Hyksos king Assis.

"1649 B. C. = 1st year of Young-ki, of the Chang" or Fourth dynasty — (Chinese chron. table).

1644 B. C. (= 1609 + "35 years" of Euseb. i. and ii., and Syncell.), accession of Belochus as Assyrian emperor.

1640 B. C. (= 991 + "105 + 162 + 382 years" of Castor in Euseb. i. p. 129, compare 1071 + "about 570 years" of Clint. i. p. 19), Inachus: the earliest name (according to Ocellus and others) known to the Greeks.

"1637 B. C. = 1st year of Tai-wou, of the Chang" or Fourth dynasty — (Chinese chron. table).

1635 B. C. = "3d year of Tai-wou" (Li-tai-ki-sse, and Pauth. 67), arrival at the court of Tai-wou of ambassadors from "seventy-six foreign kingdoms:" *interpreters* were also present, to translate what was said into Chinese.

Eightieth generation. Sept. 1st, 1634, mostly beyond youth: Nahor the younger (Gen. xi. 26 to 29, xxii. 20, and xxiv. 15), Seir the Horite (Gen. xxxvi. 20 and 1 Chron. i. 38).

1628 B. C. (= 1613 y. 2 mo. + "14 yrs" of the Armenian Euseb-Maneth. table), accession of the Hyksos king Aphophis. The name and title of the Hyksos king Apepi occurs on the monuments — (Leps. k. pl. 15).

1624 B. C. (= 1694 — "70 years" of Gen. xi. 26), Terah "seventy years" old. After the death of his son Haran, "Terah took Abram his son, and Lot the son of Haran," and "Sarai his daughter in law, his son Abram's wife," and they went forth "from Ur of the Chaldees," and "came unto Haran and dwelt there" (Gen. xi. 27 to 31, and Josh. xxiv. 2).

Ra-sekenen Taakan ruling Upper Egypt and warring against the Hyksos king Apepi — (pap. Brit. mus.). Ra-sekenen was buried at Drah Abu-el-Neggah in the Assasif at Thebes, but his tomb has not yet been discovered (Birch). His name occurs in a tomb at El-Kab (observed by myself); also in the chamber of kings at Karnak, and the series at Der-el-Medinet.

El-Kab or Eileithya, unlike the other Egyptian cities being walled, has evidently been held by an armed force; and the power of the Hyksos may thus have been prevented from extending farther up the river.

"1617 B. C. = 21st year of Tai-wou" (Chinese chron. table), beginning of the Eighteenth cycle.

"In the reign of Tai-wou" (Pauth. 68), death of Ou-hien, author of a "*Catalogue of the stars*:" — quoted by Chinese astronomers of after times.

1614 B. C. (= 1574 y. 10 mo. + "13 + 25 y. 4 mo." of Manetho in Jos. c. A. = 2015 — "402d year of the Assyrian empire" in Clem. Alex., the "32d year of the eighth Assyrian king Belochus" of Clem. Alex. in Euseb. præp. x. p. 497 giving — 1644 = 1613), at the end of "five hundred and eleven years" and after protracted war, the Hyksos excluded from the greater part of Egypt, as far as the before-mentioned stronghold of Auaris on the Northeastern frontier. The event is referred to "the reign of Inachus at Argos and of Amosis in Egypt" (by Ptolemaeus of Mendes as quoted by Apion, Just. Mart., Tatian, and Clem. Alex.; though confounded by him, Josephus, and others, with the Jewish Exodus. Compare Gen. xii. 6).

End of the Turin papyrus: some two hundred and fifty successive kings being enumerated; of whom the last "sixty-five" have been referred to the Hyksos period. — The papyrus was composed under the "Nineteenth or Twentieth" dynasty (Leps. eg. and sin. p. 395, and C. Muller fr. Man. p. 563). Traditionary reminiscences of the Hyksos, are found in Gen. xlvii. and xlviii., and Herodot. ii. 128.

V. THE PHARAOHS.

The Egyptian king who recovered his authority, is in the Maneth. tables called Amōs or Amōsis. A portrait of king Aahmas occurs on a stela (now in the museum at Marseilles): and his name — is at the head of a new dynasty on the tablet at Abydos, and in the series of kings at Gurna.

The name of king Aahmas occurs also at El Kab, in the above-mentioned tomb of an officer bearing the same name; who witnessed the capture of Auaris, and whose father served under Ra-sekenen.

A striking change now takes place in Egyptian monumental history: temples are again erected, Aahmas repairing that at Karnak — (Birch); figures of gods are no longer rare, but all sculptured walls teem with manifestations of Polytheism; while military campaigns cease to be conducted on foot:

The same tomb at El Kab contains figures of foreigners of the White Race in servitude, and of the horse — (Leps. d. iii. pl. 10 and 12); the domesticated animal brought from perhaps Tartary: with this acquisition, the Egyptians soon became a warlike conquering people, amply illustrating on their monuments the so-called Heroic Age; figures of the horse or accompaniments being very generally present during this epoch. Joseph in Egypt rode in a chariot (Gen. xli. 43); the Egyptians in chariots pursued the Israelites (Ex. xiv. 9); the war horse is described in Job xxxix. 19 to 25; and horses and chariots at the siege of Troy, are a constant theme with Homer. The horse bones among remains of Swiss villages of the Stone Age (Heer and Troyon p. 273) may have been of the animal in its wild state; "ippōus agriōus" among the Alps, are mentioned by Polybius (Strab. iv. 6. 10); and "equorum greges ferorum" herds of wild horses in the days of Pliny viii. 16 inhabited the North "septemtrio" (meaning perhaps the plains of central and Eastern Europe). Farther East, the horse seems known in China earlier than in Egypt, its sign occurring in the primitive characters of Chinese writing (Pauth. p. 84): a dwarf breed, long introduced throughout the Malayan archipelago, was observed by myself on Luzon; in Hindustan, figures of horses and horsemen were observed by myself in the Buddhist cave-temples at Adjunta, and the horse is mentioned in the Sama Veda (transl.

Stev.), and Institutes of Manu (transl. Bramin.). By Columbus himself, the horse was carried to America (F. Columb. 45 to 51), where it is now employed throughout, even among uncivilized tribes, and in both Northern and Austral America has besides relapsed into secondary wildness.

The same tomb at El Kab presents the earliest distinct figures of the pig I could find on the Egyptian monuments; a herd substituted for the goats previously employed for treading in seeds scattered on the soil: — pigs continued to subserve this agricultural purpose in Egypt in the days of Herodotus ii. 14; afterwards, another change took place, in the substitution of sheep, witnessed by Baumgarten i. 15. The hieroglyphic character of the pig, occurs as early at least as the Ptolemies (Leps. d. iv. pl. 26), and is mentioned by Horapollo ii. 35. The flesh of the "hzyr" or pig was prohibited by Moses (Levit. xi. 7): the pig is also mentioned by Homer, Aeschylus; and in Switzerland, during the Stone period, was kept domesticated, as appears from debris of the earliest villages (Troyon). Eastward, in Hindustan, the pig is mentioned in the Sama Veda (Stevenson), and in the Institutes of Manu (Deslongchamps' version); and figures of boar-headed personages were observed by myself in a Braminical cave-temple at Ellora. In China, the pig has been long known. Farther East, was aboriginally introduced throughout the Tropical islands of the Pacific (as verified by myself); but was absent from New Zealand until carried there by colonial Whites: and was carried to America by Columbus (F. Columb. 81).

Zizyphus vulgaris of the Southern border of the Sahara. Called in Italy "giuggiolo" and its fruit "giuggiula" or "zizola" or "zinzola" (Lenz), in Greece "tzitzuphuia" and its fruit "tzitzupha" (Fraas), around Lebanon "ziziphi" (Rauwolf), in Egypt "önnab" (Forsk.), and heaps of red fruit figured in the same tomb — possibly belong here: *Z. vulgaris* was pointed out to me by an Arab attendant as bearing "the best of all known fruits," in accordance with the account of Lotophagi by Homer od. ix. 97: the "lötös" of Cyrene, its timber much used in Egypt and its fruit yielding wine, is mentioned by Herodotus ii. 56 and iv. 177, Theophrastus iv. 3, Polybius, Strabo xvii. 3. 17, and Athenaeus xiv. 65; "lötös ètërös" yielding wine and its fruit eaten, is enumerated in the Scylacean Periplus among trees planted in the garden of the Hesperides, occurring also farther West along the Syrtis of the Lotophagi (Tripolitan coast): *Z. vulgaris* is mentioned by Mohammed kor. 53 (transl. Sale); was observed by Mungo Park in Interior Africa (Pers.); by Abd-allatif, Forskal liii., Delile, and Clot-Bey, under cultivation in Egypt, its timber of excellent quality and a cold infusion of its fruit much used. Farther North, the "zizuphön" is mentioned by Galen, Oribasius, and in Geoponica x. 3; *Z. vulgaris* was observed by Rauwolf around Lebanon; by Sibthorp, Chaubard, and Fraas, on Parnassus and the mountains of Attica, also in gardens. Westward, "zizipha" were brought from Syria towards the close of the reign of Augustus by Sextus Papinius, seen consul (A. D. 36) by Pliny xv. 14; and the tree is mentioned as cultivated in Italy by Columella, and Palladius: *Z. vulgaris* is termed "ziziphus" by Tournefort inst. 627; was observed by Ray (Hogg in Hook. journ.), and Lenz, cultivated and seemingly wild in Italy; and by Shaw, in Barbary. Eastward from Egypt, is known to occur in Persia (Pall. fl. ross. ii. pl. 59, and Lindl.); was observed by Roxburgh in Hindustan; by Graham, the "cultivated *there* generally found about old Musselman cities in the Deccan and Goozerat, and probably introduced at the time of Mahomedan conquest" According to Lindley, "the pleasant pectoral lozenges called *pâte de jujube* are prepared" in part from this species. (See *Z. jujuba*, and *Z. melanogona*).

Allium cepa of the Desert-margin in Syria and Persia. Called in Britain *onion*, in a Wycliffite transl. Num. "uniowns," in France "oignon" (Prior), in Germany "zwiebel" (Grieb), in Italy "cipolla" (Lenz), in Greece "krömmuthi" (Sibth.), in Egypt "basal" (Forsk.), in Egyptian "mjöl" (transl. Sept.) or "ëmjöl" (Kirch.) or "ëmjöl" (ms. Borg.) or "mjöl" (lex. Oxf.); and standing crops figured in this tomb, brown-headed and pulled while the stems are green — seem to belong here; notwithstanding the superior height of a similar crop at Bab-el-meluk under the Nineteenth dynasty: strings of onions are distinctly figured under the Seventeenth or Eighteenth dynasty (Champ.-Fig. pl. . .): "bitzlym" were longed for by the Israelites in the Desert (Num. xi. 5); and "caepas" were held sacred like gods by the Egyptians in oaths, in the days of Pliny xix. 32, and Juvenal xv: *A. cepa* was observed by Forskal, Delile, Clot-Bey, and myself, under cultivation in Egypt; and by Hasselquist, growing in the open country along the Dead Sea near Jericho (A. Dec.). Farther North, the "krömmuön" is mentioned by Homer, Aristophanes, Theophrastus, Dioscorides; is identified in Syn. Diosc. with the "képam" of the Romans; the "cepe" or "caepa" is mentioned by Varro, Horace, Persius, Columella, and according to Pliny xix. 32 to xx. 20 is unknown in the wild state: *A. cepa* is termed "*c. vulgaris floribus et tunicis candidis*" by Tournefort inst. 382; was observed by Sibthorp, Chaubard, and Fraas everywhere under cultivation in Greece, as throughout Europe. Eastward from Egypt, the Tsoung ling or onion mountain-chain passing near Kachgar, derives its name from the abundance of the plant (Klapr. mem. ii. 295): *A. cepa* is successfully cultivated within the Tropics, as witnessed by myself at Mocha and in Hindustan; is mentioned in the Institutes of Manu (transl. Deslongch.), is called in Sanscrit "palandu" or "latarka" or "sukandaka"

(Pidd., and Ainsl.), in Bengalee "palandu brikhya" or "tanmul," in Hindustanee "basal" or "piyaz" (D'roz.), and "piaz" in the environs of Bombay long famed "for the cultivation" (Graham). Farther East, was observed by Mason "exotic" in Burmah and called "kyp-t-hwon-nee;" by Loureiro, under cultivation in Cochinchina and China; by Kaempfer and Thunberg, cultivated here and there in Japan and called "soo," or usually "fitomosi." By European colonists, was carried to Peru before the visit of J. Acosta, observed there by myself; to the West Indies before the visit of Sloane i. p. 75; to New England before the visit of W. Wood i. 5 in 1629, continues abundantly cultivated in Northeast America, and partly from this source has been distributed throughout the Pacific, as ascertained by myself on the Hawaiian and Feejeean islands, New Zealand, and Australia.

Metallic *money*, probably of *silver*, at this time in use in Egypt, as shown by heaps of rings figured at El Kab (Leps. d. iii. pl. 10). — The pieces of silver given by Abimelech to Abraham, and those "weighed" for the purchase of the sepulchre at Hebron (Gen. xx. 16 and xxiii. 16), were probably of this description. Rings, regarded by Champollion-Figeac p. 208 as of silver, are figured in a tribute-procession to Tetmes III. under the Eighteenth dynasty: a mummy belonging to the time of perhaps the Twenty-fifth dynasty, was found on being unrolled in London to contain "a silver plate." Among the Greeks, the discovery of silver was attributed to Erichthonius of Athens, or by some to Aeacus (Plin. vii. 57); and "argurōēlōs" silver-studded, and "argurōtōxōs" bearing a silver bow, are expressions used by Homer il. i. 37 and ii. 45.

1612 B. C. (= 1587 y. $239\frac{3}{4}$ d. + "430 — 400 years" of ten lunations of Ex. xii. 40 and Gen. xv. 13 = 24 j. y. $93\frac{3}{4}$ d., for 30 years $\times 10 \div 12$ = "100—75 years" of Gen. xii. 4 and xxi. 5), the Call to Abram; and his departure from Haran for the land of Canaan.

The "gml" of the sojourn of Abram in Egypt (Gen. xii. 16), according to the name current there and the received opinion, is the *camel*, *Camelus dromas*: — the "gml" is also mentioned in Genesis xxxvii. 25, Leviticus xi. 4, Judges vii. 12, viii. 26, 1 Kings x. 2, and Job i. 3; but by Herodotus, in connexion with the East only; is figured in the Khorsabad sculptures at Nineveh (Botta pl. 98, and Bonom. iv. 1), and on Himyaritic monuments in Yemen (observed by myself), but seems entirely excluded from the Egyptian monuments. Egypt besides, appears to have continued for many centuries a barrier to the diffusion of the living animal Westward: even to the time of the Romans, the camel is hardly mentioned more than once in Numidia (Caes. bell. afr. 68); and its final complete introduction, carrying population into districts previously uninhabitable, doubtless revolutionized society throughout North Africa. In Hindustan, the camel is mentioned in the Institutes of Manu, and as used for riding by bramins (Braminical and Deslongchamps' versions); riding camels in India, is also mentioned by Herodotus, and Arrian, and was occasionally witnessed by myself; but I found no figures of the animal in the cave-temples. Recently, the camel has been introduced upon our Western plains, and with some promise of success.

The city of Hebron at this time in existence (Gen. xiii. 18, xviii. 1, and xxiii. 2). "Hebron was built seven years before Zoan in Egypt" (Numb. xiii. 22). In regard to the latter city, called also San or Tanis, no Tanite dynasty is named by Manetho anterior to the present date; — and the earliest relics found there are inscribed with the name of Meneptha II. of the Nineteenth dynasty.

1609 B. C. (= 1071 + "25th + 27 + 19 + 42 + 30 + 8 + 32 + 30 + 45 + 45 + 40 + 40 + 30 + 22 + 30 + 30 + 32 years" of Eusebius i. + "12 years" in another place, accession of Balaeus as Assyrian emperor. (The alleged "12 years," not reaching Cephalon's limit, cannot be correct; and in fact, "fifty-two" years are assigned to this reign in Euseb. i and ii, and Syncell.).

Amosis abolished the *human sacrifices* to Hera or Juno in Heliopolis; and in place of the victims, ordered "kērīnōus" to be laid aside (Manetho, in Porphy. de abst. ii. 55). The Greek word may in one sense mean destiny-images or soul-certificates, and therefore the small blue *sepulchral images* so frequently exhumed in Egypt. — A box for holding such images, dated in the succeeding reign, is mentioned by Birch as the earliest instance known of the custom of depositing them: he further states, that these images are all inscribed with the same extract from the Ritual or Book of the Dead.

This interfering in religious rites seems connected with the real commencement of *Greek history*, Inachus first king of Argos being a worshipper of Hera or Juno (Pausan. ii. 15. 4). The inhabitants of Greece had by this time reached the Second stage of society, the consequence (according to Dicaearchus) of accumulating provisions, slaying wild animals and domesticating certain kinds, multiplying herds through pastoral pursuits, and the introduction of war. As to the Third stage, critical examination of whatever is practically useful leading to *Agriculture*, the art if not already in Greece would probably be brought by refugee priests of Hera.

Malva sylvestris of Europe and the adjoining portion of Asia. Called in Britain *mallow* or *round-dock*, by Chaucer "dock" (Prior), in Italy "malva" or "malva selvatica" (Lenz), in Germany "wilde käsepappel," in Greece "mōlōha" or "malōha" (Fraas), in Egyptian "jōj," the same word meaning unleavened bread (Kirch.), in which we recognize the "malahē" eaten as early as this

date in Greece — (Hesiod op. 41), mentioned also in the *Batrachomyomachia* 161, and identified with the "mōlōhē" by Athenaeus ii. 52; the "mōlōhēs" root is mentioned by Antiphanes (Athen.): *M. sylvestris* was observed by Sibthorp, Chaubard, and Fraas, in low ground and waste places frequent from the Peloponnesus throughout Greece and the Greek islands, its leaves eaten (Walpole trav. p. 245); by Delile, wild near Alexandria, and is enumerated by Clot-Bey among the esculent plants of Egypt. Westward, the "malva" is enumerated among esculents by Cicero, and Horace; by Pliny xx. 84 as eaten and called "malachen" by the Greeks; and the "moloche" is mentioned by Columella x. 247: *M. sylvestris* is termed "*m. vulgaris flore majore folio sinuato*" by Tournefort inst. 95; is described by Persoon as erect; was observed by Forskal on Malta and on the hills around Marseilles; and is known to occur in waste places and fallow ground throughout middle Europe as far as Britain (Cav. ii. pl. 26, and Curt. lond. ii. pl. 51). By European colonists, was carried to Northeast America, where it was observed by A. Gray along "way-sides" in our Northern States. The plant according to Lindley is "mucilaginous and emollient." (See *M. rotundifolia*.)

Asphodelus ramosus of the Mediterranean countries. Called in Italy "asfodillo" (Lenz), in Greece "karavōuki" or "spōurhakula" or "asphōthēlō" (Sibth.), in which we recognize the "asphōthēlōs" eaten by the Greeks as early as this date, — and in after times held sacred, planted on tombs and before gates of cities (Plin. xxi. 68, and Eustath.); mentioned as esculent by Hesiod op. 40, Theophrastus vii. 12, and the favourite diet of Pythagoras (Porphy.); mentioned as growing wild by Homer od. xi. 538 to 573; and the "lēukōn asphōthēlōn," by Cratevas: *A. ramosus* was observed by Sibthorp, Chaubard, and Fraas, abounding in open situations from the Peloponnesus throughout Greece and the Greek islands, extensive tracts coloured with its flowers. Westward, its stem called "anthērikōs" was according to Hellanicus employed by the Numidians for building huts, a practice alluded to by Diodorus xx. 57, the time of gathering is defined by Mago, and the "anthērix" is also mentioned by Theocritus i. 52: the "asphōthēlōs" is identified in Syn. Diosc. with the "alvōukiōum" of the Romans, but according to Pliny xxi. 68 the "albacum" of Italy is the stem: *A. ramosus* is termed "*a. albus ramosus mas*" by Tournefort inst. 343; was observed by Lenz here and there in Italy, and is known to grow in other parts of Southern Europe (Pers.).

1508 B. C. (tomb of officer Aahmes, and Birch). after a siege of "six years," Sharuhana in Palestine captured by king Aahmes. — The city of Sharuh is mentioned in Joshua xix. 6.

1605 B. C. = "15 years before the reign of Phoroneus" (Anticlid., in Plin. vii. 56), letters or *alphabetic writing* invented by Memnon or Menon, an Egyptian. The *Phœnician alphabet* is clearly not older than the domestication of the *camel*; this animal being substituted for the *Cynocephalus* or baboon for the third letter.

The tomb of Aahotep mother of king Amosis (discovered by Mariette 91) was found to contain: a breastplate ornamented with precious stones, *red cornelian, turquoise, and lapis-lazuli* (the latter of course brought from Media): — "antique Egyptian jewelry set alternately with bits of lapis lazuli" was known to C. W. King ant. gem, who further refers here the "sapphirus" of Pliny from its coming "from Media:" according to Marco Polo 47, "balasci" and "pierres duquelz l'en fait le azur" come from Balascia:

Also a diadem of gold, ornamented with two diminutive *sphinxes*: a poignard having the blade of *bronze*, and handle of *silver*:

And three bees carved in gold. The *honey bee*, *Apis mellifica*, is enumerated as a hieroglyphic character — by Horapollo 59; is figured in a tomb above Girgeh of the time of Mienptah (observed by myself), is mentioned in the history of Samson (Judg. xiv. 8), also in Proverl's xxiv. 13, Psalm cxviii. 12, and by Hesiod, Homer il. ii. 87, and subsequent Greek and Latin writers. Eastward, is mentioned in the Sama Veda (transl. Stev.), the Institutes of Manu (transl. Deslongch.), and the Mahavansi of the Ceylon Budhists. By European colonists, was carried to Northeast America, where it continues kept in hives and has become naturalized; and in "1869," the first swarm of bees with a "store of wild honey" were found in a tree "on the west side of the Sierra Nevada mountains," there "were no wild bees" in the country beyond the Sierra when first occupied by emigrants from the Atlantic States, by whom however bees were soon imported (B. Transcript, Apr. 14th, 1869).

Eighty-first generation. Jan. 1st, 1600, mostly beyond youth: Bethuel (Gen. xxiv. 24 and xxviii. 5), Zibeon (Gen. xxxvi. 24 and 1 Chron. i. 38).

Ficus sycomorus of Abyssinia and the mountains of Yemen. The *sycamore* is called in Yemen "sokam" or "obre" or "chanas," in Egypt "djummeiz" (Forsk.), and mummy-cases under the Seventeenth dynasty are usually of its wood — (Birch): a tank with trees planted around, apparently of this species, is figured in the beginning of the Eighteenth dynasty; also the mystical sacred tree (Leps. d. iii. pl. 37 and 40), shown by later and more highly finished representations to be the *sycamore*: the "sukaminōs" is mentioned by Theophrastus iv. 2 as not growing North of Egypt; the "djummeiz," by Temimi, and Abd-allatif; and *F. sycomorus* was observed by Forskal, and Delile, in Egypt, by myself, planted on the river-flat throughout. Farther South, by Lepsius eg. and sin. p.

128 to 170, among the trees clothing the banks of the Nile beyond Lat. $14^{\circ} 30'$ and Abu Haras; by Bruce, and Salt, abounding on the Taranta mountains in Abyssinia; and the "sukaminōn aiguptiōn" is enumerated by Artemidorus, among other trees growing South of the entrance to the Red Sea (Strab. xvi. 4. 14). Eastward, *F. sycomorus* was observed by Forskal wild on the mountains of Yemen: and dried *sycomore figs* "from the Persian Gulf" were once shown me.

The name of king Aahmas occurs in the *alabaster quarries* at El Bosra, opposite Siut (Leps. eg. and sin. 32 and 115).

1593 B. C. = "22d year of Aahmas," in the *quarries* at Massara, the date of opening these quarries, to repair temples at Memphis.

1592 B. C. (= 1417 + "37 + 31 + 9 + 26 + 13 + 22 + 24 + 13 years" of the Afr.-Maneth. table = "38 + 31 + 9 + 26 + 12 + 21 + 13 + 25 years" of the Euseb.-Maneth. table), accession of the second king of the Seventeenth dynasty. The name of king Amunhotep is next on the monuments; both contemporaneous, — and in the tablet at Abydos, and the series of kings at Gurna.

Amunhotep built a portion of the temple at Karnak (De Rougé); and (according to Champollion-Figeac) foreign wars are recorded on some of his constructions:

1590 B. C. (= 1640 — "50 years" of Castor in Euseb. i. p. 129 to 131, see also Apollod. ii. 1, and Pausan. ii. 5 to 8), Inachus succeeded by Phoroneus, second king in the Peloponnesus. He collected the scattered inhabitants into a town, named after him Phoronikon (Pausan. ii. 15. 5).

His brother Aegialeus collected the inhabitants of a neighboring district on the Isthmus into a town, named after him Aegialeia, and became the first king of Sicyon (Apollod. ii. 1. 1, and Paus. ii. 5. 5).

The Arcadians living on the leaves of trees and roots of herbs before — the time of Pelasgus, according to tradition (Ruel i. 115).

Apargia tuberosa of the Mediterranean countries. Called in Greece "rathiki" or "agriōrathikōn" (Sibth.); and perhaps included among the roots of herbs eaten by the Arcadians: — the "kihōriō agriō," edible according to Theophrastus ix. 12. 4, may also be compared: *A. tuberosa*, sent by Busbecke from Constantinople, is termed "*cichorium constantinopolitanum*" by Matthioli comm. pl. 388; was observed by Sibthorp, and Chaubard, frequent in meads more or less sandy from the Peloponnesus to Cyprus. Westward, is described by Lobel pl. 232; is termed "*dens leonis asphodeli bulbillis*" by Tournefort inst. 468; is known to grow in Italy and Southern France (Pers.), and was observed by Brotero as far as Portugal (Spreng., and Steud.).

1589 B. C. (= 1587 y. 239 $\frac{2}{3}$ d. + "100 — 99 years" of Gen. xvii. 1 and xxi. 5), the Promise to Abraham. Establishment of the rite of *circumcision*. And destruction of the two cities of Sodom and Gomorrah.

According to the Septuagint and English Versions "vōuturōn" or *butter* is mentioned in Gen. xviii. 8. — The art of making butter (according to Oppian cyneg. iv. 271) was brought from the Issedones or other Northern nations by Aristaeas; according to the Hippocratic writer morb. iv. p. 357, was derived from the Scythians, and their process of making butter from mare's milk is distinctly described: butter used among the mountaineers of Portugal is mentioned by Strabo iii. p. 414; butter from sheep's or goat's milk is prescribed by Dioscorides; and from cow's milk, by Galen fac. simpl. x. p. 272 (Spreng.).

The same year (= 1557 + "32 years" of Euseb. i and ii. = 1609 — Cephalaion's 20 years limit) is given for the accession of Altadas as Assyrian emperor: but suspicion here arises of conformity to a chronological landmark; as he is called "Sethos" by Syncellus, with "fifty" years assigned to his reign.

"Towards the close of the Treta Yug" or Silver Age (Puranas, Graha Munjari tables, and Bentley as. res. viii. p. 231), Bharadwaja reigning in Hindustan.

1588 B. C. (= 1587 y. 239 $\frac{2}{3}$ d. = 1240 + "430 years" of Ex. xii. 40, compare also 1413 + "175 years" of Gen. xxv. 7), Isaac born to Abraham and Sarai.

"Hévrōn" is placed in this year by Manetho (= 1574 y. 10 mo. + "13 years" of Jos. c. A. i. 15); the "thirteen years" of Hévrōn or Hévrōs occur also in the Maneth. tables, but at different dates, and there is no such king on the Egyptian monuments. Manetho seems therefore to have been acquainted with this date in Jewish history.

Cordia myxa of Tropical Arabia and Hindustan. A large tree called in Burmah "tha-nat" (Mason), in Hindustanee "lusora" or "lesoora," in Telinga "nekra," in Bengalee "bohooari" (Lindl.), in the environs of Bombay "bhokur" (Graham), in Tamil "vidi-marum" (Drur.), in Egypt "mokhayet" (Del.), in Yemen "onneb" or "gharaf" or "sehæli" or "eschell" (Forsk.), in which we recognize the "ashl" planted by Abraham at Beer-sheba — (Gen. xxi. 33), that under which Saul abode at Gibeah, and a third under which he was buried in Jabesh (1 Sam. xxii. 6, and 1 Chron. x. 12); mummy-cases are said to be made in some instances of wood of *C. myxa*; the "mokhaita" is men-

tioned by Ibrahim Magrebi, Ishak ben Amran, and Ebn Baitar; the living *C. myxa* was observed by Alpinus, Lippi, Forskal, and Delile, in Egypt, by myself on the river-flat planted throughout, a Tropical tree that may succeed in Palestine but hardly farther North: is known however to occur in Persia (Lindl.). Farther South, was observed by Forskal p. 33 planted as well as wild among the mountains of Yemen and the fruit eaten by boys, its wood tough and solid employed by carpenters, also to procure fire by friction. Eastward, was observed by Graham "on the Ghauts and about villages throughout the Concan," its fruit pickled and eaten by the natives; by Rheede iv. pl. 47, in Malabar; by Roxburgh, and Royle, in other parts of Hindustan; by Mason, in Burmah. The "sebesten" of Avicenna, Serapion, and Averrhoes, is also referred here; and according to Gaertner, Graham, and Lindley, the transparent glutinous pulp of the fruit of *C. myxa* becomes when dried the true *sebesten* of the shops.

In the valley of Der-el-Medinet at Thebes, an example of the *arch* occurs in a tomb inscribed with the name of Amunhotep, and built of dobi or sun-dried brick (Wilk. topog. theb. 81).

The portraits of Amunhotep are sometimes accompanied by that of his wife, queen Aahotep (Leps. d. iii. pl. 1); a woman possibly of the Nubian Race, but to all appearance, a negress.

A statue of king Amunhotep is (now in the museum at Turin): — and his memory appears to have been held in after times in veneration by the Egyptians.

1579 B. C. (= 1592 — "13 years" of the Afr.-Maneth. table), end of the reign of the second king of the Seventeenth dynasty. The name of king Tutmas is next on the monuments, — in the tablet at Abydos, and the series of kings at Gurna.

The "first year of Tutmas" occurs on the rocks at Assouan, and in the quarries of Kerman opposite the isle of Tombos in 19° N. — (Birch).

1578 B. C. = "2d year of Tutmas" (Leps. k. tab. p. 17, and eg. and sin. 233), in an inscription at Tombos; the latest date in his reign found on the monuments.

Tutmas continued the temple at Karnak, placed there two obelisks (Birch); and according to Champollion-Figeac, built the earliest portion of the temple at Medinet Abu and a rock-temple at Ibrim in Nubia; a "magnificent colossal statue" of him is now in the museum at Turin.

1576 B. C. (= 1575 + his "1st year"), the accession of Tutmas II. not earlier than this date. His name is next on the monuments, contemporaneous — as well as in the tablet at Abydos, and the series of kings at Gurna.

"First year of Tutmas II." (Leps. k. tab. p. 17), the latest date in his reign found on the monuments. His name occurs in one or more rock tablets at Tombos (Leps. eg. and sin. 18); and (according to Champollion-Figeac), he built additions to the temple at Medinet Abu, and edifices at Semneh in Nubia, and at Esneh.

1575 B. C. (= 1554 y. 3 mo. + "20 y. 7 mo." of Manetho in Jos. c. A., or "21 years" in the Euseb.-Maneth. table), accession of Amēnōphis, in the Afr.-Maneth. table called "Amēnōphthis" (the termination indicating a female). The name of queen Amun-u-hnumut is next on contemporaneous monuments; — but does not occur in the genealogical series at Abydos, nor in that at Gurna (an omission due perhaps to the mode of reckoning).

Her name is associated with that of Tutmas II. at Medinet Abu, in the Assasif, and elsewhere — (Birch): and occurs in a tomb at Thebes belonging to the earlier part of the Eighteenth dynasty (Poole hor. eg. 65).

Peaceful expedition by sea as far as Punt (Pontus?), now first visited by the Egyptians — (Birch).

Among the articles brought back to Egypt, "stibium" is enumerated — (Birch): the practice of blackening the eyelids with "kohl" (a preparation said to be mainly composed of *antimony*) seems figured on the monuments as early as the Seventeenth dynasty: the use of "kohl" or eye-paint is mentioned in 2 Kings ix. 30; also by Ion, and Julius Pollux v. 16. 101, the material being termed "stimmi" by the Greeks, and "stibium" by Celsus: the custom continues in Egypt to the present day; and the importation there of antimony "from Europe," is mentioned by Forskal mat. med.

Echium setosum of the East Mediterranean countries. A rough bristly-leaved herb called in Egypt "el kahēli," its red root and bark persistently and beautifully staining the skin, and employed as a cosmetic (Forsk.); included perhaps in that composed by queen Amun-u-hnumut on the return of the Expedition — (see Birch): "aghōusa riza" used as cosmetic by women, giving rise to the term "aghōusizēsthai," is mentioned by Hesychius; the "riziōu" used by women as cosmetic, by Dioscorides iv. 98: the "ghōusa" or "aghōusa," by Aristophanes lys. 48 and eccles. 929; and is described by Theophrastus vii. 8. 3 to 9. 3 and od. 31 to 33 as having leaves spreading on the ground and a red root, imported from Syria for colouring ointments: *E. setosum* was observed by Sibthorp pl. 182, and Chabard, from Crete to the Peloponnesus; and by Forskal p. 41, and Delile, on the Mediterranean border of Egypt.

Populus nigra of Europe and Northern Asia. Called in Britain *black poplar* (Prior), in Germany

"schwarzpappel," in Italy "albaro" or "pioppa" or "pioppo nero" (Lenz), in Greece "kavaki" (Sibth.), in Egypt "baks" (Forsk.); and possibly among the foreign trees brought by the fleet and planted in Egypt — (see Birch): tall ornamental trees are figured in garden-plans at Gurna (Champ. pl. 174, and Rosselin. ii. pl. 68): the "bkaym" of David's victory at Rephaim (2 Sam. v. 23 and 1 Chron. xiv. 14) may prove the origin of the consecration of the "populus" to Hercules (see Samson): *P. nigra* was observed by Forskal, Delile, and Clot-Bey, in the gardens of Egypt; is known to occur also in Palestine (Royle in Kitt. bibl. cycl.). Farther North, the "aigēirōs" is mentioned by Hesiod, Homer, Theophrastus, Dioscorides, and the "aigēirōu krētikēs" in 1 Mul. morb. 108: *P. nigra* was observed by Sibthorp, and Chaubard, in wooded situations from the Peloponnesus and Cyprus throughout Greece. Westward, the "populus" is mentioned by Cicero, Ovid; as grateful to Hercules, by Virgil ecl. vii. 61, and Pliny xii. 2; and the "*populus nigra*," by Pliny xvii. 35. 22: *P. nigra* is described by Tournefort inst. 592, and Blackwell pl. 248; was observed by Lenz wild in Italy, and is known to grow on river-banks throughout middle Europe as far as Britain (Engl. bot. pl. 1910, and Pers.). Eastward from the Black Sea, is known to grow throughout Northern Asia, being enumerated by A. Decandolle among the plants extending two-thirds around the Subarctic circuit of the Globe. By European colonists, was carried to Northeast America, where it continues planted for ornament, especially in and near the district drained by the Hudson river. The young leafbuds according to Lindley are "employed as the basis of a balsam and tincture," and occasionally in the preparation of "unguentum populeum." (For the art of making the tree grow unnaturally tall, see *P. tremula*).

Pyrus communis of Europe and the Caucasian countries. Called in Britain *pear*, in Anglo-Saxon "peru," in France "poire," in Spain "pera" (Prior), in Germany "birn" (Grieb.), in Slavonic "krusska" or "gruscha," in Celtic "peren" (A. Dec.), in Italy "pera," and the wild kind "peruggine" or "pero selvatico" (Lenz), in Greece "apithia," and the wild kind "ahlathia" (Fraas), in Egypt "kummitri" (Forsk.); and possibly among the foreign trees brought by the fleet and planted in Egypt — (see Birch): the fruit-tree figured in one of the tombs at Gurna (Rosselin. ii. pl. 68) seems to belong here: the "apiōs" is mentioned in the Hermetic iatromathem.; and *P. communis* was observed by Abd-allatif, Forskal, Delile, and Clot-Bey, in the gardens of Egypt, the fruit besides imported from mount Sinai, and from Tor on the Gulf of Akaba. Farther North, the image of Juno dedicated by Peirasus was made of "athrathōs" wood (Paus. ii. 17. 5); the "apiōs" is mentioned by Theophrastus, Istrus, Dioscorides, Galen, and Athenaeus xiv. 63; *P. communis* was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus and other parts of Greece, both wild and cultivated; and is known to grow wild about Caucasus (Ledeb.). Westward, the "pirum" cultivated in several varieties is mentioned by Cato vii. 4, Horace, Virgil, Celsus, Pliny, the "achras pirus" by Columella, and "pirus agrestis" by Palladius iii. 25. 1: *P. communis* was cultivated in Switzerland during the Stone Age, a small-fruited kind "var. achras" occurring in debris of the earliest villages (Heer and Troyon 278 and 443); is termed "*p. sylvestris*" by Tournefort inst. 632; was observed by Lenz wild in Italy; is known to grow wild in middle Europe, and is besides cultivated throughout as far as Lat. 64° (A. Dec.). Eastward from Caucasus, pears "from Bunder-Abbas" on the Persian Gulf were shown me at Muscat; and are sometimes carried to Hindustan, as appears from having a Hindustanee name "nashpati" (D'roz.), but the tree remains unknown there even in the North (Royle); though its cultivation has extended by the way of Central Asia to China and Japan (Bunge, and Thunb.). By European colonists, the tree was carried to Northeast America, where it continues successfully cultivated in our Northern States; and to St. Helena, where I found the fruit large but tasteless. (See Peirasus).

Beta vulgaris of the Mediterranean and Tauro-Caspian countries. Called in Britain *beet* (Prior), in France "bette" or "betterave" (A. Dec.), in Germany "mangold," in Italy "barba" or "betiola" (Lenz), in Greece "sēs-kōula" or "phēs-kōula" and the red-rooted variety "kōkkinōgōulia" (Fraas), in Egypt "sælk" and the red-rooted variety "bandsjar" (Forsk.), in Egyptian "lōgēm" (Kirch.); and possibly brought to Egypt by the Expedition in question — (see Birch): agreeing with the tuft of large leaves on a root figured in the Asasif, and on subsequent monuments (Leps. d. iii. pl. 19 and 78): *B. vulgaris* was observed by Abd-allatif ii. 1, Forskal, and Delile, under cultivation in Egypt. Farther North, the "sēutlōn" or "tēutlōn" is mentioned in the Batrachomyomachia, also by Crates, Melanthius, Aristophanes pac. 1008, Eudemus, Diphilus, and Athenaeus ii. 57; the "tēutlōn lēukōn" and "mēlan" are distinguished by Theophrastus vii. 4, and Dioscorides; *B. vulgaris* was observed by Forskal in gardens at Constantinople, and by Fraas under cultivation in Greece, the white-rooted variety for the leaves only, which are eaten as greens. Westward, the "beta" is mentioned by Plautus, and Pliny, the "pede candida beta" by Columella x. 251, "fatuae fabrorum prandia betae" by Martial, and "betizare" by Suetonius oct. 87; *B. vulgaris* is described by Fuchs, Cæsalpinus, Olivier de Serres, and Parkinson; and is known to be cultivated in Italy and throughout middle Europe (Ait., and Pers.). Eastward from Egypt, is cultivated in Hindustan for its leaves only and

has no Sanscrit name (Roxb.), is called in Hindustanee "chuqandar" (D'roz.), in the environs of Bombay sometimes "paluk" or "palung," the red-rooted variety observed by Graham "commonly cultivated in gardens:" and farther East, *B. vulgaris* called "toodisia" was observed by Thunberg under cultivation in Japan. By European colonists, was carried prior to 1656 to New England (poem Bradf. in Hist. coll. iii. p. 77), where as well as throughout our Northern and Middle States it continues abundantly cultivated: the *mangel wurzel* variety, employed for feeding cattle, has also been introduced, and continues to some extent cultivated. (See *B. maritima*).

Myrtus communis of the borders of the Persian Gulf. Called in English gardens *myrtle*, in France and Germany "myrte" (Nugent, and Grieb), in Italy "mirto" or "mortella" (Lenz), in Greece "murtōn" or "mursinē" (Sibth.), in Egypt "as" or "mersyn" (Del.); and possibly brought to Egypt by the Expedition in question — (see Birch): branches carried by women are figured on a monument of about this date (Rosselin. ii. 99), and according to Clot-Bey, branches are sold to the present day and used in festivals by the Jews: the "mursinē" was already in Egypt in the days of Theophrastus, and Pliny xv. 37; and *M. communis* was observed there in gardens by Forskal, and Delile. Farther North, its branches were strewn by Xerxes on his bridge across the Hellespont (Herodot. vii. 54); were carried in Greek sacrificial processions in the days of Aristophanes vesp. 860; the "mursinē" or "murtōs" is mentioned also by Pherecrates, Euripides, Plato polit. ii. 372, Philonides, and the "mursinē ē ēmērōs" by Dioscorides: *M. communis* was observed by Sibthorp, Chaubard, and Fraiss, frequent and seemingly wild from the Peloponnesus throughout Greece and the Greek islands. Westward, the "myrtus" is regarded by Pliny xv. 36 as foreign to Italy, first seen on the tomb of Elpenor, but when Rome was founded growing already on its site; is mentioned also by Cato viii. 2, Catullus, Horace, Columella, and as sacred to Venus by Virgil: *M. communis* is described by Clusius hist. i. 67; is termed "*m. communis italica*" by Tournefort inst. 640; was observed by Lenz seemingly wild in Italy; and has become abundantly naturalized throughout the West Mediterranean countries (Chaubard), but its foliage and mode of flowering indicate Tropical origin. Eastward from the Mediterranean, was observed by Nearchus in a garden on the North shore of the Persian Gulf (Arr. ind. 27); has no Sanscrit name (A. Dec.), but is called in Hindustanee "murd" or "as" (D'roz.), in the environs of Bombay "belatee mendie" and observed by Graham "in gardens pretty common," but by myself only in a missionary garden on the Deccan. Farther East, by Macon, "exotic" in Burmah. By European colonists, was carried to Madeira (Lemann); and to Northeast America, where it has become frequent in conservatories.

Boswellia glabra of Tropical Hindustan. A small tree called in the environs of Bombay "salai" or "salphullie" and furnishing a portion of "the gum *olibanum* of commerce" (Graham); possibly therefore the "incense trees" or *frankincense* brought by the above Expedition to Egypt — (see Birch): the incense-burner is figured in the Asasif, and from this time becomes frequent on the monuments (Leps. d. iii. pl. 19, 58, 71, and Champoll.-Figeac pl. 86). Eastward, the incense-bearing tree exuding its gum from branches snapped by elephants, is mentioned by the Sanscrit dramatist Bhavabhuti uttar. ii: *B. glabra* is described by Rumphius ii. pl. 50; was observed by Gibson, and Graham, "common on the bare rocky hills of the Deccan," as well as "in the Sautpoora jungles" where the gum may be bought in quantities at a cheap rate; by Roxburgh, Royle, and Wight, in central Hindustan and as far as the Coromandel mountains; its fragrant resin called "koondricum" is much burnt as an incense in the religious ceremonies of the Hindoos, is collected largely by the Khoonds and Woodias in the extensive jungles in Goomsur and Cuttack provinces, and the same tribes in times of famine live on a soup made from the fruit (rep. Mad. exhib., and Drur.).

Boswellia thurifera of Tropical Hindustan. A tree called in Sanscrit "salaci," in Hindustanee "luban" (Lindl.), in the environs of Bombay "dup salai" and furnishing the remaining portion of "the gum *olibanum* of commerce" (Graham), from Bombay according to Royle the Indian *olibanum* is chiefly exported: *B. thurifera* may therefore have furnished the *frankincense* for the incense-burner figured in the Asasif, and that called in Egyptian "lavō" (Edw.) or "shēllōōuz" — (ms. Par.): "lbnh" is mentioned by Moses levit. ii. to xxiv and num. v. 15. and according to Jeremiah vi. 20 was brought by Arab merchants; "livanōs" brought by them, is mentioned by Herodotus iii. 107, Euripides, Theophrastus ix. 4. 7, Eratosthenes, Strabo, and Dioscorides; and the incense burned in Catholic churches according to Colebrooke res. as. ix. 317 to xi. 158 is from *B. thurifera*. Eastward, the tree was observed by Gibson, Law, Nimmo, and Graham, in the environs of Bombay and in the Southern Concan; by Roxburgh, and Wight, as far as the mountains of Coromandel; by Royle, common in central Hindustan, extending not as far North as the preceding; and according to Drury, is a large tree, affording good timber, and its gum-resin is called in Bengal "koondooroo" or "ghundurur" or "cundun."

Eighty-second generation. May 1st, 1567, mostly beyond youth: Ishmael, Anah (Gen. xxxvi. 24 and 1 Chron. i. 41): among the Greeks, Laodice mother of Apis and Niobe (Apollod. ii. 1).

1563 B. C. (= 2016 — "453 years" of both the Maneth. tables), a date possibly marking the

expulsion of the Hyksos from the Egyptian frontier. In the absence of monumental evidence that the kings of the Seventeenth dynasty carried war beyond the Northeastern frontier, the Hyksos are regarded by Lepsius as probably the obstacle in that direction. Confirmation is found in Manetho's detailed account in Jos. c. A. i. 14 and 15.

Compelled to quit the Egyptian frontier (Manetho in Jos. c. A.), the Hyksos carried along all their possessions, and the whole community numbering not less than two hundred and forty thousand, proceeded across the Desert towards Syria: but fearing the Assyrians, who now ruled Asia, they turned aside, and for their own protection built a city and called it Jêrôsôluma. (That Jerusalem was built before the Exodus of the Jews, appears from Josh. x. 1, xviii. 28, and Judg. xix. 10).

The hieroglyphic character of the *onager*  "iantôou" and "ĕiantôou" means "mountain ass," also "hill country," and therefore Pales tine; the animal in its wild state wandering no farther West. The character occurs in an inscription having reference to the Hyksos king "Apepi" or Apophis (Leps. k. pl. 15), but composed perhaps subsequently; — and with its modifications, continues in use until the reign of Ramessu VIII. of the Twentieth dynasty (Leps. d. iii. pl. 238, and k. pl. 30 to 40).

In a painting of about this date (now in the museum at London), I remarked the *onager*, *Equus hemionus*, domesticated and caparisoned. — The "white asses" of the Song of Deborah (Judg. v. 10) may therefore be compared.

Ambiguous figures at Benihassan on examination proving varieties of the dog, the above painting contains the earliest figure I have met with of the *cat* (copied in Wilkinson pl. . . .), from the surroundings possibly in its wild state as *Felis maniculata* of the Upper Nile: — under the Twenty-second dynasty (Leps. k. pl. 46) the cat makes its appearance as a hieroglyphic character, and was doubtless at this time domesticated in Egypt; though unnoticed in the Hebrew Scriptures, Hesiod, Homer, and the *Batrachomyomachia*, until mentioned by Herodotus as a familiar domestic animal in both Egypt and Greece. Eastward, I looked in vain for figures in the cave-temples of Hindustan; but according to Deslongchamps transl., the cat is mentioned in the Institutes of Manu. By European colonists, the cat was carried to America and the islands of the Pacific; was met with by our Expedition on Taheiti and Tongatabu, relapsed into secondary wildness on the Hawaiian Group, and (according to Rich) on the Samoan.

"1562 B. C. = 1st year of Tchoung-ting, of the Chang" or Fourth dynasty (Chinese chron. table).

1561 B. C. = "1st of Mechir in the 15th year of Amun-u-hnumut," commencement in the quarry of work on the two Great obelisks — (Birch).

1560 B. C. = "last day of Mesore in the 16th year of Amun-u-hnumut," and after an interval of "seven months," the two Great obelisks finished — (Birch): they continue in place in the temple at Karnak. The "16th year" is the latest in the reign of Amun-u-hnumut found on the monuments (Leps. k. tab. p. 17).

"1557 B. C. = 6th year of Tchoung-ting" (Chinese chron. table), beginning of the Nineteenth cycle.

The same year (= 1527 + 30 years of Euseb. i. and ii., and Syncell.), accession of Mamythus as Assyrian emperor.

1554 B. C. (= 1532 y. 6 mo. + "21 y. 9 mo." of Manetho in Jos. c. A., the Afr-Maneth. table giving 1417 + "37 + 31 + 9 + 26 + 13 + 22 years" = 1555), accession of Amëssis, called "Amënsis" in the Afr-Maneth. table. On the monuments, Tutmas III. head of the Eighteenth dynasty is next in order: — he immediately follows Tutmas II. in the series of kings at Abydos, and Gurna.

Nelumbium speciosum of Subtropical and Tropical Eastern Asia. The flower of the *great water-lily* has not been found on the Egyptian monuments, but certain representations, including the emblem designating Asiatic captives, appeared to me intended for the fruit; the plant is besides known to have furnished one form of capital of the Egyptian columns — (Athen. v. 9): a kind of "lôtôs" lily growing in the Nile is described by Herodotus ii. 92 as having fruit like a wasp's nest, containing seeds as large as olive-stones; the "kuamôs aiguptiôs" is mentioned also by Hippocrates, Theophrastus iv. 3 to 10, Diodorus, Strabo, and Dioscorides; the flower and fruit of *N. speciosum* occur on a medal of Vespasian, and a bust of Antinous (Del.), but the plant has since disappeared from Egypt. Eastward, continues in the Caspian as far as the mouths of the Volga (Ledeb., and A. Dec.), though perhaps not indigenous there: is figured in the cave-temples of Hindustan, both Buddhist and Braminical, as ascertained by myself; was observed by Rheede xi. pl. 30 in Malabar; by Graham "in tanks throughout the Concan" (planted); and is called "nelumbo" on Ceylon (Lam.). Farther East, was observed by Mason indigenous in Burmah and called "pa-dung-ma;" by Loureiro p. 416 in Cochinchina; is called in China "lien-hoa," is mentioned in the Eulh-ya dictionary, and its spongy fruit by Li-chi-tchi as medicinal, was observed by Cibot mem. chin. iii. 437 multiplied by seeds and roots and requiring no further care in cultivation, its seeds eaten like filberts; by Kaempfer, and Thunberg, around temples in Japan and regarded as sacred, but its stems eaten.

1552 B. C. (= 1611 y. 239 $\frac{2}{3}$ d. — “60 years” of Gen. xxv. 26), Esau and Jacob born to Isaac and Rebekah.

1550 B. C. = “5th year of Tutmas III.,” date of a contract, written on papyrus, — and now in the museum at Turin (Champ.-Figeac).

“1549 B. C. = 1st year of Wai jen, of the Chang” or Fourth dynasty — (Chinese chron. table).

1539 B. C. = “16th year of the joint reign of Amun-u-hnumut and her brother Tutmas III.,” in a tablet at Wady Maghara, re-opening of the mines there, abandoned since the Twelfth dynasty. — (Birch).

As early perhaps as this date (Graham Munjari tables, Puranas, and Bentley as. res. viii. p. 231), Viswamitra reigning in Hindustan.

Burmah at this time inhabited.*

1536 B. C. = “55th year of Phoroneus” (in Africanus, see also Philochor., Hellan., Thall., Tatian, and Clem. Alex.), the Deluge of Ogyges in Greece. Or (according to Castor) the city of Eleusis founded in this reign by Ogyges. Phoroneus and Ogyges are also made contemporary by Acusilaus: and “Ogygia” (according to Strabo, and Pausan. ix. 5. 1) was the ancient name of Boeotian Thebes.

* *Dillenia tha-byu* of Burmah. Called there “tha byu,” and from early times its fruit affording sustenance to man; — enumerated by Mason 450 and 532 as edible, the tree indigenous and not exactly agreeing with descriptions of *D. speciosa*.

Dillenia scabra of Burmah. From early times its fruit affording sustenance to man, — described by Mason v. 473 as large, “brought to bazar green and considered a favorite vegetable with the natives,” the tree confined to “the borders of streams.”

Uvaria grandiflora of Burmah. A scandent shrub called there “ta-bwot,” its fruit from early times affording sustenance, — having according to Mason v. 452 and 740 “the taste and appearance of the North American pawpaw,” and “abounding in the jungles.”

Sterculia alata of the Siamese countries. Called by residents *Boodh's cocoa-nut*, and from early times the winged seeds of its large fruit affording sustenance, — sometimes according to Mason v. 448 eaten by the natives, the tree “handsome,” growing in Tenasserim: described also by Roxburgh.

Pierardia sapota of Tropical Eastern Asia. A small tree called in Burmah “ka na-zo,” its fruit from early times affording sustenance; — described by Mason v. 451 as “one of the best and most plentiful of the jungle fruits,” the “bunches resembling large grapes,” and not as yet cultivated. Farther South, was observed by Jack in the Straits of Malacca.

Sleicheria kyet-mouk of Burmah. A tree called there “kyet-mouk,” and from early times its fruit affording sustenance, — according to Mason v. 454 “rarely seen in market, but would be a valuable addition to the dessert;” indigenous “among the hills of Tavoy.”

Bouca oppositifolia of Burmah. A tree called there “ma-yan,” by residents *opposite-leaved mango*, and from early times its fruit affording nutriment: — indigenous according to Mason v. 448, and one variety “intensely sour,” the other “as insipidly sweet.” Described also by Roxburgh i. 640: and farther West, introduced by Nimmo in 1833 into the environs of Bombay (Graham).

Bauhinia sheen-byat of Burmah. A small timber tree called “sheen-byat,” and from early times affording nutriment; — according to Mason v. 531 “bearing a sour leaf,” and its “pod containing sweet pulp.”

Willughbeia Martabanica of Burmah. Called there “theet-kyouk-nway,” its fruit from early times affording sustenance; — according to Mason v. 457 “large as an apple” and “of an agreeable acid taste but abounds in a milky juice,” is termed by residents “a kind of fig,” and is indigenous “in the forests:” is described also by Wallich.

Bignonia (Spathodea) stipulata of Burmah. Called there “bet-than,” and its flowers from early times affording nutriment, — according to Mason v. 411 and 543 brought to market for food; the tree being “common at Maulmain,” employed by the natives as “a cure for psora,” and its wood (according to Berdmore) for “making furniture, paddles, etc.,” described also by Wallich.

Artocarpus echinatus of Burmah. A tree called there “toug-peing-nai,” or by residents *mountain-jack*, and from early times its “echinated agreeably acid fruit” affording sustenance; — its timber according to Mason v. 462 and 541 considered valuable “by the natives especially for canoes:” described also by Roxburgh.

Artocarpus myouk-loke-ngay of Burmah. A tree called there “myouk-loke-ngay,” and from early times its orange-colored fruit affording sustenance; — described by Mason v. 462 as resembling “in taste a custard apple and in appearance a fig,” and “not scarce” in the forests.

Macrocladus . . . of Burmah. A palm, its terminal cluster of unexpanded young fronds from early times affording sustenance, — having “the taste of cabbage” according to Mason v. 426, and growing indigenous in various districts.

"In the reign of Phoroneus" (Tat., and Clem. Alex.), Eurōps succeeded by Tēlhis, third king of Sicyon: Crete being under the rule of Kretōs.

"1534 B. C. = 1st year of Ho-tan-kia, of the Chang" or Fourth dynasty (Chinese chron. table). Vessels from Hindustan and Arabia visiting Burmah as early probably as this date.*

Eighty-third generation. Sept. 1st, 1534, mostly beyond youth: Niobe daughter of Phoroneus (Apollod. ii. 1).

1533 B. C. = the "month Pharmouthi in the twenty-second year of his reign" (inscribed on the walls of Karnak), Tutmas III. with an army leaving the Northeastern frontier of Egypt on his first military campaign.

1532 B. C. (= 1519 y. 9 mo. + "12 y. 9 mo." of Manetho in Jos. c. A., the Maneth. tables giving 1417 + "37 + 31 + 9 + 26 + 13" = "38 + 31 + 9 + 26 + 12 years" = 1533 = 1592 — "13 — 24 — 22" = "25 — 13 — 21 years"), accession of Mēphrēs or Misaphris. Seemingly marking some event: the reign of Tutmas III. according to monumental evidence continuing without interruption.

The same year = the "month Pashons in the twenty-third year of his reign," Tutmas III. with his army arriving at Gaha or Gaza, on the "5th" he marched from the town to meet the enemy, and on the "22d" defeated them at Maketa or Megiddo — (Birch).

1531 B. C. = "24th year of Tutmas III." on the walls of Karnak, the Ruten and Assur or Assyrians continue to bring tribute — (Birch).

1530 B. C. (= 1590 — "60 years" of Castor in Euseb., see also Apollod. ii. 1, Hygin. 145, and Pausan.), in Greece Phoroneus succeeded by Apis, third king of the Peloponnesus, called after him "Apia:" as he extended his power throughout, he seems identical with the fourth king of Sicyon bearing the same name (compare Apollod. ii. 1.1 and Paus. ii. 5.5). Apis is spoken of as one of the earliest lawgivers among the Greeks (Theodoret. graec. affect. cur. iv. p. 927).

By Car, son of Phoroneus, the worship of Demeter established at Megara, and a citadel built there: probably the beginning of *Greek monumental history*. — The citadel retained the name of its founder in the days of Pausanias i. 39.5 to 44.6, to whom also the tomb of Car was pointed out. By the Romans, Demeter was called "Ceres;" possibly from Car.

The same year = "25th of Tutmas III.," in a tablet at Sarabit-el-Khadim in the Sinai peninsula — (Birch).

1527 B. C. (= 1497 + "30 years" of Euseb. i. and ii.), accession of Macchaleus as Assyrian emperor. "Twenty-eight" years only are assigned to his reign by Syncellus; who calls him Aschalius.

1526 B. C. = "29th year of Tutmas III.," his fifth military campaign — (Birch).

Among spoils obtained in this campaign, *lead* is enumerated — (Birch): the "ophrd" of Moses' Song (Ex. xv. 10), mentioned also in Job xix. 24; as used for purifying silver, in Jer. vi. 29, and Ezek. xxii. 18 to 22 (compare Pliny xxxii. 31), is admitted to be lead: and the "ank" of Amos vii. 7

* *Casuarina muricata* of the seashore of Burmah. A leafless tree called "hten-roo," from its green feathery terminal branchlets attracting the attention of approaching strangers, — growing in "the loose sandy soil of the seaboard and never inland;" its timber according to Mason v. 422 and 541 very little used by the natives, but hard and heavy and exported under the name of *beefwood* to America. By European colonists, the living tree was carried to Hindustan, observed by Roxburgh planted in Bengal, and by Graham "pretty common about Bombay."

Cassia (Cathartocarpus) nodosa of Tropical Eastern Asia. A tree called in Bisaya "lombayong" or "balayong" or "ybabao" (Blanco), in Burmah "gnu-theing," tinting the forest in Tavoy with its "pink-colored" flowers, — and according to Mason v. 404 and 525 affording "good timber." Farther East, was observed by Blanco on the Philippines, its trunk as large as a man's body, flowers ornamental "blancas y encarnadas." By European colonists, was carried to the botanic garden at Calcutta, and is described by Voight.

Gordonia floribunda of Burmah. A conspicuous tree in Maulmain called "theet-ya" itch-wood, from the itching caused by contact with its chips or bark; — affording according to Mason v. 408 the "compact timber used for house posts and for rice mortars:" described also by Wallich.

Heritiera minor of the Tropical seashore from Hindustan to Tongatabu. A tree called in Tagalo "taloto" (Blanco), in Burmah "ka-na-zo," growing within reach of occasional high tides, — its timber according to Mason v. 535 not very durable but "without a rival in strength:" observed in Burmah also by Buchanan, and farther West, is supposed to have imparted its name "soondree" to the Soonderbunds of the mouths of the Ganges; the "samandura" of Ceylon (Lin. fl. zeyl.) may also be compared. Eastward, was observed by Blanco along the seashore of the Philippines; by myself, a small tree at high-water mark around the Feejeean islands and Tongatabu.

Xylocarpus kearnan of the seashore of Burmah. An accompanying tree in low lands near the sea, — and of which according to Mason v. 539 "canoes are occasionally made," its wood besides "much used for sandals," and of a red colour that "turns black on being anointed with petroleum."

continues among the Arabs the name of lead (Kitt. cycl. bibl. lit.). Under its Greek name "mōlivthōs" or "mōlvthōs," lead is mentioned by Herodotus iii. 56, Aristophanes, and Plato; and under its Latin name "plumbum," by Plautus, Terence, Lucretius, and Columella. "Ancient lead-mines" in the mountains between the Nile and Red Sea, have been discovered by Burton; and "lead is also said to exist at a place called Sheff, near Mount Sinai."

"1525 B. C. = 1st year of Ts-ou-y, of the Chang" or Fourth dynasty (Chinese chron. table).

Other nations than the Egyptians now begin to furnish monumental history, and certain *vases* manufactured under the Chang dynasty are regarded as the earliest *Chinese works of art* — extant (Pauth. 201).

There are also artificial works at Babylon, Nineveh, and in Syria and Greece, doubtless more ancient than the last-named date; — but none have been traced with certainty so far back. Throughout the vast variety of sculptures and inscriptions, Assyrian, Phoenician, Greek, and Italian, paintings on pottery being included, the amount of information afforded on the subject of animals and plants is surprisingly small.

Henceforward, our principal dependence is on *transmitted writings*: for the lifetime of individuals whose words are extant, is now reached; — and eye-witnesses in each succeeding generation can be consulted, down to the present day.

In this year — "30th of Tutmas III.," his sixth military campaign; directed as usual Northward and Eastward, but in the same year tribute was received from Ethiopia — (Birch).

1522 B. C. = "33d year of Tutmas III.," his eighth military campaign: in which he found a tablet of his father Tutmas I., and established a fleet on the Euphrates — (Birch).

Besides lapis lazuli, "an artificial imitation of blue colour" moulded into the form of the head of a ram was brought as tribute by the chief of Singara (and according to Birch various moulded "specimens exactly alike as to material have been found on the banks of the Euphrates and the Nile"). It is perhaps the *blue earth* resembling indigo, figured in baskets in the tribute-procession to Tutmas III., — and mines of which are known to be worked on the Euphrates to the present day.

1521 B. C. = "34th year of Tutmas III.," his ninth military campaign: and in the same year, tribute was sent from Ethiopia and other countries — (Birch).

1520 B. C. = "35th year of Tutmas III.," inscribed on the monuments, his tenth military campaign: and in the same year, other tribute came from Ethiopia — (C. Mull. fr. Man. p. 385, and Birch).

The same year (= 1493 y. 11 mo. + "25 y. 10 mo." of Manetho in Jos. c. A. = 1417 + "37 + 31 + 9 + 26 years" of the Afr.-Maneth. table, the Euseb.-Maneth. table giving + "38 + 31 + 9 + 26 years" = 1521), accession of Mepbramōuthōsis or Misphragmōuthōsis. Seemingly marking some event: the reign of Tutmas III. shown by the monuments to continue without interruption.

In the procession of foreign nations bearing tribute to Tutmas III., the head and neck of a bird prepared as a curiosity seems (from the copied figure in Champollion-Figeac pl. 61) that of the *domestic fowl*, Gallus Bankivus; and therefore from Burmah, — where according to Mason v. p. 229 the bird occurs in its wild state: the domesticated bird was brought "from the West" into China B. C. 1400 (Chin. encycl.), and a proverb of the men of antiquity, "The hen should not crow, if the hen crows the family is lost," is preserved in the Chou-King (Pauth. 77). Westward from Burmah, the domesticated bird is mentioned in the Institutes of Manu as well known in Hindustan; is figured on Babylonian cylinders "between the Sixth and Seventh centuries B. C.," and "on the Harpy tomb in Lycia about 600 B. C." (Layard); but with the above exception is not figured on the Egyptian monuments; is not mentioned in the early portion of the Hebrew Scriptures, nor by Hesiod, nor Homer, and seems unknown in Switzerland during the Stone Age (Troyon); at a later period, the "alëktōr" is mentioned by Theognis 862, the Batrachomyomachia, Epicharmus, Aeschylus, and Cratinus; the "gallina" by Plautus, and Varro, the "gallus gallinaceus" by Cicero, and was already in Britain when visited by Caesar. Eastward from China and the Malayan archipelago, the domestic fowl was carried throughout the Tropical islands of the Pacific by Polynesians, as verified by myself: but continued unknown in America, New Zealand, and Australia, until introduced by European colonists.

Heaps of precious stones are also figured, including (according to Champollion-Figeac p. .) *garnets*, and *cornelian*.

The young elephant led in this Tribute-procession by men of the White race, was therefore not from the Upper Nile, but an *Indian elephant*, E. Indicus, brought overland by the Nabathean or a more Northern route. The delegates are Northerners as appears from their costume — and from the *war* led by delegates of the same nation in a subsequent Tribute-procession.

The accompanying tusks in the hands of the same delegates, from the large size clearly belong to the *African elephant*, *E. Africanus*: procured therefore by the way of Hindustan and the Persian Gulf through intercourse by sea with Equatorial Africa.

A set of delegates, with difficulty identified with the White Race, come from the Southern extreme of Arabia; shown by their resemblance to many among the existing population, and by the checkered receptacle in which they are carrying a living exotic tree:

Gen. ignot. of Tropical Arabia. This very painting — may prove the origin of the tradition that the “*pěrsěa*” tree was planted by Perseus in Egypt; a tradition credited by Alexander (Plin. xv. 13): the “*pěrsěa*” was held sacred by the Egyptian priests (Plut. is. and osir. p. 548); is called in Egyptian “*tshvé*” (Kirch.) or “*tshōuě*” (ms. Par.); is described by Theophrastus iv. 2 as a large handsome tree growing in Egypt, in habit and foliage resembling the pear, but the leaves evergreen, fruit greenish and having a smaller nucleus than the plum, and the wood solid and valuable; is mentioned also by Nicander, Diodorus, and Dioscorides; by Artemidorus (Strab. xvi. 4. 4) as wild in the country West of the entrance of the Red Sea; and is identified with the “*lebakh*” of Abu Hanifa, Firuzabadi, Avicenna, Abd-allatif, Ebn Baitar, Makrizi, and Soyouti, by the Copts, Arabs, and De Sacy. The “*læbach*” was seen by Forskal p. 196 at Melhan among the mountains of Yemen, a tree having leaves twice as long as the petiole, otherwise closely resembling those of the “*sar*” (described as lanceolate, entire, and smooth), but neither fruit nor flower were met with.

A third set of delegates are clad in the cincture of Tropical climates, yet seem to have come from either Palestine or Cyprus, for the vases in their hands manifest a taste for the fine arts suggestive of Greek nationality.

Crocus sativus of the East Mediterranean countries. Called in English gardens *saffron*, in Spain “*azafran*,” in Arabic “*al zahafaran*” (Prior), in Germany “*safran*,” in Italy “*zafferano*” (Lenz), in Greece “*krōkōs*” (Fraas), in Egyptian “*měthaiō*” (Edw.); and the single large flowers projecting above the soil in these vases — may be compared: “*krōkōs*” of Cilicia continued celebrated in the days of Dioscorides, and that of Cyrene is mentioned by him, and Theophrastus vi. 6; the “*sahaferan*” or “*zafran*” is mentioned by Arab writers; and the “*fragrant*” *crocus* was observed by Rauwolf in Syria. Farther North, the “*krōkōs*” is mentioned by Homer, Aeschylus ag. 230, Euripides, Aristophanes, the Hippocratic writings, and the “*krōkōs ēuōsmōs*” by Theophrastus ix. 7: *C. sativus* was observed by Sibthorp, and Fraas, on the mountains and rocky plains of Attica, and in fallow ground in other parts of Greece. Westward, Sicilian “*krōkōs*” is mentioned by Dioscorides; cultivating “*crocus*” in Italy is mentioned by Varro, Columella, and Pliny xxi. 17; Roman saloons and theatres were strewn with its “*costly perfume*,” and “*vinous tinctures retaining the scent were made*” (Sen. ep. 90, Lucan ix. 808, Spartian., Lamprid., and Royle in Kitt. bibl. cycl.): *C. sativus* is described by Bauhin hist. ii. p. 637, and Tournefort inst. 350; was observed by Lenz seemingly wild in Italy; continues a favourite garden flower throughout middle Europe, escaping and springing up spontaneously for successive seasons as far even as England (Engl. bot. pl. 343, and Wats.); but according to A. Decandolle, its cultivation for commercial purposes is becoming rare. Eastward from Greece, is known to be cultivated in Asia Minor, Persia, and extensively in Cashmere; the product according to Royle exported and sold at a high price in Hindustan for colouring and flavouring dishes, and as a stimulant medicine. The dried stigmas according to Pereira, and Lindley, “are the *saffron* of the shops,” among Europeans “little used except as a colouring ingredient,” and “an agreeable stimulant in many culinary preparations and liqueurs:” the “singular substance called *polychroite* is obtained” from it.

In the same tribute-procession, the two men leading a *came'opard*, from the features and complexion examined by myself in the original painting at Thebes, seem (as suggested by Gliddon) to belong to the *Abyssinian Race* of man.

The same year (in or about the “four hundred and ninety-fifth ann. Abr. and seventh year of Marathius king of Sicyon,” Euseb. . . .), the city of Corinth founded.

December (= 1551 .. 239 $\frac{2}{3}$ — “40 years” of ten lunations, Gen. xxvi. 34), marriage of Esau with Judith and Bashemath.

Balsamodendron opobalsamum of the African side of the entrance to the Red Sea. The *balsam tree* is called in Yemen “*abu scham*,” and its imported product seems connected with the name of Bashemath; — “*bshn*” is enumerated by Moses (ex. xxx. 23 to xxxv. 28) among ingredients for the anointing oil, and to the days of Ezekiel xxvii. 22 continued to be imported by “merchants of Sheba and Raamah:” the living tree (according to Josephus) was brought by the queen of Sheba to Palestine; and seems mentioned in gardens there in Cant. iv. 16 to vi. 2; the “*valsamōn thēnthrōn*” continued under cultivation in Palestine in the days of Theophrastus ix. 6, Diodorus, Dioscorides, Pliny, Tacitus, Justin, Galen, Pausanias, Nicolaus of Laodicea, Beda loc. sanct., and Willebald, after whose visit it disappeared from the country: two centuries later, trees were seen in Egypt by Ebn Samhun in a garden at Ain-Schems near Cairo, and continued flourishing when visited by Abd-allatif, Maun-

deville, Gulielmus de Baldensal, Peter Martyr, and Barthelemi de Salignac; "living stocks brought at great expense from Yemen" were seen by Belon in the same locality, also by Pellegrino Brocardi, Radzivil, and notwithstanding Alpinus' unsuccessful search by Brenning, but soon afterwards "in the early part of the Seventeenth century" they disappeared (Hartmann). Farther South, *B. opobalsamum* is described by Strabo xvi. 4. 19 as wild in the country of the Sabaeans; was observed by Bruce, and Salt, a small tree of stunted appearance "above fourteen feet high" growing especially in the vicinity of Azab (Saba) and thence as far as the entrance to the Red Sea. Was carried at an early period to Yemen (Bruce); was first observed by Forskal p. 80 at the Oude caravanserai near the end of his journey; was also carried to Hindustan (Roxb., and Wight); and afterwards by Wathen "in 1837 from Mecca" to the botanic garden at Bombay (Graham).

1518 B. C. (= 1273 + "245 years" of Berosus, in Alex. Polyhist. and Euseb. i. 4. p. 18), at Babylon, the accession of the Arabian dynasty: — a series of "nine" successive kings.

In this year = "37th of Tutmas III.," slaves and cattle brought as tribute by the Kharu and Kush — (Birch).

As early perhaps as this date (Graham Munjari tables, Puranas, and Bentley as. res. viii. p. 231), Jamadagni, nephew of Viswamitra, reigning in Hindustan.

1517 B. C. (= 1505 y. 332 $\frac{2}{3}$ d. + "7" + 7th year of ten lunations, Gen. xxx. 25 and xxxi. 41), departure of Jacob, to reside with Laban at Haran.

In this year = "38th of Tutmas III.," his thirteenth military campaign — (Birch).

1516 B. C. = "39th of Tutmas III.," his fourteenth military campaign — (Birch).

1515 B. C., in or about the "five hundredth ann. Abr. and third year of Ascatades king of Sicyon" (Euseb.).

1514 B. C. = "41st of Tutmas III.," the king in the field, warring and receiving tribute — (Birch).

A *papyrus* roll, enumerating Egyptian kings, and composed in part in the reign of Tutmas III., is mentioned by Lepsius (Eg. and Sin. p. 395). Papyri written "from the Sixteenth — to the Thirteenth century B. C.," are also mentioned by Lepsius p. 381; containing, it is inferred, like those of later date, "laudatory songs upon kings or gods, historical annals, accounts of the temple, that which relates to the calendar, and many other things with reference to this life, contracts, law-suits." The papyri were "interred in tombs;" and from the time of the Greeks, were sometimes accompanied with a Greek translation.

1508 B. C. = "47th year of Tutmas III.," in a tablet at On or Heliopolis, recording that he had surrounded the temple with a wall. (Leps. k. tab. p. 17, and Birch).

In this year (= 508 + "1000 yrs." of Herodot. iv. 5), Targitaus the first Scythian, colonist or ancestor of all the Scythians. (See Tanaus).

Cucumis dudaim of Equatorial Africa. Called in Egypt "schemmam" (Forsk.): the "thw-thym" love-apples "in the days of wheat harvest" found by Reuben "in the field" — (Gen. xxx. 14), occurring in vineyards and giving a smell (Cant. vii. 12), are according to Harris bibl. nat. hist. by "the generality of interpreters and commentators" regarded as "a species of melon: the Egyptian word "vétuké" is translated by Edwards "melonis genus silvestris, pomum amoris, mandragora" (compare "batykh"): the "schemmam" or "Syrian luffah" is described by Temimi, and Ebn Baitar; was observed by Forskal p. 169, and Delile, in Egypt, its fruit globose-ovate as large as a lemon and not edible, but cultivated for its strong and not unpleasant odour. Transported to Europe, is described by Dillenius hort. elth. pl. 77. (See *Mandragora officinalis*).

"1506 B. C. = 1st year of Tsou-sin, of the Chang" or Fourth dynasty — (Chinese chron. table).

The same year (= 1481 y. 239 $\frac{2}{3}$ d. + "30 years" of ten lunations of Gen. xli. 46), Joseph born to Jacob and Rachel.

Amygdalus communis of the Tauro-Caspian countries. Called in English gardens *almond*, in France "amande" (Nugent), in Germany "mandel," in Italy "mandolo" or "mandorlo" (Lenz), in Greece "amugthalēa" (Fraas), in Egypt "louz" (Del.). in Egyptian "karia" (transl. Sept.) indicating the geographical route of introduction: rods of "lwz" were among those selected by Jacob — (Gen. xxx. 37): *A. communis* was observed by Forskal, and Delile, in the gardens of Egypt, the fruit imported besides in quantities from Syria and Cyprus. The Greek word "karuōn" may have had the same derivation as the Egyptian; an ancient custom of eating bitter almonds to prevent intoxication is mentioned by Pliny and Plutarch sympos. i. 6; the "amugthalē" is mentioned by Xenophon anab. iv. 4. 8, Tryphon, Pamphilus, Dioscorides, Athenaeus ii. 39, and a mode of rendering the nuts sweet, by Theophrastus ii. 7. 7: *A. communis* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus and Crete throughout Greece, springing up spontaneously, the branchlets spinescent and the kernel bitter; is known to grow to all appearance wild in the country South of Caucasus (Bieb., and Ledeb.). Westward, the "nux" is mentioned by Plautus, and from being termed "graeca" by Cato is regarded by Pliny xv. 24 as probably foreign to Italy; the "nux graeca" is

mentioned by Columella, and Macrobius ii. 14; the "nux" flowering in Spring, by Virgil geor. i. . . ; "nuces amarae" by Celsus; and "amygdalae amarae" and "dulces," by Pliny xvii. 43: *A. communis* is described by Matthioli i. 247; is termed "a. amara" by Tournefort inst. 627; has become naturalized in Italy, Sicily, and Barbary, forming in Algeria groves or woods (Desf., Cosson, Guss., and A. Dec.). Eastward from Syria, is called in Persia "badam" (Roxb.), and the same word has been adopted in Hindustanee and Bengalee (D'roz.) for the imported nuts, the tree not succeeding in Hindustan even in the North (Royle, and Graham): was however observed by Loureiro, and Bunge, under cultivation in China, and called "him" or "hanh." By European colonists, was carried to America, where I have occasionally met with it in gardens in our Middle States.

Styrax officinale of the East Mediterranean countries. The *storax* tree is called in Italy "storace" (Lenz), in Greece "stōuraki" (Sibth.) or "agria kuthōnia" (Fraas), and its imported product in Egyptian "aminakōu" or "suētōs" (Edw.): the green "lbnh" selected for rods by Jacob — (gen. xxx. 37), mentioned as a tree on the mountains of Palestine by Hosea iv. 13, is referred here in the Septuagint and Arabic translations: "samgh leban Schami" or "olibanum Syriacum" is enumerated by Forskal mat. med. as imported from Greece into Egypt; and at Mocha I was informed that "lubanum" is a general term, including in the Somali country all gum-like articles of commerce. Northward from Egypt, the "sturaka" is mentioned as indigenous in Asia Minor and Greece by Herodotus iii. 107, Theophrastus, Strabo, and Dioscorides; and *S. officinale* was observed by Sibthorp, Gittard, and Fraas, from the Peloponnesus and Crete to Smyrna and Cyprus. Westward, the "styrax" seems known to Pliny xii. 40 to 55 only from the imported product; but the tree has since been introduced and become naturalized in Italy and Southern France (Cæsalp. ii. p. 71, Bertolon., and A. Dec.). As cultivated in England according to Lindley does not form *storax*, and this "fragrant resinous balsamic substance is obtained in Asia Minor."

The long reign of Tutmas III. is remarkable for an astonishing amount of building, throughout Egypt and Nubia. At Thebes, the temple in the Asasif was completed, and additions made to those at Karnak and Medinet Abu. Temples were also constructed, continued, or commenced at Esneh, El Kab, Edfu, Ombos, Elephantine, Amada, Eguisse, Semneh, Ibrim, and Wadi Halfa. Two obelisks ninety feet or so in height, were placed in Karnak; other obelisks were erected by Tutmas III. (but have been removed, two of them to Alexandria, one to Constantinople, and one to Rome. See also Leps. eg. and sin. p. 20, 25, and 42).

But above all we are indebted to Tutmas III. for an important historical document: the series of successive kings in the chamber at Karnak — (now removed to Paris).

1501 B. C. = "30th Phamenoth in the 54th year of his reign," death of Tutmas III. — (Birch).

The accession therefore of Amunhotep II., second king of the Eighteenth dynasty, not earlier than this date. His name is next in order on the monuments: both contemporaneous, — and in the series of kings at Abydos and Gurna.

Amunhotep II. continued the temple at Karnak, and others in Nubia, and built new temples at Bigeh and Kalabsheh. His name occurs also in a cave-temple at Ibrim, and in the Sinai peninsula at Sarbut-el-Khadem. A colossal statue of this king — (is now in the museum at Turin).

In this year (= 1517 — "20 years" of ten lunations, of Gen. xxxi. 41), treaty at the parting of Laban and Jacob; the heap of stones called by the former "ygr shéthwda" being perhaps the earliest specimen known of the Aramaic or *Chaldee language*. — This language is called "army" in 2 K. xviii. 26, Dan. ii. 4, and Ezr. iv. 7; and forms the text of the following portions of the scriptures: Jer. x. 11, Dan. ii. 4 to vii. 28, Ezr. iv. 8 to vi. 18 and vii. 12 to 26. The Syriac, regarded as only a dialect or somewhat later form, is to the present day spoken by the Christian Syrians on the Tigris near Mosul. (See J. Nicholson in Kitt. cycl. bibl.).

Eighty-fourth generation. Jan. 1st, 1500, mostly beyond youth:

1498 B. C. = "4th year of Amunhotep II.," in a tablet at Sarabit-el-Khadim in the Sinai peninsula — (Leps. k. tab. p. 17, and Birch).

"1497 B. C. = 10th year of Tsou-sin" (Chinese chron. table), beginning of the Twentieth cycle.

The same year (= 1477 + "20 years" of Euseb. ii.), accession of Sphaerus as Assyrian emperor. "Twenty-two" years are however assigned to his reign i. p. 44, and by Syncellus.

1495 B. C. (= 1530 — "35 years" of Castor and Euseb. i. p. 129 to 131, see also Pherecyd., Apollod., and Hygin.), Apis succeeded by his nephew Argus, son of Niobe and now fourth king of the Peloponnesus or fourth Argive king; the name of his kingdom having been changed to Argos (Hygin. fab. 145, and Paus. ii. 16. 1).

The same year = "7th of Amunhotep II.," in a tablet at Sarabit-el-Khadim in the Sinai peninsula — (Birch).

1494 B. C. (= 1484 y. 3 mo. + "9 y. 8 mo." of Manetho in Jos. c. A. = 1417 + "37 + 31 + 9 years" of the Afr.-Maneth table, the Euseb.-Maneth. table giving + "38 + 31 + 9" = 1495), accession of Thmōsis or Tōuthmōsis, as king of Egypt. Tutmas IV., third king of the Eighteenth dynasty, is next on the monuments: both contemporaneous, — and in the series of kings at Abydos and Gurna.

In this year = "1st of his reign," Tutmas IV. set up a votive tablet fourteen feet high between the fore paws of the Great Sphinx at Gizeh — (Leps. d. iii. pl. 68, and Birch). He also completed the temple at Amada, built additions to others at Wadi Halfa and Thebes, and set up obelisks (one of which is now in Rome).

1492 B. C. (= 1505 y. 332 $\frac{2}{3}$ d. — "17 years" of ten lunations of Gen. xxxvii. 2 and 28), Joseph sold to Ishmeelite or Midianite merchants, and carried by them into Egypt.

The *balm of Gilead* "tzy" on the camels of the Ishmeelites and Midianite merchants — (gen. xxxvii. 25), included among the productions of Palestine in gen. xliii. 11, healing and produced in Gilead according to Jeremiah viii. 22 and xlv. 11, brought by merchants of Judah and Israel to Tyre in the days of Ezekiel xxvii. 17, is probably the "balsamum Hierosolymitanum" seen by Forskal mat. med. in the drug-shops of Egypt: the plant from which it is procured remains unknown.

Cistus Creticus of the East Mediterranean countries. The plant producing gum *ladanum* is called in Greece "lathanō" (Sibth.) or "ēmērō kistari" or "ēmēra kōunōuklia" (Fraas), while in Egypt its imported product is called "laden" (Forsk.): the "lt" or "lwt" on the camels of the Ishmeelites — (gen. xxxvii. 25), included among the productions of Palestine in gen. xliii. 11, is referred here by Celsius, and Gesenius; the "lēthanōn" is said by Herodotus iii. 107, and Rufus Ephesius, to be procured by the Arabians, by Pliny xii. 37 to be produced in Nabathæan (Northern) Arabia and Cyprus; Arabian, Cyprian, and Libyan "lathanōn" procured from a kind of "kistōu" are mentioned by Dioscorides: gum "laden" was found by Forskal mat. med. imported into Egypt from Crete: and the process of procuring it was witnessed in Crete by Tournefort, and Sieber (Spreng.). *C. Creticus* is termed "c. ladanifera cretica flore purpureo" by Tournefort cor. 19, was observed by him, Sibthorp, and Fraas, from Crete and Corinth throughout the Greek islands to Cyprus: is known to grow also in Syria (Buxb. iii. pl. 64, and Pers.). *Ladanum* according to Lindley is a gum-resin "produced principally by this species," and "has been much esteemed as a stimulant and emmenagogue." (See *C. Monspeliensis*).

Astragalus gummifer of the mountains of Syria and Kurdistan. Gum *tragacanth* is called in Arabic "nakaoton" (Greenfield), and the "nkad" on the camels of the Ishmeelites — (gen. xxxvii. 25), enumerated among the productions of Palestine in gen. xliii. 11, is referred here by Gesenius: "katad" or "katira" is mentioned by Rhazes; and as procured on Lebanon, by Ebn Baitar: *A. gummifer* was observed by Labillardiere on Lebanon, yielding gum tragacanth; by Dickson, yielding the same in Kurdistan (Royle in Kitt. bibl. cycl.). A white kind according to Lindley, "more transparent than that of commerce, neither does it dissolve so well in water, and therefore is inferior in quality." (See *A. verus*).

Scorzonera tuberosa of Syria and the Tauro-Caspian countries. The "nkwd" brought from Gilead on the camels of the Ishmeelites — (gen. xxxvii. 25) is referred by Sprengel to the gum exuded by this root, well known in the country East of the Jordan: *S. tuberosa* is known to grow around Damascus, was observed in Syria by Rauwolf 117; and by Pallas trav. iii. app. 131, in arid situations along the Lower Volga (Pers.)

1491 B. C. — "five hundred and twenty-fifth ann. Abr." of Euseb., "five hundredth" being given in another place), in Greece, the temple at Delphi built by Erysichthon. The oracle at first belonged to Ge and Neptune (Paus. x. 5. 6, see Aeschyl. eum. 2).

"1490 B. C. = 1st year of Wou-kia, of the Chang" or Fourth dynasty — (Chinese chron. table).

1488 B. C. = "7th year of Tutmas IV.," in a tablet on Konosso recording a victory over Negro tribes; the latest date in his reign found on the monuments — (Birch).

1485 B. C. (= 1417 + "36 y. 5 mo. + 30 y. 10 mo." of Manetho in Jos. c. A., = "37 + 31" in the Afr.-Maneth. table, the Euseb.-Maneth. table giving + "38 + 31" = 1486), accession of Amēnōphis as king of Egypt. Amunhotep III. fourth king of the Eighteenth dynasty, is next on the monuments: both contemporaneous, — and in the series of kings at Abydos and Gurna.

In this year = "1st of his reign." The quarries at Tourah re-opened by Amunhotep III. (Birch.)

"1484 B. C. = beginning of the Dwapar Yug or Brazen Age" among the Hindus (Graha Munjari tables). Parasurama son of Jamadagni (Bentley as. res. viii. 231) may have been at this time reigning. He is said to have destroyed the Kshattriya or military caste (Bhavabhuti Uttar. vi., transl. H. H. Wils.). Rama, a son of Jumudugni, — is mentioned in the Ramayana i. 61 to ii. 18.

In this year = "2d of Amunhotep III.," on the rocks at the quarries at Tourah — (Birch.).

Uredo segetum of Europe and Northern Asia. A minute fungus developed in the blasting of grain-crops, and called in Britain *rust* or *blight* (Ainsw.) or *mildew*, in Anglo-Saxon "mele-deaw," in the *Ortus Sanitatis* "mel roris" (Prior), in Germany "mehlthau" (Grieb), in France "nielle" (Nugent), and the blasted ears "shdphwn" of Pharaoh's dream — (gen. xli. 6 to 27), Deut. xxviii. 22, Amos iv. 9, and 1 K. viii. 37, are referred here by Gesenius. Farther North, the "érusivēs" is mentioned by Democritus (Cass. geopon. v. 5), Theophrastus viii. 10 and caus. iii. 27; the "uredo," by Cicero, and Pliny; the "sterilem rubiginem" by Horace; "rorem inustum sole acri frugibus rubiginis causam esse" by Pliny xviii. 68; and the "ustilago rustica" by Apuleius d. h. 63. 109 (Billerb., and others).

1482 B. C. (= 1484 — "2 full years" of Gen. xli. 1 = 1002 y. 116 $\frac{4}{5}$ d. + "480th year" of 1 Kings vi. 1 = 1611 y. 239 $\frac{3}{8}$ d. — "130 years" of Gen. xlvii. 9; 1587 y. 239 $\frac{3}{8}$ d. — "130 years" of ten lunations = end of September 1483), Joseph released from prison and appointed governor over Egypt. Israel or the Israelitish nation being "an hundred and thirty years" old.

The "Coptic" or *Egyptian language* at this time the spoken language of Egypt: as appears from Gen. xlii. 23, and from the quotations preserved in xli. 43 to 45: "abr̄k" ap̄e-r̄ēk, head incline; and "tsphnd phinh" tshōf-nōud fai-nēh, in God's Desert-making bringing deliverance. The words being pure Coptic, the non-existence of any different hieroglyphic language is demonstrated. — Words however were clearly invented before *grammar*; and at what period the latter modification was made in the Egyptian language, does not appear.

1480 B. C. = "5th year of Amunhotep III.," on the rocks near Philæ in a tablet recording victories over Negro tribes: a tablet at Semneh mentioning the rapid passage of the king — (Birch).

1477 B. C. (= 1447 — "30 years" of Euseb. i. and ii., and Syncell.), accession of Mamlus as Assyrian emperor.

1474 B. C. (= 1481 y. 239 $\frac{3}{8}$ d. — 1 — "7 years" of Gen. xli. 53), arrival of Joseph's brethren in Egypt.

Joseph's cup was for *divining* as well as drinking (Gen. xlv. 1 to 5). — Divining-cups are figured on the Assyrian monuments at Nimroud; and to the present day, drinking-cups inscribed with some mystic sentence are in use throughout the East (Bonom. nin. iv. 2).

In this year = "10th of Amunhotep III.," on scarabæi recording that the king had slain "110 lions" with his own arrows — (Birch).

1473 B. C. (= 1481 y. 239 $\frac{3}{8}$ d. — "7 — 2 years" of Gen. xli. 53, xlv. 6 to xlv. 27, and Ex. i. 5), removal into Egypt of Jacob and his household: the Israelitish nation now numbering "seventy" souls, "besides Jacob's sons' wives." The date is confirmed by the Biblical genealogies; no Israelite being named after an Egyptian king more ancient than Hur or Horus and Amminadab.

In this year = "16th Athyr in the 11th year of his reign" on scarabæi, Amunhotep III. having married Tii, a foreign woman whose father's name was "Iuaa" (compare Iuda) and her mother's "Tuua," now holding a novel religious festival, introducing upon an artificial lake the boat of the responsive aid-according solar disk Aten-nefru or nōfri — (compare the Hebrew Adonai, and revealed religion).

"In the same year of his reign," Amunhotep III. bestowed endowments on the temple at Karnak — (Birch).

1471 B. C. (Gen. xlvii. 18 to 26), the land of the Egyptians bought for bread by Joseph: who "made it a law," that "Pharaoh should have the fifth:" except only, that the priests having already an assignment of food, "sold not their lands." This change in the agrarian condition of Egypt and introduction of a ground-tax, is mentioned by Herodotus, and Diodorus, but is attributed by them to Sesostris (Leps. trav. Eg. and Sin. p. 480).

Eighty-fifth generation. May 1st, 1467, mostly beyond youth: Eliphaz and Ruel, sons of Esau (Gen. xxxvi. 4 to 17, and 1 Chron. i. 35).

"1465 B. C. = 1st year of Tsou-ting, of the Chang" or Fourth dynasty — (Chinese chron. table).

1456 B. C. (= 1481 y. 239 $\frac{3}{8}$ d. — "7 — 2 — 17 years" of Gen. xli. 53, xlv. 6, and xlvii. 28), death of Jacob; in the reign of the king who ruled Egypt "two full years" before Joseph's release — (a severe chronological test).

The same year = "30th of Amunhotep III.," on a monument representing him receiving the account of a great harvest from the store-keepers of Upper and Lower Egypt — (Birch).

1451 B. C. = "35th of Amunhotep III.," at Sarbit-el-Khadim in the Sinai peninsula — (Birch). Amunhotep III. warred in foreign countries, and the names of some sixty conquered tribes and nations are recorded on the monuments. He built the great temple at Luxor, another at Elephantine, founded that at Soleb in Nubia, and set up obelisks — (Leps. eg. and sin. 19 to 236, and Birch).

The two colossi sitting on the plain at Thebes and so conspicuous in the distance, are statues of Amunhotep III.: — behind them, an immense temple has been destroyed to the foundation-stones, the lines of which are barely traceable.

1450 B. C. = "36th year of Amunhotep III.," at Sarbit-el-Khadim; the latest date in his reign found on the monuments — (Leps. k. tab. p. 17).

In this year (= 1413 + "36 y. 5 mo." of Manetho in Jos. c. A. = "37" in Afr.-Maneth. table, the Euseb.-Maneth. table giving + "38" = 1451), end of the reign of Amunhotep III., and accession of Amunhotep IV., fifth king of the Eighteenth dynasty. His name occurs on contemporaneous monuments: — but not in the series of kings at Abydos, Gurna, Medinet Abu, nor is he mentioned by Manetho.

Amunhotep IV. completed the great temple at Soleb in Nubia; but adopted the religion of his mother Tii, and in all the inscriptions composed during his reign "not one Egyptian god is mentioned except Sun" (Leps. eg. and sin. 19 to 27, and Birch. See below, Sherah).

1447 B. C. (= 1408 + "39 years" of Euseb. ii.), accession of Sparaethus as Assyrian emperor. "Forty" years are however assigned to his reign i. p. 44, and "forty-two" years by Syncellus, who calls him "Spartheus."

1445 B. C. = "6th year of Amunhotep IV." at Alabastron or Tel-el-Amarna, recording his homage to a solar disk whose rays have hands — (Immortality reaching down to man, or revealed religion). Amunhotep IV. was called Khuenaten in the latter part of his reign, and had two daughters whom he associated with him in the empire in order to succeed him (Birch).

"In the sixth generation before Deucalion's conquest" (Dionys. i. p. 45, see also Hellan., and Clint. i. p. 16), a colony from the Peloponnesus led by Pelasgus son of Larissa, accompanied by Phthius, and Achaeus, into Haemonia (Thessaly). After expelling barbarous tribes, the country was divided into three districts which received the names of Pelasgiotis, Phthiotis, and Achaea.

1439 B. C. = "12th year of Khuenaten or Amunhotep IV.;" the latest date in his reign found on the monuments — (Leps. k. tab. p. 17).

In his reign, the usual tributes came from the people of the East, North, the isles of the Mediterranean, and Ethiopia, while Asiatic and Negro soldiers filled the ranks of his army (Birch). That he preceded Horus, appears from his name on stone blocks employed by Horus in building (C. Mull. fr. Man. p. 586).

1438 B. C. (= 1449 y. 5 mo. — "12 y. 1 mo." of Manetho in Jos. c. A., Manetho also giving "5th + 12 y. 5 mo. + 9 = 12 y. 3 mo. + 12 y. 5 mo. + 0 y. 9 mo." = 25 y. 5 mo, this added to 1413 = 1439). Akēghres succeeded by her brother Rathōtis. On the monuments, Rasaakakherperu is the sixth king of the Eighteenth dynasty. He married a queen named Atenmerit, but his name — does not occur in the series of kings at Abydos, Gurna, nor at Medinet-Abu (see Leps. k. pl. 29, Poole hor. eg. 255, and Birch).

"1437 B. C. = 29th year of Tsou-ting" (Chinese chron. table), beginning of the Twenty-first cycle.

In this year (= 1437 y. 4 mo. — 9 mo., Manetho also giving "12 y. 3 mo. + 12 y. 5 mo." + 1413 = 1438), Rathōtis succeeded by Akēghēres. On the monuments, Ai or Aui is the seventh king of the Eighteenth dynasty. He had held office under Amunhotep IV.; and that he preceded Horus, is shown by his name on stone blocks — employed by Horus in building the fourth pylon at Karnak (Prisse, and Birch).

The same year = "1st of Ai," in a tablet — (Birch).

1434 B. C. = "4th year of Ai," in a tablet; the latest date in his reign found on the monuments (Leps. k. tab. p. 17, and Birch).

Eighty-sixth generation. Sept. 1st, 1434, mostly beyond youth: Pharez and Zarah (Gen. xxxviii. 29, Num. xxvi. 20, Ruth iv. 18, and 1 Chron. ii. 4); Machir "the first born of Manasseh" (Gen. i. 23, Num. xxvi. 29, xxvii. 1, and Josh. xvii. 3); Teman, Amalek, Zerah of Bosrah, and Bela king of Edom (Gen. xxxvi. 11 to 33, and 1 Chron. i. 36 to 44).

"1433 B. C. = 1st year of Nan-keng, of the Chang" or Fourth dynasty — (Chinese chron. table).

"1432 B. C." (. . . Parian marble, and Troyon p. 175), iron discovered by the Dactyli of Ida in Phrygia. — Smiths working iron, are figured on Egyptian monuments hardly later than this date (see Rossellini ii. pl. 50). The triangular bow was observed by myself figured on the Ramesseum or great temple built by Ramessu II. at Thebes; also on the temple at Medinet Abu, under Ramessu III.; and the "bow of steel," is mentioned in Job xx. 24, and 2 Sam. xxii. 35. The "brzl" of Gen. iv. 22, Josh. viii. 31, Deut. xxvii. 5, Psalm cv. 18, and Isaiah xlviii. 4, is admitted to be iron. Hesiod op. 151 speaks of a traditional period when iron was unknown; and "sitherōs" or iron, is also mentioned by Homer, and Greek writers generally. The process of manufacturing *steel* is besides described by Aristotle.

The tomb of Ai is the most ancient one in the valley of Bab-el-meluk, — his name having been "erased purposely" in all instances (Glid. analect.). This valley now became the royal cemetery of Thebes, devoted solely to subterranean tombs of Egyptian kings; and according to Lepsius eg. and sin. 264 the paintings on the walls "almost exclusively refer to *life after death*."

These paintings — remain uninjured by the slightest infiltration of moisture, notwithstanding the prodigy mentioned by Herodotus of a fall of *rain* at Thebes. That the climate is not absolutely rainless, is shown by Lepsius *eg. and sin.* 119 having experienced a “heavy rain and violent thunder-storm at Assuan,” though his “guards never remembered such a spectacle;” on my own visit there several months afterwards, the people continued to speak of this rain-storm.

1425 B. C. (= 1436 + 7 — “12 y. 5 mo.” of Manetho in *Jos. c. A.*, Manetho also giving “12 y. 3 mo.” + 1413 = 1426), Akēghērēs succeeded by another Akēghērēs. On the monuments, Tutankhamun Hiktenres is the eighth king of the Eighteenth dynasty, but his name — does not occur in the series of kings at Abydos, Gurna, nor at Medinet-Abu.

Amunhotep and Hui, governors of Ethiopia under Amunhotep III., continued in power, and Hui sent tribute; recorded together with tribute from the Syrians in a tomb at Thebes. The name of Tutankhamun Hiktenres occurs also on blocks of stone — employed by Horus in building (*C. Mull. fr. Man. p. 586, Leps. k. pl. 30, and Birch*).

In this year (= 1495 — “70 years” of Castor in *Euseb. i. p. 129*, see also *Pherecyd., Apollod., Hygin., and Pausan.*), in the Peloponnesus, Argus succeeded by his son Criasus, fifth Argive king.

Tiryns another son of Argus founding the city bearing his own name; his brother Peirasus dedicating there an image of Juno. This image, made of wood of the “*ahrathōs*” — or *wild pear*, was on the capture of the city by the Argives removed to the temple near Mycenae, where it continued extant in the days of Pausanias *ii. 17. 5 and 25.7.* (See *Pyrus communis*).

Cratægus oxyacantha of Europe and the adjoining portion of Asia. Called in Britain *hawthorn* or *white thorn* or *hedge thorn*, in Anglo-Saxon “*hagathorn*” or “*hegethorn*,” in Germany “*hagedorn*” (Prior) or “*weissdorn*” (Grieb), in France “*aubépine*” (Nugent), in Italy “*spina bianca*” (Lenz), in Greece “*mōruntza*” or “*trikōkkia*” or “*ahlatha*” (Sibth), in which we recognize the “*ahras*” fruit on which the inhabitants of Tirynthā at first lived — (Aelian and Ruel *i. 115*), also the “*ahērthō*” thorny hedge on Ithaca (*Hom. od. xiv. 10*), and “*ahērthōs*” plant of Sophocles *oed. 1596*, and Theocritus *xxiv. 89*, yielding according to Pherecrates the fruit called “*ahras*” (*Steph. th. ed. Hase*): *C. oxyacantha* was observed by Forskal, Sibthorp, Chubbard, and Fraas, a frequent tree from the Peloponnesus to Tenedos, and planted in hedges on Crete. Westward, the “*spina alba*” is mentioned by Columella *vii. 7, 2 to 9. 6*; *C. oxyacantha* was observed by Forskal near Marseilles; is known to grow wild in Italy and throughout middle Europe, where also it has long been employed for hedges (*fl. Dan. pl. 634, Jacq. austr., Pers., and Prior*). By European colonists, was carried to Northeast America, where it continues planted for ornament, and I have observed trees to all appearance spontaneously seeded and more than thirty feet high in the environs of Salem in New England. (See *C. monogyna*).

Pyrus salicifolia of the East Mediterranean countries and Siberia. Called in Greece “*gōritzia*” or “*gōuritza*” or “*ahlathia*” (Fraas), and possibly the “*ahras*” in question: — the “*ahras*” is mentioned as edible by Homer, by Aristotle *viii. 9* as food for swine, by Dioscorides as a kind of “*agrias apiōu*,” is mentioned also by Theophrastus *ii. 3*, and in the *Hermetic iatromathematica*, and is referred here by Fraas: *P. salicifolia* is termed “*p. sylvestris orientalis folio oblongo incano*” by Tournefort *cor. 43*; and was observed by Sibthorp on mount Hæmus, by Fraas, abounding in Greece and continuing a favourite food of swine; is known to grow also in Armenia and Siberia (*Pall. fl. ross. i. pl. 9, and Pers.*).

1417 B. C. (= 1505 y. 332 $\frac{2}{3}$ d. — “110 years” of ten lunations of *Gen. i. 22 to 26*), after bringing up upon his knees the children “of Machir the son of Manasseh,” and seeing “Ephraim’s children of the third” generation, death of Joseph.

The same year (= 1413 + “5th year of Kōgharis” of Manetho in *SynceLL. p. 103*), accession of Akēghērēs or Ahērērēs, as queen of Egypt. She is identified by Lepsius (*C. Mull. fr. Man. p. 586*) with “*Bech-n-aten ra (Bechra)*” widow of Amunhotep IV.; and is represented in the sculptures at Amarna with all the emblems of royalty; but whether she died in the lifetime of her brother-in-law king Horemheb, remains unascertained. The account of “*Nitōkris*” (given by Herodotus . . .), coincides in some remarkable particulars with that of “*Sherah*,” *1 Chron. vii. 21 to 24*; and in Manetho, we find even identity in name (for the sound “*sh*” cannot be expressed in Greek letters, the nearest approach being the phonetic change that has converted the Spanish “*Xeres*” or *Heres* into the English “*Sherry*”).

Convolvulus scammonia of the East Mediterranean countries. The *scammony* plant is called in Egyptian “*sakamōnia*” (*Edw.*), and the trailing sagittate-leaved *Convolvulus* figured at Amarna — (*Leps. d. iii. pl. 98*), and more or less distinctly on subsequent monuments (*Champ. pl. 5 and 273, and Rosselin. i. pl. 19 and iii. pl. 5*), may be compared: *C. scammonia* was observed by Hasselquist near Damietta on the Mediterranean border, and the imported drug has doubtless been long known in Egypt. Farther North, the “*skamōnias*” is mentioned by Antiphanes, *1 Mul. morb. 597*, Theophrastus, Nicander, and Athenæus, the plant according to Rufus Ephesius *fr. 21* growing on the Asiatic

Olympus and around Colophon: C. scammonia was received from Asia Minor by Matthioli; is termed "scammonia syriaca" by C. Bauhin pin. 294, "c. syriacus" by Tournefort inst. 83; was observed by Sibthorp in the hedges of Rhodes, and he further ascertained that it yields Aleppo scammony. Westward, the imported drug "scammonea" or "scammonium" is mentioned by Cato, Cicero, Celsus, Scribonius Largus, and Vegetius; and the kind called by the Romans "kolôphônion," in Syn. Diosc., and by Pliny xxvi. 38. The drug scammony according to Lindley is a resin obtained "from the roots," but is "extremely uncertain," the difference in quality due in part to "manipulations of the Jews."

The same year (= 317 + "1100 yrs" of Puranas, Lassen, and C. O. Mull. note to Arrian ind. 9), in Hindustan, accession of Somapi son of Sahadeva as first king of Magadha under the Kali Period. — "Forty-four or forty-five" kings follow, down to Sandracottus, an average reign of more than twenty-four years.

1414, June (= 1413 y. 302½ d. = 1240 + half of the "430 years" of ten lunations of Ex. xiii. 40, a division sanctioned by immemorial usage among the Jews), "Beth-horon the nether, and the upper, and Uzzan Sherah," cities in Palestine, founded by Sherah (1 Chron. vii. 24): an undertaking that could only be carried out with the aid and assent of the Egyptian government. The two cities first mentioned bear the name of king Orôs or Horemheb, — were certainly in existence prior to the Hebrew conquest of Palestine (Josh. x. 10, xvi. 5, xviii. 13, and xxi. 22); were repaired by Solomon (2 Chron. viii. 5); and to the present day are recognized in the two neighbouring villages called "Beit-ûr" (see Robinson topog. Palest. iii. 59 to 62).

1413, July 20th (= 753 + a phoenix of 660 years = 128 A. D. + 1540 years = 351 + "18 + 39" + erased 6 + "124 + 177 + 44 + 44 + 19 + 48 + 121 + 228 + 194 years" of the Egyptian Chronicle = "5th year of Kogharis" of Manetho in Syncell., the Afr.-Maneth. table giving 339 + "4 + 3 + 2 + 38 + 20 y. 4 mo. + 6 + 124 y. 4 mo. + 150 y. 6 mo. + 40 + 6 + 89 + 42 + 13 + 25 + 15 + 21 + 130 + 135 + 209 years" = 1412 y. 2 mo., and the Euseb.-Maneth. table giving + "6 + 4 + 6 + 20 + 21 y. 4 mo. + 6 + 120 y. 4 mo. + 42 + 25 + 17 + 6 + 45 + 8 + 6 + 7 + 12 + 44 + 44 + 49 + 130 + 178 + 194 + 40 years" = 1413 y. 8 mo., or in the Armenian version 522 y. 8 mo. + "167 + 44 + 44 + 44 + 49 + 130 + 178 + 194 + 40 years" = 1412 y. 8 mo., Theon's account agreeing for the reign of Menophre or Seti Mienptah is conventionally extended in the Afr.-Maneth. table beyond this date), end of the second *Great Year*: fairly counted by the calendar used in Egypt.

The phoenix,  is figured at Amarna, and so far as I have been able to discover, for the first time on the Egyptian monuments. — Subsequently, the hieroglyphic character of the phoenix is by no means rare, and continues in use until the end of hieroglyphic writing (Leps. d. iii. pl. 109, 226, and iv. pl. 74. See butterfly, and Horapollon i. 32, 33, and ii. 54).

The sculptures at Amarna have been already mentioned as remarkable for the absence of the Egyptian gods and the substitution of the sun's disk with rays extending downward, each terminating in a hand, expressing in hieroglyphic writing a new idea, revealed religion: but Horus also "saw the gods," — and a later king Amenophis desired the same privilege (Maneth.), and on each occasion the Israelites are found implicated.

 The accession therefore of Orôs or Horus or Hofemheb, ninth king of the Eighteenth dynasty, not earlier than the last-named date. His name is next to that of Amunhotep III. — in the series of kings at Abydos, Gurna, Medinet-Abu, and in Manetho's lists.

Horemheb restored the ancient religion, demolished the temples erected by his immediate predecessors and with the stones built the fourth pylon at Karnak (Birch): and figures of the Egyptian gods again make their appearance on the monuments.

He made a successful military campaign against the Ethiopians, recorded in grottoes at Silsilis (Birch); built additions to the temples at Luxor and in the Asasif; his name occurs also in Nubia, at Gebel Addah; and perhaps at Sedeinga or Sai, where sculptures of the time of the "Eighteenth — and Nineteenth" dynasties were found by Lepsius eg. and sin. 19.

"1408 B. C. = 1st year of Yang-kia, of the Chang" or Fourth dynasty — (Chinese chron. table).

The same year (= 1368 + "40 years" of Euseb. i. and ii.), accession of Ascatades as Assyrian emperor. "Thirty-eight" years are however assigned to his reign by Syncellus.

1407 B. C. = "7th year of Horemheb," the latest date in his reign found on the monuments (Leps. k. tab. p. 17, and Birch). Finely-executed statues of this king, — now in the museum at Turin, are mentioned by Champollion-Figeac.

On two stela under the "Eighteenth dynasty," a sort of secret or cypher writing was remarked by De Rougé: and in the royal tombs at Bab-el-meluk, something of the kind was noticed by Champollion. — the art of *writing in cipher* or occult characters, seems mentioned by Homer il. vi. 168; and is known to have been long practised in the East.

A *mummy* possibly belonging to the reign of Horemheb, is mentioned by Birch: who further ascertained, that the dead were already provided with *funeral papyri* (inscribed doubtless as in after

times with portions of the Egyptian Ritual). Bodies of persons who lived as early as this reign being rare, I may mention seeing at Thebes an unopened inner mummy-case, in the style of workmanship belonging to the Eighteenth and Nineteenth dynasties, and highly finished.

"1401 B. C. = 1st year of Pan-keng, of the Chang" or Fourth dynasty (Chinese chron. table). He changed his family name of Chang to "Yn:" — and the new name is by some writers applied to the remaining emperors of the dynasty.

The same year (= 1417 — "12 y. 3 mo. — 4 y. 1 mo." of Jos. c. A., = "16 y." in the Euseb.-Maneth. table, the Afr.-Maneth. table giving — "12—5" = 1400), accession of Ramessu, head of the Nineteenth dynasty. On the monuments — he is placed next after Horemheb in the series of kings at Abydos, Gurna, and Medinet Abu.

Eighty-seventh generation. Jan. 1st, 1400, mostly beyond youth: Hezron (Gen. xlv. 12., Num. xxvi. 21, Ruth iv. 18, and 1 Chron. ii. 5 to 24); Rephah, Resheph, and Telah (1 Chron. vii. 25).

Ramessu completed some of the columns of the temple at Luxor; and set up a large stela at Wady Halfa in Nubia.

The same year = "2d year of Ramessu" at Wady Halfa, the latest date in his reign found on the monuments (C. Mull. fr. Man. p. 583).

Ramessu engaged also in a military campaign against Syria (Birch): and his tomb, only partially finished, has been found at Bab-el-meluk near Thebes.

1399 B. C. (= 1417 — "12 — 5 — 1" in the Afr.-Maneth. table, Manetho in Jos. c. A. giving — "12 y. 3 mo. — 4 y. 1 mo. — 1 y. 4 mo." = 1400, the Euseb.-Maneth. table — "12 — 5 — 1" = 1397, and the Afr.-Maneth. table in another place 1366 + "32 y." = 1398), accession of Sēthōs or Seti Mienptah, second king of the Nineteenth dynasty. — He is next after Ramessu in the series of kings at Abydos, Gurna, and Medinet Abu.

The same year = "1st of his reign" on the monuments, Seti Mienptah carrying on war in Syria, as far as Kanana or the "Canaanites" (Leps. eg. and sin. 450, and Birch): farther North, he reached Lebanon, or at least a wooded country, as shown by tufts of *fern* and the forest of *spruce* figured on the temple at Karnak (Rosselin. i. pl. 46).

The felling of some of these spruce trees, taken in connexion with flag-staff receptacles projecting from the walls of the temple, demonstrate the existence of *navigation* upon the Mediterranean.

Abies picea of the mountains of middle and Southern Europe, and as far as Caucasus. Called in Britain *silver fir* from its white trunk (Prior), in Germany "weisstanne," in Italy "abezzo" or "abeto" or "abeto bianco" or "abeto comune," or in Lombardy "pezza" or "pescia" or "peccia" (Lenz), in Greece "ēlatē" or "ēlatōs" (Sibth), and clearly the species in question: — spars of surprising length, said to have come from Syria, were observed by myself floating in the harbour of Alexandria. Farther North, the "ēlatē" growing on the mountains is termed "ōuranōmēkēs" tall as the heavens by Homer il. xiv. 287 and od. v. 239, is mentioned also by Euripedes cycl. 385, Theophrastus, and its resin by Dioscorides i. 91 and 92: *A. picea* was observed by Sibthorp, and Chaubard, on all the high mountains of Greece; is known to grow also on the mountains of Asia Minor as far as Caucasus (Bieb.). Westward, the "picea" is mentioned by Virgil as forming dark groves; by Pliny xvii. 18 to 28, as having leaves like a comb and growing on mountains: *A. picea* is termed "a. taxi folio fructu sursum spectante" by Tournefort inst. 585; is known to grow on Sicily, and throughout the Apennines (Guss., and Schouw), Alps, Pyrenees, and Carpathians to "Lat. 51° 15'" in Silesia (A. Dec.); perhaps in ancient times farther North, for the relics in the peat-bogs of Britain and the Shetland Islands (Edmonst. ann. nat. ii. p. 71) may in part be derived from ocean-currents. The tree according to Sprengel, and Lindley, yields "*Argentoratensis*" or *Strasburgh turpentine*.

Aspidium filix-mas of Europe and the adjoining portion of Asia. Called in Britain *male fern* (Prior), in Germany "wurmfarn," in Italy "felce maschia" (Lenz), in Greece with other kinds "ptēris" (Fraas); agreeing with the tufted fern in the spruce forest figured on the walls of Karnak: — the "thēlyptēris" is described by Theophrastus ix. 18 as useful against both round worm and tape-worm; by Dioscorides, as taller than the "ptērithi" with many sprouts, which are eaten while young, and in the added Synonyms is identified with the "numphaian ptērin": *A. filix-mas* was observed by Sibthorp in woods on Crete and Zacynthus. Westward, the "thelypteris" or "nymphaeam pterin" is identified by Pliny xxvii. 55 with one of the two kinds of "filicis": *A. filix-mas* is termed "f. non ramosa dentata" by Tournefort inst. 536; was observed by Lenz frequent in Italy; is known to grow as far as Britain, and "all over the North of Europe" (Engl. bot. pl. 1458, and Lindl.). The rhizoma according to Lindley is "used as an anthelmintic; the *oil of fern*, extracted by ether, is the most efficacious."

1391 B. C. = "9th year of Seti Mienptah," in an inscription at Assouan enumerating the monuments he had constructed — (Birch).

In this year (Davis, Colebrooke as. res. v. 288 to viii. 489, and Elphinst. iii. 1 to 3, compare the adoption of the kali-yug referred in the Braminical books to "about 1400 B. C.," Buns. iv. 7. 1), the date indicated by the position of the solstitial points at the time of the division of the ecliptic into twenty-seven lunar mansions, and instituting "a cycle of five years of lunar months;" — an arrangement containing "the rudiments of the calendar" in use throughout Hindustan.*

Bela succeeded by Jobab or Job, second king of Edom (Gen. xxxvi. 33, 1 Chron. i. 44, and Jul. Afr. xix).

"1379 B. C. = the Eighth manwantara" among the Hindus — (Graha Munjari tables, and Bentley as. res. viii. 244

1378 B. C. = "22d year of Seti Mienptah," in an excavated chapel at Silsilis; the latest date in his reign found on the monuments.

A *library* in Thebes in the "Fourteenth" century B. C. (Leps. eg. and sin. 391 to 397), and there is "reason for considering it neither the most ancient nor the only one in Egypt." — Several "hieratic papyri" are "dated from the Rameseion;" and the "tombs of two librarians of this time" have been discovered.

"1377 B. C. = 25th year of Pan-keng" (Chinese chron. table), beginning of the Twenty-second cycle.

Besides building at Karnac the great hall of columns (regarded as the most imposing work ever constructed by human hands) Seti Mienptah set up obelisks (one of which is now in Rome); and his name occurs on other monuments throughout Egypt and in Nubia; in the cave-temple near Beni-hassan; in the Theban Desert at Wadi-el-Moyeh towards the Red Sea; at Sesebi or Sese in Nubia, but not farther South (Leps. eg. and sin. p. 235); and at Sarbut-el-Khadem, Elephantine, and Silsilis. He also commenced the temple at Gurna, in the Western quarter of Thebes.

Trifolium Alexandrinum of the East Mediterranean countries. A kind of *clover* called in Egypt "bersun" or "bersim" (Forsk.), and seemingly corresponding with the plant held by an Asiatic captive on the walls of the temple at Gurna — (Champ. pl. 167): *T. Alexandrinum* was observed by Forskal p. 139, and Delile, abundantly cultivated in Egypt for feeding cattle; also according to Clot-Bey ii. 39 in Syria, and the seeds exported to Egypt. Farther North, the cultivated "ërusimôn" of Theophrastus and others, may be compared: *T. Alexandrinum* was observed by Chaubard in wild situations in the Peloponnesus; and farther West, "*T. Latinum*" of Sebastiani is regarded by him as possibly identical.

"1373 B. C. = 1st year of Siao-sin, of the Chang" or Fourth dynasty (Chinese chron. table).

1371 B. C. (= 1425 — "54 years" of Castor in Euseb. i. p. 129. see also Pherecyd. . .), in the Peloponnesus, Criasus succeeded by his son Phorbas, sixth Argive king.

A portion of the walls of the tomb of Seti Mienptah, is devoted to *Ethnography*; the inhabitants of the four quarters of the world being represented in their respective costumes; including Egypt as the Western quarter.

The people of the North (probably from the Euxine) are fair-complexioned, and wear *egret-plumes* and skin-cloaks, in one instance clearly an ox-hide: there is perhaps no evidence that they were acquainted with the art of weaving cloth.

The cloaks are bordered and ornamented with down or *fur* (very distinct in the original painting examined by myself at Thebes), and if fur, of the *ermine* *Mustela erminea*; — this animal inhabited Switzerland during the Stone Age (Rütim. and Troyon); "*pontici mures albi*" were mentioned by Pliny viii. 55, and the "*mustela alpina*" or "*alba*" and "*mus mus pontici pellicula*" were known to the Romans (Ainsw.); "*ermin*" is enumerated by Marco Polo 71 among the furs brought from the country North of the Altai.

Quercus infectoria of the East Mediterranean countries. The black lines on the skin of these people of the North — (Champ.-Fig. pl. 1) seem made with *nut-galls*; a custom I found extant at

* *Trapa bicornis* of Southern China. Called in Hindustan "singhara" (W. Jones), in the environs of Bombay "shingaree" (Graham), in Sanscrit "sringata" from its horned nut which is placed among the lunar constellations — (W. Jones as. res. iv. p. 253): the "sringata" is mentioned also by Susrutas sutr. 46: *T. bicornis* was observed in Hindustan by Rheede xi. pl. 33, Roxburgh cor. iii. pl. 234, Wight; by Graham, "in tanks throughout the Concans," preserved from extirpation by "the Bhoie or Hamal caste of fishermen" by transplanting in the dry season, the fruit employed "in making a dye of a red colour" for "the Hooly festival," also "eaten by the natives on fast days," and in Goozerat "an important article of food to certain classes." Farther East, was observed by Loureiro in Southern China; and the "pi-tsi" or "chataigne d'eau" is enumerated by Cibot (mem. Chin. iii. p. 451) as long cultivated in China, a superior kind occurring in the South. (See *T. natans*, and *T. incisa*.)

Mocha, the pigment being of course imported: nut-galls are called in Egypt "afs" (possibly from the Egyptian "apē" or "aphē" signifying head), and were further ascertained by Forskal mat. med. to be imported "from Syria and Greece." The "kēkis" is mentioned by Aeschylus ag. 934, Demosthenes 816. 20, and Dioscorides; "gallae" by Virgil, the best according to Pliny xvi. 9 and xxiv. 5 brought from "Commagena," the district yielding the *Aleppo galls* of the present day: *Q. infectoria*, a shrub oak, was observed by Olivier ii. pl. 14 and 15 in Asia Minor, by Sibthorp, and Chaubard, in Greece.

 a hieroglyphic character occurring (according to Bunsen and Birch) on the walls of this tomb: (beaver signifying author of his own distress Horap. ii. 61); "nōēik" or "nōik" adulterer, also unbeliever; "pōrk" or "pōrk" or "phōrk" or "phōrk," to pluck out. Non-conformists to established religion being included, — we have an explanation of the Scriptural application of the term "adulterous" to whole nations. Compare in Hebrew, "nkr" foreigner, "nkryē" strange woman, and in vulgar English "nocker."

The drug *castoreum* probably the means through which the *beaver* became known to the Egyptians: for the living animal occurs only in the distant North: inhabiting among other countries Switzerland during the Stone period, as appears from debris of the earliest villages (Rütimeyer, in Troyon habit. lac. p. 442). — The "kastōr" or beaver is mentioned by Herodotus iv. 9, Nicander ther. 565, Dioscorides; and its product castoreum, by Lucretius, Strabo, Celsus, Pliny, Juvenal, Galen, and by the Arab writers Rhazes, Avicenna, and Serapion. The importation into Egypt of "castoreum, djild menaster," is enumerated by Forskal mat. med.

1368 B. C. (= 1323 + "45 years" of Euseb. i. and ii., and Syncell.), accession of Amyntas as Assyrian emperor.

Eighty-eighth generation. May 1st, 1367, mostly beyond youth: Chelubai or Caleb, son of Hezron (1 Chron. ii. 9 and 18), Tahan (num. xxvi. 35, and 1 Chron. vii. 25): and among Greeks, Oceanus father of Clymene (Dionys. i. p. 45).

Jobab succeeded by "Husham of the land of Temani," now third king of Edom (Gen. xxxvi. 35, and 1 Chron. i. 45).

Among moveable articles in the tomb of Seti Mienptah (discovered and opened by Belzoni) were "wooden statues coated with *bitumen*;" the earliest instance known of the employment of this material — (Birch): its use for embalming soon became general; quantities being imported overland as is alleged from the country on the Euphrates.

1366 B. C. (= 1417 — "12 y. 1 mo. — 9 — 12 y. 5 mo. — 12 y. 3 mo. — 4 y. 1 mo. — 1 y. 4 mo." of Manetho in Jos. c. A. = 51 y. 2 mo = "51 years of Sēthōs" in the Afr.-Maneth. table, giving in another place "32 + 6 + 12 y." = 50), accession of Armēsēs Miammōu. Ramessu II., third king of the Nineteenth dynasty, corresponds on the monuments: and he is placed next after Seti Mienptah in the series of kings at Abydos, Gurna, — and at Medinet Abu.

1365 B. C. = "2d year of Ramessu II.," in an inscription at Nahr-el-Kelb in Syria — (Leps. eg. and sin. 23).

1364 B. C. = "3d year of Ramessu II.," excavation of a well at Redisieh or Contra Pselcis — (Birch).

1363 B. C. = "4th year of Ramessu II.," in a second inscription at Nahr-el-Kelb in Syria — (Leps. l. c.).

1362 B. C. = "the month Epiphi in the 5th year of Ramessu," commencement of his campaign against the Khita of Syria — (Birch).

1359 B. C. = "8th year of Ramessu II.," capture of "Shaluma" or Jerusalem, also of "Tapura" or Dabir at the foot of mount Tabor, and of "Askaluna" or Ascalon — (Birch).

1358 B. C. = "9th year of Ramessu II.," — in the poetical account of his campaigns called the "Sallier papyrus," supposed to have been written not long after his death. (See Seti-Mienptah II., and Leps. eg. and sin. 394).

Besides campaigns in the North, Ramessu II. extended his conquests up the Nile to Gebel Barkal; farther than any of his predecessors, and the limit of all subsequent Egyptian conquests (the granite Rams inscribed with the name of Amunhotep III. being regarded by Lepsius as probably brought "from Soleb"). At Gebel Barkal, Ramessu II. built a great temple; evidently by Egyptian workmen, — and like all monumental remains in Nubia down to the Twenty-fifth dynasty, in the Egyptian style of art. Moveable articles have been found farther up the Nile: as an Egyptian statue of Osiris in "black granite" at Soba, in company with a "bronze vase" and "small Venus of Greek workmanship;" but of fixed Greek inscriptions, the "most Southern" were at Gebel Barkal (Leps. eg. and sin. p. 17, 162, and 189 to 222); and this continued the limit of Egyptian and European influence throughout the Roman and Early Christian periods.

Borassus Aethiopicus of the Upper Nile. The *deleb palm* is by the Negroes called "m'voomo"

(Grant), and seems the flabellate-leaved kind figured in a campaign of Ramessu II., in which the Equatorial forest has been reached — (. . .) : the "dileh" palm was first met with by Lepsius eg. and sin. 172 in about Lat. 14° at Wad Negudi, its "slender naked stem" bearing leaves large enough for one to be "set up in the boat as an umbrella," the "leaf-stalk serrated," and the round fruit "larger" than that of the doum; was observed by Grant, "plentiful in Shillook country 11° N., where natives make beautiful strong white baskets and mats for the markets on the Nile," the leaves also furnishing thatch, rope, sieves, fences, firewood, and flageolet reeds among more distant tribes, and the boiled roots eaten in famines by the Wanyamuezi, but very few about the Equator.

Hyphaene nov. sp. of Abyssinia. A palm called "mizanza" (Grant), and possibly the kind figured: — observed by Grant in desolate valleys " 21° N." on the Nile, thirty feet high and never branching, its green leaves collected to make shackles for camels; had been seen by one of his men "growing in Wambweh, 8° or 9° S. Lat."

1354 B. C. (in the ninth or tenth generation or about "283 years" before the fall of Troy, Clint. i. p. 73 and 88), Pelasgus establishing himself as king in Arcadia, the central mountainous portion of the Peloponnesus.

Quercus esculus of the wooded portion of the Mediterranean countries. An oak called in Italy "rovero" or "querce esculo" (Lenz), in Greece "agria vëlanithia" (Fraas), in which we recognise the "phëgôs" whose acorns found edible by Pelasgus were the only kind permitted by him to the Arcadians — (Paus. viii. 2. 6), the oracular tree at Dodona according to a Hesiodic poem (quoted by Sophocles trach. 1167, and Strabo vii. 7. 10), and another solitary tree on the tomb of Ilus outside the walls of Troy (Homer il. vi. 237 to xxiv. 349, and Theophrastus iv. 13): the "phëgôs" is described as having "strôggulas" rounded acorns by Theophrastus iii. 10, and as a kind of oak by Dioscorides: *Q. esculus* was observed by Sibthorp, and Fraas, in Greece and Asia Minor as far as Constantinople. Westward, the "esculos" sacred to Jove is mentioned by Horace, Virgil, Vitruvius, and Ovid, by Pliny xvi. 5 to xvii. 34 as cultivated and bearing esculent acorns: *Q. esculus* is described by Dalechamp pl. 5; is termed "q. parva sive phagus Græcorum et esculus Plinii" by Tournefort inst. 583; was observed by Lenz in Italy, its acorns according to Daubeney "so sweet as to be much eaten by the peasantry" in Tuscany; and is known to occur in other parts of Southern Europe (Pers.).

"1352 B. C. = 1st year of Siao-y, of the Chang" or Fourth dynasty — (Chinese chron. table).

"In the reign of Phorbas" (Tat., and Clem. Alex., see also Strab. ix. 1. 18), Actaios governing the district of "Aktaia," so-called after his own name; — but in later times, known as Attica.

Sambucus nigra of Europe and Northern Asia. Called in Britain *elaer*, in Piers Plowman "eller," in Anglo-Saxon "ellen" or "ellarn" from its hollow branches used to blow a fire (Prior), in France "sureau" (Nugent), in Germany "holunder," in Italy "sam'buco" or "s. montano" (Lenz), in Greece "kôuphōxulia" (Sibth.): the "aktëa" or "aktë," named from Aktë on the Gulf of Argolis — (see Strab. ix. 1. 1), mentioned also by Euryphon 2 morb. 19, Theophrastus i. 7 to iv. 4, by Dioscorides as arborescent with reedlike hollow branches and juicy purplish-black fruit, is referred here by writers: *S. nigra* was observed by Sibthorp, and Fraas, in Greece, but chiefly or altogether in the vicinity of dwellings; is enumerated by Clot-Bey as long known in the gardens of Egypt. Westward, the "ëmëron" kind or "thënthrôn arktou" is identified in Syn. Diosc. with the "sëva" of the Dacians, "skôviën" of the Gauls, and "samvōukōum" of the Romans: the "sambucus" is described by Pliny xvi. 71 and xvii. 34 as both wild and cultivated, having "abundant pith" and "small black edible" berries; seeds of *S. nigra* occur in debris of the earliest villages of Switzerland (Troyon p. 465); the living tree was observed by Lenz in wild situations in Italy; and is known to occur around dwellings as far as Sweden (Linn., Wahl, and A. Dec.). Eastward from Greece, is known to grow about Caucasus, and throughout Siberia as far as Japan (Pers., and Lindl.). "The inspissated juice of the fruit" and "the inner bark" according to Lindley are used medicinally; and the flowers "in French pharmacy are commonly employed as expectorants."

1346 B. C. = "21st year of Ramessu II.," treaty at the fortress of Pa-ramessu — (Birch).

Temples and other structures by Ramessu II. occur throughout Nubia and Egypt; are more numerous than those of any other king; and historical documents of great importance, as the Abydos series of successive kings, have been preserved by being inscribed on the walls. His name is often accompanied by his portrait, which is sufficiently striking to be at once recognized: of these portraits, the finest I have seen is one in polished sienite — (now in the possession of Francis C. Lowell of Boston).

Amid the costliness and imposing dimensions of the structures by Ramessu II., there is yet manifest a falling off in taste, a *Decline of the arts*; — strikingly parallel to that in a later period of history, under the Romans

1344 B. C. = "23d year of Ramessu II.," peace concluded between him and the Khita — (Mariette 88).

The "new king over Egypt which knew not Joseph," alarmed at the increasing number of Israel-

ites, lest "when there falleth out any war they join also unto our enemies," employed them under "taskmasters" in building, and from the name, "Raamses" one of the "treasure cities" (Ex. i. 7 to 11) could hardly have been earlier than Ramessu II.: ovals of Ramessu II. are cut in a block of granite at Abu Kesheb on the ancient Red Sea canal and this is regarded by Lepsius (eg. and sin. 438) as the site of "Raamses." The "Patōumōs" described as an Arabian town by Herodotus, and called "Thoum" in the Itinerarium Antonini, is not far distant on the same canal, and is regarded by Lepsius as the "Pithom" of the Israelites.

The *art of levelling* having been long practised in Egypt, the canal in question was carried by Ramessu II. from Bubastis to Heroonpolis — (Leps. p. 445). In B. C. "600," the canal appears to have been extended by Nekau II. as far as the Bitter Lakes; in "500," was carried to the Red Sea and the connexion completed by Darius; whose name and statue occur with cuneiform inscriptions in Persian ruins near Suez; but the canal was narrow, not intended for large ships, and in "350," in the days of Aristotle, appears to have fallen into disuse: in "250," a wide canal was carried by Ptolemy II. Philadelphus from the Bitter Lakes to the Red Sea, where he founded the city of Arsinoe: in "100 A. D.," a new canal was opened by Trajan from Babylon on the Nile to Heroonpolis: in "643" to "644," the connexion was re-opened by khalif Omar: and in "762 to 767," on the occasion of the revolt of Mohammed ben Abdallah at Medina, the canal was filled by khalif El Mansur.

1336 B. C. (= 1371 — "35 years" of Castor in Euseb. i. p. 129, see also Pausan. . .), in the Peloponnesus, Phorbas succeeded by his son Triopas, of the "seventh generation from Inachus" (Clem. Alex.) and now seventh Argive king.

Contemporary with Triopas (Paus. iv. 1, and Clint. i. p. 33, see also Homer il. κ 429 and φ 86), Lelex ruling a district in the Peloponnesus named after him Lelegia — (but in later times Laconia). Besides Aones, Temmices, and Hyantes, Leleges are enumerated as original inhabitants of Bœotia (by Strabo ix. p. 401); and holding the islands as far as the coast of Asia Minor, are identified with the Carians (by Herodotus i. 171), and with the fabulous centaurs (by Suidas, and schol. Pind. pyth. ii. 78).

Eighty-ninth generation Sept. 1st, 1334, mostly beyond youth: Paapios father of the Egyptian prophet Amenophis (Maneth. in Jos. c. A.): Laadan (1 Chron. vii. 26), Gilead (Num. xxvi. 29, Josh. xvii. 3, and 1 Chron. vii. 17), Hur the firstborn of Ephratah (Ex. xxxi. to xxxviii., and 1 Chron. ii. 19 and iv. 4): and among Greeks, Agenor son of Triopas (Hellan., and Pausan. ii. 16. 1).

Husham succeeded by Hadad, son of Bedad and now fourth king of Edom (Gen. xxxvi. 35, and 1 Chron. i. 46).

"1325 B. C." (argum. Chi-King iv. 5. 5), beginning of the reign of Kao-tsong of the Chang.*

"1324 B. C. = 1st year of Wou-ting II., of the Chang" or Fourth dynasty (Chinese chron. table).

"In the reign of Triopas" (Hes. theogon. 507, Dionys. i. p. 45, Tat., and Clem. Alex.), the three brothers Prometheus, Epimetheus, and Atlas, living. The date is important, Prometheus and Clymene being the parents of Deucalion.

Ferula communis of the East Mediterranean countries. Called in Italy "ferula" (Lenz), in Greece "kalami" (Fraas) or "anartēkas" (Sibth.), in which we recognize the "nartheca" or "ferula" employed to preserve fire struck from the rock; an art taught by Prometheus, — and continuing in Egypt in the days of Pliny vii. 57 and xiii. 43, who further speaks of staffs made of the stem: the "narthēx" is mentioned by Aeschylus prom., 109, Euripides bacch. 695, Xenophon cyr. ii. 3. 7, and Theophrastus i. 9; its medicinal uses, by Dioscorides; and *F. communis* was observed by Sibthorp, and Fraas, from Attica to Cyprus. Westward, the "ferula" is enumerated by Pliny as foreign to Italy; *F. communis*, described by Dodoens pl. 321, was observed by Lenz seemingly wild in Italy, and by Desfontaines i. p. 251 in Barbary.

Clematis cirrhosa of the Mediterranean countries. Called in Greece "hēlithrōnaki" (Fraas); and the "athragēnēs" whose wood was preferred for rubbing fire, with a laurel borer, — further described by Theophrastus v. 9. 6 and ign. 64 as a woody vine climbing around trees, is referred here by writers: *C. cirrhosa* was observed by Sibthorp, and Fraas, frequent in Attica, and by Bory on Milo.

* *Pinus Massoniana* of China. The "pin" cut for building purposes on the King mountain according to the ode to Kao-tsong, — furnishing planks for ships according to an ode to the queen of Hui (Chi-King i. 5. 5 to iv. 5. 5), growing according to the Chou-King in the province of Tsing (Gaubil), may be compared: *P. Massoniana*, having very long geminate leaves, was received by Lambert pl. 12 from China (Pers.).

Cupressus Japonica of Japan. The "cypres" also cut for building purposes on the King mountain according to the ode to Kao-tsong — (Chi-King iv. 5. 5), growing in the province of King according to the Chou-King ii. 1. 13, not shedding its leaves in winter according to Confucius lun-yu ix. 27, and unknown in Cambodia when visited by a Chinese official in A. D. 1296, may be compared: *C. Japonica*, "arbor altissima" very lofty, was observed by Thunberg 265 in Japan (Pers.).

Westward, is termed "c. peregrina foliis pyri incisib." by Tournefort inst. 293; was observed by Desfontaines i. 433 in Barbary; is known to grow also on Corsica and in Spain (Pers., and Viv.).

1323 B. C. (= 1298 + "25 years" of Euseb. ii., and Syncell.), accession of Belochus II. as Assyrian Emperor. "Forty-five" years are however assigned to his reign in Euseb. i. p. 44.

Triopas succeeded by his son Iasus eighth Argive king; his dominions (those of "the father of Io," Acusil., Herodot. i. 1 and ii. 26, see also Apollod., and Paus.) including under the name of Pelasgia all continental Greece.

Xanthus another son of Triopas led a colony of Pelasgian Greeks to Lycia;—and afterwards occupied Lesbos, an island close to the main shore of the Troad.

"1317 B. C. = 8th year of Wou-ting II." (Chinese chron. table), beginning of the Twenty-third cycle. By the emperor Wou-ting II., ambassadors received from kings of foreign nations whose language differed from the Chinese.

In this year (= 8th of Wou-ting," hist. Cor., and Klapp.), the Corean seat of government removed from Pë-yô to the A-szu-ta (Asstak) mountain.

1316 B. C. (= 1266 + "50 years" of Castor in Euseb. i. p. 134, see also Paus. i. 2. 6., Tat., and Clem. Alex.), Actæus succeeded by his son-in-law Cecrops, second (or according to Apollodorus iii. 14. 1 first) Attic king; his dominions including Boeotia. — The tomb of Cecrops on the acropolis at Athens continued extant in the days of the historian Antiochus (Strab. ix. p. 407, and Clem. Alex. pr. p. 29).

The worship of *Jupiter* supreme over the gods, not earlier than Cecrops, who inaugurated it (Paus. viii. 2. 3, Euseb. chron. ii., and Constantin. Diac. 13). Io daughter of Iasus is connected with this worship, and (according to Aeschylus prom. 705) she visited the neighborhood of Dodona. The *Oracle* at Dodona probably at this time founded (see Ammon, and Deucalion).

Lycaon son of Pelasgus and second king of Arcadia contemporary with Cecrops (Paus. viii. 2. 2). On mount Lycaeus, Lycaon built the city of Lycosura, instituted games there, and adopted the worship of *Jupiter*, but offered a human sacrifice. (See Mienptah).

Images of gods among the Early Greeks (as ascertained by Pausanias viii. 17. 2) were made either of "ἐβένος" *ebonē*, "lōtōs" (see *Zizyphus lotus* and *Celtis Australis*), "θρυίνα" *oak* (Q. robur and Q. pubescens), or of the four following kinds of wood:

Cupressus sempervirens of the East Mediterranean and Tauro-Caspian countries. The *cypress* is called in France "cyprès" (Nugent), in Italy "cipresso" (Lenz), in Greece "kuparissia" (Sibth.), in Egypt "sar" (Forsk.), in which we recognize the "kuparissōs" of which some of these images were made — (Paus.), employed also for door-posts according to Homer od. v. 54 and xvii. 340, and mentioned by Herodotus, Thucydides ii. 34, and Theophrastus: one of the gates of the temple at Jerusalem was called the "sar" gate (2 K. xi. 6 and 2 Chron. xxiii. 5): *C. sempervirens* was observed by Forskal, and Delile, planted in Egypt, and by myself in the Muslim cemeteries; by Sibthorp, and Fraas, wild on the mountains of Crete and Greece, but its abundance in the Peloponnesus, remarked by Bory, is doubtless due to human interference. Westward, the "cupressus" is mentioned as foreign to Italy by Cato, and Pliny xvi. 60, introduced with difficulty and sacred to Pluto; is further described by Pliny as sheared to the density of a wall and thus rendered unnaturally slender and pointed; is termed "cupressus funebris" by Horace epod. v. 16, and Ovid met. x. 106; and *C. sempervirens* continues to be associated with mourning in France (Nugent), is besides planted for ornament throughout middle and Western Europe as far as Spain (Pers., Targ.-Tozz, and Lenz). Eastward from Palestine, the "kuparissōs" was found by Alexander abounding in Adiabene in Babylonia, furnishing timber for a whole fleet (Arr. vii. p. 161): *C. sempervirens* is called in Hindustanee "sar" or "sarv" (D'roz.), was observed by Graham "in gardens" in the environs of Bombay, thriving "best above the Ghauts;" by myself, in Muslim cemeteries on the Deccan. By European colonists, was carried to Northeast America, where it continues in gardens, the stocks I have met with small in size.

Juniperus oxycedrus of the wooded portion of the Mediterranean countries. The *berried cedar* is a small tree called in Greece "agriophitha" (Forsk.) or "kēthrōs" (Sibth.), and a kind of timber imported into Egypt "gutran" (Forsk.): in which we recognize one of the "kēthroi" of which images of the gods were made — (Paus.), referred here by Hawkins: the "kēthrōs" is termed "ἐκκέατοῖος" easily split by Homer od. ii. 6 and v. 60, growing on Calypso's isle (Malta), is mentioned also by Herodotus. . . , Satyrus, by Theophrastus iii. 12. 3 as sometimes called "ὄξυκέθρων," its berries "xanthōs" ruddy and edible, and wood odorous and sound to the centre; its berries, by Nicander ther. 80 to 583, and the "kēthrōs mikra" by Dioscorides: the "kēthrōs" is further described by Theophrastus iii. 2. 6 and iv. 5. 5 as abounding in Syria and used for ship building; by Pliny as used in Egypt for this purpose, the galley of Ptolemy IV. was in part built of "kēthrōs" (Callixen., and Athen. v. 38) according with the use made at present of the imported "gutran" timber (Forsk. p. lvi.): *J. oxycedrus* was observed by Forskal, and Sibthorp, everywhere in Greece and on

the Greek islands, and trunks eight to ten inches in diameter were found by Bory, its berries largely exported. Westward, the "odorata cedrus" of which images of gods and ancestors were made in the days of Latinus is mentioned by Horace, Virgil aen. vii. 13 to 178, Persius, and Pliny: *J. oxycedrus* is described by Matthioli i. 115; is termed "*j. major bacca rufescente*" by Tournefort inst. 589; but from Italy along both sides of the Mediterranean to Gibraltar, hardly exceeds the dimensions of a shrub six feet high (Pers., and Lenz).

Juniperus Phœnicia of the wooded portion of the Mediterranean countries. Called in Greece "kēnthrōs" (Sibth.), and a kind of timber imported into Egypt "schærbīn" (Forsk.): one of the "kēthrōi" of which images were made—(Paus.) may be compared: the "kēthrōn phōinikēn" is distinguished by Theophrastus iii. 12. 3 and ix. 2. 3; the "kēthrōn" becoming a great tree "thēnthrōn mēga" by Dioscorides, "thēnthrōn ōu mikrōn" according to Galen simpl. vii. 8; and the largest "cedrus" on record, "one hundred and thirty feet high" with three men required to encircle its trunk, was cut for Demetrius on Cyprus (Plin. xxvi. 76): the "brwsh" growing on Lebanon (Psalm civ. 17, Hos. xiv. 3, Isaiah xiv. 8 to lx. 13, and Zech. xi. 2), of which David's musical instruments were made (2 Sam. vi. 5), employed in the construction of houses (1 K. v. 8 to ix. 11, and 2 Chron. ii. 8 to iii. 5), is mentioned by Ezekiel xxvii. 5 as also employed in ship-building, the purpose for which "schærbīn" timber is imported into Egypt (Forsk. p. lvi): *J. Phœnicia* was observed by Pococke in Palestine; by Sibthorp, Bory, and Fraas, frequent and of large size from the Peloponnesus throughout Greece and the Greek islands. Westward, is described by Matthioli i. 22, and Lobel ii. pl. 221; is termed "*cedrus folio cupressi major fructu flavescente*" by Tournefort inst. 588; and is known to grow from Italy throughout Southern France and Spain as far as Cadiz (Pers., Bory, and Lenz). "*J. Lycia*," though described by Matthioli, Lobel, and Tournefort, is regarded by Sibthorp as perhaps not distinct, as seen by him on Crete.

Taxus baccata of Europe and Northern Asia. Called in Britain *yew*, by Chaucer "ewe," by Galfridus pr. pm. "u," in Anglo-Saxon "iw," in Welsh "yw," in Old High German "iwa," in current German "eibe," in France "if," in Spain and Portugal "iva," in mediæval Latin "ivus" or "iva" or "iua" (Prior), in Italy "libo" or "tasso" or *albero della morte* (Lenz), in Greece "maurēlatōs" (Fraas): the "milax" of which some of these images were made—(Paus.) is mentioned also by Pherecrates, Euripides bacch. 108, and Aristophanes nub. 1003; the "milōs" by Theophrastus iii. 10. 2 as resembling "ēlatē" even in its foliage but bearing a red edible berry, its leaves poisonous to "lōphōura" equine animals, and its wood which seems to be all heart-wood fraudulently sold for cedar; the deadly "smilōn" by Andreas, Nicander alex. 624, and Plutarch symp. iii. p. 634: *T. baccata* was observed by Hawkins, and Fraas, on high mountains of the Peloponnesus and other parts of Greece. Westward, the "smilax" tree according to the received text of Dioscorides iv. 80 grows in Italy and Narbona bordering on Spain, its berries fatal to "ōrnithia;" is identified in the added Synonyms, and by Sextius, and Galen simpl. med. viii. 29 with the "taxōn" of the Romans; Cativolcus king of the Eburī according to Cæsar vi. 31 killed himself with "taxo;" noxious and harmless kinds are distinguished by Virgil; the "taxus" is also mentioned by Columella, Lucan, Statius, Silius Italicus, and as the only berry-bearing tree of the spruce kind by Pliny xvi. 20: *T. baccata* is described by Dodoens, Lobel (Spreng.), and Tournefort inst. 589; is known to grow in mountainous situations in Italy and throughout middle Europe as far as Britain (Pers., and Lenz). Eastward from the Black Sea, was observed by Thunberg in Japan, is known to grow throughout Siberia (Pers.), or according to A. Decandolle two-thirds around the Subarctic circuit of the Globe. The leaves according to an Italian physician "have a power similar to that of Digitalis," in too large doses "certainly fatal" (Lindl.).

1315 B. C. (= 1304 y. 248½ d. + "at least ten years" of Clint. i. p. 301, see Ex. ii. 4 to 8, and Num. xxvi. 59), Miriam born to Amram and Jochebed.

Articles apparently of green *gauze* worn by women on Egyptian monuments of about this date (. . .). The earliest Greek settlers on the island of Cos, according to the traditional account (Pausan. iii. 23. 4), came from Epidaurus near Argos: and the art of unravelling cocoons and weaving the thread, was discovered on Cos by Pamphila daughter of Plateo—(Aristot. animal. v. 19). Cos was "thickly peopled" in the days of Homer . . . and continued to be celebrated in after times for its manufacture of "woven wind." The name of the island, written in Greek "kōs," is continued in our English word "gauze."

Lilium candidum of middle Asia. Called in English gardens *lily*, in Spain "lirio" (Prior), in Germany "lilie," in Italy "giglio" (Lenz), in Greece "krinō" (Sibth.), at Constantinople "samvahi," on the mountains of Yemen "zambak" (Forsk.), in Egyptian "sumphaiphōu" or "tialōs," by the prophets "aima arēōs" (Syn. Diosc.), and a plant corresponding in stem and leaves and terminal large flower is figured at Abousimbel:—*L. candidum* was observed by Clot-Bey confined in Egypt almost exclusively to the pasha's garden; by Forskal, under cultivation among the mountains of Yemen. Northward, the "krinōn vasilikōn" or "lēiriōn" or "kallēiriōn" is identified in Syn. Diosc.

with the "sasa" of the Syrians, and "aura krōkōthēilōu" of Osthane: "lēiriōēssan" is a word used by Homer *il. iii. 152*, and the "lēiriōn" is mentioned in the Hesiodic theogon. 41, the Hymn to Ceres 427, Pindar *nem. 2. 7*, by Dioscorides as coronary and employed medicinally, affording an ointment called "sōusinōn": *L. candidum* was observed by Forskal, Sibthorp, and Fraas, frequent in the gardens of Greece; by Hawkins, and Chaubard, in some instances seemingly wild. Westward, the "krinōn vasilikōn" or "lēiriōn" is identified in Syn. Diosc. with the "avilavōn" of the Numidians, and "rōsa iōunōnis" or "liliōum" of the Romans; "candida lilia" and "grandia lilia" are mentioned by Virgil; the "lilium" by Horace, Propertius *iv. 4*, Columella, by Pliny *xxi. 11* as one of the tallest flowers, sometimes three cubits high, its neck always bending under a head distinguished for whiteness, the narrow base expanding gradually with lips around turned backwards from central saffron borne on a slender thread; "oleum liliaceum" is also mentioned by Palladius: *L. candidum* was known to Walafridus Strabus (*F. Adams*), and Macer Floridus 22; is figured "somewhere about 1480" in an engraving by Martin Schongauer (*Lindl. gardn. chron. ii. p. 744*); is described by Lobel *pl. 183*, is termed "*L. album vulgare*" by Tournefort *inst. 369*; is a well known garden-flower throughout Europe, and has been found seemingly wild in Switzerland and near Cadiz (*Pers.*). By European colonists, was carried prior to 1657 to New England (*poem Bradf. in hist. coll. iii.*), where as well as throughout our Northern and Middle States it continues a favourite in gardens. (See *Pancratium Illyricum*, and *Iris sambucina*).

1312 B. C. = "55th year of Ramessu II.," death of one of his sons Shāmuas, who for a long time was governor of Memphis. His mummy — has been found there in the Serapeum, "in one of the chambers of the mummies of the hill Apis" (*Birch*).

1307 B. C. (= 1240 + "83 years" of ten lunations of Ex. vii. 7), Aaron born to Amram and Jochebed.

Clearly after the birth of Aaron, the Ordinance of the king of Egypt respecting the Israelites: "Every son that is born ye shall cast into the river, and every daughter ye shall save alive" (Ex. i. 22).

As early possibly as this date (*Graha Munjari tables, Puranas, and Bentley as. res. viii. p. 232*), Galava reigning in Hindustan.

1305 B. C. (= 1304 y. 246 $\frac{2}{3}$ d. = 1240 + "80 years" of ten lunations of Ex. vii. 7), Moses born to Amram and Jochebed.

Cyperus dives of Tropical marshes from the Red Sea to Hindustan. The flags "swph" among which the infant Moses was placed (*ex. ii. 3 to 5*), growing along "the brooks of defence" according to Isaiah *xix. 6*, gave the name "ym swph" (*Psalms cvi. 7 to 22 and cxxxvi. 13*) to the Red Sea, in Egyptian "phiōm ntshari" (*transl. Sept. ex. x. 19*), and therefore correspond to the Egyptian "saris" — rendered "calamus" or "juncus" in *ms. Borg.* (compare also *R. Salomo, Forskal p. 24*, and *C. Mull. geogr. min. i. p. 112*): the "sari" is described by Theophrastus *iv. 8. 2 to 5* as growing in water in the marshes and flat land of Egypt, its stems thick as the thumb and two cubits high, triangular as in the papyrus with a similar top, and in like manner chewed for the juice: *C. dives*, four to five feet high with radical leaves three feet long and rough with small prickles, was observed by Lippi, and Clot-Bey, in Egypt, by Delile *pl. 4* under cultivation in the wet plains of the Delta, its stems split for making mats. Eastward, was observed by Fresnel at the extremity of the Sinai peninsula near Tor; and is known to grow in Hindustan (confounded according to Delile in herbaria with the next species).

Cyperus alopecuroides of Tropical marshes from the Red Sea to Hindustan. Probably included in the "swph" in question; — observed by Delile intermingled in cultivation with *C. dives*, and used for the same purpose. Eastward, is known to grow in Tropical Arabia (*Pers.*); was observed by Graham in the environs of Bombay, by Roxburgh *i. 208* in other parts of Hindustan. From transported specimens, is described by Rottboell *xxxviii. pl. 8*, and Willdenow (*Steud.*).

The same year = "62d year of Ramessu II.," on a stela — now in Florence; the latest date in his reign found on the monuments.

The same year (= 1365 y. 10 mo. — "61 yrs." in the Afr.-Maneth. table), the accession of Mienptah, thirteenth son of Ramessu II. and now fourth king of the Nineteenth dynasty, not earlier than this date. He is next on the monuments, — and immediately follows Ramessu II. in the series of kings at Medinet Abu.

The same year = "1st of Mienptah," in a tablet at Silsilis, recording offerings to the gods Amon-Ra and Hapi — (*Birch*); the earliest instance known of the worship of Amon, which could not be traced by Lepsius beyond the Twentieth dynasty (*Buns. v. 4. 4*, see Jupiter).

About three miles beyond Girgeh and on the Eastern margin of the river-flat where some mounds of rubbish mark the site of an ancient city (possibly the lost "Lepidotum"), one of the chambers or tombs excavated in the face of the cliff contains ovals of king Mienptah, — observed by myself.

Nineteenth generation. Jan. 1st, 1300, mostly beyond youth: the Egyptian prophet Amenophis (*Maneth. in Jos. c. A. i. 26*): Ammihud (*Num. i. 10, ii. 18, vii. 48, x. 22, and 1 Chron. vii. 26*), Am-

minadab (Ex. vi. 23, Num. i. 7, vii. 12, and Ruth iv. 20), Hephher (Num. xxvi. 33, xxvii. 1, and Josh. xvii. 3), Uri son of Hur (Ex. xxxv. 30): and among Greeks.

The same year (= 1365 y. 10 mo. — “66 y. 2 mo” of Manetho in Jos. c. A. = 1412 y. 2 mo. — “51 — 61 years” of the Afr.-Maneth. table), Amēnōphis or Amēnōphath or Ammēnēphthēs, a date possibly marking the great victory gained by Mienptah over the Libyans and their allies invading from the West, the Shakalusha or Sicilians, Tursha or Etruscans, Akaiusha or Greeks, and Luka or Lycians: the number of the enemy slain is set down at “12,535” — on the temple at Medinet Abu. (The date at least is one of the three regarded as established by De Rouge with absolute certainty, De Saulcy acad. inscript. Apr. 7th 1876 in Boston Transcript of May 5th 1876).

Hadad succeeded by Samlah of Masrekah, now fifth king of Edom (Gen. xxxvi. 36, and 1 Chron. i. 47).

1298 B. C. (= 1268 + “30 years” of Euseb. i. and ii., and Syncell.) accession of Balatōres or Beletaras as Assyrian emperor; (according to Bion, Alex. Polyhist., and Agath. ii. 25 p. 119) head of a new or Second dynasty.

The same year = “8th year of Mienptah,” in private letters — (Birch).

The name of king Mienptah occurs also at San or Zoan, and in his own tomb at Bab-el-meluk (Glid. analect.).

The accession of Seti Mienptah II., a king of the Nineteenth dynasty, not earlier than this date. — He immediately follows Mienptah in the series of kings at Medinet Abu.

The same year = “1st year of Seti Mienptah II.,” latest date in the Sallier and similar papyri on the campaigns of Ramessu II. — (Leps. eg. and sin. 394).

1297 B. C. = “2d year of Seti Mienptah II.,” on a pillar at Silsilis — (Birch).

On a tablet at Abusimbel, Seti Mienptah II. is represented as a conqueror: his name occurs also at Karnak and Luxor in Thebes, on various stelæ, and in his own tomb at Bab-el-meluk: a fine statue of him found at Thebes — is now in the British museum, the anciently-erased name “Set” showing that the attempted substitution of the god Set for Osiris was subsequent to his reign (Birch, and Glid. analect.).

The name of Amunmessu, a king of the Nineteenth dynasty, occurs in his own tomb at Bab-el-meluk. The name of his wife is also known, but whether he preceded or followed Seti Mienptah II., has not been ascertained — (Birch). He is omitted in the series of kings at Medinet Abu.

Viola odorata of Europe and the adjoining portion of Asia. The *sweet-scented violet* called in Britain *March violet* from the season of flowering (Prior), in Germany “veilchen” (Grieb), in France “violette” (Nugent), in Italy “viola” or “viola mammola” or “mammoletta” (Lenz), in Greece “viōlēta” (Sibth.) or “mēnēxē,” in Egypt “benæfsidj” (Forsk.), in Egyptian “ian” — (Kirch.): observed in the gardens of Egypt by Abd-allatif, Forskal, Delile, Clot-bey, and found by myself a general favourite. Northward, the “iōn” or “iōn” is mentioned by Homer od. v. 73, Pindar, Aristophanes, Plato conv. 212, and Theophrastus; the “iōn pōrphurōun” is described by Dioscorides as having a fragrant flower, its purple portion given as medicine to children; *V. odorata* was observed by Forskal in gardens at Constantinople; by Sibthorp, and Fraas, in moist shady places on the mountains of Greece. Westward, the “ia” is identified by Pliny xxi. 14 to 76 with the purple-flowered “viola” cultivated as well as growing wild; the “viola” and “violarium” bed of violets, are mentioned by Cicero, Varro, Horace, Virgil, and Columella, the Romans having “a wine made of violet flowers, and it is said they are still used in the preparations of the Grand Signior’s sherbet” (Pereira, and Lindl.): *V. odorata* is described by C. Bauhin pin. 199; is termed “*v. maritima purpurea flore simplici odore*” by Tournefort inst. 419; was observed by Lenz wild in Italy, is known to grow in shaded situations as far as Denmark (fl. Dan. pl. 309, Pers., and A. Dec.), and is besides cultivated. Eastward from the Mediterranean, is called in Hindustanee “banafsa” or “na-farman” (D’roz.), and was observed by Law cultivated near Bombay (Graham); by Mason, “exotic” in Burmah; by Kaempfer, and Thunberg, in Japan and called “kotjo” or “kotjo so,” also “kinsai” or “simire.” By European colonists, was carried to Northeast America, where it continues in gardens, and according to A. Gray “sometimes grows spontaneously near dwellings.” Its petals according to Lindley are “used as a laxative for children.”

1295 B. C. = “1st year of Setnekht Merera Miamun,” in a papyrus (Leps. eg. and sin.). His accession not later than this date; and he immediately follows Seti Mienptah II. — in the series of kings at Medinet Abu.

His name occurs at Sarabit-el-Khadim in the Sinai peninsula, in the Queens valley at Thebes, and on a column — now in the British museum (Glid. analect., and Birch).

King Amēnōphis (according to Manetho) wished the privilege accorded to his predecessor Horus of “seeing the gods:” and under advice from the prophet Amēnōphis to clear Egypt of lepers

and "other unclean people," assembled all persons labouring under bodily infirmity in the quarries East of the Nile; some "learned priests" being included. The deserted city of Auaris was next granted: when Osarsiph, one of the priests was elected ruler with absolute power. He prohibited marriage outside of the community, and worship of the Egyptian gods; rebuilt the city wall, called Hyksos from Jerusalem, and seizing the granaries gained possession of Egypt (Jos. c. A. i. 26 to 29. Other particulars are given by Manetho, who admits, that the account is not taken from Egyptian records, but from "unascertained writers").

1294 B. C. (= 1280 y. 2 mo. + "13 years" of Manetho in Jos. c. A.), withdrawal of king Aménôphis and the Egyptian army into Ethiopia. Mienptah II. Siptah, regarded by Rosellini as leader of this Second Hyksos invasion, holds the place on the monuments of the seventh king of the Nineteenth dynasty. — He is however omitted in the series of kings at Medinet Abu.

He was placed on the throne by Baï, who with prince Seti of Ethiopia is represented on the monuments as offering homage — (Birch).

Callisto daughter of Lycaon was slain by *Diana*; whose worship and that of her twin brother *Apollo* inaugurated hardly later than this date — Callisto is alluded to by Pamphos, and her tomb, a mound surmounted with a temple to Diana, was shown in Arcadia to Pausanias viii. 3. 6 and 35. 8.

Some centuries "seculis aliquot" before the Trojan war, building of the most memorable of the Greek temples, that to Diana at Aulis. — All knowledge of the material employed, was lost before the days of Pliny xvi. 79.

Phe-monoe, first priestess of Apollo at Delphi, invented or first employed hexameter verse (Strab., Plin., Clem. Alex., and Pausanias x. 5. 7, who however in another place quotes a hexameter distich ascribed to the anterior Peleïads). In augury, Phe-monoe used principally the "triorchem," — identified by Pliny x. 9 with the "buteonem" of the Romans (the *buzzard*, *Buteo vulgaris*).

1290 B. C. (= 1336 — "46 years" of Castor in Euseb. i. p. 129, see also Pausan. ii. 16. 1), in Greece, Iasus succeeded by Crotopus, son of Agenor, and now ninth king at Argos.

Lycaon succeeded by his son Nyctimus, third king of Arcadia (Eumel., Asius, and Paus. viii. 3).

Aided by Nyctimus, his younger brothers Oenotrus and Peuce-tius led a colony into Italy; the earliest Greek colony, and so far as known to the Greeks, the earliest of all foreign settlers (Phere-cyd., Antioch., Apollod. iii. 8. 1, and Paus.). Italy was found to be inhabited by the *Umbrians*, "a very ancient people" dispersed over many parts of the country; and the Greek settlers — with their descendants became the people called "Aborigines," who are known to have subsequently welcomed a body of Pelasgians, and at a later date the companions of Evander (Cato, C. Sempron., and Dionys. i. p. 27).

"In the reign of Crotopus" (Tat., and Clem. Alex.), and "five generations" after their first settlement (Hell., and Dionys. i. p. 45), the Pelasgians expelled from Haemonia or Thessaly by Curetes, Leleges (Laconians), and others, led by Deucalion. The event is sometimes termed "the Deluge of Deucalion," and is regarded as the beginning of *Hellenic ascendancy*, the name being derived from Deucalion's son Hellen, who now became ruler of the "Dorians" in Phthiotis (Herodot. i. 56).

Of the expelled Pelasgians, a band proceeded by the way of Dodona into Italy, and producing an *oracle* were received in a friendly manner by the "Aborigines" (prior Greek settlers), and were allowed to reside in Velia. The reinforced Aborigines, now able to repel the Sicels, seized Croton a town of the Umbrians, occupied Caere or Agylla, — Pisa, Saturnia, Alsium, and other towns which they gradually took from the Tuscans, and penetrated into the Campania, where they founded among other towns Larissa, so named from a Larissa of their own in the Peloponnesus (Diodor. xiv. 118, Strab. v. p. 220, and Dionys. i. p. 45).

Other expelled Pelasgians joined the Expedition to Lesbos under Macar son of Crinacus, and helped form a second settlement on that island — (Diodor. v. 81, Dionys. i. p. 47, see also Hesiod, and Homer).

The name of Siptah occurs at Silsilis, also on the Ramesseum at Thebes, — and with that of his wife queen Tasesurt in his tomb at Bab-el meluk (Glid. analect.).

At the end of "thirteen years exile" (Maneth.), Merera Miamun recovered his kingdom, — and was buried in the appropriated tomb of Siptah at Bab-el-meluk.

1281 B. C. (= 1299 y. 8 mo. — "19 y. 6 mo." of Manetho in Jos. c. A. = 1412 y. 2 mo. — "51 — 61 — 20 years," 1071 + "209 years" of the Afr.-Maneth. table = 1280), accession of "Séthosis and Raméssēs:" or Merera Miamun succeeded by his son Ramessu III., second king of the Twentieth dynasty. — He immediately follows Merera in the series of kings at Medinet Abu.

1277 B. C. = "5th year of Ramessu III.," the Libyans and their confederates defeated with great slaughter — (Birch).

1274 B. C. = "8th year of Ramessu III.," a fleet having been prepared, the enemy defeated in the earliest *naval combat* on record; represented on the main hall of the great temple at Medinet Abu; and (on comparing the historical account in Manetho and the statement of the Egyptian priests to Germanicus, Tacit. ii. 60) the two foreign nations fighting the Egyptians should be the Phoenicians, and people of Cyprus. The foreign ships were probably built of timber from Syria and the neighbouring portion of Asia Minor. The Egyptian ships are similar in form; and one of them, — a few years later may have brought Danaus into Greece; the celebrated "pēntēkōntōrōs" or first large galley seen by the Greeks.

1273 B. C. (= 747 + "526 years" of Berosus in Alex. Polyhist., and Euseb. i. 4. p. 18, Berosus using the Era of Nabonassar and placing Phul and Sennecherib afterwards), accession over Babylon of the Assyrians: — a series of "forty-five" successive kings. (See below Sosares.)

"In the reign of Crotopus" (Tat., and Clem. Alex.), the conflagration through Phaethon; a historical person — (according to Hellanicus, and Apollodorus).

As the sisters of Phaethon were transformed into poplars, whose tears along the "Eridanum by us called Padum" become *amber* (Apollon. Rhod. iv. 506, Diodor. v. 23, and Pliny xxxvii. 11), this fossil gum of the shores of the Baltic may now have first reached the Mediterranean countries: the transfer to the Po of the name of the Rhine "ērithanōn" (see Choerilus) indicates the route across Switzerland through the Greek or St. Gothard pass; and bits of amber have been found among debris of Swiss lake-villages of the Stone age: — also, in prehistoric tombs in Italy between Albano and San Marino (see Troyon p. 254 and 288); the palace of Menelaus (according to Homer) was ornamented with amber; "ēlēktrōn" or amber is mentioned by Hesiod (Hygin. 154), Herodotus iii. 115, and Timaeus (Plin. iv. 27); and the amber district on the Baltic, was visited by sea by Pytheas from Massilia. Among the Orientals, I found amber in request in Egypt, highly prized to the present day.

Of other foreign articles brought into Switzerland in connexion possibly with the amber traffic, Oriental *nephrite* from Turkestan in Asia, white *coral* from the Mediterranean, and *serpentine* and *flint* chiefly from France, have been found among debris of early lake-villages (Troyon p. 288).

Trapa natans of Eastern Asia. Called in Britain *water-nut* or *saligot*, in France "saligot" (Prior, and Nugent), in Germany "wassernuss," in Italy "castagna acquatica" or "tribolo acquatica" (Lenz), in China "lin-kio" (Cibot): possibly introduced into Switzerland as early as this date, for remnants occur in the debris of lake-villages, — and the plant no longer grows in that country (Haller 527, and Troyon p. 279); since the days of Lyte 536, has also disappeared from Britain, and when once transported to a new locality is known to maintain itself for a long series of years (A. Dec. g. b. 634 and soc. vaud. 1859): the "trivōlōs ēnuthrōs" was eaten as bread by the Thracians (Dioscor., and Plin. xxii. 12); is described by Theophrastus iv. 9. 1 as growing not in all waters but in the deep pools of rivers: *T. natans* is termed "castaneas ferrarienses" by Hermolaus Barbarus (Spreng.), "tribuloides vulgare aquis innascens" by Tournefort inst. 655; is described by Lobel hist. 324, and Camerarius pl. 715; is known to occur in Italy and middle Europe as far as Denmark (Pers., and Fries); and was observed by Sibthorp in Greece. Farther East, is known to grow around Caucasus and in Siberia (A. Dec.); was observed by Royle abounding in the lakes of Cashmere (Graham); by Cibot, under cultivation in China (mem. Chin. iii. 451); and by Thunberg in Japan, the roots cooked and eaten. Was observed by Grant at "2° N. in the Nile," also around the margin of Lake Victoria N'yanza, the nuts eaten by wild boars, gathered also by the Waganda, but the name "singara" indicates introduction from Hindustan (see *T. bicornis*).

The above Greek legend seems to imply that the basin of the Po was already dyked out and planted with poplars; — a very conspicuous feature in the landscape to the present day, *P. nigra* being rendered unnaturally tall by pruning, preventing the growth of large branches: an art known perhaps in the days of Homer od. vii. 106, who speaks of the "makēthnēs" high-tapering "aigēirōiō," clearly implied in "procerissimas populos" of Cicero, and "populus" devoid of shade of Pliny xvii. 18: the "populus fluviali consita ripa" planted on the river-bank, is mentioned by Ovid.

Populus tremula of Europe and Northern Asia. Called in Britain *aspen*, by Chaucer "aspe," in Anglo-Saxon "æsp" or "æpse," in Germany "aspe," in Old High German "aspa," in Old Norse "espi" (Prior), in France "tremble" (Nugent), in Italy "tremolo" or "tremula" or "populo montano" (Lenz); used occasionally for piles or posts of the early lake-villages of Switzerland (Troyon p. 16), and perhaps already planted along the Po, — where I found the tree rendered tall with the preceding, so as to be distinguished only on near inspection: the industrious ever-moving leaves of the "makēthnēs aigēirōiō" of Homer od. vii. 106 seem to belong here, as well as the leaf-stalk "tremulo populis et iisdem solis inter se crepitantia" of Pliny xvi. 38: *P. tremula* is known to grow from Italy throughout middle and Northern Europe (Engl. bot. pl. 1909, and Lenz); was observed by Sibthorp from Boeotia to mount Athos, by him and Belon, in the environs of Constantinople; by Clot-Bey and Figari, in the gardens of Egypt; is known to grow wild throughout Northern Asia, or according to A. Decandolle two-thirds around the Subarctic circuit of the Globe.

A trade-route from the Po along the Rhine to the Baltic implies the existence of population more or less scattered; and the following fruits, seeds, and roots, growing wild and affording sustenance, occur in debris of the earliest lake-villages of Switzerland (Heer and Troyon 445 to 465): *beech-nuts*, *Fagus sylvatica*; *filberts*, *Corylus avellana*; *wild apples*, *bird cherries*, *Cerasus padus*; *blackberries*, *Rubus fruticosus*; *elder berries*, *Sambucus nigra*; *yew berries*, *Taxus baccata*; and

Prunus spinosa of Europe and the adjoining portion of Asia. A rigid spinescent bush called in Britain *blackthorn* or *sloe*, in Lancashire "slaigh" or "sleawgh," in Old English "sle," in Anglo-Saxon "sla-" or "slag-" or "slab-thorn," in Danish "slaen," in Swedish "sla," in Dutch "slee," in German "schlehe," words connected with slaying or striking (Prior), in France "prunellier" (Nugent), in Italy "prugnolo" or "susino selvatico" (Lenz), in Greece "tzapournia" or "mamousia" (Sibth.); and its fruit found in debris of the earliest lake-villages of Switzerland — (Heer): the "spōthias" as if an "agria kökkumēla" is mentioned by Theophrastus iii. 6. 4, Dioscorides i. 174, and Athenaeus ii. . . ; the "prunus silvestris" by Columella ii. 2. 20, "silvestrium prunorum baccae" by Pliny xv. 13 and xxiii. 68, and the "spinifera prunus" by Palladius xiv. 81. *P. spinosa* is termed "p. sylvestris" by Tournefort inst. 623; is known to grow from Italy throughout middle Europe as far as Britain (Pers., Engl. bot. pl. 842, and Lenz); was observed by Sibthorp, and Fraas, frequent in thickets in Greece and hedges around Constantinople; and farther East, was observed by Thunberg in Japan. By European colonists, was carried to Northeast America. "road-sides and waste places, E. New England, Penn., etc." (Pursh, and A. Gray). The juice according to Lindley "is a substitute for catechu," and "is said to be used in factitious or adulterated Port wine."

Rubus Idæus of Europe and Northern Asia. Called in Britain *raspberry*, in France "framboise" (Nugent), in Germany "himbeere" (Grieb), in Italy "lampone" or "lampione" or "ampomelle" (Lenz), in Greece "ēmēra vata" (Fraas); and its fruit found in debris of the same lake-villages — (Heer): the "vatōs orthōphuēs" of Theophrastus iii. 18. 4, and "vatōs ithaia" abounding according to Dioscorides on mount Ida, are referred here by writers; the "idæus rubus" seeming known to Pliny xvi. 71 and xxiv. 75 chiefly from Dioscorides: *R. Idæus* was cultivated in middle Europe in the medieval period (A. Dec.); is described by Ruellius, and Turner; is termed in its wild state "*r. idæus spinosus*" by Tournefort inst. 614; is known to grow wild from the mountains of Northern Italy to Lapland (fl. Dan. pl. 788, Pers., Wats., and Lenz); was observed by Sibthorp, Chaubard, and Fraas, on high mountains from the Peloponnesus to the Bithynian Olympus; by Forskal, in the gardens of Constantinople; is known to grow on the subalpine portion of Caucasus (Bieb.); and farther East, was observed by Thunberg in Japan and called "itsingo." By European colonists, was carried to Northeast America, where in our Northern and Middle States it continues sparingly cultivated.

Cornus sanguinea of Europe and Northern Asia. A shrub called in Britain *cornel* or *dogwood* (Prior), in Germany "rother hartriegel," in Italy "verga sanguigna" or "sanguinello" (Lenz), in Greece "maurovērġia" (Sibth.); its berries found in debris of the same lake-villages — (Heer): the "thēlukranēia" of Theophrastus i. 8. 2 to iii. 12. 1, and "femina cornus" and "sanguinei frutices" of Pliny xvi. 30 to 43, are referred here by writers: *C. sanguinea* is termed "c. femina" by Tournefort inst. 641; was observed by Lenz frequent in Italy; is known to grow throughout middle Europe as far as Sweden (Engl. bot. pl. 249, and Wats.); was observed by Sibthorp, and Fraas, from the Peloponnesus to the Bithynian Olympus; and according to Clot-Bey and Figari has been recently introduced into the gardens of Egypt. Eastward, is known to grow throughout Siberia (Pers., Dec., and Wats.); and was observed by Thunberg in Japan.

Betula alba of Europe and Northern Asia. Called in Britain *birch*, in Anglo-Saxon "birce" or "byrc" or "beorc," in Icelandic and Swedish "biörk," in Danish "birk," in Dutch "berke," in Low German "barke," in Old High German "piricha," in Russian "bereza," names giving rise to the Latin "barca" and English "bark" in its double signification of tree-rind and vessel, birch-bark being used for boat-building to the present day in Northern Europe (Prior), in France "bouleau" (Nugent), in Italy "bedollo" or "betula" (Lenz). Furnishing some of the piles or posts on which the earliest lake-villages of Switzerland were built (Troyon p. 16); buried also in the submarine forests along the coast of France and Britain, and in peat-bogs on the Faroe Islands — where it no longer grows (Beudant, and Martins): the "betulla" is described by Pliny xvi. 30 as growing in Gaul, a tree of cold climates and marvellous whiteness, "terribilis magistratum virgis:" *B. alba* was observed by Lenz on the mountains of North Italy, is known to grow on Etna and throughout middle and Northern Europe as far as Lat. 70° 40' in Lapland, and in rare instances in Interior Iceland (Wats., and A. Dec.). Eastward, was observed by Clot-Bey in the gardens of Egypt; is known to grow on Caucasus, and from Lat. 37° on the East side of the Caspian to the Altai mountains, Lat. 68° on the Jenisei, 58° in Kamtschatka, Daouria (Wats.), and Japan (Thunb.).

The remaining piles or posts are mostly of "pommier sauvage," *Malus sylvestris*; "chêne" or *oak*, *Quercus robur*; "hêtre" or *beech*, *Fagus sylvatica*; "ormeau" or young *elm*; and "sapin," *Abies excelsa* — (Troyon p. 16 to 40).

Nymphaea alba of Europe and the adjoining portion of Asia. Called in Britain *white water-lily* (Prior), in France "nuphar blanc" (Fée), in Germany "weisse seerose," in Italy "ninfea" or "ninfea bianca" or "carfano femina" (Lenz), in Greece "něrōkōlōkuthia" (Sibth.); and remnants found in debris of the same lake-villages — (Heer): the "sithē" with leaves and rose-like flower floating upon the Orchomenian lake and seeds eaten according to Theophrastus iv. 10. 1 to 7, known in the same locality to Nicander ther. 887, mentioned also by Athenaeus xiv. 53, and the white-flowered "numphaia" of Dioscorides growing in rivers of the Peloponnesus, are referred here by writers: the "nymphaea" with a flower "lilio simili" is identified by Pliny xxv. 37 with the "heracleon" or "rhupalon;" and according to Marcellus Burdigalensis its clavate root is called by the Gauls "baditin" (Spreng.): *N. alba* is termed "*n. alba major*" by Tournefort inst. 260; was observed by Lenz in Italy; is known to grow also in Sicily, Sardinia, Algeria, Spain, and throughout middle and Northern Europe as far as the Shetland Islands and Lapland (Munby, Guss., Wats., Fries, and A. Dec.); was observed by Sibthorp, and Fraas, from Zacynthus and the Peloponnesus to Thessaly and Bithynia. Its root-stock according to Lindley is "astringent," and "is occasionally chewed by singers to relieve the relaxation of the uvula."

Nuphar lutea of Europe and the adjoining portion of Asia. Called in Britain *yellow water-lily* (Prior), in France "nenuphar jaune" (Fée), in Germany "gelbe seerose," in Italy "ninfea gialla" or "nannunfero" or "carfano maschio" (Lenz), in Greece "nupharōn" or "nōunōupharōn," or by the Turks "pufer ciceghi" (Sibth.), and remnants found in debris of the same lake-villages — (Heer): the sweet-rooted "numphaia" growing according to Theophrastus ix. 13 in lakes and marshes from Crete to the Orchomenian district, and called "mathōnia" by the Boeotians who eat its fruit, is referred here by writers: the "alle numphaia" is described by Dioscorides as having yellow flowers and growing about the river Peneus in Thessaly; is identified in the added Synonyms with the "numphōna" whose flower is called "nōuphar;" but seems known to Pliny xxv. 37 only from Dioscorides: *N. lutea* is termed "*n. lutea major*" by Tournefort inst. 261; was observed by Sibthorp from Thessaly to Constantinople, and a refrigerating drink made from the flowers by the Turks; was observed by Lenz frequent in North Italy; is known to grow also in Sicily, Sardinia, and throughout Europe as far as Finland (fl. Dan. pl. 603, and Pers.), its roots and leaf-stalks eaten by the Finns and Russians (Linder venen. p. 651, and Spreng.). Eastward from Russia, has been observed only in the neighbouring portion of Siberia (Ledeb.), its presence in Japan alleged by Thunberg, requiring confirmation (A. Dec.). The root-stock according to Lindley "has been reputed sedative and anti-aphrodisiac." *

Of quadrupeds inhabiting Switzerland during the Stone age, the main sustenance of the inhabitants, and found in debris of the earliest lake-villages, the following are enumerated by Rüttimeyer (Troyon p. 271 and 442):

The *elk*, *Cervus alces*. — A "peculiar" animal, having the form of the stag with the neck and hair of a boar "kaprō," and under the chin a hairy appendage a span long and as thick as a colt's tail, is attributed to the Alps by Polybius (Strab. iv. 6. 10). The "alcem" is also mentioned by Pliny viii. 16, and as not unlike the reported "achlin" of Scandinavia. At the present day, the elk is confined to the Scandinavian peninsula, and Russia as far as Poland (see Heer):

The *urus*, *Bos urus*. — "Vōēs agriōi" are mentioned by Herodotus vii. 126; and are attributed to the Alps by Polybius (Strab. iv. 6. 10). The "urus" is described by Caesar as resembling a bull, but larger and very swift: according to Pliny xi. 45, "urorum cornibus barbari septemtrionales potant," the barbarians of the North use horns of the urus for drinking-cups: the "ōūrōs" is also described by Epiphanius expos. iii.: and from this animal (according to Heer), the Swiss canton of Uri derives its name, the head being figured to the present day on the escutcheon. The urus, after long continuing frequent throughout middle and Northern Europe, gradually became rare, and in the "Seventeenth" century disappeared. The name however is retained in French dictionaries; and we have a relic in the English phrase "to take a horn;" explicable by Pliny's account of the habits of our ancestors living on continental Europe:

The *bison*, *Bos bison*. — The "vōnasōs" by the Paeonians called "mōnapōn," described by Aristotle anim. ix. 45 as inhabiting the country North of Macedonia, is clearly the bison: the brazen head of a "visōnōs" or Paeonian bull was sent by Dropion Deontis king of the Paeonians to Delphi (Paus. x. 13. 1); and Pliny viii. 15 and 16 speaks of the "iubatos bisontes" of Germany. The bison, once known throughout middle and Northern Europe, is described by Heer as a fierce animal, now restricted to a forest in Lithuania and to Caucasus:

* *Nuphar pumilum* of middle and Northern Europe. Remnants of the dwarf *yellow water-lily* are found in debris of the same lake-villages — (Heer), at the present day growing in but one of the lakes of Switzerland (Troyon p. 445): known however to grow in Germany and Sweden (Timm, Willd., and Wahlenberg).

The *brown bear*, *Ursus arctos*; *badger*, *Meles vulgaris*; *martin*, *Mustela martes*; *pine martin*, *M. foina*; *polecat*, *M. putorius*; *otter*, *Lutra vulgaris*; *fox*, *Vulpes vulgaris*; *European wildcat*, *Felis catus*; *hedgehog*, *Erinaceus Europæus*; *squirrel*, *Sciurus Europæus*; *wild boar*, *Sus scrofa*, and a race inhabiting the marshes, smaller with short tusks; and the *roe-buck*, *Cervus capreolus*:

Of birds, the *kite*, *Falco milvus*; *falcon*, *F. palumbarius*; *sparrow-hawk*, *F. nisus*; *pigeon* in the wild state, *Columba palumbus*; mallard or *duck* in the wild state, *Anas boschas*; *teal*, "*A. querquedula*?" and the *heron*, *Ardea cinerea*:

Of reptiles, the *box-tortoise*, *Cistudo Europæa*; and the *frog*, *Rana esculenta*: and of fishes, the *pike*, *Esox lucius*; *carp*, *Cyprinus carpio*; and *bleak*, *C. leuciscus*.

1271 B. C. = (1238 + "40 years" of ten lunations of Josh. xiv. 7), Caleb born to Jephunneh.

The same year (= "200 years before the fall of Troy" of Bocchus), Saguntum in Spain founded, and a temple built there to Diana. — The temple was spared by Hannibal from religious motives, and with the original rafters continued extant in the days of Pliny xvi. 79.

Juniperus communis of Europe and Northern Asia. Called in Britain *juniper*, in France "genevrier" (Nugent), in Germany "wachholder," in Italy "ginepro" (Lenz), on mount Athos "kéthros" (Sibth.), in which we recognize the "juniperi" rafters of this temple, — the tree according to Pliny xvi. 30 to 78 growing very large in Spain, growing also on the mountains of Italy, and its timber incorruptible and equalling "cedro:" "juniperi gravis umbra" is mentioned by Virgil, and the "iōunipērōum" of the Romans is identified in Syn. Diosc. i. 103 with the "iōupikēllōusōn" of the Gauls: *J. communis* is termed "*J. vulgaris fruticosa*" by C. Bauhin pin. 488, and Tournefort inst. 588; was observed by Lenz frequent on the hills and mountains of North Italy; by Forskal, near Marseilles; is known to grow throughout middle Europe, and in a dwarfed form as far as the Shetland Islands, Sweden, Lapland, and Iceland (Hook., Wats., and A. Dec.). Eastward, was observed by Sibthorp on mount Athos and the Bithynian Olympus; and is known to grow throughout Siberia as far as the mountains of Daouria (Gmel., and Pall.). By European colonists, was carried to Northeast America, where I have observed it occasionally planted for ornament in our Middle States. Its berries are employed medicinally, and the oil is said to be "the most powerful of all diuretics" (Alexand., and Lindl.).

Death of Linus, infant son of Psamathē the daughter of Crotopus. On this occasion (according to Conon, Ovid, Statius, and others), the "linōs" was composed: a *poem* however claimed as an imitation or translation from the Egyptian — (see Herodot. ii. 79). The "linōs" is mentioned by Homer il. xviii. 570; and some fragments are extant. The village of Psamathon ("psamathēithas" Nic. ther. 887) near the Orchomenian lake seems to have been named from Psamathē.

The same year = "11th year of Ramessu III.," his victory over the Mashuasha and Tahennu — (Birch).

1269 B. C. (= 1290 — "21 years" of Castor in Euseb. i. p. 129. Pausan. ii. 16. 1 . . .), in Greece, Crotopus succeeded by his son Sthenelas, tenth king at Argos.

After subduing the Assyrians and Medes, and overthrowing the cities and kingdoms of the East, Ramessu III. recalled with his army by a *letter* from the chief-priest, giving information of the misconduct of his brother at home (Manetho in Jos. c. A. i. 15).

1268 B. C. (= 1236 + "32 years" of Euseb. i. and ii.), accession of Lamprides as Assyrian emperor. "Thirty" years only, are assigned to his reign by Syncellus.

"The same year" (= 1258 + "10 years" of Isocr. . ., Apollod., Pausan., and others), arrival of Danaus at Lindus in Rhodes. Being (according to Manetho in Jos. c. A. i. 15) no other than Armais the expelled brother of Ramessu III. Among other inventions brought by him to Greece, are enumerated: "uthrēia" wells, or perhaps *pumps* for raising water (Strab. i. 2. 15 . . . and Blair).

The upper portion of the temple at Medinet Abu bears representations of Ramessu III. playing games, like draughts or chequers, with his daughters: the origin apparently of the Greek legend of the "fifty daughters of Danaus."

The main hall at Medinet Abu exhibits the battles of Ramessu III., and notwithstanding the vast expanse of wall, seems barely to afford room: nations not previously figured make their appearance in his campaigns.

The *domestic pigeon*, *Columba palumbus*, has been already noticed as a hieroglyphic character: but at Medinet Abu, a bird bearing little outward resemblance, is from the attendant circumstances referred by Wilkinson to the *carrier pigeon*. — The "aggēlōnta pēristēran" or messenger pigeon, is mentioned by Pherecrates, Athenæus, the pseudo-Anacreon, and Maundeville x.

Ninety-first generation. May 1st, 1267, mostly beyond youth: Elishama (num. i. 10, vii. 48, and 1 Chron. vii. 26), Nahshon (ex. vi. 23, num. i. 7, vii. 12, Ruth iv. 20, and 1 Chron. ii. 10), Zelophehad (num. xxvii. 1 to 3, Josh. xvii. 3, and 1 Chron. vii. 5), Korah (ex. vi. 21, num. xvi., and 1 Chron. vi. 22), the artisans Bezaleel and Aholiab (ex. xxxi. to xxxviii, and 1 Chron. ii. 20): and among Greeks, Electra mother of Dardanus (Apollod. iii. 12. 1).

Samlah succeeded by Shaul or Saul of Rehoboth, sixth king of Edom (Gen. xxxvi. 37, and i Chron. ii. 10).

The same year = "15th year of Ramessu III.," on the monuments — (C. Mull. fr. Man. p. 589).

Ships of war first employed on the Red Sea by ("Sesostris," according to Herodotus ii. 101, meaning probably) Ramessu III.

The same year (= 1257 + "9 years" of Castor in Euseb. i. p. 134), Cecrops succeeded by Cranaus, third Attic king (reigning however according to some authorities as early as Deucalion's conquest, Apollod. iii. 14, 15).

"1265 B. C. = 1st year of Tsou-keng, of the Chang" or Fourth dynasty — (Chinese chron. table).

In the "sixth generation" before the fall of Troy (Clint. i. p. 45 to 56), first appearance of Aeolus or Aeolic Greeks in Thessaly.

Nyctimus succeeded by Arcas (of the "sixth" generation before the fall of Troy, Clint.), son of Callisto and now fourth king of Arcadia (Paus. viii. 4. 1).

1259 B. C. (= 1247 + "12 years" of Apollod. iii. 14. 15, Castor giving only "10 years"), and "in the reign of Sthenelas" (Tat., and Clem. Alex.), Cranaus expelled by his son-in-law Amphictyon, now fourth Attic king: a "son of Deucalion," and therefore Hellenic in opposition to the Pelasgians. — The tomb of Cranaus in the demos of Lamprae continued extant in the days of Pausanias i. 31. 3.

"1258 B. C. = 1st year of Tsou-kia, of the Chang" or Fourth dynasty — (Chinese chron. table).

The same year (= 1269 — "11 years" = 991 + "105 + 162 years" of Castor in Euseb. i. p. 129 to 131, see also Apollod. ii. 1. 4, and Pausan. ii. 16. 1 and 19. 3), in Greece, by consent of the people and of Gelanor son of Sthenelas, Danaus made eleventh king at Argos.

The acropolis at Argos (according to some authorities, Strab. viii. p. 371) built by Danaus, received the name of "larissa;" and from this spot, the migrations of the Pelasgian Greeks can be traced by a city of this name founded in each new settlement. Seventeen Larissas are enumerated: including one, only "thirty-five" miles from Nineveh; one in Lydia; one mentioned by Homer under the name of "Argissa," in Thessaly; one in Mitylene; two in Crete; one in Attica; and one in Italy (Xenoph., Dionys., Strab., Pausan., Stephan. Byz., and Clint. i. p. 25).

The same year = "24th year of Ramessu III.," on the monuments (Champ.-Fig. p. 347). His name is also inscribed on an older obelisk, — the one removed to and now standing at Alexandria (Leps. eg. and sin. p. 42).

"1257 B. C. = 2d year of Tsou-kia" (Chinese chron. table), beginning of the Twenty-fourth cycle.

As early perhaps as this date (Graham Munjari tables, Puranas, and Bentley as. res. viii. p. 232), Causica reigning in Hindustan.

1256 B. C. = "26th year of Ramessu III.;" the latest date in his reign found on the monuments — (Leps. k. tab. p. 19).

 (two heads, a man looking inward, and a woman looking outward, signifying "phulaktērion" safeguard or amulet, Horap. i. 24); "nahvi" head; "natsh" protection; "natshpēri" charm, amulet; "vōōn" amulet, evil eye, "vōōnē" hurt, damage, (the superstition of the *evil eye* being at least as ancient as this date). — The character occurs under the Seventh Ptolemy (Leps. d. iv. pl. 25).

Strings of a great variety of small articles in pottery or carved in stone are found on Egyptian mummies, — and one of these strings carried by myself to Zanzibar was recognized by a native as an *amulet*: those tied around the head of Zanzibar infants differing merely as I soon perceived in the selection of natural objects. Northward from Egypt, the amulet "pēriaptōn" is mentioned by Plato polit. iv. 426; "vaskania" witchcraft and the envious eye, by Plato phaed. 100, and Demosthenes coron. 291. 21: and in Italy we find "fascia" and "fascinum," the god "Fascinus," and "amuleti" tied on infants (Plin. xxviii. 7 and xxxvii. 12. See phylactery).

In the reign of Ramessu III., ornamental wood-work carried to great perfection at Thebes. In his tomb at Bab-el-meluk, cushioned chairs are figured; with other *cabinet furniture*, richly carved, and in some instances presenting unexpected coincidence with the most approved patterns of the present day.

Lagenaria vulgaris of Eastern Hindustan. The *gourd* is called in France "gourde" or "calebasse" (Nugent), by the Turks "tali-chappach," in Yemen "dubba dybbe" (Forsk.) and one variety in Egypt "qara' debbeh" (Del.), in Egyptian "shlō" (ms Par.) or "fēnt-shlōt" (transl. Sept. Jonah iv. 6), and the Cucurbitaceous plant without flowers or fruit figured in this tomb — and that of a later king of the same dynasty, seems to correspond: the "kara" is mentioned by Ebn Baitar; and *L. vulgaris* was observed in Egypt by Abd-allatif, Forskal, Delile, and by Rauwolf in Syria. Farther North, the "kōlōkuntē" is mentioned by Hermippus, Aristophanes, Theophrastus, its "lily-like" flower by Diphilus, and Zenobius, and the "kōlōkuntha" by Dioscorides as edible and holding wine; the "cucurbita" is mentioned by Cato, by Varro as curved in shape, by Propertius as swollen at one

end "tumido cucurbita ventre," by Pliny xix. 24 as used to hold water as well as wine and sometimes "novem pedum longitudinis" nine feet long: "calabazas" are enumerated by Herrera in 1513 as cultivated in Spain; *L. vulgaris* is described by Ruellius, Brunfels iii. 189, and Lobel: was observed by Forskal in gardens at Constantinople, by Bory under cultivation in several varieties in the Peloponnesus, and by myself its cooked fruit in Mediterranean steamships. Southward from Egypt, was observed by Forskal under cultivation in Yemen; by myself, at Muscat, and ascertained at Zanzibar to be cultivated by Negro tribes as far inland as N'Yasa lake. Eastward, is mentioned in the Institutes of Manu (transl. Deslongch.) is called in Sanscrit "ulava" or "ulavoo" (Roxb., and Pidd.), in Bengalee "lau" or "kadu," in Hindustanee "petha" or "kumtha" or "lauki" or "kadu" (D'roz.), in the environs of Bombay "hurreea kuddoo" the fruit "of great importance to the natives as an article of food" (Graham); was observed by Rheede viii. pl. 1 in Malabar, cultivated and growing spontaneously; and a bitter kind called in Sanscrit "kutoo-toombee," growing in the humid forest near Deyra Doon in Eastern Hindustan, is regarded as indigenous by Roxburgh, and Royle him. p. 218. Farther East, was observed by Mason "exotic" in Burmah and called "boo-hsen-sway;" by Loureiro p. 728 in Cochinchina; by Van Braam in China (A. Dec.); by Kaempfer, and Thunberg, in Japan and called "feo" or usually "nari finango;" by Blanco on the Philippines, and called in Tagalo "tabayag" and one variety "opo:" by Rumphius v. pl. 144 under cultivation on the Moluccas; by myself, from the Malayan archipelago to New Zealand and throughout the Feejeean, Tongan, Tahitian, and Hawaiian islands, aboriginally introduced and cultivated; but the variety with giant fruit, the shell substituted for casks and trunks, confined to the last-named locality. Eastward from the Polynesian Groups, a peculiar variety with small yellow depressed fruit was observed by myself in debris of the Ancient Peruvian cemetery at Pachicamac, also recent in the Lima market; *L. vulgaris* was already in the West Indies when first visited by Columbus (F. Columb. 24), and "calabças" of all the forms known in Spain were cultivated in the West Indies and Nicaragua in the days of Oviedo nat. hyst. 80 and gen. hist. vii. 8.

1248 B. C. (= 1281 — "33 yrs." of Diodorus i. 58), end of the reign of Ramessu III. He appears to have been the "king of Egypt" who "sought to slay Moses" — (ex. ii. 15 and 23 to iv. 19).

Armais the expelled brother was called by the Greeks Danaus, and Egypt derived its name from Ramessés (Manetho in Jos. c. A. i. 15, meaning of course its Oriental name "Mussera"). Confirmation is found in Gen. xlvii. 11, and in the Greek traditionary account of the hero Aiguptōs. Ramessés therefore limits the antiquity of the Mizraim of the Hebrews, and Ermes or Hermes of the Greeks.

Allium Dioscoridis of the East Mediterranean countries. The "mölu" with milk-white flowers and black root indicated by Ermes for protection against enchantments — (Hom. od. x. 305, and Plin. xxv. 8), described by Theophrastus ix. 15. 7 as growing about Pheneum and Cyllene with scilla-like leaves and a round onion-like root, by Dioscorides as having grass-like leaves spreading on the ground from a small bulbous root and a slender stem four cubits high and garlic-like at the summit, is referred here by Sibthorp: *A. Dioscoridis* was observed by him in shaded bushy places from Mysia in Asia Minor to Cyprus, its stem sometimes three to four cubits high, flowers white somewhat resembling those of *Peganum harmala*, in accordance with the statement of Dioscorides iii. 46, but there are no specimens for verification.

Peganum harmala of the Desert and its Northern border from the Atlantic to Hindustan. Called in Greece "vrömösouérkōs" (Fraas) or "vrömōhōrtarō," or by the Turks "yserlich," in Egypt "ghalget ed dib" or "harmal" (Forsk.), in which we recognize the "armala" identified in Syn. Diosc. with the "ἐρνόυβου" of the Egyptians, "vēsasa" of the Syrians, "mölu" of the Capadocians and Galatians, — and "pēganōn agrīōn" having according to Dioscorides many stems from one root, strong-scented leaves, and white flowers: the "vēsasa" according to Galen comp. med. loc. ix. p. 257 is seed of the "agriōu pēganōu" growing in Syria and called there "armala:" *P. harmala* was observed by Forskal, and Delile, in the Desert from Alexandria as far as Cairo, and Belon found its seeds used continually by the Arabs as a safeguard against evil Spirits; was observed by Forskal, Sibthorp, Chaubard, and Fraas, from Crete and the Peloponnesus as far as Tenedos. Westward, the "pēganōn agrīōn" is identified in Syn. Diosc. with the "hōurma" of the Numidians; *P. harmala* is termed "harmala" by Tournefort inst. 257; is known to grow in Italy, Sardinia, Algeria, and Spain (Pers., and A. Dec.). Eastward from Syria, is known to grow around the Caspian, and from the Crimea to the Ural mountains near Lat. 51°, and the Alatau mountains in Tartary (Ledeb.); to Northern Hindustan (Royle), and within the Tropics "in considerable abundance on the ruins of Beejapoor," regarded by Graham as possibly "introduced by the Muselmens?"

Mercurialis annua of the Mediterranean countries. Called in Britain *French mercury*, in Germany "bingelkraut" or "kuwartz," in Old French "cagarelle" (A. Dec.), in Italy "mercorella" or

"mercuriale" (Lenz), in Greece "skarōlahanōn" or "skullōlahanōn" (Sibth.), in which we recognize the "ērva mērkōūrialis" identified in Syn. Diosc. with the "aphlōphō" of the Egyptians, said to have been discovered by Mercury or Hermes — and hence sometimes called "hermupōan" by the Greeks (Plin. xxv. 18): the "linōzōstis" is mentioned by Euryphon 2 morb. 12 to 77; by Dioscorides as a span or more high with twin rounded fruit and laxative when eaten as a potherb; is identified in the added Synonyms with the "ērmōu vōtanion" or "parthēnion"; and by Ebn Baitar with the "halhub": M. annua is mentioned also by Averrhoes, and Moses Charras (F. Adams); was observed by Delile at Alexandria on the Mediterranean border of Egypt; by Hasselquist in Palestine; and by Forskal, Sibthorp, Chaubard, and Fraas, in waste places and cultivated ground from Cyprus and the Peloponnesus to Marmora. Westward, the "linōzōstis" is identified in Syn. Diosc. with the "asōumēs" of the Numidians; and the "herba mercurialis" is enumerated by Cato as both medicinal and esculent: M. annua is mentioned by Turner as seen by him in Germany and beginning to be cultivated in Britain, where it has since become naturalized (Hill, and Bromfield phytol. for 1850); is described also by Valerius Cordus, Dalechamp (Spreng.), Bauhin hist., and Tournefort inst. 534; was observed by Lenz frequent in Italy; and is known to occur in waste places and cultivated ground throughout middle Europe (Pers.).

In this year therefore Ramessu III. succeeded by his son Ramessu IV. Hikma. A portrait of Ramessu IV. is sculptured on the walls of Karnak. His name occurs also on other temples at Medinet Abu and Elephantine, and on moveable articles — now in the museums of Europe.

1247 B. C. = "2d year of Ramessu IV.," at Hammamat — (Birch).

In this year (= 1197 + "50 years" of Castor in Euseb. i. p. 134, the three displaced or duplicated reigns "+ 40 + 50 + 40" being omitted, see also Isocr. panath. p. 258 d., and Apollod. iii. 14. 1), Amphietyon succeeded by Erichthonius, fifth Attic king. The Panathenæa were instituted by Erichthonius (Hellan., and Androt.).

1244 B. C. = "5th year of Ramessu IV.," on the monuments — (Leps. k. tab. p. 19).

1243 B. C. (= "240 years before the building of Solomon's temple" of Josephus a. J. viii. 3. 1), the city of Tsor or Tyre founded. Being a seaport, merchant ships sailing thence and commerce upon the Mediterranean are implied. — The city of Tyre in existence at the time of the Israelitish conquest of Palestine, and mentioned in Josh. xix. 29. Tyre is also mentioned by Ezekiel, and Herodotus ii. 43; was captured by Alexander, an event followed by the establishment of a rival emporium Alexandria, yet continued "the first commercial city of the East" in the time of Hieronymus, and in a flourishing condition until the discovery of America and of the route around Africa into the Indian Ocean. A town continues in existence on the site; but there is shelter for small vessels only (see Sm. geogr. dict.).

Cassia senna of the Tropical portion of the Desert from the Atlantic to Hindustan. Called in Egypt "sena gebely" of the Desert, or "s. beledy" or "s. baharaouy" (Del.) or "s. Hedjazi" or "s. Mecki" (Forsk.), in which we recognize the burning "snē" seen on mount Horeb by Moses — (ex. iii. 2, and deut. xxxiii. 6): C. senna was observed by Forskal in the Desert Eastward from Cairo; by myself, just beyond the tide-flow at the Northern extreme of the Red Sea. Southward and Westward, by Delile in Upper Egypt; by Oudney in Central Africa; and is known to grow from Nubia to the Cape Verd Islands (Lindl.). Eastward from Sinai, was observed by Burn growing "abundantly in various localities in Goozerat" and called "mendie awl" (Graham); is known to grow also as far as the "high dry uncultivated lands of Mysore" (Roxb., Wall., and Wight). The dried leaves are imported into France under the names of "séné de Tripoli" or "s. de Barbarie" (Del.); are "the inferior senna known by the name of Aleppo and Italian," and Lindley further states that the living plant has been introduced into the West Indies.

In reference to the account in ex. ix. 23 to 34, it may be observed, that *thunder* and *hail* are not entirely unknown in Egypt. — A "hailstorm" was experienced by Lepsius (eg. and sin. p. 53 and 119) in Lower Egypt, at the pyramids at Gizeh; and a "violent thunder-storm," even at the Southern extreme of Egypt "at Assuan" (see Ai II.).

At this time, "rhē" *hand-mills* in use for grinding corn: mentioned by Moses ex. xi. 5 — and num. xi. 8; also by Isaiah xlvi. 2, and Matthew xxiv. 41, and to the present day I found them in use in Yemen and farther East.

Capparis spinosa of Tropical and Subtropical Arabia. The *caper* bush is called in Italy "cappero" (Lenz), in Greece "kapparia" (Sibth.) or "rimōniaria," in Egypt "kabbar," in Yemen "lasaf" (Forsk.), around mount Sinai "alsef" (Burkhardt); and the "azwb" for striking blood on the door posts in the night appointed for the Passover, — further met with by Moses lev. xiv. 4 to 52 and num. xix. 6 to 18 in the Sinai peninsula, and of which Solomon spoke as springing "out of the wall" at Jerusalem (1 K. iv. 33), also the "ussōpōs" that furnished a stick at the Crucifixion (John xix. 29), are referred here by Royle (Kitt. bibl. cycl. ii. p. 976): C. spinosa was observed by Forskal p. 99 on

the wall of Taæs in Yemen, and abounding in the district around Hammam Faraun in the Sinai peninsula; by him, and Delile, at Alexandria in Egypt; and by Hasselquist, at Jerusalem. Northward and Westward, the "kapparis" is mentioned by Antiphanes, Aristophon, Zeno the Stoic, Timocles, Demetrius, Clearchus Solensis, Dioscorides, and Athenaeus; the "capparis," by Plautus, Pliny, and Martial: *C. spinosa* is described by Lobel pl. 635; is termed "c. s. fructu minore folio rotundo" by Tournefort inst. 261; was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from Rhodes and Tenedos to the Peloponnesus; by Lenz, seemingly wild in Italy; by myself, conspicuously projecting from crevices in walls of buildings on Malta; by Forskal, on Malta, and in arid situations around Marseilles; by Desfontaines i. 404, in Barbary; is known to occur also in Sicily and Spain, is besides cultivated (Pers.), and its berry like flower-buds largely exported have become generally known as a condiment. (See Satureja juliana).

Centauria calcitrapa of the Mediterranean countries. Called in Britain *caltrop*s, in Anglo-Saxon "coltræppe," in the romance of K. Alisander "calkeitrappen," in medieval Latin "calcitrapa" (Prior), in Greece "kala anthê" (Sibth.) or "katrinaggathô," in Egypt "schok" or "morreyr" (Forsk., and Del.), in which we recognize the "mrrym" eaten in the night appointed for the Passover, — further met with Moses ex. xii. 8 and num. ix. 11 in the Sinai peninsula on the anniversary of the Passover (translated "trivölös" by Hermas iii. 9. 20 and the "trivölös phullakanthôs" of Theophrastus vi. 5. 3 seems to correspond); associated with wormwood in Lam. iii. 15: leaves and young stems of *C. calcitrapa* were found by Forskal p. 152 eaten crude in Egypt, the plant abounding there, as observed also by Delile, Clot-Bey, and myself. Northward and Westward, *C. calcitrapa* is described by Colonna phyt. pl. 24; is termed "carduus stellatus sive calcitrapa" by Tournefort inst. 440; was observed by Forskal, Sibthorp, Chaubard, and Fraas, from Constantinople to the Peloponnesus; by Forskal, on Malta and around Marseilles; and is known to occur along waysides and in cultivated ground as far as Britain (Engl. bot. pl. 125. Lam. fl. fr., and Pers.). By European colonists, was carried to Madeira (Lindl.); to Northeast America, where it continues in Carolina and Eastern Virginia springing up spontaneously (A. Gray, and Chapm.). The plant according to Lindley "has been used as a febrifuge, and has even been preferred to gentian."

Picris hieracioides of the Mediterranean countries. Called in Greece "hëirövotanôn" (Sibth.), in Egypt "murreyr" (Del.), and possibly the plant in question, "mrrym" — being translated "pik-rithês" in the Septuagint: *P. hieracioides* is termed "hieracium ægyptium gigas" by Lippi, as seen by him in Egypt; was observed by Forskal, and Delile (Steud.), on the margin of cultivated land about Cairo, and was received from Egypt by Vaillant act. paris. for 1721. Northward and Westward, is termed "hieracium asperum majori flore in limitibus agrorum" by Tournefort inst. 469; was observed by Forskal, and Sibthorp, from the Dardanelles to Athens and Zacynthus; and is known to occur, always as above indicated on the margin of cultivated ground, as far as France and Britain (Lam. fl. fr., Pers., and Engl. bot. pl. 196; see Helminthia echinoides).

1240, April (ex. ix. 31, xii. 1 to 12, and xiii. 4; see Introd. p. . . ., the moon's place remaining unascertained), after the revelation of the name "Jehovah," Exodus of the Israelites (see Ramessu VI.).

The eleventh Egyptian month being now made the first Hebrew month, a year of ten months was established: as is further shown, by the "30 years" of Ex. xii. 40 corresponding to the "100—75 years" of Gen. xii. 4, xv. 13, and xxi. 5 ($30 \times 10 \div 12 = 25$); by the Hebrew generation of "40 years" ($\times 10 \div 12$) equalling the Greek generation of "33½"; by the use among the early Romans of a calendar year of "ten months;" and by usage among the Jews to the present day. In further confirmation that Moses was the author of the calendar year of ten lunations; — the new moons were observed by the Israelites (. . . Num. ix. 5); and such a calendar continues in use on the Tarawan or Kingsmill Islands (see Hale ethn. Expl. Ex.). Both modes of reckoning were in use in the time of Clemens Alexandrinus, who gives the interval between the Exodus and Solomon as by some estimated "595," and by others "576 years" ($\times 10 \div 12 = "480"$ of 1 K. vi. 1, and "595" years of ten lunations = 481 y. 21¾ d. In Gen. vii. 11 to viii. 13, there is a reckoning in ten Egyptian months of thirty days each: "17th of Seventh month" — "17th of Second month" = 5 months = "150 days," and "10th" $\times 30 + "40 + 7 + 7" = 354 \text{ days} = \text{lunar year}$).

Wearing an inscribed sentence "twtphtd" bound on the forehead and around the wrist enjoined by Moses ex. xiii. 9 to 16: — *phylacteries* "phulaktêria" are mentioned in Matthew xxiii. 5. Instead of writings "grammata," the Egyptians of the time of Horapollo i. 24 protected themselves against demons by the representation of two human heads (see amulet).

The reality of the sojourn of the Israelites in Egypt is proved by some of them bearing the name of Egyptian kings: as Amminadab (from Amunhotep, in Greek Amēnōphis); Hur (from Hor-emheb, in Greek Orōs); and Ram (from Ramessu, in Greek Ramēssēs) Moses is mentioned by Manetho; and among Greek writers, yet earlier by Hellanicus; also by Philochorus, Polemon the archæologist, Castor, and Ptolemaeus of Mendes (see Just. Mart. ad Graec. p. 10, and Cyrill. a Jul. i. p. 15).

The "mixed multitude" accompanying the Israelites (Ex. xii. 38), may perhaps derive some illustration from Manetho's account of the Exodus: that among those departing, were persons afflicted with *leprosy*, may be inferred from the treatise on this disease in Levit. xiii.

Ceratonia siliqua of Western Africa. The *carob tree* or *St. John's bread* is called in France "caroubier" (Fée), in Italy "carrubio" or "carrubo" (Lenz), in Greece "xulōkératia" (Sibth.), in Egypt "kharroub" (Del.), in Egyptian "kōntrātes" (lex. Oxon.) or "jiiri" (lex. Oxon., and Kirch., perhaps from "jir" a small kind of salted fish): is regarded by Sprengel as the tree with which Moses ex. xv. 25 sweetened the bitter water at Marah, — the "hhrub" according to Avicenna p. 205 having the property of sweetening salt and bitter water: the "kērōnian" of the Ionians according to Theophrastus iv. 2. 4 is improperly called "aiguptiōn sukōn," growing not in Egypt, but in Syria and Ionia and about Cnidus and Rhodes, and bearing pods on its trunk and branches; is identified by Galen with the "kératia;" said by Strabo xvii. 2. 2 to grow beyond Meroe; mentioned also in Luke xv. 16; and its edible pods, by Dioscorides i. 158: *C. siliqua* was observed by Alpinus, Forskal, Delile, and Clot-Bey, in the gardens of Egypt, but continues rare, and was not met with by myself; was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus and Attica throughout the Greek islands. Westward, "siliquis" are mentioned by Horace epist. ii. 1. 123; "siliquae graecae" and their cultivation, by Columella; and "siliquas syriacas" by Pliny as very sweet, a finger in length by an inch broad, and sometimes falcate: *C. siliqua* is termed "s. edulis" by Tournefort inst. 578; was observed by Forskal, and myself, on Malta; continues according to Lenz under cultivation in Southern Italy; appeared to me discordant in the Mediterranean countries, exotic and having a Tropical aspect, was in fact seen by Denham and Clapperton in Bornou in Central Africa (Hogg in Hook. j. bot. 1834). By European colonists, was recently carried to Hindustan (Graham p. 254), observed by myself in the Botanic garden at Bombay.

Nigella sativa of the East Mediterranean and Tauro-Caspian countries. Called in Britain *Roman coriander*, in Germany "schwarzkummel" (Grieb), in Italy "nigella" or "cominella" or "melanzio domestico" (Lenz), in Greece "mavrōkōukathēis" (Sibth.) or "maurōkōukki" (Fraas), in Egypt "kammoun asoud" black cummin or "habbah soudeh" black grain (Del.), in Egyptian "stikmmē" (transl. Sept. Is.); in which we recognize the "melanthion" identified with the "gith" by Pliny, and the "gth" resembling the grains of manna sent through Moses ex. xvi. 14 to 31 and num. xi. 7: — the "mēlanthiōn" is mentioned in the Septuagint translation of Isai. xxviii. 25 as cultivated in Palestine: and the black seeds of *N. sativa* scattered over the thin wafer-like bread made throughout Egypt were observed by Belon, and myself. Farther North, "makōnithōn artōn" is mentioned by Alcmān (Athen. iii. 75); the "mēlanthiōn" is mentioned in the treatise Steril. 675, and Nicander ther. 43; its seeds are described by Dioscorides as black pungent odorous and "kataplas-sōmēnōn ēis artōus" plastered on bread; and the "mēkōna agriōn mēlana" is identified in the added Synonyms: *N. sativa* was observed by Sibthorp, and Fraas, frequent from the Peloponnesus to Cyprus; is known to grow also about the Taurian mountains and Caucasus (Pall., and Bieb.). Westward, the "melanthium" is mentioned by Cato 102, and Columella x. 245; the seed called "git," by Columella vi. 34. 1; the "gith ex Graecis" or "melanspermon" by Pliny xx. 71 "gratissime panes etiam condat;" and the "gith" by Palladius x. 13. 3 as cultivated: *N. sativa* is termed "n. flore minore simpliciter candido" by Tournefort inst. 258; and is known to be cultivated in France and Germany (Pers.). Eastward from the Caspian, is called in Goozerat "kala jeera" (Graham), has been long cultivated in other parts of Hindustan "both as a condiment and as a medicine" (Roxb., and Royle in Kitt. bibl. cycl.): was observed by Mason v. 495 "exotic" and called "sa-mung-net" in Burmah, where it is sometimes cultivated. Its seeds are described by Lindley as "aromatic, subacid," "formerly employed instead of pepper, and have also been used as carminatives."

Coriandrum sativum of Central Asia. Called in Britain *coriander*, in France "coriandre" (Nugent), in Germany "koriander," in Italy "coriandro" or "coriandolo" (Lenz), in Greece "kōri-anthrōn" or "kōusvaras" (Sibth.), in Egypt "kousbarah" (Del.), in Egyptian "vērētshē" or "vērētshēu" (ms. Par.) or "vērtshēu" (Kirch.) or "vērtshēou" or "vērsēou" (transl. Sept.) or "ōhiōn" (compare "ōhiōnōn" granum herbescentis of Kirch.), by the Numidians "gōith" (Syn. Diosc.), and agreeing better with the implied white or bdellium-coloured "gth," — translated "kōriōn" in the Septuagint ex. xvi. 31 and num. xi. 7: the best "coriandrum" in the days of Pliny xx. 82 came from Egypt; and *C. sativum* was observed under cultivation there by Abd-allatif, Forskal, Delile, and Clot-Bey. Farther North, the "kōriōn" or "kōriannōn" or "kōriannētōn" is mentioned by Anacreon, the comic poet Alcaeus, Anaxandrides, Antiphanes, Zeno, Theophrastus, Xenocrates, Pollux vi. 107, and Athenaeus ii. 77 and iv. 47: *C. sativum* was observed by Sibthorp in cultivated ground from Cyprus to the Peloponnesus, but is regarded by Chaubard as not indigenous. Westward, the "coriandrum" is mentioned by Varro, is termed "famosa" by Columella . . . is not wild in Italy according to Pliny, who gives directions about its cultivation; is mentioned also by Apicius, Apuleius 102, and Macer Floridus . . . *C. sativum* is termed "c. majus" by Tournefort inst. 316; is known to be

cultivated from Italy throughout middle Europe, and has besides become naturalized in certain localities in France and England (Engl. bot. pl. 67, Pers., Wats., and A. Dec.). Eastward from the Black Sea, was observed by Szovitz "in the corn fields of Tartary" (Lindl.): is called in Hindustanee "kothmir" or "dhaniya" (D'roz.); was observed by Graham "in gardens" in the environs of Bombay, the seeds "much used by Musselmen in their curries;" by Roxburgh, in other parts of Hindustan: by Mason p. 495, "exotic" and called "nan-nan" in Burmah, often cultivated by the natives who use the seeds "as a condiment for curries as well as for medicine." By European colonists, was carried prior to 1670 to New England (Josselyn rar. . .), where as throughout our Northern and Middle States it continues in gardens. Its fruits according to Lindley are "carminative and aromatic." (The English word "virtue" as pronounced "virtshu" may be compared with the above Egyptian names).

"In the third month" after leaving Egypt (ex. xix. 1 to xx. 17), the Ten commandments delivered on Mount Sinai.

Moses was of course familiar with Egyptian hieroglyphic writing, and a modification in which figures of animals and other external objects (the human form excepted) are avoided, — has been discovered in Palestine: the language not ascertained, but possibly Hebrew.

The "argmn" to be brought as an offering (ex. xxv. 4) — is admitted to be *sea-purple*, a dye procured from *Murex trunculus* (Wilde in Kitt. cycl. bibl.) and other marine univalve shells of the Mediterranean. The "argmn" and garments dyed with it, are also mentioned in Ex. xxvi. to xxxix. 29, Judg. viii. 26, Prov. xxxi. 22, Jer. x. 9, and Ezek. xxvii. 7; the "alipōrphurōs," by Homer od. vi. 54; the "pōrphura thalassia," in 1 Macc. iv. 23, Diodorus iii. 68, and Josephus bell. Jud. v. 5; and the "dibapha Tyria" or Tyrian dye, by Horace, Pliny, and others. This dye continued to be manufactured in the "Twelfth century" at Thebes in Greece, but its use has now become obsolete.

Balsamodendron myrrha of Abyssinia. The imported product is called in Britain *myrrh*, in France "myrrhe" (Nugent), in Germany "myrrhe" or "mirrhe" (Grieb), in Latin "myrrha," in Greek sometimes "murra" (Gesén.), in Egypt "mur" (Forsk.), in Egyptian "tshal" (transl. Sept. and N. Test.) or "val" (Plut. is. and osir.), in Sanscrit "bola" (Royle) and in Hindustanee "hol" or "mur" (D'roz.), in which we recognize the "mr" in the anointing oil enjoined through Moses ex. xxx. 23: — "mur" is mentioned also in Prov. vii. 17, Cant. v. 5, Psalm xlv. 8, and Esther ii. 12: "smurna" by Herodotus iii. 107, the Hippocratic writings, Theophrastus, ix. 4. Nicander, and Opiarian; "myrra" by Plautus, Virgil, and Ovid am. i. 288; and of myrrh brought to Egypt, a portion according to Forskal mat. med. comes from Arabia, but the best from Abyssinia. The myrrh tree as seen under cultivation in Tropical Arabia was described to Theophrastus ix. 4. 3; is mentioned as growing along the Sabaeen or opposite African coast by Artemidorus, Strabo, the Erythraean periplus, and Pliny xii. 33: was ascertained by Ehrenberg and Hemprich to be the "katarf" found by Forskal p. 80 cultivated at Beit el fakih; and I learned at Mocha that a portion of the myrrh of commerce is really produced in Arabia, the main supply coming from the opposite Somali country, where the tree was observed by Bruce, and Johnson. Eastward, myrrh has long been imported into Hindustan, and is generally known there under the above name "bol" (Royle in Kitt. bibl. cycl.). The "bdellium" seen in Egypt by Forskal mat. med. was ascertained by him to be only imperfect myrrh. (See Amyris commiphora, and Borassus dichotomus).

Pandanus odoratissimus of the seashore of Hindustan. The *fragrant screw-pine* is called from Cutch to Bombay "keura" (Forsk., and Graham), in Malabar "kaida" (Rheede), in Yemen "kadi" (Forsk.), in which we recognize the "kthē" in the anointing oil, — and sold according to Ezekiel xxvii. 19 at Tyre: oil scented with the "kadsī" of Yemen is mentioned by Abu Hanifa, Rhazes, Serapion, and Ebn Baitar; *P. odoratissimus* was observed by Forskal p. 172 under cultivation among the mountains of Yemen, and I found its fragrant flowers in the Mocha market, but is a maritime plant, and from the character of the coast so far as examined by myself can hardly be indigenous in Arabia. Eastward, was observed by Rheede ii. pl. 1 to 8 in Malabar; by Graham, in the environs of Bombay, its flowers "very sweet scented" and "generally sold in the bazars;" by myself, wild in the same neighbourhood around Elephanta; by Roxburgh, on the Coromandel coast; is described also by Rumphius iv. pl. 74; and was observed by Mason "exotic" in Burmah and called "hsatta-phu."

Acorus calamus of Northern Climates. Called in Britain *sweet flag* (Prior), in Germany "kal-mus" (Grieb), in Italy "calamo aromatico" or "acoro" or "acoro vero" (Lenz), in Greek "akōrōs" (Sibth.), in Egyptian "okē" (ms Borg.) or "akē" (Zoeg.); in which we recognize the "knē bshn" in the anointing oil, — or "knē" of Cant. iv. 14, Isaiah xliii. 24, "from a far country" according to Jeremiah vi. 20, and according to Ezekiel xxvii. 19 imported and sold at Tyre; also, the "kalamōs" in the "kuphi" incense mentioned by Manetho (Plut. is. and osir.); the "kalamōs murēpsikōs" of 2 Mul. morb. 651; the "kalamōs ēuōthēs" of Theophrastus iv. 8. 4 to odor. 34, growing around a lake in Syria and scentless while fresh, its root marked with interstices; the "calamus alexandrinus"

of Celsus, and Dionysius Periegetes; and the "akōrōn" of Dioscorides having leaves like the "iris" but narrower, roots jointed at intervals and extending near the surface, acrid to the taste and fragrant, mentioned also by Galen: *A. calamus* was observed by Sibthorp in the Peloponnesus; its root is enumerated by Alpinus among the ingredients of the Egyptian theriac, and by Forskal mat. med. as imported into Egypt from Greece. Westward, the "acorus" is mentioned by Celsus, and Pliny xii. 48 to xxv. 100: *A. calamus* is termed "a. verus sive calamus aromaticus officinarum" by C. Bauhin pin. 34; was observed by Lenz in North Italy, and is known to grow throughout middle Europe as far as Sweden (Engl. bot. pl. 356, Dec., and Wats.). Eastward from Syria, "kalamōs arōmatikōs" produced in India is mentioned by Dioscorides i. 17: *A. calamus* was observed by Rheede xi. pl. 48, Roxburgh, and Lush, under cultivation in Hindustan, by Nimmo seemingly wild in the Southern Concan; is called in Hindustanee and Bengalee "bach," in Telinga "vasa" or "vadaja," in Tamil "vashambu" (Drur.), in the environs of Bombay "yekund" and "employed in medicine as a febrifuge" (Graham): was observed by Mason v. 496 "exotic" in Burmah, cultivated "to a small extent for its medicinal properties" and called "len-hæ;" by Thunberg, near Nagasaki in Japan; and by Gmelin, wild throughout Siberia. Farther East, by Drummond on the Saskatchewan river at 54° in central North America; by Nuttall on the Arkansas, by Short in Kentucky, by myself from 43° to 38° along the Atlantic, by Croom at 35°, and is known to grow as far as Florida (Ell., and Chapm.). The root according to Lindley is in Constantinople "made into a confection" which is "eaten freely during the prevalence of epidemic diseases," but in Britain is "chiefly employed by perfumers, in the manufacture of hair powder." (See *Andropogon Martini*).

Cinnamomum aromaticum of Mindanao. Imported *cinnamon* is called in Arabic "dar-sini" (Sontheim.), in Hindustanee and Bengalee "dar-chini" (D'roz.), in Sanscrit "dhal-kinna" China-wood (. . .): the "knmwn" in the anointing oil,—and of Prov. vii. 17, and Cant. iv. 14, is referred here by writers: "the best cinnamon of any" according to Pigafetta 121 grows on Mindanao, is called there "cainmana" from "cain" wood and "mana" sweet, "is a small tree not more than three or four cubits high," and "its wood and leaves when they are green have the taste and force of the bark itself:" *C. aromaticum*, furnishing according to Nees von Esenbeck the valuable *Chinese cinnamon*, was seen by Roxburgh, and Wight, under cultivation in Hindustan; by Graham, "in gardens Bombay, rare."

The name however seems to indicate the route of transmission of the earliest-known article, and that the Hebrew "kn" really means *China* or possibly *Siam*, appears from the Sanscrit "kinna"—occurring in the Greek words "kinnamōmōn" and "kinnavar" (another product of China, and mentioned by Ctesias). China is called in Egyptian "iēlōpōn" (Mar., and Kirch.)

The concluding Hebrew syllable "mwn" is perhaps the Tamil "maun" signifying tree, in accordance with the above Sanscrit name; and if so, may prove the earliest specimen known of the *Tamil language*.

Cinnamomum cassia of Java and Ceylon. A tree furnishing the *cinnamon* of commerce or *Ceylon cinnamon*; probably the "knmwn" of Moses,—and Solomon, "kinnamōmōn" of Herodotus iii. 111, Hippocrates, Theophrastus, Strabo, Dioscorides, and Galen, "cinnamomum" or "cinnamum" of Ovid, Pliny, and Claudian, and "dar-sini" of Ishak ben Amran, Avicenna, and Ebn Baitar. The bark of the roots and coarser branches according to Marshall is the *cassia* of commerce, and according to Galen antid. i. p. 70 the two spices are from the same tree: the "kasia" brought by the Arabs is mentioned also by Herodotus iii. 111, Theophrastus ix. 5. 1, Agatharchides, Strabo xvi. 4, Dioscorides, Pliny xii. 42, and Dionysius Periegetes 939: *C. cassia* is known to be "cultivated to a great extent in Ceylon" (Graham); and a degenerate variety according to Nees von Esenbeck was by Europeans carried to the neighbouring portion of Hindustan, where it has become naturalized (Wight pl. 123). By European colonists also, *C. cassia* was carried to various places within the Tropicks, and is now cultivated even in America (Lindl.).

Galbanum officinale of central Asia. The imported gum-resin *galbanum* is called in Egypt "qanavascheq" (Forsk.), in Egyptian "kakōnia" (Edw.); and the "hlbnē," an ingredient of the perfume enjoined ex. xxx. 34,—is referred here by writers: "halvanē" is regarded by Theophrastus ix. 7.2 as the product of a Syrian plant called "panakōus," of a "narthēkōs" according to Dioscorides, of a "ferula" called "stagonitin" according to Pliny xii. 56, and "halvanis riza" is mentioned by Nicander ther. 938: "galbanum" is mentioned by Celsus, and Juvenal; and its odour driving away reptiles and insects, by Nicander ther. 555, Virgil geor. iii. 415, and Pliny xix. 58: "kinnah" is mentioned by Ebn Baitar, the "narthēx" of the Greeks being called "kana" (Sontheim.); and "galbanum" was found by Forskal mat. med. imported into Egypt "from Persia." Farther East, the drug is called in Hindustanee "qanna" or "birzad" or "barija" (D'roz.); and Royle learned that the plant is called "kinneh" or "nafeel:" but according to Lindley, "nothing is known of this plant except" the imbedded seed described by Don (which may belong elsewhere), "the drug comes from Smyrna and India."

The "shld" entering into the composition of the enjoined perfume — is referred by Gesenius to *blatta byzantina* also called *unguis odoratus*, and valued on account of the fragrant odour given out in burning: the "ōnux" is described by Dioscorides as the operculum of a shell resembling the purpura-shell, and inhabiting the marshes or pools of Hindustan; the "ostracium" by some called "onychem," is mentioned by Pliny xxxii. 46; *unguis odoratus*, by Arab writers cited by Bochart, and under the name of "dofr el affrit" was found by Forskal mat. med. imported into Suez from Mocha. Eastward, the "nakhi" meaning nail, is enumerated among perfumes in the Amera Cosha, and is sold under that name in the bazars of Bengal (Wils.); under the Arabic name "azfar al-teeb" may everywhere be obtained in Northern Hindustan, and is further described by Royle antiq. hind. med. p. 95 as the operculum of *Strombus lentiginosus*, but he "was unable to ascertain whence it was brought:" the operculum however "is less fragrant than that of *Pleurotoma Babylonæ* or *Pl. Trapsiit*."

The "shphn" whose flesh is prohibited by Moses lev. xi. 5. — finding refuge among rocks (Psalm civ. 18), and translated "hōirōgrullīōs" in the Septuagint, is admitted to be *Hyrax Syriacus*: the "hōirōgrullīōs" is described by Hieronymus ii. 658 as an animal resembling a mouse and bear and hence called "arkōmus" in Palestine, where it abounds, dwelling in caves among rocks and holes in the ground.

1239 B. C. On the first day of "the first month in the second year" after leaving Egypt, "the tabernacle was reared up" (Ex. xl. 17).

Vitex agnus castus of Subtropical Arabia and Persia. Called in English gardens *chaste-tree* or *hemp-tree* or *Abraham's balm* (Ainsw.), in Italy "agno casto" (Lenz), in Greece "agnēia" or "lugaria" (Sibth.), in Egypt "kaf maryam" Mary's hand (Del.), in Egyptian "tshēts" or "tshēntshits" (transl. Sept.) or "sōum" by the prophets "sēmōn" or "aima ivēōs" (Syn. Diosc.); and the "orby" whose boughs are enjoined by Moses lev. xxiii. 40 to be brought during the Feast of tabernacles, — mentioned also in connexion with brooks in Isaiah xv. 7 and xlv. 4, Job xl. 22, and as growing "by the rivers of Babylon" in Psalm cxxxvii. 2, is referred here by the Septuagint: the Hebrew name according to Gesenius implying whitish leaves: the "kaf maryam" is mentioned by Ebn Baitar; and *V. agnus-castus* was observed by Forskal, Delile, and Clot-Bey, in the gardens of Egypt. Farther North, the "lugōs" of Homer il. xi. 105, od. x. 166, Nicander ther. 65, and others, is identified by Dioscorides with the "agnōs" strewn by women in religious ceremonies; mentioned also by Theophrastus, Nicander, Galen, and Paulus Aegineta: *V. agnus-castus* is known to abound along the water-courses of Syria and Greece, arborescent, sometimes twenty-five feet high, its trunk eight inches in diameter (Forsk., Sibth., Chaubard, and Fraas). Westward, the "agnōs" or "agōnōn" or "amiktōmiainōn" or "tridaktulōn" is identified in Syn. Diosc. with the "salix marina" or "pipēr agrēsté" or "lēkristikōum" of the Romans; by Pliny xxiv. 38, with the "vitex" growing in Italy: *V. agnus-castus* was observed by Lenz wild in Italy, is known to grow also in Sicily (Pers.) and Southern France (Lam. fl. fr.). Eastward from Syria, has a Persian name "band-schankascht" (Avicenn., and Ebn Baitar), and is therefore known in Persia; but the plant belongs to a Tropical genus, and may only be exceeding its natural limits in extending into the Mediterranean countries. Its berries according to Lindley are "acrid," and the powdered seeds were found by Forskal at Smyrna applied externally against colic.

On "the fourteenth day of the first month" the passover was kept (Num. ix. 5); terms implying, a reckoning of lunations in a regularly-formed calendar.

"On the first" day "of the second month, in the second year after they were come out of the land of Egypt" (Num. i. 1 to 18), the Tribes numbered. "On the twentieth of the second month" (Num. x. 11 to 33), departure of the Israelites from Sinai through the Desert for Paran.

Allium ampeloprasum of the Mediterranean countries. Its cultivated form is called in Britain *leek*, in Anglo-Saxon "por-leac," in Holland "look," in Germany "lauch" (Prior), in France "poireau" or "porreau" (Nugent), in Italy "porro" or "porretta" (Lenz), in Greece "ta prasa" (Fraas), in Egypt "korrat" (Forsk.), in Egyptian "ēshē" or "ēshē" (ms. Borg.) or "cji" (Kirch, and transl. Sept.); the "htsy" of Egypt longed for by the Israelites and mixt multitude ex. xi. 5 — is referred by the Septuagint to the "prasa;" but the "htsy" of Psalm civ. 14, Job viii. 12 and xl. 15, is admitted to be grass: the cultivation of the "porrum" in Egypt is mentioned by Pliny xix. 33; the "kurrath," by Ebn Baitar; and the leek was observed under cultivation in Egypt by Forskal, Delile, and Clot-Bey. Farther North, the term "prasiai" is used by Homer od. vii. 127, "prasiōs" green by Plato, "prasiēs hlōērōn prasōn" by Nicander ther. 879; the "prasōn" is mentioned in the Batrachomyomachia, also by Chionides, Theophrastus, Athenaeus ix. 13; and is identified by Diphilus, and Dioscorides, with the "képhalōtōn" of Epicharmus, and Polemon: the leek was observed by Chaubard, and Fraas, under cultivation in Greece. Westward, the "prasōn" is identified in Syn. Diosc. with the "pōrrōum" of the Romans; the "porrum" is mentioned by Horace, Columella, and the "capitato" kind is distinguished by Pliny xx. 22: the leek is figured by Blackwell pl. 421, is known to be culti-

vated in Italy (Lenz) and throughout middle Europe (Pers.). Eastward from Egypt, is mentioned in the Institutes of Menu (transl. Deslongch.); is called in Bengalee "purou" (Pidd.) from the Latin, in Hindustanee "kurras" (D'roz.), in the environs of Bombay "khorat" (from the Arabic), "cultivated" there "to a small extent" according to Graham: and farther East, was observed by Mason "exotic" in Burmah and called "tau-kyet-thwon." By European colonists, was carried to Northeast America, where it continues under cultivation in our Middle States. *A. ampeloprasum* in its wild form is the "ampelōprasōn" of Dioscorides; occurring in vineyards according to Pliny xxiv. 86; is described by Lobel, Clusius (Spreng.) and Rudbeck elys. ii. pl. 151; is termed "a. sphæriceo capite folio latiore" by Tournefort inst. 383; has not been found as far East as Caucasus (A. Dec.), but was observed by Sibthorp frequent on rocks and the minor Greek islands; by Fraas, frequent in vineyards and cultivated ground in Attica; is known to occur as far West as Algeria and Portugal, and as a weed in cultivated ground as far as Britain and Ireland (Ray hist. p. 1125, Gay, and A. Dec.); but by European colonists was carried to the Azores Islands (Wats.).

Allium sativum of the plains of Western Tartary. Called in Britain *garlic* from the Anglo-Saxon "gar-leac" spear-plant (Prior), in France "ail" (Nugent), in Germany "knoblauch," in Italy "aglio" or "aglio sativo" (Lenz), in Greece "aglithia" or "gēlgithia" or "skōrthōn" (Fraas), in Egypt "tōum" (Del.), in Egyptian "skōrtōn" (lex. Oxf.) or "tshshēn" (transl. Sept.) or "tshjēn" (ms Borg.); and the "shwm" of Egypt longed for by the Israelites and mixt multitude, — is referred by the Septuagint to the "skōrtha:" cultivation of the "allium" in Egypt is mentioned by Pliny xix. 32; and the "thum," by Ebn Baitar: *A. sativum* was observed by Forskal under cultivation in Egypt, but according to Hasselquist, Delile, and Clot-Bey, is principally imported from Syria. Farther North, the "skōrthōn" is mentioned by Homer, Herodotus ii. 125, Aristophanes, Theophrastus, and Dioscorides: and *A. sativum* was observed by Chaubard, and Fraas, under cultivation in Greece, in some instances becoming spontaneous. Westward, the "skōrthōn" is identified in Syn. Diosc. with the "alliūm" of the Romans; and "allium" is mentioned by Plautus, Varro, Horace, Virgil, by Pliny xix. 34 as cultivated in Italy and springing up spontaneously in cultivated ground: *A. sativum* was observed by Lenz under like circumstances in Italy; and is known to be cultivated in Spain and throughout middle Europe (Lobel pl. 158, and Morison iv. pl. 15). Eastward from Greece, is known to grow wild in the Soongoro-Kirgish Desert (Ledeb., and A. Dec.): is mentioned in the Institutes of Menu (transl. Deslongch.); is called in Sanscrit "mahoushudha" (Roxb.), in Bengalee "rasun," in Hindustanee "sir" or "lahsan" (D'roz.), in the environs of Bombay "lussun" and according to Graham "cultivated:" farther East, was observed by Mason, "exotic" in Burmah and called "kyet-thwon-phyoo;" and by Loureiro, under cultivation in China. By European colonists, was carried to America, and has been observed by myself under cultivation in both the Northern and Austral portions of the continent.

Allium scorodoprasum — supposed to be a variety only of the preceding (Dec. fl. fr., and Koch), is called in France and Britain *rocamboles* (Nugent, and Prior), in Italy "agliporro" (Lenz), and with a corresponding combination in Egyptian "kōrthōm" (Kirch.): the "skōrthōn agrion" called according to Dioscorides ii. 181 "ōphīōskōrthōn," and in the addition identified with the "ēlaphōskōrthōn," is referred here by writers: *A. scorodoprasum* was observed by Sibthorp, and Fraas, on Cyprus and the Greek islands. Westward, is described by Valerius Cordus, Tragus (Spreng.), and Clusius hist. i. pl. 191; is termed "a. sativum alterum sive allioprasum caulis summo circumvoluto" by Tournefort inst. 383; was observed by Lenz seemingly wild in Italy, is known to occur throughout middle Europe as far as Denmark (Pers. and A. Dec.), and is besides cultivated. "*A. arenarium*" regarded as not distinct, is described by Bauhin hist. ii. 599 (Spreng.), and is known to occur from the Pyrenees and Switzerland to Denmark (fl. Dan. pl. 290, Hall., Lapeyr., and Steud.).

On reaching Paran, spies including Caleb and Joshua, sent into the land of Canaan (Num. xiii. 3, and xxxiii. 16 to 18).

1236 B. C. (= 1216 + "20 years" of Euseb. ii., and Syncell. = 710 + "526 years" of Berossus), accession of Sosaes as Assyrian emperor, Berossus' "526 years" of Assyrian rule over Babylon, as usually adjusted, begin with this reign (see above Ramessu III.).

Subsequent to the "parōusia" arrival of Danaus (Tat., and Clem. Alex.), Dardanus grandson of Atlas (Apollod. iii. 10.1) and fifth lineal ancestor of Priamus (Homer il. ω 215) leading a migration of Pelasgian Greeks to Samothrace (called in consequence "Dardania"), and thence into the Troad. — The city of Larissa in the Troad, mentioned by Homer, may be compared with this migration.

Dardanus had received an ark or chest containing an image of Dionysus or *Bacchus*. As mount "Nusa" of the Greeks is clearly Sinai written after the Hebrew manner from right to left, etymology indicates the origin of the new deity and his worship. — The same ark or chest constituted in after times the palladium or one of the palladia of the city of Troy (Hom. il. xx. 459, Paus. vii. 19. 6, and Serv. ad aen. viii. 285).

Osiris when born was placed in an ark and set adrift upon the water; and his identity with

Dionysus is expressly stated by Plutarch is. and osir. 35. Indeed, Osarsiph is given as the Egyptian name of Moses by Manetho.

Trigonella hamosa of Cyprus, Syria and Egypt. Called in Egypt "daragrag" or "adjelmælek," in which we recognize the "alchimelek" of Avicenna, or the "achilel melich" identified by Serapion with the "mëllilôtös:" the "mëllilôtön" growing on the banks of the Nile, coronary and connected with the history of Osiris — (Plut. is. and osir. 14 and 38), may therefore be compared: *T. hamosa* was observed in Egypt by Alpinus, Forskal, and Delile; and farther North, by Hasselquist in Palestine, and by Sibthorp on Cyprus. (See *Lotus rectus*).

Ninety-second generation. Sept. 1st, 1234, mostly beyond youth: Assir, Elkanah, and Abiasaph, sons of Korah (ex. vi. 24, num. xxvii. 11, and 1 Chron. vi. 22 and 37): and among Greeks, Erichthonius son of Dardanus and father of Tros (Hom. il. xxiv. 215 to 240); the Aeolic chieftains Sisypheus and Salmoneus (Hes., Hom. il. vi. 154 and od. xi. 235, and Apollod.).

By Tectamus, grandson of Hellen and father of Asterion, a migration of Dorians from Northern Greece led into Crete — (Hom. od. xix. 172, Andron in Strab., and Diodor. iv. 60).

Saul succeeded by Baal-hanan, son of Achbor and now seventh king of Edom (Gen. xxxvi. 38, and 1 Chron. i. 49).

1231 B. C. (= "28th year of Tsou-kia," Pauth. p. 69), death of the chief of the province of Tcheou, after naming his youngest son for the succession. The two excluded brethren retired to "the Eastern extremity of Kiang-nan," and after cutting their hair and making marks on the skin, were received as rulers by the barbarous population around the mouth of the Kiang. The eldest brother, Tai-pe, is regarded by several Chinese historians as the ancestor of the "dairis" or emperors of Japan.*

Setaria verticillata of Subtropical Asia. A small kind of millet called in Yemen "særa erra" (Forsk., and Steud.), in Japan "hiye," and cultivated there from the introduction of agriculture by Ukemochi-no-kami — (Jap. centen. comm. 104): observed under cultivation there by Kaempfer, and Thunberg. Westward, by Roxburgh, and Graham, in Hindustan, and the same or a closely allied species by myself under cultivation on the Deccan; by Forskal p. 20, at Hadie in Yemen, and termed "p. adherens;" by Delile, around Cairo; by Sibthorp, frequent in cultivated ground on the Greek islands; is termed "gr. geniculatum" by Tabernæmontanus iii. 1.532 (Spreng.), "p. vulgare spica simplici et aspera" by Tournefort inst. 515; is known to occur as a weed throughout middle Europe, and from at least the time of Ray in Britain (Roth germ. ii. 69, Lam. fl. fr., Pers., and A. Dec.). Probably by European colonists was carried to Northeast America, where it continues a weed "near dwellings, rare northward" (A. Gray), occurs also "around dwellings, North Carolina" (Chapm.).

Phaseolus radiatus of Subtropical Eastern Asia. Called in Japan "adzuki," and included perhaps in "the various kinds of peas and beans" cultivated there from the introduction of agriculture — (Jap. c. c. 32 and 104): *P. radiatus* is known to occur also in China (Pers.). And from transported specimens is described by Linnæus.

The same year = "18th year of Ramessu IV.;" the latest date in his reign found on the monuments — (Birch). His name occurs also in his tomb at Bab-el-meluk.

1230 B. C. (= 1280 y. 2 mo. — "51 yrs" of the Afr.-Maneth. table), a date possibly marking the accession of the usurping Ramessu V. Amunihopsef-miamun, third king of the Twentieth dynasty. The name of Ramessu V. occurs in a tablet recording benefits conferred on Silsilis — (Birch).

In this year (= 710 + "520 years" of Herodot. i. 95, Appian præf. c. 9 giving 331 + "900 years" = 1231), commencement of "Assyrian rule in Upper Asia;" after the death, as will be observed of Ramessu III. The "526 years" of Berosus, may again be compared. (See above, Sosares and Ramessu III.).

As early perhaps as this date (Graham Munjari tables, Puranas, and Bentley as. res. viii. 232) Diptiman reigning in Hindustan.

* *Anemone cernua* of Japan. Known to the Chinese as early perhaps as this date and called "hak-too-woo;" — observed by Thunberg, and Siebold i. pl. 4, on exposed parts of the mountains of Japan; and according to Lindley, the "root in great reputation among the Japanese and Chinese."

Xanthoxylon piperitum of Japan. A prickly shrub called in Japan "seo" or "sansjo" (Lindl.) or "sansho" (Jap. c. c. 31), and known from early times: — observed there by Kaempfer pl. 803, Thunberg, and Siebold, used as spice in place of ginger or pepper. According to Lindley, "the active principle chiefly in the fresh leaves, the dry bark, and the pericarp;" the bruised leaves applied in a poultice to sore throats.

Ocimum crispum of Japan. — Observed there by Thunberg 248, an infusion of the leaves used against rheumatism (Lindl.).

"1225 B. C. = 1st year of Lin-sin, of the Chang" or Fourth dynasty — (Chinese chron. table).

"In the time of the Chang" (topog. Cant., and Pauth. 472), arrival in China of Youe-yeou of the East, having the hair cut short and the body *tattooed* (*Malayans*) "bringing boxes of fish skins, bucklers and short swords; and from the South, *pearls*, *tortoise-shell*, *elephants'* teeth, *peacocks'* feathers, birds, and small dogs."

The "*peacocks'* feathers" may have come from Burmah; where the bird in its wild state was observed by Mason, being not exclusively confined to Hindustan. — The peacock (according to Stevenson) is mentioned in the Sama Veda: a doubtful figure was observed by myself in the Buddhist cave-temples at Adjunta; but distinct figures, in Braminical cave-temples at Ellora. Westward, "twkyym" peacocks were brought up the Red Sea in Solomon's ships (1 K. x. 22, and 2 Chron. ix. 21); and among the Greeks, the "taōs" peacock is mentioned by Eupolis, Aristophanes, Strattis, Anaxilaus, Menodotus, and Athenaeus.

The "pearls" may have come from the coral-bound shores of the East Indies and Burmah, or possibly from Ceylon, — long celebrated for its pearl-fishery. The discovery of pearls "*margaritēn thē tōn thalassion*," was attributed by some among the Indians to Hercules; the shell containing them, or the pearl-oyster, is further described by Megasthenes; and Arrian ind. 8 states, that pearls imported from India were formerly in great request among the wealthier Greeks, as in his own day among the Romans.

The "*tortoise-shell*" was probably really from the South, from among the East India islands. Tortoise-shell from the Indian Ocean, may at this time have been brought up the Red Sea to the Mediterranean countries, — but I am not aware of any direct evidence. "*Dorsa testudinum*" were brought to Alexander on the Lower Indus (Q Curt. ix. 25); the art of splitting tortoise-shell was first taught by Carvilius Pollio (Plin. ix. 13); and I found tortoise-shell a well known article of commerce at Mocha.

The Philippines known therefore to the Chinese probably at this date.*

Subsequent to the "parōusia" arrival of Danaus, and before the accession of Lynceus (Tat., and Clem. Alex.), recovery and return of Europa daughter of Phoenix. She became the wife of Asterion ruler of Crete (Hom. il. xiv. 321, Apollod. iii. 1. 2, and Paus. vii. 4. 1).

1222 B. C. (= 1181 + "41 years" of Castor in Euseb. i. p. 129, see also Apollod., and Pausan. x. 35. 1), Danaus succeeded by Lynceus, husband of his daughter Hypermnestra, and now twelfth king of Argos. *Minerva's* temple at Lindus in Rhodes, attributed to the daughters of Danaus, — continued extant in the days of Herodotus, Callimachus, Apollodorus, Diodorus, and Strabo xiv. 2. 11.

Xanthium strumarium of Northern climates. Called in Britain *bur-weed* or *ditch-bur*, by Turner "dyche-bur" from growing on dykes (Prior), in France "*lampourde glouteron*" (Fée), in Germany "*spitzklette*," in Italy "*sanzio*" or "*lappolone*" or "*lappola minore*" or "*bardana minore*" (Lenz), in Greece "*ēmēra kollētizatha*" (Fraas), in Egypt "*kharāq el-bahr*" (Del.), in Yemen "*mandj el ma*" or "*kavar el abid*" (Forsk.): the "*argemon*" herb healing swine, and said to have been discovered by Minerva, — is identified by Pliny xxiv. 116 to xxv. 15 with the "*canaria lappa*;" and the "*lappam*" of the Romans by Syn. Diosc. with the "*xanthiōn*:" the "*xanthiōn*" is described by Dioscorides as growing in fertile soil and dried-up pools, a cubit high with an angular fleshy stem, "*atraphaxēi*"-like leaves having the odour of "*karthamō*," fruit like a large olive, prickly and adhering to garments, and made into a plaster against swellings; is identified in the added Synonyms with the "*hōirathōlēthrōn*" by some called "*aparinēn*;" is mentioned also by Galen, and Paulus Aegineta: *X. strumarium* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from Constantinople to the Peloponnesus; and farther South, by Forskal, and Delile, in Egypt, by myself along the river-bank; and by Forskal, among the mountains of Yemen. Westward, is described by Lobel, Gerarde, and Parkinson; is termed "*xanthium*" by Tournefort inst. 439 and plant. par. ii. p. 124, who found *scrofula* dispersed by its leaves (Spreng.); was observed by Lenz seemingly wild throughout Italy; and is known to occur as far as Sweden (fl. Dan. pl. 970, and A. Dec.). Farther West, is known to occur on the Azores Islands (Wats.); was observed by myself along the seashore of New England

* *Justicia* (*Graftophyllum*) *pictum* of the Malayan archipelago. A garden shrub called in Malabar "*tjude-marum*" (Rheede), in Burmah "*gnwæ-ban*" or the sanguineous-leaved variety "*salat-nee*" (Mason), in Tagalo "*balasbas*" or from its variegated leaves "*moradong maputi*" violet white, in Bisaya "*balasbas*" or "*antolang*" or "*san francisco*;" and known from early times: — observed by Rheede v. pl. 60 in Malabar; by Graham, "a very common shrub in gardens" and "several varieties" cultivated in the environs of Bombay; by Roxburgh, and Wallich, in other parts of Hindustan; by Mason, "*exotic*" in Burmah; is described also by Rumphius iv. pl. 30; was observed by Blanco on the Philippines, planted by the natives, the bruised leaves applied to cancerous tumours of the breast.

and inland along river-banks, but occurring also as a weed around dwellings; by Nuttall, on the Upper Missouri and the Arkansas; by E. James, near the base of the Rocky mountains (Tor.); by Baldwin, as far South as Lat. 31° in Florida; but is regarded by Elliot as not indigenous around Charleston. Clearly by European colonists, was carried to Greenland (Wats.); to Patagonia, and the Hawaiian Islands, and in both localities as observed by myself has become naturalized. "X. Orientale" regarded as not distinct, was observed by Kaempfer, and Thunberg, near Nagasaki in Japan, and called "soonii" or usually "namone."

1221 B. C. (= 1412 y. 2 mo. — "51 — 61 — 20 — 60 yrs" of the Afr.-Maneth. table = 1613 y. 3 mo. — "393 yrs" of Josephus c. A. i. 16 and 26, Manetho in Jos. giving 1280 y. 2 mo. — "59 yrs" = 1221 y. 2 mo, and the Euseb.-Maneth. table and Egyptian Chronicle 1413 — "194 yrs" = 1219), marking perhaps the accession of Ramessu VI. Amunikhopsef-nuterhikten, fourth king of the Twentieth dynasty. — His name occurs in a tomb near Deru, in which an Ethiopian prince offers a royal statue; also in his own tomb at Bab-el-meluk (Birch).

(Some similarity in name may be remarked with "Nēhēphrēōus" given by Artapanus jud. in Clem. strom. i. 23 as the pharaoh of the Exodus, called "Hēnēphrēōus" by Eusebius, "Hēnēvrōn" in the chron. alex.; and according to Birch, the rising of Sothis or the Dog-star is calculated in the tomb of Ramessu VI. "at 1240 B. C.," compare also the second Sethos of Manetho in Jos. c. A. i. 26).

In this year (= 716 + "505 years" of Herodot. i. 7, and Clint. i. p. 133), *beginning of Lydian history*; Agron becoming king at Sardis. — His descendants reigned there in lineal succession "twenty-two generations," Candaules being the last. The *Lydian language* continued extant in the mountain district of Cibyra South of Lydia proper in the time of Strabo xiii. 1. 17.

"In the reign of Lynceus" (Tat., and Clem. Alex.), abduction of Proserpina.

"1219 B. C. = 1st year of Keng-ting, of the Chang" or Fourth dynasty (Chinese chron. table).

"In the reign of Lynceus" (Tat., and Clem. Alex.), agriculture of Triptolemus. The city of Tarsus on the Southern coast of Asia Minor, founded (according to Strabo xvi. 2. 5) by the Argive companions of Triptolemus. — Tarsus or Tharshish continued in existence in the time of Solomon (1 K. x. 22, xlii. 43), of Isaiah xxiii. 1 to 10, and of the Apostle Paul (Acts xxii. 3).

1216 B. C. (= 1186 + "30 years" of Euseb. i and ii., and Syncell.), accession of Lampares as Assyrian emperor.

About this time (Pind. ix. 86, Plut. quaest. graec. 15, and Eustath. hom. p. 277), the city of Hyanteia or Oeantheia in Western Greece founded by Locrus, son of Physcius and grandson of Amphictyon.

Rosa sempervirens of the Mediterranean countries. An evergreen *rose* called in Greece "vata" or "agria vata" or "hamōvata" (Fraas); and the "kunōsvatōn" that wounded Locrus in fulfilment of an oracle respecting the bite of a wooden dog, — mentioned also in Ulc. 8, Theophrastus iii. 18. 4, Theocritus v. 92, having according to Dioscorides white flowers and oblong fruit of the shape of an olive-stone and downy within, known also to Athenaeus ii. 87 in Egypt, is referred here by Sibthorp, and Fraas: the "kunōkanthē" is mentioned by Aristotle an. v. 19, and the "kunōsvatōn" by some called "ōxuakanthan" in Syn. Diosc.: *R. sempervirens* was observed by Sibthorp, Chaubard, and Fraas, frequent in Greece and the Peloponnesus. Westward, the "cynosbaton" of the Greeks is identified by Palladius i. 34 5: and *R. sempervirens* is known to grow wild in Northern Italy, on the Balearic Islands, and as far as Germany (Pers., Steud., and Lenz). A scented variety "var. moschata" is distinguished by Fraas, is called in Greece "agriō mōskia" (Sibth.), and by Tournefort inst. 637 "r. moschata sempervirens."

Smilax aspera of the Mediterranean countries. Called in Italy "rogo cervione" or "smilace aspra" or "smilace" (Lenz), in Greece "smilagga" (Forsk.) or "smilax" or "xuloklēma" or "arkōuthōvatōs" or "skulōvatōs" (Fraas), in Egyptian "luisthe" (Syn. Diosc.); in which we recognize the "smilax trachēia" called by some "kunōsvatōn" according to Syn. Diosc., and therefore possibly the plant that wounded Locrus: — the "smilax" is described by Theophrastus iii. 18. 11 as resting upon other stems, its own stem prickly, leaves ivy-like but not angular, and white odorous flowers; the "smilax trachēia" by Dioscorides as twining around trees and bearing red berries, and is identified in the added Synonyms with the "lukanthēmōn" or "ēliōphutōn" or "anatōlikōn": *S. aspera* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from Constantinople to the Peloponnesus, Crete, and Cyprus, tangling the forest and in spring the young shoots eaten. Farther South, is known to grow in Palestine (Pers.), and branches of "milaxi" (of course imported) were carried in Alexandria at the festival of Ptolemy Philadelphus (Callixen., and Athen. v. 28). Westward, the "smilax trachēia" is identified in Syn. Diosc. with the "rathia" of the Tuscans, and "mērgina" of the Romans; the "smilax" growing in Italy and worn although unsuitable in garlands at festivals of Bacchus, is men-

tioned by Pliny xvi. 63; *S. aspera* is described by Fuchsius p. 719, is termed "s. a. fructu rubente" by Tournefort inst. 654, was observed by Lenz in Italy, by Forskal near Marseilles, and is known to grow in Carniolia and other parts of Southern Europe (Pers., and Spreng.). "*S. nigra*" described by Clusius hist. i. 113, termed "s. a. minus spinosa fructu nigro" by Tournefort inst. 654, and known to grow in Portugal and Spain (Pers.), was observed by Sibthorp, and Bory, from the Peloponnesus to Constantinople, but is regarded by Fraas as not distinct.

1208 B. C. (= "40th year after" leaving "Egypt, in the first of the fifth month," Num. xx. 27, xxi. 4, and xxxiii. 37), Eleazar installed high priest, and the death of his father Aaron on Mount Hor. In proceeding "to compass the land of Edom," many persons were bitten by serpents; and "Moses made a serpent of brass."—This specimen of his handiwork was kept in after times at Jerusalem; and continued to attest the reality of the abode in the Desert, until broken in pieces by order of king Hezekiah (2 K. xviii. 4).

Clusia lanceolata of the mountains of Tropical Arabia. Called in Yemen "luch" or "alloh" (Forsk.); and the growing "aëlym" trees of Balaam's prophecy num. xxiv. 6—may be compared: *C. lanceolata* was observed by Forskal p. 170 at Boka in Yemen in the middle region of the mountains; and according to Vahl resembles *C. pulchella* of Austral Africa (Pers.).

August (= 1207 y. 241 $\frac{1}{8}$ d. = 1240 — "40 years" of ten lunations of num. xiv. 33, xxvi., and xxvii. 12), death of Moses on Mount Abarim in sight of the promised land.—Mount Nebo has been re-discovered by De Saulcy (correspond. Lond. athen. 1865), and still bears the name of "Jebel Neba;" while another eminence in the vicinity called "Jebel Jelul" illustrious mountain, is regarded by him as very probably marking Beth-peor or the burial-place of Moses. As Moses gave directions for building an altar "of whole stones" untouched by iron (Deut. xxvii. 5 and 6), it may be inferred, that some "twenty *dolmens* and *cromlechs* exactly like those of France and England" observed by De Saulcy, were not in existence before the days of Moses.

1207 B. C. ("on the tenth of the First month," Josh. iv. 19), the Jordan crossed by the Israelites under Joshua. "On the fourteenth day of the month," the Passover kept "in the plains of Jericho." And not many days afterwards, the city of Jericho captured; an event attended by the transgression of Achar (Josh. v. 10, vii. 26, xxii. 20, and 1 Chron. ii. 7).

Hazor, the Canaanitish or Phœnician capital of the country around the sources of the Jordan, burned by Joshua (Josh. xi. 10).—In the time of Deborah, the city had recovered its importance (Judg. iv. 2). Its site, bearing the ancient name, was found by G. Williams (Sm. geogr. dict.) East of the Jordan and of Lake Merom, on a hill commanding the road from Tyre to Damascus.

1203 B. C. (= 1239 — "45 years" of ten lunations of Josh. xiv. 5 to 13), division of the conquered land among the Israelites; Hebron being assigned to Caleb son of Jephunneh.

Phragmites communis of Temperate climates. Soft-stemmed and called in Britain *bog reed* or *bennels* from its use in forming roofs (Johnst.), in Anglo-Saxon "hreed," in Germany "riet" (Prior) or "schilfrohr," in Italy "canna palustre" or "cannuccia" or "spazzola di palude" (Lenz), in Greece "agriokalamōs" or "haïta" (Sibth.) the latter word used by Homer and Euripedes and applicable to thatch, in Egypt "bous" (Del), and doubtless connected with the river "knē" mentioned in Joshua xvi. 8 and xvii. 9 to xix. 28:—the "agmwn" growing at Babylon (Jer. li. 32), may also be compared: *P. communis* was observed by Delile on islets in the Nile, by Forskal p. 25 occupying the Ghobeibe marsh in the Sinai peninsula and its stems transported to Egypt and throughout Arabia. Farther North, "kalamōi" were found by Darius around a lake beyond the Danube (Herodot. iv. 109); were figured growing in water among fishes by Polygnatus at Delphi (Paus. x. 28. 1); and are one of the kinds distinguished by Theophrastus iv. 11. 11: *P. communis* was observed by Sibthorp, Chaubard, and Fraas, frequent in marshes from the Peloponnesus throughout the Greek islands to Bithynia. Westward, the "fluvialis arundo" is mentioned by Virgil geor. ii. 414; "canna" covering the slothful pool, by Ovid; "arundines" lasting for ages as thatching among Northern people, by Pliny xvi. 64; and remnants of *P. vulgaris* for bedding or for thatching roofs, have been found among debris of the earliest Swiss villages (Troyon p. 44): *P. communis* is termed "*a. vulgaris*" by Tournefort inst. 526; was observed by Savi, and Lenz, in Italy; and is known to grow in Barbary, Portugal, and throughout middle and Northern Europe as far as Lapland and Iceland (Desf., Brot., Wats., and Hook.). Eastward from Syria, is known to grow in the Tauro-Caspian countries, and throughout Siberia as far as Japan (Bieb., Gmel., and Thunb.). Farther East, was observed by myself in California and Oregon; by Drummond, at Cumberland House on the Saskatchewan; was called "wekinash" by the aboriginals of New England (R. Williams); and is known to grow throughout Canada and along the Atlantic as far as Lat. 31° in Florida (Wats., Baldw., and Chapm.). In the Southern Hemisphere, was observed by myself in the drizzly climate of Western Peru, also in Chili and Patagonia; and is known to grow in Australia (Wats., and Kunth).

Baal-hanan succeeded by Hadar or Hadad II., eighth king of Edom (Gen. xxxvi. 39, and 1 Chron. i. 50).

Ramessu VI. succeeded by his brother Ramessu VII. Atamum-nuterhikten, fifth king of the Twentieth dynasty. The name of Ramessu VII. occurs at Medinet Abu, and in his own tomb at Bab-el-meluk.

As early probably as this date, the "paieōna" composed by Tynnichus of Chalcis (Plat. ion. 5). The "paieōna" is described by others, as originally sung at Delphi to celebrate the killing of the serpent Python by Apollo: — it was sung by the Greek army before the walls of Troy (according to Homer il.).

Ninety-third generation. Jan. 1st, 1200, mostly beyond youth: Micah of Mount Ephraim (Judg. xvii): and among Greeks, Tros father of Ilus (Hom. il. xxiv. 215 to 240), Tyro daughter of Salmo-neus and mother of Neleus and Amythaon (Hom. od. xi. 234 to 258).

1199 B. C. (= 1071 + "128 years" of Euseb. ii., and Clint. i. p. 345), Gordius succeeded by his son Midas as king of Phrygia. — Midas promoted the worship of Dionysus or Bacchus, and founded the city of Ancyra (Herod. i. 14, Strab. vii. p. 304, Paus. i. 4. 5, and Ael. var. hist. iv. 17).

Rosa centifolia of Eastern Caucasus. A rose called in Italy "rosa a bottoni" (Lenz) in Greece "triantaphullēa" (Fraas), in Egypt "ouard" (Del.), in Egyptian "vērt" or "ērt" (ms. Borg.) or "ouert" or "ouērt" (ms. Par.): "rōtha" having sixty petals and exceeding other kinds in fragrance were springing up spontaneously in the gardens of Midas in Macedonia — in the days of Herodotus viii. 138: the most fragrant roses yielding the sweetest ointment came from Cyrene in the days of Theophrastus vi. 6. 5: *R. centifolia* was observed by Forskal, Delile, and Clot-Bey, cultivated for commercial purposes in Egypt; by Fraas, in the gardens of Greece; is well known in the gardens of Italy and middle Europe (Desf., Pers., Red. pl. 25 and 52, and Lenz); and according to Lindley is indigenous in "woods in the eastern parts of the Caucasus." Its petals are employed medicinally, and "for the distillation of rose water" (Lindl.). A fragrant oil of roses was known in the time of the Trojan war (Hom. il. xxiii. 186); the "nrth" at the king's table in Cant. i. 12, rose-ointment for the dinner-table mentioned by Pliny xxi. 10, may also be compared: the term "narthōs" being extended by the modern Greeks to a similar perfume, the essential oil of lavender (see *R. Damascena*, *Lavandula*, and *Valeriana jatamansi*).

"1198 B. C. = 1st year of Wou-y, of the Chang" or Fourth dynasty — (Chinese chron. table).

"1197 B. C. = 2d year of Wou-y" (Chinese chron. table), beginning of the Twenty-fifth cycle.

The same year (= 1071 + "23 + 30 + 48 + 25 years" of Castor in Euseb. i. p. 134), Erichthonius succeeded by his son Pandion, sixth Attic king.

The same year ("in the reign of Pandion at Athens," Castor in Euseb. i. p. 135, and "of Lynceus at Argos," Tat. and Clem. Alex., and "about 130 years before the fall of Troy," Clint. i. p. 86), arrival of Cadmus in Greece: bringing (according to Sophocles, Herodotus, Aristotle, and ancient authors generally) the *alphabet* and art of writing from Phoenicia.

One of his companions, Memblarius, was left upon the island of Kallistē (afterwards called "Thērē," Herodot. iv. 147, Pausan. iii. 1. 7, and Schol. Pind. pyth. iv. 88). Traces of ancient colonization from Phoenicia and Palestine, are found in geographical names in various parts of Greece: as in the Peloponnesus a river called "Iardanos" or Jordan, another in Crete (Hom. il. vii. 135, od. iii. 292, and Pherecyd.); and in . . . a city called "Hebron."

The worship of *Bacchus* also brought by the Cadmeans — (Herodot. ii. 49, and Pausan. ix. 5).

"1194 B. C. = 1st year of Tai-ting, of the Chang" or Fourth dynasty — (Chinese chron. table).

The same year (= 991 + "7 + 26 + 40 yrs" of the Euseb.-Maneth. table), a date possibly marking the accession of Ramessu VIII., sixth king of the Twentieth dynasty. — His reign is recorded by a royal scribe in a sepulchral tablet dedicated to the deities Osiris, Onouris, and Horus (Birch).

Leaving Boeotian Thebes, Cadmus and Harmonia proceeded Westward and Northward to the Encheleans on the Illyrian shore of the Adriatic; and near Rizon (Risano on the Gulf of Cattaro) founded the new city of Bōuthōē (Herodot., Apollod., Nicand., Strab., Etym. magn., Stephan., and C. Mull. geogr. min. i. p. 31): — called "Butuam" by Pliny, and at the present day "Budua." The temple or tomb of Cadmus in that vicinity is mentioned in the Scylacean Periplus, and by Eratosthenes, Phylarchus, Apollonius Rhodius, and others.

"1191 B. C. = 1st year of Ti y, of the Chang" or Fourth dynasty — (Chinese chron. table).

As early perhaps as this date (Graha Munjari tables, Puranas, and Bentley as. res. viii. p. 232), Crīpa reigning in Hindustan.

Phinehas being high-priest (Ex. vi. 1, Num. xxv., Josh. xxii., and Judg. xx. 28), civil war; ending in the almost total extirpation of the Tribe of Benjamin.

The **OVP** kīlo used in this war — (Judg. xx. 16), mentioned also in the history of David (1 Sam. xvii. 40), and somewhat later in 2 K. iii. 25, is admitted to be the sling; figured on the Assyrian

monuments at Nineveh (Bonom. iv. 3); and bands of "funditores" or slingers were employed in the Roman armies (Sall., and Val. Max.). The use of this weapon extended even to America: as shown by an ancient Peruvian sling found by myself among the ruins of Pachacamac near Lima.

1186 B. C. (= 1141 + "45 years" of Euseb. ii., and Syncell.), accession of Panyas as Assyrian emperor. He is also mentioned by Cephalion: but "forty-two" years only are assigned to his reign in Euseb. i.

Tantalus father of Pelops, Broteas, and Niobe, a wealthy king, and (according to Diodorus iv. 74, Hyginus 124, and Servius ad aen. vi. 603) king of Lydia or of Sipylus; — an account confirmed by recent discoveries on mount Sipylus (see Niobe).

1185 B. C. (= 1176 y. 302 $\frac{3}{8}$ d. + "8 years" of Judg. iii. 8), the Israelites "sold" into "the hands of Chushan-rishathaim king of Mesopotamia;" or the first Servitude.

"In the reign of Lynceus" (Tat., and Clem. Alex.), Crete governed by the lawgiver Minos. Regarded as having inaugurated naval dominion: extending his authority over other islands, and even imposing tribute on the city of Athens. — The wisdom and justice of Minos are celebrated by Homer (il. iii. 232, xiii. 450, od. xi. 322, 569, and xix. 179), the Cretans continuing pre-eminent as mariners, and communication with the main land being frequent. The tribute imposed by Minos on Athens, continued to be paid annually for about eight hundred years, ceasing soon after the death of Socrates (Plat. leg. iv. 2).

Minos encouraged *archery*, and a law in which he directs children to be instructed in the art — has been preserved by Ephorus (Strab. x.): the quiver is represented on the earliest coins of Crete (Goltz. græc.); the Cretan archers according to Xenophon iv rendered great assistance in the Retreat of the ten thousand; to the time of Pausanias, the Cretans excelled all other Greeks in the art; and their proficiency was found by Tournefort trav. i. 100 not altogether obsolete.

Cenchrus ? *frutescens* of the East Mediterranean countries. Called in Greece "pētrōkalamō" (Sibth.), and furnished the arrows — according to Tournefort trav. i. 100: the "kalamōus inthikōus" or "mēstōkalamōus" or "valitis" is said by Democritus to indicate water if the shoots are tender; the "kalamōu epigēion" of Theophrastus iv. 13 may be compared; and the "nastōs" from which arrows are made, distinguished by Dioscorides i. 114, is referred here by Sibthorp: *C. frutescens* is termed "arundo graminea aculeata" by Alpinus exot. pl. 104, as observed by him on Crete (Spreng.), "gramen orientale spicatum fruticosum spinosum spicis echinatis in capitulum congestis" by Tournefort cor. 39; was observed by Sibthorp frequent in maritime sands around Crete, the Peloponnesus, and the Greek islands, and according to Linnæus occurs also in Armenia; but in the absence of specimens from the Linnæan and Sibthorpean herbaria, the plant remains altogether obscure (J. E. Smith).

1181 B. C. (= 1158 + "23 years" of Castor in Euseb. i. p. 129, see also Pausan. ii. 16. 2, and Tat.), Lynceus succeeded by his son Abas, thirteenth king at Argos.

1178 B. C. = "17th year of Ramessu VIII.," in a papyrus — (Birch, in Buns. præf. iii.).

1177 B. C. (= 1158 y. 302 $\frac{3}{8}$ d. + "18 years" of Judg. iii. 14), Chusan-rishathaim of Mesopotamia defeated by the Israelites under Othniel.

Cleitör succeeded by his cousin Aepytus, grandson of Arcas and now seventh king of Arcadia — (Pind. vi. 54, and Paus. viii. 4. 7). Aepytus was killed by the bite of a "sēps," described by Pausanias as a *viper* of the smallest size, ash-coloured with dots, the head broad and neck slender. The tomb of Aepytus is mentioned by Homer il. ii. 604, and was visited by Pausanias.

On the summit of mount Cyllene in Arcadia, Cyllen brother of Aepytus built a temple to Mercury; — in ruins when visited by Pausanias viii. 17. 1.

Callitris quadrivalvis of Barbary. Called in Egypt and Yemen "atl" (Forsk.): by a marked exception, the image of Mercury in this temple was of "thuōu" — (Paus.); burned on Calypso's Isle (Malta) for sacrifice (Hom. od. v. 60); mentioned by Theophrastus v. 3 as growing in Cyrene and the Oasis of Ammon; and "xulōn thuinōn" by Callixenus, Strabo iv. 6, and in Rev. xviii. 12: the "atl" is mentioned by Ishak ben Amran, Serapion, and Ebn Baitar: *C. quadrivalvis* was observed by Forskal, Delile, and Clot-Bey, in Egypt; by myself, planted in gardens throughout and in the distance much resembling a Casuarina; according to my Nubian attendant is well-known in Dongola; was observed by Forskal as far as Yemen; and *galls* from the "atl" are enumerated by Forskal mat. med., and Clot-Bey, as employed in Egypt for dyeing in place of those from the oak. Westward, the "thyōn" of Homer and others is identified by Pliny xiii. 29 to 30 with the "citrus" of the Romans, the material of tables so highly prized from the time of Cicero, the variegated knotty root being especially valued: "libyssa citrus" is mentioned by Varro; its wood as precious by Horace iv. 1; and "citrea mensa" by Petronius, Lucan, and Martial: *C. quadrivalvis* was ascertained by S. E. Cook to have furnished the roofing of a mosque at Cordova built in the "Ninth" century (Royle in Kitt. bibl. cycl.); and according to Daubeny "beautiful specimens of ornamental cabinet-work" so much admired a few years ago in Paris; was observed by Schousboe in its wild state, "a tree of enormous size" in the Upper portion of the province of Temsme in Morocco.

This tree (according to Broussouel) yields *sandarach*, called in Egyptian "vanē" (Arab. transl. ex. xxx. 34) or "stiriakē" — (Kirch.): "sandarakē" or "sandarakhē" is mentioned as a vegetable product by Menecrates, Aristotle an. viii. 24, and Pliny xi. 7. From "the resinous substance called sandarach" is "prepared the *pounce* employed in rendering parchment fit to write upon" (Lindl.).

1173 B. C. (= 1155 + his "19th year"), the accession of Ramessu IX. Khaem-miamun, seventh king of the Twentieth dynasty, may be placed provisionally at this date. His name occurs at Medinet Abu, and on two stelæ — now in Berlin (Glid. analect.).

1172 B. C. (= 1071 + "23 + 30 + 48 years" of Castor in Euseb. i. p. 134, see also Apollod. iii. 14. 15; and Pausan. i. 2. 5), Pandion succeeded by his son Erechtheus, seventh Attic king. Erechtheus is mentioned by Homer il. ii. 547 and od. vii. 81; and according to some writers, was an Egyptian (Diod. i. 29, and Leps. eg. and sin. p. 383).

His brother Butes now hereditary priest of *Neptune*: this being the original worship in Attica (Isocr. panath. lxxviii. p. 273. c., and Apollod. iii. 14. 1). The temple called the "ērēththēion," situated on the acropolis at Athens, is mentioned by Herodotus viii. 55.

Senecio vulgaris of Europe and the adjoining portion of Asia. Called in Britain *groundsel*, in Anglo-Saxon "grundswelge," by Galfridus pr. pm. "chynchone," in medieval Latin "ceneceon" (Prior), in France "seneçon" (Nugent), in Italy "erba calderugia" or "solleccione" or "senecione" (Lenz), in Greece "ōglēgōras" (Fraas); in which we recognize the "sēnēkiōum" of the Romans identified in Syn. Diosc. with the "ērigērōn" or "ērēththitēs" (named apparently from Erechtheus and his temple on the Acropolis): — the "ērigērōn," old in the spring from flowering throughout the winter, is mentioned by Theophrastus vii. 7. 1 to caus. i. 22. 4; is termed "acanthida" by Callimachus from its heads of down resembling those of thistles, by others "pappus" (Plin.); is yellow-flowered according to Dioscorides and growing chiefly in cities and along walls; and is identified by Ebn Baitar with the "shih elrabia": *S. vulgaris* was observed by Delile at Damietta in Egypt; by Sibthorp, Chaubard, and Fraas, frequent about dwellings from the Peloponnesus throughout Greece; is known to occur also along the Taurian mountains and in Siberia (Bieb., and Ledeb.). Westward, the "erigeron" or "senecio" is mentioned by Pliny xxv. 106: *S. vulgaris* is described by Brunfels i. p. 119 (Spreng.); is termed "*s. minor vulgaris*" by Tournefort inst. 456; was observed by Munby in Algeria, by Forskal on Malta, by Lenz in Italy; and is known to occur in waste places as far as Lapland and Iceland (Hook., Fries, and Wats.). By European colonists, was carried to Madeira (Lowe, and A. Dec.); to the Falkland Islands (Durv., and J. D. Hook.); and before 1669 (Jossel.) to Northeast America, where it has become frequent in our Northern States, in one winter observed by myself flowering until January in the streets of Boston.

1171 B. C. = "3d year of Ramessu IX." on the monuments — (C. Mull fr. Man. p. 589).

Of hymns and prayers to particular deities "composed in the reign of Ramessu IX.," several — were procured at Thebes by Lepsius eg. and sin. 392.

"1169 B. C." (Diodor., Euseb. ii. p. 299, and Clint. i. p. 23), a change in naval dominion. The "empire of the sea" acquired by the Lydians and Mæonians. — Held by them "ninety-two" years.

On the death of Polydorus son of Cadmus, Nycteus father of Antiopa governing Boeotian Thebes during the minority of Labdacus (Apollod. iii. 4. 2, and Paus. ix. 5).

Ferula Tingitana of Barbary. Pills of "*ammoniac*," employed in Egypt medicinally and called "kelleck" are mentioned by Alpinus, and Forskal mat. med., and "calak" was ascertained by Rouyer to be brought "from Barbary": agreeing therefore with the "ammōniakōn" of Amythaon — (Gal.), Hippocrates (Pereir.), Antipater, Callinicus, Meges, Triphon, Servilius Damocrates, Galen comp. med. gen. vii. 7, and Paulus Aegineta, termed "thumiamatōs" by Andreas, "guttæ" by Scribonius Largus, and described by Dioscorides as the juice of a "narthēkōs" growing in Libya and together with its root called "agasullis": two kinds or qualities are distinguished by Dioscorides, and Pliny xii. 49 and xxiv. 14; gum ammoniac is mentioned by Rhazes, and Avicenna; and the plant producing it was observed by Shaw, and Jackson, in Barbary, and is described by them as belonging to this genus (F. Adams): *F. Tingitana* is described by Hermann par. pl. 165. Morison ix. pl. 15, and Rivinus pentap. iii. pl. 10; and is known to grow in Spain and Morocco (Pers., and Lindl.), but according to Viviani not as far East as Cyrene. The "fetid gum resin ammoniacum" according to Lindley "is chiefly employed as a discutient and expectorant." (See Dorema.)

Ninety-fourth generation. May 1st, 1167, mostly beyond youth: Salmon (Ruth iv. 20, and 1 Chron. ii. 11), the high-priest Abishua (1 Chron. vi. 5, Ezr. vii. 4, and Jos. v. 11. 15); and among Greeks, Hyagnis the earliest flute-player known to the Greeks (Plut. mus., and others).

The city of Ilium or Troy, founded by Ilus (Euseb.). Ilus, brother of Assaracus and father of Laomedon, — is mentioned by Homer il. xxiv. 215 to 240.

In Boeotian Thebes, death of Labdacus shortly after his accession, leaving a son Laius "a year old." Lycus, who succeeded his brother Nycteus as regent, made war against Epopeus fourteenth king of Sicily, and brought back his own niece Antiopa (Apollod. iii. 5. 2, and Pausan. ix. 5).

1159 B. C. (= 1138 y. 302 $\frac{1}{2}$ d. + "20 years" of Judg. iv. 1), Eglon king of Moab, slain by Ehud; and shortly afterwards, the Moabites defeated in battle by the Israelites.

1158 B. C. (= "16th year of Ramessu IX.," on the monuments — (Leps. k. tab. p. 19, and Birch).

In this year (= 1141 + "17 years" of Castor in Euseb. i. p. 129, see also Apollod. ii. 1. 4, Pausan., and Clint.), Abas succeeded by his twin sons, Acrisius at Argos, and Proetus as king at Tiryns. The walls of Tiryns built by Proetus — (Strab. viii. 6. 11, and Pausan. .) are mentioned by Homer il. ii. 559, and from their colossal dimensions continue to excite admiration to the present day (Sm. geogr. dict.).

Salix viminalis of Europe and the adjoining portion of Asia. Called in France and Britain *osier*, in medieval Latin "oseria" (Prior): the earliest Greek shields, as those carried by Acrisius and Proetus, were woven of "itēa" — (Pausan. corinth., and Fée); "itēinōisin" shields are mentioned by Theocritus xvi. 79; the bending of "salignas umbonum crates," by Virgil aen. viii. 632; manufactured articles of wicker-work, by Plato vii. 23; "ōisuinōs," by Homer od. v. 256; and the "ōisua" is enumerated among the signs of water by Democritus (Cass. geopon. ii. 6): *S. viminalis* was observed by Sibthorp in moist situations in Greece and around Constantinople. Westward, willow-grounds "salicta" are mentioned by Ennius, Cato, and Cicero; the person having charge "salictarius," by Cato; slender withs "vimines" by Caesar, Varro, and Columella; "salices fecundae viminibus," by Virgil; and the cultivation and product of "salicis viminalis," by Pliny xvi. 68 and xvii. 32. Farther North, articles of fine osier-work have been found in debris of the lake-villages of Switzerland (Troyon p. 465 and pl. vii. 22); *S. viminalis* is termed "s. folio longissimo angustissimo utrinque albedo" by Tournefort inst. 591; was observed by Forskal near Marseilles; and is known to grow along banks of streams throughout middle Europe as far as Britain (Hoffm. pl. 2, 5, and 21, Lam. fl. fr., and Engl. bot. pl. 1828). By European colonists, was carried to Northeast America, where I have occasionally observed it cultivated.

In Thessaly, a city called "Larissa" founded by king Acrisius: a temple to Ceres at Thermopylæ, is also attributed to him (Callim. e. 41, Pausan. ii. 23. 9, and Steph. Byzant.).

As early perhaps as this date (Graha Munjari tables, Puranas, and Bentley as. res. viii. p. 232), Rishyasringa reigning in Hindustan.

"In the reign of Proetus" (Tat. and Clem. Alex., see also Thucyd. ii. 5, Isocr., Lycurg., and Pausan. i. 31. 2), invasion of Attica by Thracians under Eumolpus, assisted by the citizens of Eleusis: apparently a religious war between the partisans of Neptune and Minerva. Erechtheus was supported by Ion, but was slain (Philochor., Strab., and Pausan. i. 38. 4). He was succeeded by his brother Cecrops II., eighth Attic king. The date is confirmed by Tatian and Clemens Alexandrinus, who make Ion and Cecrops II. contemporary with Acrisius.

1155 B. C. (= 1071 + "18th + 67 years" of Castor in Euseb. i. p. 131 = "85th year" of Syncellus, see also Homer il. ii. 105), Pelops brother of Broteas appointed curator of the Olympiads at Pisatis.

The most ancient statue of Cybele mother of the gods on the rock of Coddinos on mount Sipylus, made by Broteas brother of Niobe — (tradit. of the Magnetes in Pausan. iii. 22. 4). The statue has been recognized as the Niobe turned to stone of Homer il. xxiv. 603, Ovid met. vi. 155, and Pausanias viii. 2, continues extant (Van Lennep in trans. Amer. Orient. soc. May 1867), and is the earliest specimen known of *Greek art* (see Mycenæ).

The same year (= 1613 y. 2 mo. — "393 — 66 yrs" of Josephus, Manetho in Jos. c. A. i. 26 giving 1221 y. 2 mo. — "66 yrs" = 1155 y. 2 mo, and the Euseb.-Maneth. table 991 + "130 + 7 + 26 yrs" = 1154), possible date of the sacrilegious plundering of ten royal tombs at Thebes, and punishment of the offenders in the "19th year of Ramessu IX." — After his "19th year," Ramessu IX. associated his son in the government (Birch).

Helleborus Orientalis of the mountains of Asia Minor and Greece. Called by the Greeks "skarphe" (Sibth.), by the Turks "zoptème" (Lindl.): the "ēllēvōrōs melas" with which the daughters of Proetus were healed by Melampus son of Amythaon — (Hesiod in Apollod ii. 2. 2, Diosc., and Plin. xxv. 21), mentioned also by Euryphon 2 morb. 34, Theophrastus ix. 11, and according to Dioscorides having the root purgative and flower purplish, is referred here by writers: *H. Orientalis* is termed "h. niger Orientalis . . . flore purpurascens" by Tournefort cor. 20; was observed by Sibthorp, and Fraas, on the mountains of Asia Minor and Greece, frequent also in the environs of Constantinople; and is known to grow in Macedonia and Thrace (Spreng.). Farther South, the "ēllēvōrōs melas" is identified in Syn. Diosc. with the "zōmaritis" of the prophets, and "isaia" or "ēlaphuēs" or "kēmēlēg" of the Egyptians; and roots of "helleborum nigrum" were found by Forskal mat. med. used medicinally in Egypt. Westward, the "helleborus" is mentioned by Plautus, Horace, and Virgil, and the medicinal use in Italy of "elleborum nigrum" (probably imported roots) is implied by the account of Pliny xxv. 21 to 94. The root of *H. Orientalis* according to Lindley "is acrid and violently cathartic" but "is still used in the Levant." (See *H. niger*, and *Veratrum nigrum*.)

By Melampus also, the *worship of Dionysus* or Bacchus (derived according to Herodotus ii. 49 through the Cadmean Phoenicians in Boeotian Thebes) was extended in Greece. Melampus resided at first with his uncle king Neleus at Pylos:—and his descendants, hereditary prophets as far as Theoclymenus of the fourth generation seen by Telemachus, are enumerated by Homer *od.* xi. 291, and xv. 225.

1154 B. C. (= "527 A. D. + 1680" = 1804 A. D. + "2957 years" of Bentley *as. res.* viii. p. 233), the Hindu astronomer Parasara, whose rule for the adjustment of the calendar—is quoted in the Vedas.

"The same year = 1st year of Tcheou or Cheou-sin, of the Chang" or Fourth dynasty—(Chinese chron. table).

Olen of Lycia the earliest composer of "umnoi" or hymns among the Greeks—(Herodot. iv. 35, and Pausan. ix. 27. 2): "hymns to the gods" were recited or sung during the Trojan war (Homer *il.*).

The names of a party of Hyperborei visiting Delos recorded by Olen of Lycia:—Hyperborei are also mentioned by Boeo of Delphi, Hesiod *epigon.*; and their home is placed by Aeschylus *prometh.*, and Pindar, at the sources of the Ister or Danube.

The arts of *agriculture* and *weaving cloth* known to the Hyperboreans as early probably as this date (see Meneptha Sethos, and amber):—the presents they continued sending to Delos came wrapped in straw of "purōs" (Herodot., and Paus. i. 31. 2):

And in direct accordance, the two kinds of grain most anciently cultivated in Switzerland are shown by the debris of lake-villages to be *Triticum vulgare* var. antiquorum (Heer, see also Chinnoung), and *Hordeum vulgare* var. hexastichum sanctum, six-rowed barley.

Linum angustifolium of Europe and the adjoining portion of Asia. Called in Greece "agriōlinari" (Sibth.): and shown by the debris of lake-villages to be the kind of *flax* cultivated in Switzerland for weaving cloth during the Stone period—(Heer): *L. angustifolium* is termed "l. sylvestre angustifolium floribus dilute purpurascens vel carneis" by Tournefort *inst.* 340: was observed in Barbary by Desfontaines; and is known to grow in Britain, especially in the vicinity of the sea (Huds., *Engl. bot. pl.* 381, and Pers.). Eastward, the "amōrithōs" is mentioned by Aristophanes *lysistr.* 735; "amōriginōs hitōn," by Antiphanes, and Pollux; the "amōrgis" is identified by Orion *etym.* with the "linōkalamēn;" and according to other authority, is the most slender kind of flax and an herb with a purple flower (see also Scarlatius): *L. angustifolium* was observed by Sibthorp and Chaubard, in Crete and the Peloponnesus.

The domestic animals of Switzerland during the Stone Age, are enumerated as: the *bullock*, *Bos taurus*, a small race with the horns short and incurved forward; the *goat*, *Capra hircus*, numerous; the *sheep*, *Ovis aries*, in rare instances; *swine*, *Sus scrofa* domesticated; and the *dog*, *Canis familiaris* (Troyon p. 273 and 442).

In Denmark, judging from the culinary relics, the *dog* appears to have been the only domestic animal during the Stone Age (Troyon), but additional wild animals occur in debris of the earliest dwellings and villages, as the following used for food: the *seal*, *Phoca*; *lynx*, *Felis lynx*; the "rat de terre" . . . of birds, the *wild swan*, *Cygnus* . . . ; *eider duck*, *Anas mollissima*; "petite oie sauvage," *Anser* . . . ; *great auk*, "*Alca impennis*;" "coq de bruyère," *Tetrao* . . . of fishes, the *herring*, *Clupea* . . . , and *eel*, *Anguilla* . . . of Crustacea, the *crab*, *Cancer* . . . and of mollusks, the *oyster*, *Ostrea* . . . ; *scollop*, *Pecten* . . . and *land-snails*, *Helices* (Steenstrup, and Troyon 97).

"1150 B. C." (Pauth. note to Chi-King iii. 1. 1), Wen-Wang, founder of the Tcheou dynasty.

In this year (= 1071 + "80th year" of Philistus, Dionys. i. . .), the Sikels, driven out of Italy by the "Aborigines" and associated Pelasgian Greeks, proceeding to the neighbouring large island occupied by Sikani; an Iberian tribe recently driven there by the Ligurians. The Sikels formed settlements; and hence the name "Sikēlia" or *Sicily*.—The island of Sikelia is mentioned by Homer *od.*

The above event is further referred to the "twenty-sixth year of the priestess Alcyone; in the third generation before the fall of Troy" (Hellan.): the first part of this extract being from the Register kept at Argos by the priestesses of Juno. The language of this Register was in all probability Greek, and the *writing* alphabetic.

Lycus after governing Boeotian Thebes "twenty years" (including the short reign of Labdacus) slain and succeeded by Zethus and Amphion, sons of Antiopa. Instead of continuing the regency, they expelled Laius, and proceeded to build a wall around the city (Homer *od.* λ 262, Apollod. iii. 5. 2, and Pausan. ix. 5).

The improvement of combining *poetry* with *instrumental music* attributed to Amphion (Heraclides in Plut. *mus.* p. 1132). The poet-musician Linus at this time living,—whose tomb at Boeotian Thebes continued to be pointed out for many centuries (Pamph., Hes., Heraclid., and Pausan. ix. 29. 3).

Petroselinum sativum of the Mediterranean countries. Called in Britain *parsley*, by Treveris "percelly" (Prior), in Germany "petersilie," in Italy "petroselino" or "prezzemolo" or "apio ortense" (Lenz), in Greece "makéthônēsi" or "maithanō" or "murōthia pētrōsēlina" (Fraas) or "murōthia" (Sibth.), in Egypt "baqdunis" (Forsk.) or "maqedounis" (Del.); in which we recognize the "apium amarum" with which the poet Linus adorned his head — (Virg. ecl. vi. 98): the "apium" with which Nemean victors were crowned (Plin.) is identified by Cato with the "sēlinōn kēpaion" of Pindar, and Aristophanes, mentioned also by Dioscorides iii. 67; and the "sēlinō ōulō" is mentioned in 2 Morb. mul. 63: *P. sativum* was observed by Sibthorp on mount Athos and other craggy declivities in Greece, but by Chaubard, and Fraas, nowhere indigenous in the Peloponnesus. Farther South, the "moka-dunas" is mentioned by Ebn Baitar; *P. sativum* was observed by Forskal, and Delile, under cultivation in Egypt, the roots besides and "aqua petroselin." employed medicinally. Westward, the cultivation of the "apium" is mentioned by Columella, and Palladius, and directions for rendering the plant "crispus" are given by Pliny xix. 46: *P. sativum* is described by Dodoens pl. 694; is termed "a. hortense seu petroselinum vulgo" by Tournefort inst. 305; is known to grow wild on Sardinia (Pers., Moris i. p. 21, and Spreng.), and is besides cultivated and naturalized in Italy and throughout middle Europe as far as Britain (Wats., and A. Dec.). Eastward from Egypt, is called in Hindustanee "pitirseli" or "ajmod" or "karafs bostani," in Bengalee "randhani shak" (D'roz.), and was observed by Graham "in gardens" around Bombay; by Mason, "exotic" in Burmah: by Kaempfer, and Thunberg, under cultivation in Japan and called "kin," or usually "seri." By European colonists, was carried to Northeast America, where it continues under cultivation. The leaves according to Linley "are diuretic, and are at once recognized by their agreeable smell."

As early perhaps as this date, the accession of Ramessu X. Amunikhopsef, eighth king of the Twentieth dynasty. His name occurs on a tablet — now in the British museum, and in his own tomb at Bab-el-meluk (Glid. analect.).

1149 B. C. = "2d year of Ramessu X.," the latest date in his reign found on the monuments — (Leps. k. tab. p. 19).

"1144 B. C." (= 11th year of Cheou-sin, Pauth. note to Chi-King iii. 1. 3), Wen-Wang imprisoned by the emperor Cheou-sin — for three years.

During his imprisonment Wen-Wang explained the y-king or eight Koua symbols, and doubled the number of symbols. — His explanations were continued by his son Tcheou-kong (Visdelou, and Pauth. panth. lit.).

1141 B. C. (= 1122 + "19 years" of Euseb. i. and ii.), accession of Sosarmus as Assyrian emperor. The assigned length of this reign probably incorrect, falling short of the "twenty years" limit given by Cephallion; and in fact, the reign of Sosarmus is extended to "twenty-two" years by Syncellus.

The same year (= 1096 + "45 years" of Castor in Euseb. i. p. 129, see also Homer il. xiv. 319, Pherecyd., Pausan., and Clint. i. p. 81), not later than this date, death of Acrisius by the hand of his grandson Perseus. Perseus removed the Argive seat of government to Mycenae; and (according to Apollodorus ii. 4. 4, and Strabo viii.) built walls there. These cyclopiian walls include a gateway with two sculptured lions; an early specimen of Greek art — (see Sm. geogr. dict. and Broteas).

Boletus edulis of Europe and the adjoining portion of Asia. An edible mushroom called in Italy "ghezzo" or "porcino" or "bolè porcini" (Lenz), and the "mukēs" growing on the site and giving its name to the new city — (Paus. ii. 16. 3) may be compared: "mukai" are enumerated as edible by Epicharmus, Ehippus, Antiphanes, are termed "ēustōmōus" by Diphilus of Siphnus although in his day an article of food generally despised; and mushrooms growing near fig-trees are pronounced salutary by Nicander (Athen. ii. 56): "suilli" are enumerated by Pliny xxii. 47 as collected and dried in Italy, like those imported from Bithynia: *B. edulis* was observed by Sibthorp in woods in the Peloponnesus; and is known to grow in Italy and throughout middle Europe as far as Britain (Schæff pl. 134, Bulliard h. fr. i pl. 60. 494, and Sibth. oxon. 375).

"In the days of Shamgar the son of Anath, in the days of Jael" wife of Heber the Kenite (Song of Deborah, and Judg. iii. 31 and iv. 4), the country inhabited by the Twelve tribes disturbed and unsafe.

1139 B. C. (= 1131 y. 302½ d. + "7 years" of Judg. vi. 1), the army of Jabin king of Canaan at Hazor, defeated by the Israelites under Deborah and Barak.

In the Song of Deborah, "ships" mentioned, also embroidery or the Sidonian "needlework."

The accession of Ramessu XI. Siptah, ninth king of the Twentieth dynasty, hardly later than this year. His name has been found "only on a large tablet at Silsilis" — (Glid. analect.).

"1137 B. C. = 18th year of Cheou-sin" (Chinese chron. table), beginning of the Twenty-sixth cycle. The emperor urged to change his course by his minister Pi-kan, who was in consequence put to death: the first instance in Chinese history of this self-sacrifice (Pauth. p. 70).

Plantago major of Northern Asia. Called in France and Britain *plantain* (Prior, and Nugent), in Germany "wegerich" (Grieb), in Italy "piantaggine maggiore" (Lenz), in Greece "pēntanēurōn" (Forsk., and Sibth.), in Egypt "massasah" or "lissan el-hamal" lamb's tongue (Del.), by the prophets "ōuran ihnēmōnōs," in Egyptian "asōnth" or "asōēth" (Syn. Diosc.) or "asōut" from "ēsōōu" sheep (Kirch.), in Japan "siaden," or usually "obako" (Thunb.): the "feou-yi" gathered by women in pathways and under the wheels of chariots according to an ancient ode — (Chi-King i. 1. 8) is referred here by Pauthier: *P. major* was observed by Kaempfer, and Thunberg, in Japan; by Siebold, on Yezo; by Gmelin, throughout Siberia. Westward, "lissan el-hamal" translated into Greek becomes the "arnōglōsson" of Theophrastus vii. 8. 3, and Themison, "arnōglōssōn mēizōn" being medicinally the most useful kind according to Dioscorides: in Syn. Diosc., the "arnōglōssōn" or "arnēiōn" or "provatēiōn" or "ēptaplēurōn" is identified with the "atičirkōn" of Numidians, "thēsarikam" of Spaniards, and "tarvēlōthathiōn" of Gauls; and the "heptapleuron" is identified by Pliny xxv. 39 with "plantago maior:" *P. major* is known to occur in waste places along the Taurian mountains (Bieb.); was received by A. Richard from Abyssinia; was observed by Forskal, and Delile, around Damietta and Cairo; by Forskal, Sibthorp, Chaubard, and Fraas, frequent from Constantinople to Crete and the Peloponnesus; is known to occur in pathways from Italy throughout Western Europe as far as Lapland (Tourn. inst. 126, Pers., and Wats.). Eastward from Japan, may have been carried by Aino or Aleutian colonists to America; was received from the neighbouring American coast by Gmelin, was observed by Brackenridge around Chinnook villages on Gray's harbour, but otherwise by him and myself throughout Oregon only around the trading-post of Fort Colville; was received however by Hooker from California, Fort Vancouver, and Sitcha; was observed by Nuttall on the Arkansas; and in 1515 by Oviedo gen. hist. xi. 2 in the West Indies, "plantē al qual los medicos llamen plantago." In our Atlantic States, has an indigenous aspect along salt-marshes, was received by Hooker from Labrador, and observed by him on Iceland, yet may have been introduced throughout by European colonists: Josselyn voy. 188 and rar. 86 found in 1663 "broad-leaved plantain" the only "sort" in New England, which "the Indians call Englishman's foot, as though produced by their treading;" Bartram also found the natives "pretending that this plant never grew here before the arrival of Europeans" (Kalm trav. i. 92); and in various instances the plant has certainly accompanied the footsteps of fur-traders. Clearly also by European colonists, was carried to the Southern Hemisphere; to Chili (C. Gay); and to New Zealand, occurring there in but one known locality (Raoul, and A. Dec.; see *P. media*).

Hardly later than this date, *Panacea* the "all-healing." — She was regarded as the daughter of Aesculapius, and a temple was erected to her at Oropus (Aristoph. plut. 702, Paus. i. 34. 2, and schol. Aristoph.).

Ferula ferulago of the East Mediterranean countries. The "panaces" called after Aesculapius because he named his daughter Panacea, — further described by Pliny xxv. 11 as yielding "succus coactus ferulae," that procured in Macedonia being called "bucolicon," may be compared: "halvanē" produced in Syria by a plant called "panakēs," is mentioned by Theophrastus ix. 7 to 11; "halvanis riza," by Nicander ther. 938; a "narthēx" in Syria producing "halvanē," by Dioscorides iii. 87; "galbanum" produced by a "ferula" growing on mount Amanus in Syria and called "stagonitin," by Pliny xii. 56; *F. ferulago* was obtained by Lobel obs. 451 from seeds found in the gum (Spreng.); was observed by Sibthorp, and Chaubard, from Crete to the Peloponnesus; is known to grow also in Transylvania, Gallicia, and as far as Caucasus (Jacq. austr. app. pl. 5, and Lindl.). Westward, is termed "*f. galbanifera*" by Tournefort inst. 321; is known to grow in Sicily (Morison ix. pl. 15, and Pers.); and was observed by Desfontaines p. 251 in Barbary. The plant according to Lindley "yields abundantly a gum-resinous secretion," but "it would appear that the opinion of" its producing galbanum "is unfounded." (see *G. officinale*).

Thapsia Asclepium of the East Mediterranean countries. Called in Greece "aglēgōra" (Sibth.); and the "panakēs asklēpiēiōn" — distinguished from the preceding by Theophrastus ix. 8 to 11, having a white root a span long "alukōthē" brackish, stem geniculate every way, and "thapsia"-like leaves, which according to Dioscorides are hairy and the flowers yellow, is referred here by Columna (Spreng.): *T. Asclepium* was observed by Sibthorp from the Peloponnesus to Rhodes and Constantinople. Westward, is enumerated among foreign plants in the Ortus Sanitatis and termed "thapsiam" (Spreng.), but was found by Brassavolus on the Appenines; is described also by Matthioli 545, and Columna ecphr. i. pl. 85; is termed "th. tenuiore folio apula" by Tournefort inst. 322; and is known to grow as far as Apulia at the Southern extreme of Italy (Pers.).

"1134 B. C. = 1st year of Wou-wang" (Chinese chron. table). A vase dedicated to Wou-wang's father Wen-wang, is figured by Pauthier pl. xxxix. 5.

Ninety-fifth generation. Sept. 1st, 1134, mostly beyond youth: Boaz, and Ruth; the high-priest Bukki (1 Chron. vi. 5, Ezr. vii. 4, and Josep. v. 116); Bellerophon grandson of Sisypheus (Hom. il. vi. 154); Laomedon king of Troy and father of Priamus, and Capys father of Anchises

(Hom. il. xxiv. 215 to 240); the Phrygian flute-player Marsyas, son of Hyagnis (Plut. mus., Clem. Alex., and others); Pittheus son of Pelops (Pind. and Apollod.).

1132 B. C. (= 1113 y. 302 $\frac{1}{8}$ d. + "18 years" of Judg. x. 8), the Midianites defeated by the Israelites under Gideon, also called Jerubbaal.

Ramessu XI. built the temple in the rear of Karnak — dedicated by his successor to the god Khons (Birch).

Platanus Orientalis of the Tauro-Caspian countries. Called in Britain *plane tree* (Prior), in Italy "platano" (Lenz), in Greece "platanōs" (Sibth.), in which we recognize the "platanus" on the road from Apamea into Phrygia, said to be that on which Marsyas was hanged, — and which continued to be pointed out in the days of Pliny xvi. 88 and 89; who further mentions a "platanus" at Delphi said to have been planted by Agamemnon, and trees or their offshoots continuing on the tomb of Protesilaus within sight of Troy: the "platanistōs" (translated "platanus" by Cicero) was already at the beginning of the Trojan war in Asia Minor and Greece, as appears from Homer il. ii. 307; is mentioned also by Herodotus vii. 31; and the "platanōu" is described by Dioscorides as having green globular fruit and down on the leaves: *P. Orientalis* was observed by Forskal, Sibthorp, Chaubard, and Fraas, abounding along streams in Asia Minor and throughout Greece and the Greek islands, besides being sometimes planted. Farther South, was already planted in Egypt in the days of Theophrastus; and was observed there in gardens by Forskal, Clot-Bey, and by myself as far even as Middle Egypt. Westward, according to Pliny xii. 3 the "platanus" was first brought over the Ionian Sea to the isle of Diomedes to adorn his tomb there, and thence to Sicily, having been planted by the first Dionysius; "platanōs" trees on the tomb of Diomedes are mentioned also by Theophrastus: *P. Orientalis* continues to be planted for ornament in Southern and middle Europe.

1131 B. C. (= 431 + "700 yrs" of Thucyd. v., Tourn. trav. i. 174), from this date the island of Milo, halfway between the Peloponnesus and Crete, — retained its independence "seven hundred years."

1130 B. C. (= 1071 + "60th year" of Dionys. i., see also Strab.), in Italy, arrival of Evander from Arcadia with "two ships" and the *alphabet*; which had "recently been acquired by the Arcadians." He was amicably received by king Faunus of the tribe called "Aborigines," and allowed to settle on the Palatine hill: — four centuries later, included in the site selected for the city of Rome.

Acer pseudoplatanus of Europe and the adjoining portion of Asia. Called in Britain *sycamore* or *great maple* (Prior), in Germany mountain "ahorn," in Italy "acero" or "acero di montagna" (Lenz), in which we recognize the "acernis" of which the spear of Evander was made — and the Trojan horse (according to Virgil aen. ix. 87), the tree growing in the sacred groves of Phrygia. the "klinōtrōhōn" with wood white and tough employed for the rollers of bedsteads, is further described by Theophrastus iii. 10 as having the leaves lobed as in the plane but less fleshy and pointed at the apex: *A. pseudoplatanus* has been observed by modern travellers in Greece, and according to Forskal is called there "platanōs": farther South, was observed by Clot-Bey in the gardens of Egypt. Westward, the "*acer gallicum*" affording wood of special whiteness, is further described by Pliny xvi. 26 as growing in Italy North of the Po, and in the country beyond the Alps; *A. pseudoplatanus* is known as a lofty forest-tree in France and middle Europe as far as "Lat. 52°" (Duham. i. pl. 36, Pers., A. Dec., and Daub.); and is besides planted for ornament (Engl. bot. pl. 303). By European colonists, was carried to Northeast America, where it continues occasionally planted; to the Mauritius Islands, where it is called "platane," but was not seen by Bojer flowering.

1128 B. C. (= 51 A. D. + "1178 years" of Plin. xvi. 79, pseud.-Aristot. mir. 146 giving 859 + "287 years" = 1146, see C. Mull. geogr. min. i. p. xx), Utica, sometimes called "Old Carthage," founded by Phoenician mariners.

Cedrus Atlantica of the Atlas mountains. Rafters of the temple of Apollo at Utica, built at the same time with the city, — continued extant in the days of Pliny xvi. 79, and proved to be of "numidicorum cedrorum;" referred by A. Decandolle to the *cedar of Atlas*: the timber was doubtless sometimes imported into Egypt and Italy, and included in the "*cedrus magna*" of Pliny; but the living *C. Atlantica* remained unknown to botanists until recently discovered by Manetti (see C. Libani).

The same year (= 991 + "130 + 7 yrs" of the Euseb.-Maneth. table), possible date of the accession of Ramessu XII. Miamun, tenth king of the Twentieth dynasty. His name occurs at Karnak, Medinet Abu, on a stela — now belonging to Mr. Hoskins (Glid. analect.), and in his own tomb at Bab-el-meluk.

1127 B. C. (= 1071 + "56 years" of Clint. i. p. 78, see Hom. il. xi. 719, and Pind. ol. ix.), war against king Neleus of Pylos, his son Nestor at this time regarded as too young to bear arms. Other particulars illustrating the condition of Greece from this period — down to the Trojan war, are contained in the narrations of Nestor.

Mulius, the husband of Agamede daughter of king Augeas of Elis, slain in battle by Nestor.

Agamede was acquainted with all the "pharmaka" medicinal plants that the Earth produces — (Hom. *il.* xi. 739).

Geranium Robertianum of Europe and the adjoining portion of Asia. Called in Britain *herb robert* from at least the Thirteenth century (ms. vocab., and Prior), in Germany "ruprechtskraut" (Grieb): the "heracleon siderion" supposed to have been discovered by Hercules — (Plin. xxv. 15), termed "sithēritis ēraklēian" by Cratevas, agglutinating wounds according to Dioscorides, and growing in vineyards and along walls, its single root giving out many coriander-like leaves around smooth tender whitish or reddish stems a span high and bearing small red flowers bitter and viscous to the taste, is referred here by Dodoens p. 62, and Anguillara p. 257: *G. Robertianum* was observed by Sibthorp, and Chaubard, in shaded situations in the Peloponnesus and on the Greek islands. Westward, the "amomum" of *Ortus Sanitatis* 22 is referred here by Sprengel: *G. Robertianum* is described by Brunsfels *il.* 37, Fuchsius *iii.* 206, and Tournefort *inst.* 268; was observed by Desfontaines in the gardens of Algiers, by Savi in Etruria, and is known to grow throughout middle Europe as far as Denmark and Moscow (*fl. Dan.* pl. 694, Pers., and Dec.). By European colonists, was carried to Northeast America, where it has become naturalized in our Northern and Middle States, observed by myself among shaded rocks in wild situations; to Brazil, observed in the streets of Porto Alegre by A. Saint-Hilaire (*A. Dec.*). Employed in Germany according to Prior to cure a disease called "ruprechts-plage;" and according to Lindley, "a popular remedy in Wales in Nephritic complaints."

Scrophularia lucida of the East Mediterranean countries. Possibly the plant in question: — the "sithēritis ēraklēian" as described by Dioscorides, and Pliny, is referred here by Sibthorp, and Sprengel; and the "sideritin" by some regarded as the "achilleon" is enumerated by Pliny xxv. 19 as growing on walls and fetid when bruised: *S. lucida* is termed "*s. saxatilis lucida laserpitii massiliensis foliis*" by Tournefort *inst.* 167; was observed by Sibthorp, and Chaubard, on the Greek islands; is known to grow on Crete and about Naples, and on the walls of Hydrus in Southern Italy (*Bocc. mus. pl.* 117, and Pers.). "*S. livida*" observed by Sibthorp *pl.* 601 in Asia Minor, but regarded by Bory as not distinct, seems the "*aliā sideritin*" of Pliny xxv. 19 growing in vineyards and resembling the preceding, but having whiter and more fleshy leaves.

Heracleum sphondylium of Europe, Northern Asia, and Northwest America. Called in Britain *cow-parsnep* (Ainsw., and Prior) or *brankursine* (Lindl.), in Germany "barenklau," in Italy "panace" or "panace erculeo" (Lenz), in which we recognize the "panakēs ēraklēiōn" — having according to Theophrastus *ix.* 11. 3 large spreading leaves three palms either way, and a bitterish root as thick as the finger: *H. sphondylium* was observed by Sibthorp, and Chaubard, from the Peloponnesus to mount Athos. Westward, is described by Rivinus *pl.* 4: is termed "sphondylium vulgare hirsutum" by Tournefort *inst.* 320, "*s. branca ursina*" by Hoffmann; was observed by Scopoli in North Italy, by Linnæus in Sweden, its young shoots eaten; and is known to grow throughout middle and Northern Europe (Pers., and Engl. bot. *pl.* 939). Eastward from the Black Sea, is known to grow throughout Siberia to Kamtschatka (Spreng.), and as far as Unalaschka near the American coast (Lindl.). The "rind and root" according to Lindley "are acrid and will ulcerate the skin," but the "root contains sugar."

Pastinaca opopanax of the East Mediterranean countries. Called in Greece "pōlukarpōn" or "ampelōna" (Sibth.) or "kōphtia" (Fraas): the "panakēs ēraklēiōn" — of Dioscorides yielding "ōpōpanax" and growing in Cyrene, Arcadia, Boeotia, and Macedonia, cultivated besides for its juice, very tall with a terminal "anēthōu"-like umbel of yellow flowers, the seed fiery and fragrant, clearly belongs here: "jawashir" is mentioned by Rhazes, Avicenna, and gum "opopanax" called "djoaschir" is enumerated by Alpinus, and Forsk. *al. mat. med.*, as imported into Egypt from Syria: seeds of *P. opopanax* were found in the gum by Dodoens p. 309; and the living plant was observed by Sibthorp, Chaubard, and Fraas, frequent in the Peloponnesus and Southern Greece; is known to grow also in Syria (Pers.). Westward, the account by Pliny *xii.* 57 and *xx.* 100 of the "panacem" five cubits high, the drug "opopanax" being separately mentioned, seems chiefly taken from the Greeks: *P. opopanax* is described by Lobel *adv.* p. 312 as observed by him near Montpellier (Spreng.); is termed "*p. sylvestris altissima*" by Tournefort *inst.* 319; is known to grow also in Hungary, Italy, and Sicily (*Gouan pl.* 13, *Lam. fl. fr.*, *Kitaib. hung.* *iii.* *pl.* 212, and Pers.). According to Lindley, *opopanax* is "a fetid gum resin similar in its effects to assafoetida."

Lagoecia cuminoides of the East Mediterranean countries. Called in Greece "lagōkuminō" (Fraas) or "agriōrigani" (Sibth.); in which we recognize the "agriōriganōs" identified in Syn. Diosc. with the "panakēs ēraklēiōn," — and according to Dioscorides *iii.* 31 having slender stems a span high, "anēthō"-like umbels, white flowers, and a slender useless root: the "panakē lēptōphulōn" is mentioned by Theophrastus *ix.* 11. 4; and the "lagōu kuminōn" in Syn. Diosc. *iv.* 17: *L. cuminoides* was observed by Sibthorp, Chaubard, and Fraas, in vineyards and cultivated ground frequent from the Peloponnesus throughout Greece. Westward, is described by Matthioli (Spreng.); is termed "cuminum sylvestre capitulis globosis" by C. Bauhin (Pers.), "cuminoides vulgare" by Tournefort *inst.* 301.

Origanum Creticum of the Mediterranean countries. Also called in Greece "agriōrigani" (Sibth.); in which we recognize the "agrian ōrēiganōn" or "panakitha" or "ēraklēiōn" — identified by Diocles with the "kōnīlēn" (Petrich. oph., and schol. Nicand.); also the "panakē" not "lēptōphul-lōn" of Theophrastus ix. 11. 4; the "panaktēiōn kōnīlēn" of Nicander ther. 626; the "cunilam bubulam" called "panacem" by Cratevas, bruised and placed on wounds and taken internally against serpents even by tortoises (Plin. xix. 50 to xx. 61); the "agrian ōriganōn" by some called "panakēs" according to Dioscorides iii. 49, his "agriōriganos," identified with the "kōnīlēn" of Nicander, so far as relates to the "ōriganō" — like leaves clearly belonging here; also the "panaces heraclion" of Pliny xxv. 12, attributed to Hercules and by some called "origanum heracleoticum silvestre" from resembling "origano," its root useless: *O. Creticum* was observed by Sibthorp, and Fraas, from Crete and Greece throughout the Greek islands; is known to grow also in Palestine (Pers.). Westward, is described by Lobel pl. 494, and Tournefort inst. 199; was observed by Lenz in Italy, and is known to grow in other parts of Southern Europe (Pers.; see *O. Heracleoticum*).

Hyoscyamus albus of the Mediterranean countries. Called in Greece "gērōuli" or "uōsku-amōs," by the Turks "ben tochunni" (Sibth.), in Egypt "beng" (Del.), in which we recognize the "uōskuamōs" supposed to have been discovered by Hercules — (Plin. xxv. 17), mentioned also by Pherecrates, Xenophon oecon. i. 13, Nicander alex. 415, Paulus Aegineta, and the medicinal and mildest kind described by Dioscorides as white-seeded and growing by the seaside and in waste places: *H. albus* was observed by Forskal, Sibthorp, and Chaubard, in precisely those situations from the Peloponnesus to Smyrna. Farther South, the "hyoscyamus" or "apollinaris" is identified by Pliny with the "altercum" of the Arabs; *H. albus* was observed by Delile around Alexandria, but the seeds of "hyoscyamus" or "bindj" employed medicinally in Egypt were found by Forskal mat. med. to be imported from Greece. Westward, "hyoscyamus" is prescribed by Celsus ii. 33; seeds of "alterci albi" and roots of "apollinaris herbae," by Scribonius Largus 90 to 121; the "apollinaris" of the Romans is mentioned also in Syn. Diosc., and Pliny's description corresponds: *H. albus* is termed "h. a. major vel tertius Dioscoridis et quartus Plinii" by Tournefort inst. 118; and is known to grow in Italy and other parts of Southern Europe (Blackw. pl. 111, Pers., Spreng., and Lenz).

Colchicum montanum of the East Mediterranean countries. The "petilio" said to have been named by Hercules, — in the autumn according to Pliny xxi. 25 springing up among brambles and commended for its colour only which is that of "rosae silvestris," the leaves appearing after the nodding flower turns upwards, "parvo calyce at versicolori" enclosing yellow seed, may be compared: *C. montanum* is described by Clusius hist. i. pl. 200; is termed "*c. m. angustifolium*" by Tournefort inst. 350; was observed by Sibthorp on the mountains of Attica, and by D'Urville on the island of Milo (Bory).

1124 B. C. (= 1071 + "23 + 30 years" of Castor in Euseb. i. p. 134, see also Pausan. i. 5. 3). A date possibly marking the accession of Pandion II., son of Erechtheus, and now ninth Attic king.

1123 B. C. = "6th year of Ramessu XII.," on the monuments — (C. Mull. fr. Man. p. 589).

"1122 B. C. = 13th year of Wou-wang; who, vanquishing Cheou-sin," now becomes the head of the new dynasty of the Tcheou. He changed the name of the years from "sse" to "nian," a term having reference to harvest-time (commentator of the Li-ki, and Chinese chron. table). Wou-wang also reformed the calendar: making "the lunation containing the Winter solstice the first one of the year;" and making "the civil day commence at midnight."*

Khi-tsu of the dethroned imperial family, unwilling to accept office under Wou-wang, was made king of Corea — (geogr. Chin., and Klaproth).

In this "13th year" (Chou-king iv. 4. 1), the Hong-fan, a philosophical treatise attributed to the emperor Yu, delivered by prince Ki-tse to Wou-wang.

* *Euryale ferox* of Southern China. A kind of *water-lily* having leaves nearly a yard in diameter and thorny on the nervures and petiole, called in China "ki-teou:" at this time under cultivation but rare, — has since according to Cibot (mem. Chin. iii.) become more frequent, its seeds yielding farina, the pulp around them eaten, and the root used medicinally; was observed by G. Staunton in the province of Kianang. Westward, was carried at an early period to Hindustan, where it has become seemingly wild in lakes in Chittagong and Eastward of Calcutta and Lucknow, and is called in Hindustanee "machana" (Roxb., Royle, and Drur.).

Rubus Moluccanus? of Eastern Asia. Called in Bisaya "dagamit" (Blanco), in Japan "fugu itsiigo" (Siebold); and the "ronces flexibles" holding back the door of tombs, mentioned in an ode of the kingdom of Tchín — (Chi-King i. 12. 6) may be compared: *R. Moluccanus* was observed by Rumphius v. pl. 47 on Amboyna (Pers.); by Roxburgh, Wallich iii. pl. 234, Wight, and Graham, in Hindustan; by Mason, in Burmah; by Blanco, on the Philippines; by Thunberg, in Japan; by Siebold, on Yezo, enumerated among the useful plants.

"When the Tcheou conquered the Chang" (topog. Cant., and Pauth. p. 472), eight barbarous nations in communication with China.

The same year (= 1095 + "27 years" of Euseb. i. and ii., and Syncell., see also Cephal.), accession of Mithraeus or Metraios as Assyrian emperor.

Aconitum napellus of the mountains of middle and Eastern Europe. Called in Britain *monks-hood* or *aconite* (Prior), in Italy "napello" or "aconito" (Lenz), in Greece "akōnītōn," in which we recognize the "akōnītōn" discovered by Hecate, wife of Aeetes king of Colchis and mother of Medea — (Diodor. iv. 45); growing in the countries on the Black Sea according to Theopompus, and Strabo, mentioned also by Heraclides, Antigonus Carystius, Euphorion, and Aelius Promotus, and the "akōnītōn pōntikōn" used by physicians of Syn. Diosc. iv. 78: the "parthalianhēs" whose root was placed in meat to destroy wild beasts, according to Aristotle an. ix. 6, and Nicander alex., identified in Syn. Diosc. iv. 77 with the "thēluphōnōn" or "thērōphōnōn" or "muōktōnōn." may also belong here: *A. napellus* was observed by Sibthorp in the Peloponnesus. Westward, Calpurnius Bestia consul B. C. 111 was accused of poisoning women with "aconitum." and this material is mentioned as a poison by Ovid, by Pliny xxv. 75 and xxvii. 2 as the most speedy poison known: *A. napellus* is described by Lobel pl. 679, and Clusius hist. ii. pl. 96; is termed "a. cæruleum seu napellus primus" by Tournefort inst. 425; is known to grow wild on the mountains of Italy Switzerland and Eastern Germany (Spreng., and A. Dec.); is besides cultivated and naturalized throughout middle Europe, and was already in Britain in the days of Gerarde. By European colonists, was carried to Northeast America, where it continues to be cultivated for ornament. The plant according to Lindley is "a true narcotico-acrid poison," and "numerous fatal cases of its application are recorded."

About this time (Sm. b. d.), Clymenus king of Orchomenus slain by Perieres at the festival of the Onchestian Neptune. His son and successor Erginus marched at once against Boeotian Thebes, and compelled the inhabitants to pay an annual tribute.

Lonicera periclymenum of Europe and the adjoining portion of Asia. Called in Britain *woodbine*, in Old English "woodbinde" or "woodvynde," in Anglo-Saxon "wudu-bind" or "wudu-winde" (Prior), in Germany "geissblatt" (Grieb), in Italy "periclimeno" (Lenz), in Greece "agriōklēma" (Fraas), in which we recognize the "pēriklumēnōn" identified through Syn. Diosc. with the "klumēnōn" named after king Clymenus (Plin.) and called in Egyptian "klumēniōn" or "agōnōn" or "ōxiōni": — the "klumēnōn" is described by Dioscorides as having a tetragonal stem and plantain-like leaves, the mountain kind best, the juice of the root and whole plant astringent and refrigerating administered in potion, and the bruised leaves applied to recent wounds: *L. periclymenum* was observed by Sibthorp, Chaubard and Fraas. in Greece and Cyprus, along hedges as well as on the mountains. Westward, the "klumēnōn" by some called "smilax" or "kalukanthēmōn" or "ēliōphuēs" or "ēpatitis" or "anatōlikōn" or "thutikōn" or "mērginē" is identified in Syn. Diosc. with the "ōuōlōukrōm" or "ōuōlōukrōm maiōus" of the Romans; the "*clymenus herba*" is described by Pliny xxv. 33 and xxvi. 48 as growing in woodland and mountainous situations, the stem "inani articulis præcincta," the odour "gravi," and the seed ivy-like and administered in wine: *L. periclymenum* is described by Tragus f. 311, and Fuchsius p. 646; is termed "wald-winde" by Gerarde (in Tabernæm. ii. 616), "*caprifolium germanicum*" by Tournefort inst. 608; and is known to grow in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 908, and Pers.).

Lonicera caprifolium of the wooded portion of the Mediterranean countries. Called in Britain *caprifoly* (Prior), in Italy "caprifolio" or "madreselva" (Lenz), in Greece "agriōklēma" (Sibth., and Forsk.), in which we recognize the "sylvae matrem" identified by Scribonius Largus 129 with the "pēriklumēnōu" of the Greeks; called by some "klumēnōn" — (according to Syn. Diosc.), and described by Dioscorides as twining around other shrubs in hedges and cultivated places, and having at intervals leaves "pēricilēphōta" surrounding the stem (compare also Periclymenus brother of Nestor, Hom. od. xi. 285): *L. caprifolium* was observed by Forskal, Sibthorp, and Chaubard, frequent in hedges from the Peloponnesus throughout the Greek islands to Constantinople. Farther South, the "pēriklumēnōn" by some called "kalukanthēmōn" or "ēpatitis" or "aiginē" or "klēmatis" or "karpthōn" or "splēniōn" or "ēlxinē mēizōn" or "mursinē" is identified in Syn. Diosc. with the "pōliōn aphrōthitēs" of the prophets, and "tōurkōn" of the Egyptians. Westward, with the "lanath" of the Numidians, and "ōuōlōukrōm maiōus" of the Romans; the account of the "periclymenos" by Pliny xxvii. 94 seems chiefly taken from Dioscorides; but *L. caprifolium* is described by Matthioli p. 691 (Spreng.), is termed "c. italicum" by Tournefort inst. 608, and is known to grow wild in Southern France (Mut., Gren., and A. Dec.); is besides planted for ornament throughout middle Europe, and has become naturalized in various localities as far as Britain (J. E. Smith flor. 260, Wats., and Bromfield). By European colonists, was carried to Northeast America, where it continues to be cultivated for ornament.

1117 B. C. (= 1114 + "3 years" of Judg. ix. 22), not later than this date, Abimelech son of Jerubbaal made by the "men of Sechem" ruler "over Israel."

Lycium Europæum of the Tauro-Caspian countries and mountains of Tropical Arabia. Called in Greece "ramnōs" (Sibth.), in Egypt and Yemen "ausadj" or "ausædj" (Forsk.), in which we recognize the "ramnōs" identified in Syn. Diosc. with the "atathin" of the Numidians; or "atth" of Jotham son of Jerubbaal — (Judg. ix. 14), and Psalm lviii. 9: *L. Europæum* was observed by Hasselquist in Palestine; by Alpinus, Forskal, and Delile, at Alexandria and Damietta. Among the Greeks, the "ramnōs" was regarded sacred to Aesculapius (Pausan. iii. 14), is mentioned also by Sophron, Euphorion, Eupolis, Theophrastus, Nicander; and is described by Dioscorides as a shrub with straight thorns growing along hedges: *L. Europæum* was observed by Sibthorp, and Chaubard, frequent in hedges in Greece. Westward, the "ramnōs" is identified in Syn. Diosc. with the "spina kervalis" of the Romans, but the account of the "rhamnus" by Pliny xxiv. 76 seems in part taken from Dioscorides: *L. Europæum* is known to occur also in Italy, Barbary, Portugal, and France (Pers.). In its wild state, was observed by Pallas trav. iv. not far from Astrakan; by Forskal, among the mountains of Yemen.

"Before the time of Homer" (Strab. iii.), the Phoenicians, in possession of the best part of Africa and Spain, discovered the Islands of the Blest (Canaries), not far from the extremity of Mauritania, opposite Gades (Cadiz).

"1116 B. C. under the Tcheou dynasty" (Stan-Jul.), the following plant known to the Chinese.

Carthamus tinctorius of Eastern Asia. Called in English gardens *safflower* (Prior), in Germany "saflor" (Grieb), in France "safranon" or "faux safran" (A. Dec.), in Italy "zafferano falso" or "sarcinesco" or "zaffrone" or "cartamo" (Lenz), in Greece "saphlanōni" or "asphōuri" (Fraas), in Egypt "ösfar" or "qortom" (Forsk.), in Egyptian "tshōug" (Lex oxf.) or "jōui" (Kirch.) or "shōush" (ms. Par.), in the environs of Bombay "koosumba" (Graham), in Japan "benino fanna" or "kookva" or "kurenai" (Thunb.), and as early as this year used in China in cosmetic pigment; imported in "115 B. C. under the Han dynasty" (Stan. Jul. industr. chin. 83), but at present cultivated and exported (parcels examined by myself): was observed by Kaempfer, and Thunberg, under cultivation in Japan as well as growing spontaneously, and occasionally employed by women to tinge the lips. Westward, is enumerated by Mason v. p. 512 as "exotic" in Burmah and extensively cultivated, "the best yellow dye in the country, and mixed with other ingredients" to "dye red and to give a variety of tints:" is termed "crocus indicus" by Rumphius v. pl. 79; was observed by Roxburgh under cultivation in Hindustan; by myself, commonly cultivated on the Deccan, for the use according to Graham "of dyers and for the oil obtained from the seeds;" and according to Gibson cultivated "also in Guzerat to a small extent." Farther West, "krököpēplōs" saffron-coloured clothing was known to Homer il. xxiii. 227; the term "krökōvaphēs" dyed with saffron occurs in Aeschylus ag. 1092, "krökōtithiōn" and "krökōtōs" saffron robe in Aristophanes lys. 48 and ran. 46, "crocotula" saffron garment in Plautus, "tunica crocina" in Catullus; the "cnicon" mentioned by Pliny xxi. 53 to 107 as unknown in Italy, an "aegyptia herba" with seeds yielding oil, may in part belong here; and the "kurthum" or "usfar" is mentioned by Ebn Masawia, Abi Othman, Abu Hanifa, Ebn Masah, Maserjawia, Rhazes, Edrisi, and Ebn Baitar: *C. tinctorius* was observed by Abd-allatif, Forskal, Delile, and Clot-Bey, under cultivation in Egypt; by Grant in descending the Nile was found cultivated "for its oil" at Kartoom in 15° 30'; was seen by Fraas experimentally cultivated in Greece; is described by Caesalpinus, and Bauhin iii. p. 76; and is known to be now cultivated in Italy (Lenz). By European colonists, was carried to Northeast America, where it continues in gardens. (See *C. Creticus*).

"1115 B. C. = 1st year of Tching-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table). The earliest round *copper-money* having "a square hole in the middle," issued during the reign of Tching-wang (Pauth. 84).

Ranunculus thora of the mountains of middle and Eastern Europe. The acrid juice of its root employed by Swiss hunters to envenom their weapons (Lindl.) as early perhaps as this date, in accordance with the Latin word "toxicum" perverted from the Greek through the use of poisoned arrows — (Nicand. alex. 207 and schol. Plin. xvi. 20): the word "toxicum" occurs as early as Plautus: the "phthoram" of the Waldenses or *R. thora* is described by Gesner hort. f. 244 (Spreng.), and C. Bauhin pin. 284; is termed "*r. cyclaminis folio asphodeli radice major*" by Tournefort inst. 285; and is known to grow "near the limits of perpetual snow" on the Pyrenees, Alps, and Carpathians (Jacq. austr. pl. 442, Pers., A. Dec., and Lindl.). Eastward, the "thruōn," a magic plant of the Colchians (argon. Orph. i. 916), is identified in Syn. Diosc. with the "pēntathruōn" or "struhnōn manikōn;" the "thruōrōn" or "pērittōn" or "struhnōs manikōs" is described by Theophrastus ix. 11. 6 as having a head like the fruit of the plane tree, and Dioscorides adds that the head is sessile; the "manicon" is further identified by Pliny xxi. 105 with the "dorycnion" poison in which spear-points were dipped; and in Alexipharm. praef. and 6, and Galen comp. med. x. p. 356 with the "thōruknion" plant: *R. thora* was observed by Sibthorp on the mountains of the Peloponnesus. (See *Atropa belladonna*).

1114 B. C. (= 1413 y. 302 $\frac{1}{2}$ d. — “300 years” of Judg. xi. 26), the Ammonites defeated by the Israelites under Jephthah. — From the etymology of the name, it has been conjectured: That Jephthah's daughter became the Iphigeneia of the Greeks: and confirmation is found in the silence of Homer respecting Iphigeneia.

In this year = “22d of Epiphi in the 15th year of Ramessu XII.,” medical aid requested for the queen's sister, a daughter of the chief of Bakhtan — (Birch, and Mariette 98).

Chiron residing on mount Pelion, — where in the following year he was visited by Jason and his companions on the Argonautic expedition (Apollon. Rhod. i. 554. and Orph. 375).

Hypericum lanuginosum of the mountains of Greece. The “*hēirōnōs rīzan*” or “*panakēs*” discovered on mount Pelion by Chiron, — further described by Nicander ther. 500 as having “*amara-kōēssa*” marjoram-like foliage and golden flowers, by Theophrastus ix. 11. 1 as having leaves like those of “*lapathō*” but larger and more hairy, applied externally and the small root (see Pliny xxv. 13) taken in wine against poisonous reptiles, by Dioscorides as growing chiefly on mount Pelion and having a slender acrid root, may be compared: *H. lanuginosum* is termed “*h. montis Olympi foliis circa margines hirsutis*” by Tournefort inst. 255; and was observed by Sibthorp in Greece, probably on mount Athos (J. E. Smith).

Tamus communis of Europe and the adjoining portion of Asia. Called in Britain *black bryony* from its dark glossy leaves (Prior), in Italy “*smilace liscia*” or “*tamaro*” or “*vite nera*” (Lenz), in Greece “*vrūōn*” or “*ta vrūa*” (Fraas), in which we recognize the “*vrūōnia mēlaina*” or “*ampēlōs mēlaina*” identified in Syn. Diosc. with the “*hēirōnēiōn ampēlōn*,” discovered by Chiron — according to Pliny xxv. 16; also the “*bryonium*” proper or “*chironiam*” or “*vitis nigra*” whose “*asparagos*” young shoots from their medicinal properties are preferred for food to “*veris asparagis*” by Diocles (Plin. xxiii. 17): the “*ampēlōs mēlaina*” is described by Dioscorides as ascending trees and having leaves approximating those of “*smilakōs*,” the young shoots eaten: the entangling of the *urus* by its horns in “*tanis*” vines, is mentioned by Epiphanius phys. 3: *T. communis* was observed by Sibthorp, Chaubard, and Fraas, frequent in woods and hedges from Crete and the Peloponnesus to Cyprus, and on the last-named island the young shoots cooked and eaten. Westward, the “*ampēlōs mēlaina*” or “*vōukraniōn*” is identified in Syn. Diosc. with the “*priathēla*” or “*pēgrina*” of the Dacians, “*laōuōthēn*” of the Numidians, and “*ōvlamēnia*” or “*vatanōuta*” or “*vētisalka*” of the Romans: “*taminia uva*” are prescribed by Celsus, and besides medicinal uses are according to Pliny sometimes worn as an amulet; the “*vitis nigra*” is also identified by Pliny with the “*gynaecanthēn*” or “*aproniam*”: *T. communis* is termed “*tamnus racemosa flore minore luteo-pallescente*” by Tournefort inst. 103; and is known to grow in Italy and throughout middle Europe, but in Britain is regarded by Bromfield as possibly exotic and only naturalized (Pers., A. Dec., and Lenz).

Tamus Cretica of the East Mediterranean countries. Called in Greece by the same names with the preceding (Fraas), and possibly the plant discovered by Chiron: — the “*vrūōnian*” or “*vrūōnitha*” is prescribed by Apollodorus ther. against freckles and cutaneous affections; the “*vrūōnis*” is mentioned also by Nicander ther. 858; the “*ampēlōu agrias*” is enumerated as a drug by Theophrastus ix. 14. 1; is identified by Cratevas with the “*hēirōnēiōn*” (schol. Nicand. ther.); and is described by Dioscorides as a woody vine, having the flower after the manner of “*trīhas vrūōthēis*,” round berries red while ripening, the root used against dropsy, and young shoots stored for food: *T. Cretica* is termed “*tamnus cretica trifido folio*” by Tournefort cor. 3, and was observed by Sibthorp in the woods and hedges of Greece, Crete, and Cyprus, not rare and the young shoots eaten. (See *Bryonia dioica*, and *Clematis vitalba*).

1113 B. C. (= 1071 + “42 years” of Clint. i. p. 140), the Argonautic expedition led into the Black Sea by Jason, son of Aeson and father of Euneus. Periclymenus brother of Nestor was one of the Argonauts (Pind. pyth. iv. 311); and Philammon was the bard of the Expedition — (Pherecyd. fr. 63, and Apollon. Rhod.). After the return to Greece, the ship Argo was drawn on shore and left with a dedicatory inscription in the city of Corinth (Dio Chrys. corinth. p. 458, and Aristid. isthm. i. p. 24).

Salvia horminum of the East Mediterranean countries. Called in Greece “*sarkōtrōphī*,” and the “*ōrminōn*” of the companions of Jason — (argon. Orph. i. 917), Polemon diæt. ii. 14, Theophrastus viii. 7, Nicander, wild and cultivated according to Dioscorides and its stem quadrangular, is referred here by writers; together with the “*phōrvīōn*” of Galen fac. simpl. viii. p. 152, “*phōrmiōn*” of Paulus Aegineta vii. p. 249, and “*zēntōgalēn*” of Nicolaus Myrepsus iii. 62: *S. horminum* is described by Alpinus exot. p. 112, and was observed by Sibthorp, and Fraas, frequent in cultivated ground in Greece. Farther South, the “*ōrminōn*” was known to Athenaeus xi. 56 in Egypt. Westward, the “*ōrminōn ēmērōn*” is identified in Syn. Diosc. with the “*ormia*” of the Dacians, and “*gēminalis*” of the Romans; the “*horminum*” is mentioned by Pliny xviii. 10 and xxii. 76 as cultivated in Italy, and his account seems in part taken from Dioscorides: *S. horminum* is described by Matthioli, Dodoens, and Lobel pl. 555; is termed “*h. coma purpuro-violacea et coma rubra*” by

Tournefort inst. 178; and is known to occur in both Northern and Southern Italy (Pers., and Lenz). "S. viridis," termed "h. coma viridi" by Tournefort inst. 178, is regarded as probably not distinct; was observed by Forskal, Sibthorp, and Bory, in cultivated ground from Constantinople to Caria and the Peloponnesus, and is known to occur in Italy and around Tunis (Desf. atlant. pl. 1, and Pers.).

Lagurus ovatus of the Mediterranean countries. A grass called in Britain *hare's-tail* (Prior), in Greece "lagōnōura" or "alōpōnōra" or "rēnna vōutōmō," in which we recognize the "vōutōmōn" cut for beds by the companions of Jason — (Theocr. xiii. 35), having according to Democritus "lēiriōis"-like leaves, growing in marshes, eaten by cattle, and one of the signs of subterranean water; described also by Theophrastus i. 10. 5 as having keeled leaves: L. ovatus was observed by Forskal, Sibthorp, and Chaubard, from the Dardanelles to the Peloponnesus abounding on hills near the sea, especially in depressions that have contained water. Farther South, was observed by Forskal and Delile, on the Mediterranean border of Egypt. Westward, is described by Morison viii. pl. 4; is termed "gramen spicatum tomentosum longissimis aristis donatum" by Tournefort inst. 517; was observed by Forskal on Malta; and is known to grow in various parts of Southern Europe (Pers.).

Butomus umbellatus of Europe and the adjoining portion of Asia. Having a "tall rush-like stem" and called in Britain *flowering rush* (Prior), in France "jonc fleuri" (Fée), in Italy "biodo" or "giunco florido" (Lenz), in Greece "psathē" (Fraas), and the "vōutōmōn" — described by Theophrastus as growing in water, is referred here by writers: B. umbellatus was observed by Sibthorp, and Fraas, on the banks of streams from Constantinople throughout Greece. Westward, is described by Gerarde p. 27, and Bauhin; is termed "juncus cyperoides floridus" by Lobel, "b. flore roseo" by Tournefort inst. 271; and is known to grow in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 604, Pers., and Lenz).

Cyclamen Persicum of the East Mediterranean countries. Called in Greece "kuklamitha" (Sibth.), in which we recognize the "kuklamis" of the Argonautic expedition — (Orph. 916), or the "kuklaminōs" identified in the Syn. Diosc. with the "trimphalitis" of Zoroaster and "asphō" of Osthanes, prescribed in 1 Morb. mul. 682, mentioned also by Theophrastus ix. 10, Nicander ther. 945, by Dioscorides as having the leaves spotted on both sides, again identified in the added Synonyms with the "ithuōthērōn," and according to Pliny xxv. 69, and Oppian h. iv. 658 the root employed for poisoning fish: C. Persicum was observed by Sibthorp, and Chaubard, on the mountains of Greece and frequent around Athens, the root employed for driving cuttle-fish from their hiding places; is known to grow also on Cyprus (Pers.).

1111 B. C. (= 1141 — "31 years" of Castor in Euseb. i. p. 129, = "32d year of Perseus" mentioned by Apollodorus chron. in Clem. Alex. strom. i. p. 322, see Clint. i. p. 76), a date to all appearance marking the end of the reign of Perseus. He was succeeded as Argive king by his four sons, Sthenelas II., Alcaeus, Mestor, and Electryon (Herodot., see also Palaephatus, Apollod., and Strab. viii. p. 372).

"In the reign of Laius" (Herodot. v. 59), war of Amphitryon son of Alcaeus against the Teleboae: connected (according to Hesiod in Schol. Apollon. i. 747) with the death of Electryon. The inscription on Amphitryon's commemorative tripod, seen and copied by Herodotus, is described by him as in the "*Cadmean letters*;" differing very little from those used among the Ionians.

Lemna minor of Temperate Climates. Called in Britain *duck-weed* or *duck-meat*, by Galfridus pr. pm. "ende-mete" (Prior), in an Anglo-Saxon glossary "dok mete" (Harl. 3388, and Cockayne), in Italy "lente palustre" (Lenz), in Greece "psarōphaki" (Fraas): and the aquatic plant "pin," collected according to an ode of the time of Tchao-Koung — (Chi-King i. 2. 4), is described by Tchou-hi as a diminutive rootless herb floating upon stagnant water, and called "piao" by the inhabitants East of the river Kiang: L. minor was observed by Thunberg in Japan; is known to grow also throughout Siberia as far as Taurus and Caucasus (Bieb., Kunth, and Wats.). Farther West, the "phakōs ō ēpi tēlmatōn" is described by Dioscorides as growing moss-like on stagnant water, resembling lentils, and a refrigerating application; is prescribed by Paulus Aegineta; is identified in Syn. Diosc. with the "pkakōs agriōs" or "ēpiptērōn," and with the "vipēralis" or "ikēōsmighthōnōs" of the Romans; and the account of the "palustris lens" by Pliny xxii. 70 seems taken from Dioscorides: a Lemna called "blesemman" was observed by Forskal among the mountains of Yemen; L. minor is known to grow in Abyssinia (Fresen.); was observed by Sibthorp, Chaubard, and Fraas, on stagnant water throughout Greece; by Desfontaines, and Munby, in Barbary; and is known to grow throughout Europe as far as the border of Lapland (Fries), also on the Canary Islands, Madeira, and the Azores (Lemann, Wats., and A. Dec.). Beyond the Atlantic, has been observed by myself from 43° in New England; by Elliot, in South Carolina; by Chapman, as far as "Florida;" by Short, in Kentucky; by Drummond, at Fort Cumberland in 54°; by Nuttall, on the Arkansas; by Humboldt and Bonpland, on the mountains of New Grenada (Kunth); by Gay, in Chili; by J. D. Hooker, in New Zealand; and by R. Brown, in Tasmania and Australia; probably in some instances transported through entanglement in the plumage of water-fowl. By Feejean or possibly Polynesian

colonists, carried together with taro culture to the Feejee Islands, observed by myself on the artificial pools there. (See L. gibba).

1105 B. C. (= "11th year of Tching-wang," Pauth. 88), death of the regent Tcheou-koung; distinguished also as an astronomer and literary man. He was acquainted with the properties of the right-angle triangle, measured the elevation of the pole and length of the solstitial shadow, and built an observatory, which is still pointed out in the city of Teng-foung in Ho-nan. Some of his poetry and other writings are also extant. By Tsheu-Kung (according to Humboldt cosm. iv. p. 125) the earliest *Chinese astronomical observations*, and the meridian shadows in the two Solstices measured, making the Obliquity of the Ecliptic "23° 54' or 27' greater — than in 1850."

Tching-wang made war against the Toungi or Oriental tribes; regarded as all belonging to Corea (comment. Chou-king, and geogr. Chin. transl. Klapp. p. 152).

"Some time after the Argonautic Expedition" (Clint. p. 64), Medea of Colchis at Athens on the arrival there of Theseus, at this time a "mëirakiôn" boy of about fourteen (Plut. thes. 6). His father Aegeus, tenth Attic king, now reigning.

Colchicum autumnale of Europe and the adjoining portion of Asia. Called in Britain *meadow saffron* or *naked ladies*, in Germany "nakte jungfern" (Prior) or "zeitlose" (Grieb), in France "colchique" (Nugent), in Greece "vôlhikôn" (Sibth.); and the "éphëmëron" discovered by Medea — (Nicand. ther. 849 and alex. 250), mentioned as deadly by Theophrastus ix. 16. 6, is identified in Syn. Diosc. with the "kôlhikôn" of Dioscorides, growing mostly in Messenia and Colchis, putting forth a whitish saffron-like flower late in the autumn, and its bulbous root when eaten fatal: *C. autumnale* was observed by Sibthorp, and Fraas, from Parnassus to Constantinople; and is enumerated by Clot-Bey as long known in Egypt. Westward, the "kôlhikôn" or "vôlvôn agriôn" is identified in Syn. Diosc. with the "vôlvôm agrestêm" of the Romans; "colchicon" is enumerated among poisons by Pliny xxviii. 33; and *C. autumnale* is described by Maranta simpl. p. 83 (Spreng.), is termed "c. commune" by Tournefort inst. 348, and is known to grow throughout middle Europe as far as Britain (Hall., and Pers.). Its root and seeds according to Lindley "are used extensively in the manufacture of *veratria*, and in various" medicinal preparations.

1103 B. C. = "26th year of Ramessu XII.," on a second application for medical aid for the queen's sister, the ark of the god Khons sent to Bakhtan; represented on the tablet as borne by twelve priests — (Birch, and Mariette 98. Compare Amos v. 26).

1102 B. C. "Little more than thirty years before the fall of Troy" (Clint. i. p. 87, see also Homer il. xxxiii. 670 and od. xi. 271), Oedipus succeeded by Eteocles, as king of Boeotian Thebes.

As Erginus reigned at Orchomenus "till within thirty years of the fall of Troy" (Clint. i. p. 49), the war against him in which Amphytrion was slain, possibly not earlier than the last-named date.

1101 B. C. (= 1071 + "not more than 30 years" of Clint. i. p. 51, and during the infancy of Diomed, il. vi. 222 and xiv. 121), the First war against Boeotian Thebes; conducted by Adrastus king of Argos and Sicyon, accompanied by Tydeus, Amphiaraus, and four other chieftains, of whom Adrastus alone lived to return. The rival brothers Polyneices and Eteocles were both slain, and Laodamas son of Eteocles became king of Boeotian Thebes.

The same year (= 1103 — "seventeen months" on the tablet), arrival of the ark of Khons in Bakhtan — (Birch).

The inscription in hexameter verse on Laodamas' votive tripod (copied by Herodotus v. 59) is an early specimen of *Greek poetry*. The inscription was in the "Cadmean letters."

Ninety-sixth generation. Jan. 1st, 1100, mostly beyond youth: Obed (Ruth iv. 22, and 1 Chron. ii. 12); the high-priest Uzzi (1 Chron. vi. 5, Ezr. vii. 4, and Josep. v. 11. 15); and among Greeks, Idomeneus grandson of Minos (Hom. il. xiii. 450, and od. xix. 178); the Phrygian poet and flute-player Olympus, a pupil of Marsyas (Plat., Plut., Clem. Alex., and others); the sculptor Daedalus (Paus. ix. 40. 3 and x. 17. 4).

1098, August (= 1097 y. 240 $\frac{1}{2}$ d. = 1113 y. 302 $\frac{1}{2}$ d. — "20 years" of ten lunations, Judg. xv. 20), death of Samson. The death of Hercules corresponds (as deduced by Clinton 1 p. 78 from Greek authorities, "26 years before the fall of Troy" = 1097). Hercules is described by Homer as a military chieftain, who wore armour and led an army. By Herodotus and other Greek writers, Hercules is admitted to have been a Phoenician; and his identity with Samson — is confirmed by the fact (recorded by Menander Ephes. in Jos. a. J. viii. 3. 1 and c. A. i. 18) that the temple to "Hercules" at Tyre was built by king Hiram. Friendship towards Greeks of "Boeotia and the Peloponnesus only" (Cadmean and Dorian) was extended by Arab tribes on the Red Sea in the time of Agatharchides 95. (See Dorian conquest of the Peloponnesus).

Before the close of the year (= 1103 — "1 y. 5 mo — 3 y. 9 mo" in the tablet), after a detention of "three years and nine months," departure from Bakhtan of the ark of Khons, the chief having been warned in a vision — (Birch).

1096 B. C. = "19th of Mechir in the 33d year of Ramessu XII.," return of the ark of Khons to the temple of the god at Thebes — (Leps. k. tab. p. 19, and Birch).

1095 B. C. (= 1071 + "25th year" of Euseb., see also Ctesias in Diodor. ii. 21), accession of Teutamos as Assyrian emperor.

The same year (= 1091 + "4 years" of Apollod. ii. 8. 2, see also Hom. il. xix. 123, Thucyd. i. 9, Euseb. ii. p. 288, and Clint. i. p. 106, Castor's numbers corresponding very closely 991 + "105 years of the Pelopidæ" = 1096), the Argive king Eurystheus son of Sthenelas II., slain in battle; succeeded by two sons of Pelops, Thyestes at Mycenæ, and Atreus at Argos.

As early possibly as this date, Jewish colonists settling at the Southern extreme of Arabia. — An offshoot of these colonists is perhaps found in the Zaffe-Hibrahim inhabiting the island of Nossi Hibrahim and neighbouring portion of Madagascar: who brought with them Geomancy or foretelling by fingers, practise circumcision, will not intermarry with strangers, observe Saturday, claim descent from Abraham, and have retained the names of Noah, Isaac, Jacob, Joseph, and Moses; but know nothing of later prophets, nor of the author of Christianity, nor of Mohammed, whose followers they regard as "Caffres" or destitute of laws (Flacourt præf.).

Theseus on his expedition against the Marathonian bull hospitably entertained by a poor old woman named Hecale, — in whose honour he subsequently ordained in Attica a sacrifice, to her and Zeus Hecalus (Callim., Ov. rem. am. 747, and Plut. thes.).

Sonchus oleraceus of Europe and Northern Asia. Called in Old German "du-tistel," in Anglo-Saxon "thuthistel" or "thufethistel" all meaning sprout thistle, in Ortus Sanitatis 148 "suwe-distel" or "saw-distel," in current English *sow thistle* (Prior), in current German "gansedistel" (Grieb), in France "laiteron" (Nugent), in Italy "cicerbita" or "sonco" (Lenz), in Greece "sōhōs" (Sibth.), in Egypt "galayl" or "libbeyn" (Del.); in which we recognize the "sonchos" placed by Hecale before Theseus — (Callim., and Plin.), mentioned as esculent by Dioscorides, and the "albus" kind by Cleoporus (Plin. xxii. 44): the "sōghōs" is also mentioned by Matron, Antiphanes, Hegesander, Theophrastus, Erasistratus, Nicander, as medicinal by Agathocles, and Zenon, and was known to Athenæus in Egypt: *S. oleraceus* was observed by Sibthorp frequent in waste and cultivated ground throughout Greece and the Greek islands; by Forskal, and Delile, around Cairo in Egypt. Westward, is described by Tournefort inst. 474; was observed by Forskal on Malta as well as near Marseilles; and is known to grow throughout middle and Northern Europe as far as Lapland (fl. Dan. pl. 682, Fries, and Wats.). Southward from Egypt, was observed by Forskal among the mountains of Yemen and called "myrrejr," and was received from Abyssinia by Richard. Eastward, is known to grow throughout Siberia and in Nepal (Ledeb., and Wats.); was observed by Nimmo "at Surat," and by Lush "in Deccan gardens" (Graham); by Roxburgh, and Wight, in other parts of Hindustan; by Blume, on Java; by Thunberg, in Japan, frequent and called "fsitsikusa;" and probably by Polynesian navigators was carried throughout the islands of the Pacific to New Zealand (where it was found by Cook and Forster) and Southeast Australia (where it was found by R. Brown). Clearly by European colonists, was carried prior to 1669 (Jossel.) to Northeast America, where it has extended itself from Newfoundland to our Southern States (Chapm.) and throughout Canada to the Saskatchewan and mouth of the Columbia (Hook.), following the fur traders as verified by myself at Fort Nisqually on Puget Sound; to the West Indies (Swartz, and Wydl.), Rio Janeiro and Buenos Ayres (herb. Dec.), Patagonia and Peru (observed by myself), Chili, the Chonos archipelago, Falkland Islands, and Tristan d'Acunha (Hook., and A. Dec.); to the Mauritius Islands (Bojer); to Southwest Australia, where it was unknown before English settlement (J. Drummond in Hook. journ. 1840); to the remote Aukland Islands, the only evidence of prior visits of mariners obtained by Dr. Silas Holmes on our Expedition; seems in fact the pioneer of plants accompanying man, the first to acquire foothold even within the Tropics.

Asparagus acutifolius of the Mediterranean countries. A kind of wild *asparagus* called in Italy "sparaghella" or "asparago selvatico" (Lenz), in Greece "sparaggi" or "spharaggia" (Sibth.) or "asparaggia" (Fraas); in which we recognize the "aspharagōs" thickets that concealed Perigyne beloved of Theseus, — the plant in consequence protected by law among the Ionians inhabiting Caria (Plut. thes. viii): the "aspharagōn" is mentioned also by Cratinus, Pherecrates, Phrynichus, Ameipias, Antiphanes, Theopompus, Athenæus ii. p. 240; and the "asparagōs pētraïōs" of Dioscorides is identified in the added Synonyms with the "muōn" or "muakanthan:" *A. acutifolius* was observed by Forskal, Sibthorp, and Fraas, from the Peloponnesus to Constantinople; by Chaubard, abounding in the Peloponnesus. Westward, the "myacanthon" or "hormenum" or "libycum" or "silvestrem asparagum" is identified by Pliny xvi. 67 and xx. 43 with the "corrua" of Cato and others; *A. acutifolius* is termed "a. foliis acutis" by Tournefort inst. 300; was observed by Forskal near Marseilles; is known to grow also in Italy, Spain, and Portugal, its young sprouts eaten (Pers.).

Asparagus aphyllus of the Mediterranean countries. Called in Greece by the same names as the preceding (Sibth.), in Egypt "a'aqoul" or "shouk" (Del.); and probably included with the preceding species: — the "aspharagōs" is enumerated by Theophrastus vi. 4. 1 as one of the two leafless plants known to him: *A. aphyllus* is termed "a. creticus fruticosus crassioribus et brevioribus

aculeis" by Tournefort trav. i. pl. 88; was observed by Sibthorp, and Chaubard, frequent from Crete and the Peloponnesus to mount Athos, the young sprouts collected and eaten; by Forskal, and Delile, was observed in Lower Egypt. Westward, the "asparagus" leafless and altogether thorn is mentioned by Pliny xxi. 54; *A. aphyllus* is described by Morison i. pl. 1, and is known to grow in Sicily, Barbary, Spain, and Portugal (Pers.). "*A. horridus*" regarded as not distinct, was observed by Sibthorp on Cyprus, is known to grow also in Barbary and Spain (Desf., Cav. ii. pl. 136, and Pers.).

Corydalis solida of Europe and the adjoining portion of Asia. The "thēsēiōn" flower of which the Ariadne garland was made — according to Timachidas (Athen.), may be compared: the root of the "thēsēiōu" is enumerated by Theophrastus vii. 12. 3 as tuberosus "kēphalōrrizōn," bitter, and purgative: *C. solida* was observed by Sibthorp, and Chaubard, in Boeotia and the Peloponnesus from the fertile plains to the higher portion of Taygetus near the snow. Westward, the account of the "thesium" by Pliny xxi. 67 to xxii. 31 seems taken from Theophrastus: *C. solida* is termed "f. bulbosa radice non cava major" by Tournefort inst. 422, "*pistolochia solida*" by Bernhardt; and is known to grow in shaded situations throughout middle Europe as far as Denmark (fl. Dan. pl. 1224, Engl. bot. pl. 1471, and Pers.).

1094 B. C. (= 1078 + his "17th year" on the monuments = 1280 y. 2 mo. — "55 — 66 — 40 — 26 y." in the Euseb.-Maneth. table), accession of Ramessu XIII. Hhaem-mianun-nuterhikten, eleventh king of the Twentieth dynasty. His name occurs at El Kab, Karnak, Gurna, and on a stone — now in Cairo (Glid. analect.).

The same year (= 1071 + "23 years" of Castor in Euseb.). Theseus being absent or excluded from Athens, the accession of Menestheus son of Peteus as Twelfth Attic king.

Examples have been already given of Scriptural names of animals and plants continuing in use in Egypt: but further, many names current there are found to go behind the formation of the Greek language, supplying the meaning of obsolete Greek words, and showing relationship, the more intimate as we recede into antiquity.

Next after Olen and before Homer, hymns to the gods composed at Athens, and first by Pamphos — (Pausan. ix. 27. 2, and Philostrate. her. p. 693).

Narcissus tazetta of the Mediterranean countries. Called in Greece "toumpakia" (Fraas), in Egypt "nardjis," in which we recognize the ΝΑΡΚΙΣΣΕΩΣ of Pamphos, — the Cyprian Verses, hymn to Ceres, Hippocrates, Theophrastus vii. 12, Plutarch sympos. iii. 1, Pausanias ix. 31, and the "narkissōs ēn mēsō krōkōēithēs" of Dioscorides referred here by Sibthorp, and Fraas: *N. tazetta* was observed by Wheeler, Sibthorp, Chaubard, and Fraas, wild and frequent in Greece; by Forskal in the gardens of Constantinople, "introduced from Cyprus;" by Forskal, in gardens at Cairo, and by Delile, "growing spontaneously in gardens at Damietta." Westward, the "narcissus" of Ovid metam. iii. 509, and the "calyx herbaceus" kind of Pliny xxi. 12 and 75, are referred here by Fraas; *N. tazetta* is termed "n. medio luteus copioso flore odore gravi" by Tournefort inst. 354; and is known to grow in Italy, Barbary, Portugal, Spain, and Southern France (Barrel. pl. 918, Desf. i. p. 282, Pers., and Lenz). Is enumerated among medicinal species by Lindley.

Narcissus poeticus of the mountains of Southern Europe. Called in Italy "giracapo" or "tazette selvatice" or "narciso poetico" (Lenz), and possibly the "narkissōs" of Pamphos: — the "narkissōs ēupnōōs" fragrant, is mentioned by Moschus ii. 65; the sweet-scented mountain kind is pronounced the best by Dioscorides, and his "narkissōs ēn mēsō pōrphurōēithēs" is referred here by writers: *N. poeticus* was observed by Wheeler on Helicon and other mountains of Greece (Sibth.). Westward, the "purpureus narcissus" is mentioned by Virgil ecl. iv. 34, and the kind "flore candido calyce purpureo" by Pliny xxi. 12: *N. poeticus* is described by Camerarius (Spreng.); is termed "n. albus circulo purpureo" by Tournefort inst. 353; is known to grow wild on the mountains of Northern Italy and as far as central France (A. Dec., and Lenz); is besides cultivated for ornament, and has become naturalized in various localities as far as Belgium and Britain (Wats.). By European colonists, was carried to Northeast America, where it continues to be a favourite garden flower. According to Lindley, "the bulbs have considerable energy as emetics," and "in doses of two to three drachms the extract is a deadly poison."

1091 B. C. (= 1071 + "20 years" of Herodotus ix. 26, and Clint. i. p. 79 to 106), First invasion of the Peloponnesus by the Heraclidæ. Met on the Isthmus by the Achæans, Ionians, and the Arcadians of Tegea; and Hyllus the Heraclid leader slain in single combat by king Echemus of Tegea.

The worship therefore of Samson or Hercules advancing rapidly throughout middle and Western Europe. — The "temple to Hercules" supposed by Ephorus to exist on Cape Sagra in Portugal, was found by Artemidorus to consist of only "three or four stones put together in many places," which the inhabitants taught by their fathers said was the work of Hercules (Strab. iii. 1. 4); an account clearly referring to *cromlechs*. Druidical circles are perhaps less ancient: but Druids were

seen in France by Posidonius, and Caesar; and as appears from Pliny xvi. 95 "sexta luna quae principia mensium annorumque his facit et seculi post tricesimum annum" the sixth day of the moon which is the beginning of their months and years and of their thirty-year period, the Druids used the calendar year of twelve lunations, and were acquainted with the "Cycle of 360 lunations = 10,631 days." (See mount Nebo, Deut. xxvii. 5, Jeroboam, and Amaziah).

Ireland inhabited as early probably as this date, and *crannoges* (palisaded villages on lake islets and shoals) perhaps already constructed: — they are mentioned in Irish annals "from the Fifth century A.D.," serving as strongholds and places of refuge during wars, and one of them continued extant as late as "1610" (Wilde, and Troyon p. 87 and pl. 2).

The kinds of timber employed in these crannoges include "aulne," *Alnus glutinosa* (Troyon p. 458).

Among bones of animals in great quantities on the site of these crannoges, those of the extinct *Irish elk*, *Cervus* . . . , were probably merely collected in the fossil state. Implements are intermingled of different degrees of antiquity, some made of stone and possibly belonging to the Stone Age (see Troyon).

Of plants less anciently cultivated in Switzerland during the Stone Age, possibly therefore as early as this date, the following are enumerated (by Heer, in Troyon p. 443): the *pear*, *Pyrus communis*; *sour cherry*, *Cerasus avium*; *plum* or *bullace*, *Prunus insititia*; two-rowed *barley*, *Hordeum vulgare*; *spelt*, *Triticum spelta*; and *T. monococcum*.

Of forest trees and shrubs, the following are enumerated (by Heer in Lee's edit. Keller): *Juniperus communis* and *Pinus sylvestris*.

Besides the manufacture of metallic implements throughout middle and Western Europe, the *Bronze Age* is especially marked by the change from burying to burning the dead — (Troyon 302).

"1089 B. C." (Euseb. and Clint. i. p. 23, Diodorus' numbers giving 1169 — "92" = 1077), "Second" change in naval dominion. Leaving the Lydians and Mæonians, the "empire of the sea" acquired by the Pelasgian Greeks. — Held by them "eighty five" years.

1088 B. C. (= 1071 + "18th year" of Castor in Euseb. i. p. 131, and of Clemens Alexandrinus), Thyestes succeeded at Mycenæ by Agamemnon, son or grandson of Atreus and now Argive king.

1087 B. C. (= 1071 + "16 years" of Clint. i. p. 140, see Homer il. iv. 406), Second war against Boeotian Thebes, Diomed being old enough to take part. On the capture of the city, its wall was demolished, and the *Cadmeans* with their king Laodamas expelled from Boeotia. — At a later period, the Gephyraei, a Phœnician and Cadmean family or clan, were allowed to reside at Athens; and are specially noticed by Herodotus v. 57 to 61.

Ruscus hypoglossum of the mountains of Eastern Europe and Asia Minor. Called in Italy "bonifacia" or "bislingua" or "lauro alessandrino" (Lenz), in which we recognize the "alēxanthrēia thaphnē" with which Alexander or Paris was crowned victor in the Games at Troy — (Stapel ad Theophr.), termed "epiphullocarpus" by Theophrastus i. 10 and iii. 17, and identified by Dioscorides with the "stēphanēn" or "ithaian" or "thanaēn" or "upōglōttōn" or "zalēian" growing on mountains and having red fruit in the middle of the leaf: *R. hypoglossum* was observed by Sibthorp on mount Athos and in thickets towards the Black Sea. The "*laurus alexandrina*" or "hipoglottion" or "carpophyllon" growing mostly on Ida and about Heraclea in Pontus always on mountains, is mentioned by Pliny xv. 39 and xxiii. 80: *R. hypoglossum* is described by Matthioli p. 829, is termed "*r. angustifolius fructu folio innascente*" by Tournefort inst. 79, and is known to grow in shaded situations on the mountains of Hungary and Italy (Pers., Spreng., and Lenz).

Ruscus hypophyllum of Southeastern Europe. Called in Greece "kōrallōvōtanōn" (Sibth.), in Egypt "qafandar" (Del.): the "hamaithaphnē" by some called "alēxanthrēian" — (Diosc. iv. 147), mentioned by Theophrastus iii. 18, and described by Dioscorides as having laurel-like but smoother leaves with red fruit attached to the leaves, is referred here by Columna ephr. i. p. 165, and Sibthorp: *R. hypophyllum* was observed by Sibthorp in the woods on mount Athos; and by Delile, in the gardens of Egypt. Westward, the "chamaedaphe" is mentioned by Pliny xv. 39 and xxiv. 81 as a woodland shrub "*silvestris frutex*;" *R. hypophyllum* is termed "*r. latifolius fructu folio innascente*" by Tournefort inst. 79; and is known to grow on hillsides in Italy (Pers., and Lenz).

Daphne laureola of Europe and the adjoining portion of Asia. A shrub two or three feet high called in Britain *loril* or *laury* (Ainsw.), or *copse laurel* or *spurge laurel* (Prior), in France "*laureole*" (Nugent), in Italy "*laureola*" (Lenz), in which we recognize the "*laurēōla*" of the Romans identified with the "thaphnitēn" in Syn. Diosc. iv. 147: the "*daphnoides*" or "*stephanon alexandri*" — or "*pelasgum*" or "*epetalon*" of Pliny xv. 39, or the "thaphnōēithēs" growing according to Dioscorides in mountainous situations, a cubit high with thong-like branches leafy from the middle upward, the leaves laurel-like but not easily broken, burning the throat if tasted, and the ripe fruit black, clearly belongs here: *D. laureola* was observed by Sibthorp in shaded situations on the Bithynian Olympus. Westward, is described by Anguillara, Dodoens, Lobel, and Cæsalpinus (Spreng.); is

termed "*thymelæa lauri folio sempervirens*" by Tournefort inst. 595; and is known to grow in woods in Sicily, Italy, and throughout middle Europe (Jacq. austr. pl. 183, and Smith engl. fl. ii. 229), "every part" according to Lindley "very acrid," producing "a burning heat in the mouth and throat," the scent of the flowers "resembling saffron, with an overpowering sweetness," but "perceptible in an evening only," the berries "black."

1082 (= "2 years" before the assembling of army and fleet at Aulis, Sm. b. d.), preparations commenced by the Greeks for war against Troy.

Pinus maritima of the Northern shores of the Mediterranean. A kind of *pine* called in Greece "pëukōs" (Sibth.), in which we recognize the "pëukē" whose timber withstands rain — (Hom. il. xxiii. 328), mentioned also in Hesiodic scut. herc. 376, and by Crates, Euripedes med. 4, Dioscorides, Athenæus iii., and the "pëukēn paralian" by Theophrastus iii. 9. 1 and ix. 2. 5: *P. maritima* was observed by Sibthorp, and Chaubard, in low sandy situations from the Peloponnesus throughout Greece, and the only kind of pine on Cyprus, furnishing pitch, turpentine, and abundance of excellent ship-timber. Westward, "tibus" are described by Pliny xvi. 17 as growing along the seashore of Italy, slender and used for ship-building: *P. maritima*, "a tree twenty feet high," is described by Bauhin (Pers.), and Lambert pl. 10; is known to grow in Italy as far as Genoa, and in Southwestern France (A. Dec., and Daub.). By European colonists, was carried to the Mauritius Islands (Boj.). "*P. Alepensis*" regarded as not distinct, was also seen by Bory in the maritime portion of the Peloponnesus, is known to grow from Tauria to Barbary (Lamb. pl. 11, and Pers.), was observed in the gardens of Egypt by Forskal, Delile, and Clot-Bey, and its imported timber called "snoubar."

Spartium junceum of the Mediterranean countries. Called in Italy "ginestra" (Lenz), in Greece "spartō" (Sibth.) or "ta sparta" (Fraas), in which we recognize the material of the ropes "sparta" in the Greek ships — (Hom. il. ii. 135), the "spartōn" or "spartiōn" plant of Cratinus, Herodotus v. 16, Plato polit. 280, Aristotle an. ix. 40, Dioscorides, and the "linōspartōn" plant of Theophrastus i. 5. 2: *S. junceum* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout Greece and the Greek islands to the Dardanelles: and "sparta" cordage was known in Egypt as early at least as the arrival of the ships of Menelaus (Hom. od. iii. 300). Westward, great quantities of "spartum" were accumulated by Asdrubal for naval use (Liv.), and that produced in Africa being small and worthless, were probably imported from Carthage in Spain, where according to Pliny xix. 7 and xxiv. 40 the plant covers whole mountains and is collected by persons having their hands and legs protected: the term "sparteus" occurs in Columella, and "lentæ genistæ" in Virgil, but whether the "genista" of the Romans useful for ties is identical with the "sparton" plant of the Greeks, Pliny is uncertain: *S. junceum* is termed "genista juncea" by Tournefort inst. 643; was observed by Forskal near Marseilles; and is known to grow in Italy and other parts of Southern Europe (Pers., and Lenz).

1080 B. C. ("in the beginning of the war against Troy," Pausan. ix. 5. 7. and Clint. i. p. 87). Thersander son of Polynices and father of Tisamenus, slain in Mysia. He had recalled many fugitive Cadmeans.

Fagus sylvatica of Europe and the adjoining portion of Asia. Called in Britain *beech*, in Anglo-Saxon "bece" or "boc," in Germany "buch," in Old High German "puocha," in M. H. G. "bueche," in Holland "beuk," in Old Norse "beyki," in Denmark "bøg," in Sweden "bok," all signifying both the tree and book, from Runic tablets made of this wood, and in accordance with the Sanscrit "boko" letter and "bokos" writings (Prior), also in Slavonian "buk" (A. Dec.), in Tartar "biuk" (Pall.), in France "hêtre" or "fouteau" (Nugent), in Italy "faggio" (Lenz), in Greece "oxua" (Sibth.), in Egypt its imported timber "sansan" (Forsk. p. lvi); in which we recognize the "ōxua" tree that gave its name to the Mysians — (Xanthus, quoted by Menecrates of Elais and Strabo xii. 8. 3), and the "ōxuē" spear of Archilochus: the "ōxua" is described by Theophrastus iii. 10. 1 to v. 8. 6 as the only tree of its kind, its softly-echinate fruit enclosing a nut having the sweetness and taste of chestnuts, its wood used for wagons: *F. sylvatica* was observed by Hawkins on high mountains in Greece, by Sibthorp in woods near Constantinople, by Griesbach on the mountains of Asia Minor, by Karelín as far as Astrabad South of the Caspian; is known to grow also about Caucasus, and in the province of Talusch, and as far as the Ural (Gmel., Pall., and Clauss.). Westward, the "ōxuē" is said by Theophrastus iv. 8. 3 to grow in Latium, large enough for the keels of Etruscan ships; the "fagus" is mentioned by Caesar, Varro, Virgil, Columella, Martial, and is described by Pliny xvi. 7 as bearing nuts "triangula cute:" *F. sylvatica* occurs in piles or posts of Swiss lake-villages belonging to the Stone Age, and in quantities of the nuts among the debris (Troyon 16 to 40, and Heer); is termed "fagus" by Tournefort inst. 584; was observed by Lenz on the heights of North Italy; and is known to grow throughout middle and Northern Europe as far as Lat. 60° 31' (Lindblom). By European colonists, was carried to Madeira, where it continues under cultivation (Heer, and A. Dec. g. b. 47 to 154).

"1078 B. C. = 1st year of Kang-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

The same year = "17th year of Ramesseu XIII.," in an official letter addressed to his son Painehsi. His name occurs also in his tomb at Bab-el-meluk — (Glid. analect, Leps. k. tab. p. 19, and Birch).

The same year (= 1071 + "7 years" of both Maneth. tables = 1417 — "16 — 8 — 15 — 5 — 68 — 40 — 55 — 66 — 40 — 26 years" of the Armenian Euseb.-Maneth. table), accession of "Thōuōris called Pōluvōs by Homer," = (1417 — "51 — 61 — 20 — 60 — 5 — 7 — 135 years" of the Afr.-Maneth table, this table also giving 991 + "14 + 9 + 6 + 9 + 4 + 46 years" = 1079) accession of Smēnthēs or Smēnthis, first king of the Twenty-first dynasty. The name and portrait of king Herhor-siamun have been found on the temple of Khons at Thebes; with evidence, that under Ramesseu XII. he held the office of high-priest of Amon. (Compare the "Prōtēus" of Homer, and Herodotus).

Herhor received the submission of the Northern Syrians, and married a Semitic female, — by whom he had several sons bearing Semitic names (Birch).

Aethra, daughter of Pittheus and mother of Theseus, a captive in Troy during the siege by the Greeks (Hom. il. iii. 144, Arctin., Lesch., and Hellan.). Theseus is mentioned as seen by Nestor and Ulysses, and as taking no part in the war — (Hom. il.).

The Eumolpian bard Musaeus, son of Antiophemus (Paus. x. 5. 6), composing poetry about the time of the Trojan war (Theodoret. serm. ii. 741). His daughter Astyanassa is said to have been a slave of Helen — (Suid., Phot., and Sm. b. d.).

Teucrium polium of the Mediterranean countries. Called in Greece "amarantō" or "agapēs-vōtanē" or "panagiōhōrtōn," by the Turks "giuda" (Forsk., and Sibth.), and the ϜΟΥΙΟΝ pōliōn celebrated by Musaeus — (Plin. xxi. 84), and Hesiod op. fragm., mentioned also by Hippocrates, Theophrastus ix. 21, Nicander ther., and Dioscorides, is referred here by writers: T. polium was observed by Forskal, Sibthorp, and Chaubard, frequent in mountainous and dry situations from the Dardanelles and Smyrna throughout Greece and the Greek islands; and farther South, by Forskal, and Delile, on the Mediterranean border of Egypt near Alexandria. Westward, the "polium" is mentioned by Celsus v. 23, and Pliny; T. polium is described by Matthioli p. 612; is termed "p. montanum album etiam luteum" by Tournefort inst. 206; was observed by Forskal near Marseilles; and is known to grow also in Italy and Spain (Pers., and Lenz).

Teucrium capitatum of the Mediterranean countries. Called in Greece "livanōhōrtōn" or "pō-lēōn tōu vōnōu" (Sibth.), and distinguished from the preceding as early probably as this date: — the "pōliōn ētērōn" is described by Dioscorides as weaker and less odorous; and the "polion herba" by some called "libanotis" is mentioned by Marcellus 20: T. capitatum is described by Sibthorp as "præcedenti valde affinis," and was observed by him, and Fraas, frequent in Greece both on plains and mountains: is known to grow also in Siberia (Pers.). Westward, the "polium campestre" is distinguished by Pliny xxi. 21; T. capitatum is termed "p. candidum tenellum tomentoso flore purpureo" by Tournefort inst.; and is known to grow in Italy, Spain, and Southern France (Barr. rar. pl. 1047, Pers., and Lenz).

Ornus Europæa of mountains on the North side of the Mediterranean. A small tree called in France "orne" (Fée), in Italy "orno" or "ornello" or "avornio" (Lenz), in Greece "mēliōs" or by the Turks "disu budak" (Sibth.); in which we recognize the ΜΕΛΙΗΣΙΝ mēliēsīn of Musaeus — (Clem. Alex. str. vi. p. 618), Hesiod op. 145, growing according to Homer il. 767 in the mountain forest, mentioned also by Aristophanes, Theophrastus iii. 11, Nicander fragm., Dioscorides, and Oppian cyn. iv. 383; the name derived from its saccharine exudation, a tree yielding honey being expressly mentioned by Diodorus xvii. 75, Curtius vi. 4, Polyænus iv. 3. 32, and Athenæus xi. 500: O. Europæa was observed by Sibthorp, Hawkins, Chaubard, and Fraas, from Constantinople frequent on high mountains throughout Greece. Farther South, the "mēlia" was in Egypt in the days of Theophrastus; and O. Europæa was observed in gardens there by Clot-Bey: the seeds are besides imported for culinary and medicinal use, and are called "lissan asfur" bird tongues (Forsk. mat. med., and Del.). Westward, the "ornus" is mentioned by Virgil, and Pliny xvi. 30, as growing on the mountains of Italy; O. Europæa is termed "f. florifera botryoides" by Tournefort inst. 577; is known to grow in Italy, especially towards the Southern extreme (Lindl., and Lenz), also in Spain (Cav., and Pers.); and according to Lindley yields the *manna* of the shops.

Ornus rotundifolia of Italy and Greece. Another species of *flowering ash* called "mēliōs" in Greece, and probably included in the "mēliēsīn" of Musaeus, — and Homer the "mēlia" termed "upsēlē" and "ēumēkēs" by Theophrastus iii. 11, is referred here by Fraas; and O. rotundifolia was observed by him to be the most frequent kind in Northern Greece: is known to grow also in Hungary (Pers.). Farther West, is known to grow in Calabria or Southern Italy, "yields *manna*, and according to Tenore of better quality than the last" (Lindl.). Farther South, "sarachoscht frandji, manna calabrica" is enumerated by Forskal mat. med. as imported into Egypt.

Juniperus macrocarpa of the East Mediterranean countries. The ΑΡΚΕΥΤΟΕ of Musaeus — (schol. Apollon. iv), and Satyrus, is described by Theophrastus iii. 3. 1 to 12. 3 as growing on mountains, taller than the “kēthrōs” and less prickly, its wood inferior and scentless, and berries black and hardly edible; is mentioned also by Nicander ther. v. 584; and the “arkēuthōs mikra” having fruit no larger than a filbert, by Dioscorides: “lesser arkēuthis” berries are among the ingredients of the “kuphi” incense enumerated by Manetho, and the “arkēuthōs” is identified in Syn. Diosc. with the “livīōum” of the Egyptians, and “zōūōrinsipēt” of the Numidians: the name, subsequently pronounced “argētōs,” has according to Fraas become obsolete: *J. macrocarpa* is termed “j. maior” by Matthioli p. 118, “j. maximi illyrici” by Lobel hist. 629 and ii. pl. 223, “j. major bacca cæreulea” by Tournefort inst. 589; was observed by Sibthorp, and Fraas, on the mountains of Greece, its berries obovate, twice as large as in *J. oxycedrus* and black with a blue bloom; is known to grow also in Illyria, Istria, and Sicily (Spreng., and Lenz).

“1077 B. C. = 2d year of Kang-wang, of the Tcheou” or Fifth dynasty (Chinese chron. table).

1075, November (= 1073 y. 302 $\frac{1}{8}$ d. — “7 months” of 1 Sam. vi. 1), the ark of the covenant removed from Shiloh and captured by the Philistines: and on “the same day,” death of the high-priest Eli.

1074 B. C. (= 1113 y. 302 $\frac{1}{8}$ d. — “40 years” of Judg. xiii. 1), the ark of the covenant returned by the Philistines; and placed at Kirjath-jearim. The Philistines afterwards defeated by the Israelites under the prophet Samuel (1 Sam. vii. 1 to 13).

Achillea millefolium of Northern climates. Called in Britain *milfoil* or *nosebleed* or *sanguinary* or *yarrow*, in Anglo-Saxon “gearwe,” in Germany “garbe,” in Low German “geruwe,” in Old High German “garawa,” in Old Frisian “kerva,” names apparently from the Greek “iēra” (Prior), in France “mille-feuille” (Nugent), in Italy “millefoglie” or “achillea” (Lenz); in which we recognize the “millefolium” or “achilleos” with which the wounded king Telephus of Mysia was healed by Achilles — (Plin. xxv. 19); described by Dioscorides as having coriander-like leaves with numerous incisures, white or purple flowers in a terminal umbel, used for agglutinating wounds and stanching blood, and in the added Synonyms identified with the “ahillēōn sithēritin” or “hiliōphullōn” or “muriōmōrphōn” or “stratiōtikōn”: *A. millefolium* was observed in Greece by Fraas; is known to grow also along the Taurian mountains; and to and beyond Lat. 62° throughout Siberia (Meyer). Westward, the “ahillēōn sithēritin” or “ēraklēōn” is identified in Syn. Diosc. with the “astēr hōilōth” of the Numidians, and “militarēm” or “millēphōliōum” of the Romans; and the “millefolium” or “achilleos” or “panacem heracleon” is described by Pliny as a cubit high and branchy, clad from the base with leaves like those of fennel but smaller; the “herbaque quæ foliis nomen de mille” is mentioned by Serenus Sammonicus; the “sanguinaria” or “millefolium,” by Marcellus 1; the “millefolium,” in a medical formula of the time of Charlemagne (Spreng.); and the “herbam cui nomen foliis de mille,” by Macer Floridus: *A. millefolium* is described by Brunfels iii. p. 171, Lobel, Gerarde, and Parkinson theatr. 695; is known to grow in Italy and from the Pyrenees throughout middle and Northern Europe as far as Lapland (Wats., and A. Dec.). Farther West, was observed by Hooker in Iceland; by Giesek, in Greenland; by Richardson, nearly to Slave Lake; by Drummond, on the crest of the Rocky mountains; by Georgi, on the Pacific coast of America and islands as far as Kamschatka; is known to grow from Lat. 57° 20' in Labrador (Meyer) throughout Canada and along the Atlantic to our Southern States (Chapm.), springing up in clearings and having an un-American aspect, but already in New England in 1620 on the arrival of the first colonists (Mourt rel.); From Europe, according to Clot-Bey, has recently been introduced into the gardens of Egypt.

Achillea tomentosa of the East Mediterranean countries. Included in the “ahillēōs” — at least by Dioscorides, who describes the flowers as sometimes “hrusizōnta” golden: *A. tomentosa* was observed by Forskal, Sibthorp, Chaubard, and Fraas, on mountains of the Peloponnesus to the environs of Constantinople. Westward, is termed “millefolium tomentosum luteum” by Tournefort inst. 496; is known to grow in Italy (Lenz), and France (Pers.); but as occurring in England, is regarded by A. Decandolle as hardly naturalized.

Bupleurum rotundifolium of the Tauro-Caspian countries. Called in Britain *hare's ear*, by Turner “thorow-wax,” or “throw-wax” its “stalke waxeth throw the leaves,” in mediæval Latin “auricula leporis” (Prior), in Germany “hasenohr,” in Italy “bupleuro” or “cinquefoglio giallo” (Lenz); and the “veram achilleon” with which Telephus was healed — is referred by others to a branchless plant a foot high, its stem blue and elegantly invested throughout with separate round leaves (Plin. xxv. 19): *B. rotundifolium* is known to grow wild about Caucasus and the mountains of Suwant (Bieb., and Hohen.), and it may be in Persia (Fisch., and A. Dec.); was observed by Sibthorp, and Chaubard, in cultivated and fallow ground from Constantinople and Cyprus to the Peloponnesus. Farther West, is termed “b. perfoliatum rotundifolium annuum” by Tournefort inst. 310; was observed by Forskal near Marseilles, but throughout Western Europe is known only as a weed in cultivated ground (Pers., and A. Dec.).

1072 B. C. (Hom. il. ix. 328), the country around Troy ravaged by Achilles, who destroyed "eleven" towns in the Interior and "twelve" on the coast.

"In the Tenth" and last year of the war (Sm. b. d.), pestilence in the Greek camp, and the daughter of Chryses priest of Apollo at Chryse, sent back to her father. — With which event, Homer's account opens.

Ulmus effusa of the Mediterranean countries. A small kind of *elm* called in Greece "phtëlia" (Sibth.) or "phtëlëa" (Fraas), in which we recognize the "ptëla" growing along the river-brink near Troy — (il. vi. 419 and xxi. 242 to 350), mentioned also by Hesiod op. 435, Aristophanes nub. 1008, Dioscorides, and distinguished from the "örëöptëlä" large mountain kind by Theophrastus iii. 14: *U. effusa* was observed by Sibthorp, and Fraas, from Crete throughout Greece, according to Chaubard, never becoming very large; Westward, the "*ulmus*" is mentioned by Plautus, Virgil, and a "*silvestre*" kind by Pliny xvi. 29: *U. effusa* is distinguished by Willdenow, is termed "*u. pedunculata*" by Fougereux; and is described by Lindley as "a small tree" growing in "woods in the Southern parts of Europe."

Ulmus suberosa, — by some writers regarded distinct, is termed "*u. sativa*" by Duroi, "*u. pumila*" by Pallas, "*u. fruticosa*" and "*arborea*" by Willdenow (Steud.), and is perhaps the "kharkhaft" long known in the gardens of Egypt, according to Delile, and Clot-Bey, but hardly exceeding the dimensions of a shrub.

Salix alba of Europe and the adjoining portion of Asia. A large tree called in Britain *white willow* (Prior), in Italy with other species "*salcio*" (Lenz), in Greece "*gëtgia*" (Forsk.) or "*ëtia*" (Sibth.) or "*itëa*" (Fraas); and the "*itëai ölēsikarpöi*" growing among lofty poplars and conspicuous from the sea — (od. x. 510), "*itëa lëukë*" of Theophrastus iii. 13, and "*itëa thënthrön*" of Dioscorides, are referred here by Fraas; the "*candidam*" kind is also enumerated by Pliny xvi. 69 as cultivated in Asia, and the most useful: *S. alba* was observed by Sibthorp, and Fraas, from Cyprus throughout Greece; by Forskal, in gardens at Constantinople. Westward, the "*candida*" kind of "*salix*" is mentioned by Cato vi. 9, Virgil, and Ovid met. x. 96; *S. alba* is termed "*s. vulgaris alba arborescens*" by Tournefort inst. 590, "*omnium maxima et utilissima*" by Persoon, and according to Carey is sometimes "eighty" feet high; is known to grow in meads from Italy throughout middle Europe (Pollini, and Engl. bot. pl. 2430), and is besides planted. Eastward from the Black Sea, was observed by Thunberg in the outskirts of cities in Japan, and called "*kawa-ianigi*." By European colonists, was carried to Northeast America, where it continues planted for ornament in our Northern States. Its bark, recommended by "Stone in 1763," is regarded by Smith as "valuable in the treatment of agues" though "inferior to that of *S. Russeliana*" (Lindl.).

Salix fragilis of Europe and the adjoining portion of Asia. A tall and handsome tree called in Britain *crack willow* (Prior), the annual shoots readily breaking off (Pers.), in Germany "*brechweide*," in Greece "*itëa*" (Fraas) or "*ëtia*" (Sibth.); in which we recognize the "*itëa*" growing along the river-brink near Troy — (il. xxi. 350): the "*itëa*" divining-rod is mentioned by Herodotus iv. 6; a shield of "*itëa*," by Euripides suppl. 705; and the "*itëa mëlaina*" becoming a tree, according to Theophrastus iii. 13. 7, with shoots more useful for weaving than the "*lëukë*" kind: *S. fragilis* was observed by Sibthorp, Chaubard, and Fraas, on river-banks from the Peloponnesus to Constantinople; by Forskal, in the gardens of Constantinople, as well as those of Egypt. Westward, is described by Tournefort inst. 591; is termed "*s. decipiens*" by Thuillier (Steud.); and is known to grow throughout middle Europe as far as Sweden and Russia (Pers., Engl. bot. pl. 1807, and Wats.). By European colonists, was carried to Northeast America, where it is "cultivated for basket-work" (Carey), but whether perfecting seeds is not stated. Its bark is "included in some pharmacopœias" (Lindl.). "*S. Russeliana*," according to J. E. Smith the most valuable officinal species, seems generally regarded as not distinct.

Cornus mascula of Europe and the adjoining portion of Asia. Called in Italy "*corniolo*" or "*cornal*" or "*cora*" (Lenz), in Greece "*krania*" (Fraas), in which we recognize the "*kranëia*" of the mountain forest — (il. xvi. 767), and of Herodotus vii. 92, Anaxandrides, Theophrastus iii. 12, Dioscorides, and Galen: *C. mascula* was observed by Sibthorp, Chaubard, and Fraas, in Asia Minor and Greece, wild in the forest; and by Forskal, and Bory, planted in gardens at Constantinople and in the Peloponnesus. Farther South, "*cornus*" berries are enumerated by Forskal mat. med. as imported from Greece into Egypt, and the living tree according to Clot-Bey has been recently introduced. Westward, the "*cornus*" is mentioned by Lucretius v. 939, Horace, Columella, Silius Italicus, is termed "*bona bello*" by Virgil georg. ii. 447, and the "*cornus mascula*" is described by Pliny xvi. 30 to 42 as growing on mountains and its wood exceeding strong and destitute of pith: *C. mascula* is termed "*c. sylvestris mas*" by Tournefort inst. 641; is known to grow wild in Italy and middle Europe, is besides planted (Desf., Pers., and Lenz).

Buxus Balearica of mountains in the Mediterranean countries. The "*puxös*" of which Priam's horse-collars were made — (il. xxiv. 268), as well as writing-tablets, not only among the Greeks but

according to the Septuagint translation mentioned in Isaiah xxx. 8, may be compared: wood of B. Balearica according to Royle (in Kitt. bibl. cycl.) continues to be exported from Smyrna, Constantinople, and the Black Sea. and a species of *Buxus* grows on Caucasus: farther South, the "shamsar" or "shumshad" is mentioned by Ebn Baitar, and other Arab writers. Westward, "*buxum gallicum*" is enumerated by Pliny xvi. 28 as the largest kind; and B. Balearica is known to grow on Minorca.

Buxus sempervirens of Europe and the adjoining portion of Asia. Called in Britain *box*, in Anglo-Saxon "box" or "bux" (Prior), in Germany "buchs" (Grieb), in France "buis" (Nugent), in Italy "bosso" or "busso" (Lenz), in Illyrian "bus" (A. Dec.), in Calmuk "boschtom," in Georgian "bsa" (Pall), in Greece "puxari" (Sibth.); and possibly the "puxōs" in question, — as well as that of the comic poet Plato, Theophrastus iii. 15, and Pollux: B. *sempervirens* was observed by Hawkins (Sibth.), and Griesebach p. 148, wild in Bithynia and Macedonia and as far South as Pindus; and "*buxus minor*" was seen by Forskal in gardens at Constantinople. Westward, the "*buxus*" is mentioned by Virgil, Ovid, Columella, Firmicus, Claudian, as cultivated in gardens and the branchlets sheared "*tonsile buxetum*" by Pliny, and Martial: B. *sempervirens* is termed "*b. arborescens*" by Tournefort inst. 578; is known to grow wild chiefly in calcareous soil in Italy and on the Pyrenees and Jura as far as Lat 48°; is besides cultivated, and has become naturalized as far as Holland and Britain (Gerarde, Ray, Wats., and A. Dec.). Eastward from Greece, is known to grow in Persia (Lindl.); was observed by Kaempfer, and Thunberg, in Japan and called "ojo" or "tsuge," growing here and there and often cultivated. By European colonists, was carried to Northeast America, where it continues a frequent edging in gardens, but I have not seen it flowering. The leaves and wood according to Lindley are "sudorific and purgative," and "a fœtid empyreumatic oil 'oleum buxi,' was formerly sold in the shops."

Sium latifolium of Europe and Northern Asia. Called in Britain *water-parsnip* (Prior), in Germany "wassermærk," in Italy "herba canella" (Lenz), in Greece "nērōsēlina" (Fraas); in which we recognize the "sēlinōn" of the marshes eaten by horses — (il. ii. 776, vi. 39, and od. v. 32): S. *latifolium* was observed by Fraas in brooks and standing water everywhere in Greece. Westward, is described by Caesalpinus vii. 39, the leaves in Italy cooked and eaten (Spreng): is known to grow also throughout middle Europe as far as Sweden (Engl. bot. pl. 204, Pers., and Wats.). Eastward from Greece, is known to grow along the Taurian mountains, and was observed by Gmelin from the Yaic river in Siberia to the Ob.

Helosciadium nodiflorum of Europe and the adjoining portion of Asia. Also called in Greece "nērōsēlinōn" (Sibth.), and possibly the "sēlinōn" in question eaten by horses: — H. *nodiflorum* was observed by Forskal, Sibthorp, and Chaubard, frequent in water throughout from the Peloponnesus to Smyrna. Westward, is described by Morison ix. pl. 5; is termed "*sium aquaticum ad alas floridum*" by Tournefort inst. 308; and is known to grow on river-banks throughout middle Europe as far as Britain (Engl. bot. pl. 639, and Pers.). By European colonists, was carried to the Azores (Wats., and A. Dec.); and before 1788 (Walter) to Carolina, where it has become naturalized around the city of Charleston (Ell., and Cham.).

Lotus corniculatus of Europe and the adjoining portion of Asia. Called in Britain *birdsfoot clover* (Prior): the "lōtōs" prevalent on plains "pēthia lōtēunta" and eaten by horses around Sparta and Troy — (il. ii. 776 and xii. 284) is referred by Chaubard to "*L. Argolicus*" observed eaten by cattle and horses in the Peloponnesus, but perhaps not a distinct species: the term "lōtō triphullō" employed by Dioscorides iv. 110 seems also to imply knowledge of a non-trifoliate kind: L. *corniculatus* was observed by Forskal, and Sibthorp, from the Peloponnesus throughout the Greek islands to Marmora and Smyrna; by Forskal, and Delile, around Alexandria and Cairo; and by Pallas, along the Caspian. Westward, is described by C. Bauhin pin. 332; is termed "*L. sive melilotus pentaphyllos minor glabra*" by Tournefort inst. 402; and is known to grow in woods and meads throughout middle and Northern Europe as far as Lapland and Iceland (fl. Dan. pl. 991, Pers., and Hook.). Eastward from the Caspian, was observed by Thunberg frequent in Japan. By European colonists, was carried to South America (Wats.); and to Southeast Australia, where subsequent to the visit of R. Brown it has become extensively naturalized (Corder in phytol. 1845, and A. Dec.).

Lotus major of Europe and the adjoining portion of Asia. The "lōtōs" growing along the river-brink near Troy — (il. xxi. 351) may be compared with this allied but larger species; observed by Sibthorp in wet situations on mount Hæmus, though not distinguished by (J. E. Smith). Westward, L. *major* is described by Rivinus tetrap. pl. 76; is termed "*L. pentaphyllos flore majore luteo splendente*" by Tournefort inst. 403, "*L. uliginosus*" by Schkuhr; and is known to grow in shaded moist situations throughout middle Europe as far as Britain (Thuill., Pers., and Engl. bot. pl. 2091).

Lotus (Dorycnium) latifolius of the mountains of the East Mediterranean countries. The "lōtōn th' ērsēēnta" forming with other flowers a dense soft bed on mount Ida — (il. xiv. 348), may be compared: D. *latifolium* is termed "*d. orientale latifolium villosum*" by Tournefort cor. 26,

"totum villosum" by Persoon; is described also by Buxbaum i. pl. 32; and was observed by Sibthorp on the Bithynian Olympus.

Crocus vernus of mountains in the Mediterranean countries and middle Europe. Called in Britain *crocus* (Prior), in Italy "castagnola" or "magnugola" (Lenz), in Greece "agriōs krōkōs," in which we recognize the "krōkōs agriōs" of Galen comp. med. loc. iv. 8: the "krōkōs" of mount Ida — (il. xiv. 347) is referred here by Fraas; and the "glaukēs krōkōu" is mentioned by Empedocles (Plut. def. orac. 41): *C. vernus* was observed by Sibthorp, and Fraas, on mountain-summits in Cyprus, Crete, and Greece. Westward, the "rubens crocus" is mentioned by Virgil geor. iv. 180; *C. vernus* is termed "c. orientalis vernus flore subcæruleo (s. violaceo) externe spadiceo-rubente" by Tournefort cor. 25; was observed by Desfontaines on the Atlas mountains; is known to grow in North Italy (Lenz), but according to Gay, does not descend the central mountains of Europe into the plains of Germany and France; is however cultivated and partly naturalized in Britain (Engl. bot. pl. 344, and A. Dec.). By European colonists, was carried to Northeast America, where it continues to be cultivated for ornament.

Sedum altissimum of the Mediterranean countries. Called in Greece "amarantō" or "staphulaki" or "kōllōritha" (Sibth.), and the herb applied to wounds to remove pain — (il.) may be compared: also the "tēlēphion" of Dioscorides ii. 217 resembling in leaves and stem "anthrahnē," growing in vineyards and cultivated places in the Spring and full of thick fleshy leaves used for cataplasms; in the added Synonyms identified with the "aëizōn agriōn": *S. altissimum* was observed by Sibthorp, and Chaubard, frequent on walls and rocks from the Peloponnesus throughout Greece and the Greek islands, and the leaves used for refrigerant cataplasms. Farther South, the "tēlēphion" is identified in Syn. Diosc. with the "anōth" of the Egyptians. Westward, with the "atirtōpōuris" of the Numidians: and Pliny xxvii. 110 adds that the "telephion" cures wounds: *S. altissimum* is termed "sempervivum sediforme" by Jacquin hort. i. pl. 81; was observed by Tenore pl. 41 (Bory) in Italy, and is known to grow in other parts of Southern Europe (Pers.; see also *S. stellatum*).

Anthylis vulneraria of Europe and the adjoining portion of Asia. Called in Britain *kidney vetch* or *woundwort* from its soft downy leaves having been used as lint for dressing wounds (Prior), in Germany "wundkraut" (Grieb), in Greece "kōkōnōhōrtōn" (Sibth.), and possibly the plant in question:—*A. vulneraria* was observed by Sibthorp, and Chaubard, from Crete and the Peloponnesus to the Bithynian Olympus. Westward, is described by Dodoens p. 554; is termed "*vulneraria rustica*" by Tournefort inst. 391; was observed by Munby in Algeria; and is known to grow in Italy and throughout middle Europe as far as Scotland (Scop., Lam. fr., and A. Dec.). The plant in the days of Lyte i. 7 was employed against "strangury and against the payne of the reynes;" and according to Lindley "has had a great reputation as one of the best of styptics."

Cyperus longus of the Mediterranean countries. Called in Italy "cipero" (Lenz), in Greece "kupēirōs" (Sibth.) or "agriōn kupēiri" (Fraas); in which we recognize the "kupēirōn" growing along the river-brink near Troy — (il. xxi. 351), and of Herodotus, and Theophrastus i. 8, termed "ēlēiōrizōn" by Hesychius: *C. longus* was observed by Sibthorp, Chaubard, and Fraas, frequent in marshes from the Peloponnesus throughout Greece; and was received by Vahl from Egypt. Westward, the "cyperos" of Varro iii. 16. 23, and Columella xii. 20, is referred here by Fraas: *C. longus* is described by Morison iii. pl. 11; is termed "*cyperus odoratus radice longa sive officinarum*" by Tournefort inst. 527; and is frequent in Italy and other parts of Southern Europe (Pers., and Lenz). Its imported root is called in Britain *galingale* from "having been fraudulently substituted for the genuine" (Prior); and according to Lindley, is employed "as a stomachic."

Cyperus fuscus of the Mediterranean countries. Called in Egypt "söod" or "nghil" (Forsk.): the "kupēirōn" growing on the plains, and on which a warrior's body was laid — (il. and od. iv. 603), termed "thrōsōthē" dewy or tender by Pherecrates, and growing under oaks according to Theocritus v. 45, may be compared: *C. fuscus*, low and having a subflaccid stem, was observed by Sibthorp, Chaubard, and Fraas, frequent in moist situations from the Peloponnesus to Constantinople and Smyrna: farther South, by Forskal p. 14, and Delile, in Lower Egypt, the most abundant grassy plant in the moist portions of the river-flat. Westward, the "molle cyperon" is mentioned by Petronius; *C. fuscus* is described by Morison viii. pl. 9; is termed "c. minimus panicula sparsa nigricante" by Tournefort inst. 527; and is known to grow in Carniolia, Barbary, and throughout middle Europe as far as Denmark (Haller helv., Scop. carn., fl. Dan. pl. 179, and Pers.).

Zostera marina of Northern seas. A marine plant rooting and reaching the surface in sheltered situations, called in Britain *grass wrack* (Prior), in Germany "wasserriemen" (Grieb), in Greece "ualōhōrtōn" (Fraas) or "phukia" (Sibth.), and the "phukiōessa" strand — (Hom. il. xxiii. 693) is referred here by Sprengel: the grass-like "phukōs" with a long geniculate root is mentioned by Theophrastus iv. 66, and the "phukia" by Theocritus vii. 58: *Z. marina* was observed by Sibthorp, Chaubard, and Fraas around Greece, and is known to grow in the Black Sea to its Eastern extreme (Bieb.). Westward, "the sal nigrum" of Pliny has been identified with the salt procured by burning

this plant, places for which purpose are among the debris of the Stone Age in Denmark (Trojon 98): *Z. marina* is termed "alga angustifolia vitriariorum" by Tournefort inst. 569; is known to grow from the Adriatic outside of the Mediterranean as far as the Baltic (Pers.), Lapland and Iceland (Hook., and Wats.); was observed by myself along the coast of New England; by Pursh, in Delaware Bay; by Chapman, in West Florida. In the Pacific, by Thunberg in Japan; and is known to grow in Australia (Wats.).

1071 B. C. (Hom. il. iv. 327, Hellan., Plut. thes. 32, Clem. Alex., and Euseb.), death at Troy of Menestheus leader of the Athenians. He was succeeded at Athens by Demophon, son of Theseus and now Thirteenth Attic king.

Before the close of the year ($= 711 + "1360 - 1000 \text{ years}"$ of Ctesias in Diodor. ii. 21 $= 1417 - "16 - 8 - 15 - 5 - 68 - 40 - 194 \text{ years}"$ of the Armenian Euseb.-Maneth. table $= 1280 - "209 \text{ years}"$ of the Afr.-Maneth. table, the same table giving $339 + "4 + 3 + 2 + 38 + 20 \text{ y. } 4 \text{ mo. } + 6 + 124 \text{ y. } 4 \text{ mo. } + 150 \text{ y. } 6 \text{ mo. } + 40 + 6 + 89 + 120 + 130 \text{ years}" = 1072 \text{ y. } 2 \text{ mo.}$), Troy captured by the Greeks. The event is further placed by Ctesias in the reign of the Assyrian emperor Teutamos. (The date here given is 56 years or fourteen olympiads below the lowest Greek estimate, "1127" of Callimachus, and Africanus: which estimate could not perhaps be conveniently disregarded by Manetho for he has given $991 + "130 + 7 \text{ years}"$ of both Maneth. tables $= 1128$, and $1417 - "32 - 61 - 20 - 60 - 5 - 7 \text{ years}"$ of the Afr.-Maneth. table $= 1126$. The next Greek estimate, "1183" of Eratosthenes, will be observed to be 56 years higher; and the third Greek estimate presents the same difference. The First registered olympiad, "776," is called by Africanus the "Fourteenth;" and the above difference of fourteen full olympiads are found between the Olympiad of Iphitus as placed by Callimachus and Africanus in "828," and by Eratosthenes in "884." Between the Return of the Heraclidæ and the Registered olympiads (according to Clinton i. p. 128 and 139) "fifty-five" years are omitted by Phanias of Eresus; an interval also found between the date "1257" assigned by Callimachus to Cadmus, and "1312" given by Hales as the current Jewish date of the Exodus. The 56 years difference, continually recurring in Greek computations, is possibly derived from the combination of the Great Julian year, for in the Egyptian reckoning, $1539 - 1461 \times 2 = 156$, of which "100 years" are disposed of under Phiops. See Introd. p. xiv).

After the fall of Troy (Homer il. xx. 308), the Troad ruled by Aeneas. The assertion by later writers of his leaving the country, therefore unfounded.

Ulysses on his homeward voyage driven to the Lybian coast and the Lotophagi, a people living on the "lôtös" that from its sweetness causes him who tastes to forget his country — (Hom. od. ix. 95); found by Artemidorus to be an herb that is eaten entire: clearly the "helbeh" *Trigonella farnum Græcum*, eaten crude in Egypt and its sprouting seeds often mixed in a ragout with honey (Clot-Bey). The explanation may be found in the "helweh" conserve, once an article of export even to Britain, and to the present day employed by Arabs along the East African coast for child-stealing. By Serapion, the "mëlilôtös" of the Greeks is referred directly to a species of *Trigonella* (see T. hamosa, and T. elatior).

Quercus ilex of the wooded portion of the Mediterranean countries. The *holm oak* is called in Germany "steineiche" (Grieb), in France "yeuse" (Nugent), in Italy "leccio" or "elice" (Lenz), in Greece "pournari" (Fraas) or "aria" or "arëös" (Sibth.); in which we recognize the three "ilices" on the site selected for the city of Tiburtes — (remaining in the days of Pliny xvi. 5 to 87), also the "ilex" in the Vatican bearing an Etruscan inscription and older than Rome, while among the Romans the earliest civic crown was the "iligna:" the "ilex" is also mentioned by Cato v. 7, Terence, Horace, Virgil, Columella, Statius, and Martial: (1.) *ilex* is described by Matthioli valgr. i. pl. 186; is termed "i. oblongo serrato folio" by Tournefort inst. 583; was observed by Forskal in the environs of Marseilles; and is known to grow in Italy, Sicily, Sardinia, Morocco, and Spain (Moris, Guss., Webb, and A. Dec.). Eastward, the "akulön" of Homer od. x. 242 is regarded by Pliny xvi. 8 as including the acorns of both kinds of "ilicis," that with leaves resembling those of the olive being by some Greeks called "smilaces;" an account derived partly at least from Theophrastus iii. 16. 2, who further identifies the "phëllöthrun" of the Arcadians with the "arian" of the Dorians: (2.) *ilex* was observed by Sibthorp, and Fraas, from Crete and the Peloponnesus to mount Athos, one of the dominant forest-trees according to Chaubard as throughout the Mediterranean region.

1069 B. C. ("about the end of the Second year after" the fall of Troy, Dionys. Hal.), in Italy, the city of Lavinium founded by the alleged companions of Aeneas. The city of Tiburtes in Italy perhaps as ancient, its founder Tiburtus, contemporary with Aeneas (according to Virgil aen. vii. 671), being a son of Amphiaraus who died at Thebes a generation before the Trojan war "una ætate ante iliacum bellum" (according to Pliny xvi. 87).

The same year ($= 1062 + "7 \text{ years and } 8\text{th year}"$ of Hom. od. vii. 259 to 261), arrival of Ulysses at Ogygia or Calypso's Isle.

Apium graveolens of marshes more or less saline throughout Europe to Caucasus, the seashore of Austral America and as far along the Pacific as California. Called in Britain *smallage* or *small ach*, in France "ache de marais" or "ache rustique" (Prior), in Italy "apio" or "apio palustre" or "seleno" (Lenz), in Greece "agriōsēlinōn" (Sibth.), in Egypt "kerafs" (Forsk.); in which we recognize the "sēlinōn" in the meads of Ogygia — (Hom. od. v. 72); mentioned also by Theocritus xiii. 42, Galen al. fac. ii. 52, the Geopon. xii. 23, or the "ēlēiōsēlinōn" of Theophrastus vii. 6, and Dioscorides: *A. graveolens* was observed by Sibthorp, Chaubard, and Fraas, in wet ground from the Peloponnesus throughout Greece; and is known to grow on Caucasus (Lindl.). Farther South, the "karafs" is enumerated by Ebn Baitar as both wild and cultivated; its seeds are prescribed by Rhazes, and seeds of *A. graveolens* were found by Forskal mat. med. employed by the Egyptians to stop sea-sickness; the living plant was seen by him, Alpinus, and Delile, in the gardens of Egypt, and by Hasselquist in Palestine. Westward, the "ēlēiōsēlinōn" or "pēthinōn" or "uthrōsēlinōn agriōn" is identified in Syn. Diosc. with the "apiōm rōustikōm" of the Romans; "apio" wild "in humidis" is mentioned by Pliny xix. 37; *A. graveolens* is described by Turner nom., and Gerarde; is termed "a. palustre et a. officinarum" by Tournefort inst. 305; is known to grow in Italy and throughout middle Europe as far as Denmark (Ludw. ect. pl. 180, fl. Dan. pl. 790, and Pers.), in its wild state according to Lindley "acrid and poisonous." (See *A. dulce*).

Barbarea vulgaris of Northern climates. Called in Britain *yellow rocket* or *winter rocket* or *winter cress* (Prior p. 58) or *yellow water-cress* or *belders* (Ainsw.), in Italy "crescione" or "lavari" or "lavero" (Anguillar. p. 114); and the accompanying "iōn" in the meads of Ogygia, is read "siōn" — by some writers: the "siōn" is mentioned by Theocritus v. 125; by Cratevas, as an herb with a few roundish leaves larger than those of "ēthuōsmōu" and very near those of "ēzōmō;" the "siōn tō nērōkarthamōn," by Nicolaus Myrepsus (Steph. th. ed. Hase); and the "riwas" of Ebn Baitar is translated "wasser-eruca" by Sontheimer: *B. vulgaris* was observed by Sibthorp in marshes from the Peloponnesus to mount Hæmus; but by Chaubard in moist places in gardens. Westward, the "siōn" or "tharēn iōn" is identified in Syn. Diosc. ii. 153 with the "laōuvērthē;" the "siōn" with "sapore nasturtii," and "laver" growing "in rivis," are mentioned by Pliny xxii. 41 and xxvi. 32; *B. vulgaris* is described by Fuchs pl. 746, Tragus, and Dodoens (Spreng.); is termed "sisymbrium erucæ folio glabro flore luteo" by Tournefort inst. 226, "eruca barbarea" by Lamarck fl. fr.; and is known to grow from North Africa throughout Europe as far as Lapland (fl. Dan. pl. 560, and Wats.). Eastward from the Black Sea, is known to grow throughout Siberia to Kamtschatka (Dec., Cham., and Wats.): farther East, was observed by Chamisso on Unalascha; by Mertens, near the trading-posts on Norton Sound; by myself, frequent along Puget Sound and clearly indigenous; is known to grow at the mouth of the Columbia, and from Lat. 68° throughout Canada (Hook.), along Lake Superior (A. Gray); was observed by Short in Kentucky; by myself, in wild situations along the Atlantic in New England, but more frequently a weed in waste ground. Clearly by European colonists, was carried to the Mauritius Islands, where it continues regularly cultivated (Boj.).

Alnus glutinosa of Europe and Northern Asia. Called in Britain *alder* or *aller*, in Anglo-Saxon "alr" or "aler," in German "erle," in Gothic "erila," in Holland "els," names connected with awl and boring (Prior), in France "aulne" (Fée), in Italy "alno" or "ontano" (Lenz), in Greece "skilithrō" (Forsk.) or "klēthra" (Sibth.), in which we recognize the "klēthrē" growing on Ogygia — (Hom. od. v. 64), mentioned also by Theophrastus iii. 14: *A. glutinosa* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from Constantinople to the Peloponnesus: by Hasselquist, as far as the Mediterranean border of Egypt; and is known to grow on Caucasus (Bieb.). Westward, the "alnus" is mentioned by Cicero, Vitruvius, Virgil, Juvenal, Silius Italicus, and Statius: *A. glutinosa* is included in the kinds of wood used by the ancient Irish in constructing crannoges (Troyon p. 458); is termed "a. rotundifolia glutinosa viridis" by Tournefort inst. 587; was observed by Desfontaines in Barbary; and is known to grow in Italy and throughout middle Europe as far as Sweden (Engl. bot. pl. 1508, Pers., and Wats.). Eastward from Caucasus, was observed by Gmelin throughout Siberia; by Thunberg, in Japan and called "iasia," its cone-like fertile aments sold for dyeing black. According to Lindley, "a decoction of the bark is employed as a gargle," and even as a substitute for cinchona.

Ninety-seventh generation. May 1st, 1067, mostly beyond youth: the Hindu astronomer Garga (Bentl. as. res. viii. p. 232); Jesse; the Greek "aōidōi" or bards, Phemius and Demodocus (Hom. od. i. 337, viii. 472, xiii., xvii., and xxii.); the Heraclid chieftain Antiochus, father of Phylas (Apollod. ii. 8. 3, and Pausan. ii. 4. 3).

1064 B. C. (= 1071 — 7 years in the Parian marble, "Demophon ruling Athens"), in Cyprus the city of Salamis founded by Teucer. The fact is mentioned by Aeschylus, Pindar, Strabo, and Pausanias; and confirmation is found in the name being that of Teucer's native island.

Ceterach officinarum of Europe and the adjoining portion of Asia. Called in Britain *stone fern* from growing on stone walls, but originally "spleen-wort" or "miltwaste" (Gerarde, W. Coles, and

Prior), in France "scolopendre" (Nugent), in Italy "cetracea" or "erba dorata" (Lenz), in Greece "skōrpithi" or "hrusōhōrtōn" (Sibth.); in which we recognize the "teucrion" discovered by Teucer in throwing away entrails from its adhering to and absorbing the spleen, — further identified by Pliny xxv. 20 with the "hemionion," growing according to Theophrastus ix. 18. 7 in stony mountainous places and resembling "skōlōpēnthrō:" the "skōlōpēnthriōn" is mentioned by Andreas, Nicander ther. 684, and is identified in Syn. Diosc. with the "ēmionion" or "splēniōn" or the "asplēnōn" of Dioscorides growing on shaded walls and rocks, its leaves resembling the "skōlōpenthra" animal, incised after the manner of "pōlupōthiōu," green above and fulvous and hairy beneath: the account of swine feeding on "splenion" being destitute of a spleen is further mentioned by Pliny (a similar statement is attributed to Vitruvius by W. Coles): C. officinarum was observed by Sibthorp, Chaubard, and Fraas, frequent on walls and rocks from the Peloponnesus throughout Greece. Farther South, is called in Egyptian "askōlōvantērion" (Edw.); and was observed by Forskal on the mountains of Yemen. Westward, is termed "ceterach" by Matthæus Sylvaticus, "a. sive ceterach" by Tournefort inst. 544; is described also by Tragus f. 209; and is known to grow from Italy to Spain and throughout middle Europe as far as Britain (Engl. bot. pl. 1244, and Bory).

Acrostichum marantæ of the East Mediterranean countries. Possibly the "teucrion" in question, — Pliny's account being in part taken from the "ēmionitis" of Dioscorides, growing in stony places, having neither stem fruit nor flower, but slender roots and a lunate leaf resembling that of "thrakōntēiō," dissolving the spleen; and in the added Synonyms identified with the "splēniōn:" the best "asplenium" too, according to Pliny xxvii. 17, came from Crete: A. marantæ is termed "asplenium ramosum" by Tournefort inst. 544; and was observed by Sibthorp on Crete, Cyprus, and mount Athos.

1063 B. C. (= "8th year" after the death of Agamemnon, Hom. od. iii. 306), Mycenæ recovered by his son Orestes, the lawful Argive king. — Who after acquiring Argos and Sparta, became the most powerful chieftain of the Peloponnesus (Pind. pyth. xi. 24, Pausan. ii. 18, and others).

On the very day when Orestes was solemnizing the burial of his mother Clytemnaestra and of Aegisthus (Hom. od. iv. 365, and "8 years after the fall of Troy" Paus. iii. 22. 2), return of Menelaus to Sparta.

Physalis (Withania) somnifera of Arabia. Called in France "coqueret somnifère (Fée), in Greece "tragia" (Fraas), in Egypt "morgan" coral-fruited or "sakeran" inebriating (Del.), in Yemen "barde" or "ōbab" or "uarak esscheffa" (Forsk.), in Malabar "pevetti," in Tamil "amkooling," in Telingan "penerroo," in Bengalee "amkoolang" (Drur): and the "nēpēnthēs" drug brought by Helen from Egypt and causing one to forget trouble — (Homer od. iv. 221): fragments of W. somnifera, unrolled from Egyptian mummies, were identified by Kunth (Lindl.): the plant was observed by Forskal, and Delile, in Egypt, its "leaves steeped in oil" applied "to inflammatory tumours" (Lindl.); again by Forskal, along the base of the mountains of Yemen. Farther North, the "halicacabum sporiferum" or "morion" or "moly" used in prophesying by soothsayers, and medicinally by Diocles, Evenor, and Timaristus, is according to Pliny xxi. 105 "etiam opio velocius ad mortem;" "halicacabi cortex" is prescribed also by Celsus v. 20: the "struhnōs upnōthēs" is described by Theophrastus ix. 11. 5 as growing in clefts and on sepulchres, and having hairy leaves and bright red fruit; by Dioscorides, as growing in stony places near the sea, and the bark of its root placed in wine to procure sleep: W. somnifera was observed by Sibthorp in stony places on the seashore of Cyprus and Euboea; by Forskal, Chaubard, and Fraas, farther inland in other parts of Greece. Westward, is described by Clusius hist. ii. p. 85 (Spreng.); is termed "alkekengi fructu parvo verticillato" by Tournefort inst. 151; and is known to occur in Spain (Cav. ii. pl. 103, and Pers.). Eastward from Arabia, was observed by Graham in "the English burial ground, Bombay," growing also in "both the Concans and Guzerat;" by Hamilton, Roxburgh, and Wight, as far as Travancore and Bengal, its seeds used to coagulate milk (Drur.), its leaves according to Lindley "steeped in oil" and applied in a similar way as in Egypt. By European colonists, was carried to Mexico (Pers.).

1062 B. C. (= "10th year" after the fall of Troy, Hom. od. iii. and xxiv. 322), Telemachus son of Ulysses visiting Nestor at Pylos, and Menelaus at Sparta: before the close of the year, return of Ulysses to Ithaca

Triticum spelta of the Tauro-Caspian countries. Called in Britain, Holland, Denmark, Sweden, and Germany *spelt*, in Spain "espelta," in France "espeautre" (Prior) or "epeautre" (Nugent), in Italy "spelta" or "farro" or "grano farro" (Lenz): the "zēia" mixed with barley and given to horses in the Peloponnesus — (Hom. od. iv. 41 to 594), mentioned also by Herodotus ii. 36, by Xenophon anab. v. 4. 16 as cultivated in Pontus, by Strabo v. 2. 10 and vii. 5. 4 as cultivated in Illyria and Umbria, by Mnesitheus of Cyzicus as cultivated in cold climates, by Theophrastus caus. iv. 6 as "pōluhitōna" many-husked, is referred here by writers: "zēia" and "tīphē" changing into wheat is mentioned also by Theophrastus ii. 4. 1 and caus. viii. 9. 2, and the "zēia thikōkkōs" two-seeded kind

by Dioscorides: *T. spelta* was observed by Fraas rare in Greece, and experimentally cultivated: farther South, seeds exhumed in Egypt and regarded as of the time of the Pharaohs, were sent by Ehrenberg to Heer (Lee's edit. Keller, 345), and the living plant was seen in Egypt by Belon. Westward, "far" called "semen" and anciently "adorem," the only kind of grain eaten by the Romans for "three hundred years" (Verrius) is mentioned also by Varro, Virgil, Valerius Maximus, Columella, by Pliny xviii. 10 to 19 as kept for seed in its envelopes "in vaginulis suis," and the term "farinarius" mealman is employed by Cato: *T. spelta* occurs in the debris of the ancient lake-villages of Switzerland (Troyn), has been cultivated from ancient times by the Celts and Germans (Reynier p. 421), continues to be cultivated on mount Etna (Gemellar.) and throughout middle Europe (Morison pl. 6, Hall. helvet., and Pers.). In its wild state, was observed by Michaux in Persia near Hamadan, and by Olivier trav. iii. 460 on the Upper Euphrates (A. Dec.).

Cydonia vulgaris of the East Mediterranean countries. Called in Britain *quince*, by Chaucer "coine," in France "coing," in Spain "cotogna" (Prior), in Germany "quite" (Grieb), in Italy "cotogno" or "melo cotogno" (Lenz), in Greece "kuthōnia" (Sibth.), in Persia "betana" (A. Dec.), in Egypt "sefargel" (Del.): perhaps the original "mēlōn" of the Greeks, the same word signifying sheep, agreeing in their woolly coating and aspect on distant hills, and "mēlinōs" further signifying yellow: the "mēlōn" was cultivated in orchards on Ithaca — (Hom. od. vii. 115), is mentioned also by Hesiod; "kuthōnea" from Cydon in Crete or "kuthōnia mēla" are mentioned by Stesichorus, Solon leg., Theophrastus iv. 8. 11, Dioscorides, Plutarch conj. pr. 1, and Athenaeus: *C. vulgaris* was observed in Greece by Forskal, Sibthorp, Chaubard, and Fraas, both cultivated and in wild situations; is known to grow also apparently wild in the Crimea and around Caucasus (Ledeb.). Farther South, is called in Egyptian "ōushē" (Kirch.); was observed by Abd-allatif, Schems-eddin, Delile, and Clot-Bey, under cultivation in Egypt; by myself, the fruit in market at Mocha, and the seeds from the abundant mucilage substituted for flax-seed. Westward, the "cydonia" is identified by Pliny xv. 10 with the "malum cotoneum" of Cato vii. 2, and Varro; *C. vulgaris* is known to grow in wild situations in Italy and Sardinia (Bertol., Moris, and Lenz), is naturalized in Sicily, Algeria, Spain, and Portugal (Guss., Pers., Munby, and A. Dec.), and is besides cultivated as far as Britain. Eastward from Caucasus, is called in Hindustanee "safargal" or "bih" or "darakht-i-bihi," in Bengali "tahir phal" (D'roz.), and though having no Sanscrit name has been long cultivated in Cashmere and Northern Hindustan (Roxb., and Royle ill. himal.); the seeds are besides "imported in considerable quantities from Persia" and "used medicinally by the natives" (Little, and Graham). By European colonists, was carried to the environs of Bombay (Nimmo); to Japan (Thunb.); and to Northeast America, where it continues under frequent cultivation.

Rubus fruticosus of Europe and the adjoining portion of Asia. Called in Britain *bramble* or *blackberry* (Prior), in France "ronce" (Nugent), in Germany "brombeere," in Italy "rovo" or "more" or "rusca de mora" (Lenz), in Greece "vatō" or "vatōs" (Sibth.) and the fruit "mōuris" (Forsk.), in which we recognize the "vatōn" infesting orchards — (Hom. od. xxiv. 230), mentioned also by Pindar olymp. vi. 90, Salmonius, Theophrastus, Nicander, Dioscorides, and Athenaeus ii. 36: *R. fruticosus* was observed by Forskal, Sibthorp, and Chaubard, abounding from the Peloponnesus to the Dardanelles and Smyrna. Farther South, the "vatōs" is identified in Syn. Diosc. with the "aimōiōs" or "amētōs" of the Egyptians, and "aima titanōu" or "aima ivēōs" of the prophets: *R. fruticosus* was observed by Hasselquist in Palestine; by Delile, on the Mediterranean border of Egypt; and "rubus root from Alexandria" was found by Forskal mat. med. in the Egyptian drug-shops. Westward, the "vatōs" is identified in Syn. Diosc. with the "mantēia" of the Dacians, and "sēntēs" or "rōuvōum" or "mōra vatikana" of the Romans: the "rubus" is mentioned by Horace, Virgil, Columella, Pliny xxiv. 73, and the morum of the "rubetum" bramble-thicket by Ovid met. i. 104: *R. fruticosus* is termed "*r. vulgaris*" by Tournefort inst. 614; was observed by Lenz frequent in Italy, by Forskal near Marseilles, and is known to grow throughout middle Europe as far as Britain (Pers., and Engl. bot. pl. 715).

1054, June 20th (= 1073 y. 302 $\frac{1}{2}$ d. — "20 years" of 1 Sam. vii. 2, "wheat harvest" of xii. 17 being determined by Usher to the end of May or beginning of June), Saul anointed king over the Israelites; with his power limited, especially in religious matters, and defined in a *written record* by the prophet Samuel (1 Sam. x. 25, xiii. 9, and xv. 24).

Thamyris, son of Philammon, composing poetry after the fall of Troy — (. . .). He is mentioned in the addition to Homer il. ii. 595: some of his poetry continued extant in the days of Plato, and two lines have been preserved by Plutarch cohib. ira 5.

Delphinium ajacis of the Mediterranean countries. Called in English gardens *rocket larkspur* (Graham), in Germany "garten rittersporn" (Fraas, and Lenz), on Zacynthus "agriō linārō tōu vōnōu" (Sibth.) or at Constantinople "kapōutziñōs," in Egypt "ajakabuh" (Forsk.) or "ayakbough" (Del.), in which we recognize the "uakinthōs" flower said to have sprung from the blood of a beautiful youth beloved by Thamyris and accidentally killed by Apollo — (Apollod. i. 3. 3): the name

of Ajax "aias" was substituted before the days of Euphorion, and Theocritus x. 28: the "uakinthōs" is termed "pōluthrēnōs" by Nicander 902; is identified in Syn. Diosc. iii. 77 with the "thēlphiniōn;" and the "uakinthōs" inscribed with letters is identified by Pausanias i. 35. 4 and ii. 35. 5 with the "kōsmōsanthalōn" having coronary flowers: these letters according to Moschus iii. 5, and Ovid met. x. 211, are the Greek ΑΙ, and Lucian xiv. p. 43 speaks of "ἐπαιαζόντα" the dead: D. ajacis was observed by Forskal in gardens at Constantinople; by Sibthorp, in fallow ground from Bœotia to the Peloponnesus, its corolla according to Chaubard, distinctly bearing the letters ΑΙΑ: farther South, was observed by Forskal, Delile, and Clot-Bey, in the gardens of Egypt. Westward, is described by Miller, and Linnæus; is termed "d. simplex" by Salisbury; is known to occur in Switzerland (Pers.), and the flowers according to Sprengel are often red. Eastward from Egypt, was observed by Wight, and Graham, in Tropical Hindustan, "in Deckan gardens" according to Lush, "where it is planted below orange and peach trees to keep down weeds;" was observed by Mason "exotic" in Burmah.

Scilla amoena of Eastern Europe and the adjoining portion of Asia. After the death of Ajax, according to the inhabitants of Salamis, a pale reddish flower made its appearance, smaller in all its parts than the "krinōu" and inscribed with letters like those on "uakinthōis" — (Paus.): the "uakinthōs" is mentioned by Homer il. xiv. 348 and od. vi. 231 as growing on mountains; by Theophrastus vi. 8, as vernal but continuing a long while flowering; by Dioscorides, as a span high and resembling in root and leaves the "völvd," the green stem more slender than the little finger and terminating in a curved raceme of purplish flowers, the root believed to delay puberty in boys: *S. amoena* is described by Rudbeck. ii. pl. 7; is termed "ornithogalum cæruleum byzantinum" by Tournefort inst. 380; was observed by Sibthorp in the Peloponnesus, by Chaubard, in ascending Taygetus; is known to grow also in Germany, Austria, and Russia (Jacq. austr. pl. 218), and according to Persoon its petals are marked at base with two white lines.

"1052 B. C. = 1st year of Tchao-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

In this year (= 1078 — "26 years" of both Maneth. tables), Smēnthēs succeeded by Psōusēnnēs, second king of the Twenty-first dynasty. Herhor siamun was succeeded by his grandson Pisem or Painetem; whose name has been found on contemporaneous monuments (Leps. k. pl. 43), though not enclosed in royal ovals. He married Rakamat of the Ramessid line, acquiring thus a kind of legitimate title to the throne — (Birch).

The same year (= 1054 — "2 years" of I Sam. xiii. 1), war against the Philistines commenced by Saul.

Picridium Tingitanum of the Desert-margin and the shores of the Mediterranean. Called in Egypt "houeh" (Del.), in which we recognize the חוה hwh among which Israelites now concealed themselves — (I Sam. xiii. 6), mentioned also in Prov. xxvi. 9, Cant. ii. 2, Isai. xxiv. 13, and Job xxxi. 4: *P. Tingitanum*, an herb with crowded leaves rejected by all kinds of cattle except donkeys, was observed by Forskal p. 143 not far from Cairo growing in the Désert; by Delile, near Alexandria; by Sibthorp, along roadsides in Asia Minor and on the seashore of Caria and Cyprus. Westward, is described by Hermann lugd. pl. 659; is termed "*S. tingitanum papaveris folio*" by Tournefort inst. 475; and is known to grow on the seashore of Barbary (Pers.).

1041 B. C. (= 1091 — "50 years" after the death of Hyllus, Diodor. iv. 58, see also Oenom. in Euseb. pr. v. p. 210, and schol. Pind. isthm. vii. 18), Second invasion of the Peloponnesus by the Heraclidæ. Repelled, and their leader Cleodæus, son of Hyllus, slain. (By some writers, the event is placed three years later, see below).

Gnista monosperma of the Desert-margin, from the Atlantic to the Sinai Peninsula. Called in Egypt "retam," in which we recognize the coals of רֶטֶם rdm alluded to by David while a fugitive. (Psalm cxx. iv): — Elijah on his way to Mount Horeb rested under a "rdm" (1 K. xix. 4), as is often done in the same region by modern travellers (Kitt. bibl. cycl.); the "rdm" is mentioned also in Job xxx. 4, and charcoal procured in the Sinai Peninsula from *G. monosperma* continues to be carried to Egypt (Forsk., and others): the living plant was observed by Forskal near Suez; by Delile, not far from Cairo growing in the Desert. Westward, is known to grow in Morocco, and in sterile situations in Portugal and Spain (Pers.; see also *Atriplex coriacea*).

1038 B. C. (= 1037 y. 240 $\frac{3}{8}$ d. = 1005 y. 116 $\frac{1}{8}$ d. + "40 years" of ten lunations of 1 K. ii. 11 and 1 Chron. xxix. 27 = 1053 y. 302 $\frac{1}{8}$ d. — "20 years" of ten lunations, in Josephus as read by Epiphanius, in Theophilus of Antioch, and in Clemens Alexandrinus), Saul succeeded by David, second Jewish king.

The same year (= 1071 — "33 years" of Castor and Eusebius), Demophon succeeded by his son Oxyntes, as king of Athens. (The Second invasion of the Heraclidæ, according to Eusebius ii. p. 300, is by some writers placed in the "first year of Oxyntes." See above).

Ninety-eighth generation. Sept. 1st, 1034, mostly beyond youth: Ethan the Ezrahite (1 K. iv. 31, 1 Chron. ii. 6, and Psalm lxxxix), Heman (1 K. iv. 31, 1 Chron. ii. 6, vi. 33, xxv. 4, and 2 Chron. xxxv. 15), Chalcol or Calcol, and Darda or Dara (1 K. iv. 31, and 1 Chron. ii. 6), Asaph (1 Chron. vi. 39, xxv., and 2 Chron. xxxv. 15), the prophets Gad, and Nathan (2 Sam. xxiv. 11 to 18, and 1 Chron. xxix. 29), the compiler of the book of Yshr (quoted in Josh. x. 13, and which contained David's lamentation 2 Sam. i. 18 to 27): among the Greeks, the Heraclid chieftain Phylas, father of Hippotus (Oenom., and Pausan. ii. 4. 3), Tisamenus father of Autesion (Herod. iv. 147, and Pausan. ix. 8).

1032 B. C. (= 1037 y. 240 $\frac{1}{2}$ d. — "7 years" of ten lunations of 1 K. ii. 11), the Jewish seat of government removed by king David from Hebron to Jerusalem.

The art of *serpent-charming* mentioned in Psalm lviii. 5: the 𐤃𐤕𐤍 fdn or "deaf adder" that "stoppeth her ear," implying the ear-like appendages of the cerastes or *horned viper* (already noticed): — the "fdn" is also mentioned in Psalm xci. 13, and Isai. xi. 8.

Cassia aschrek of Tropical Arabia. Called there "aschrek" (Forsk.), and the 𐤌𐤓𐤕𐤕 azrh of Psalm xxxvii. 35 — may be compared: the "ischrik" is mentioned by Ascha, Firouzabadi, Abul Abbas Elhafits, Elgafaki, and is described by Ebn Baitar as growing "in Arabia" and having the "leaves of senna:" C. aschrek was observed by Forskal p. 86 on the Western margin of the Arabian Desert.

"1022 B. C. = the Ninth manwantara" among the Hindus — (Graha Munjari tables, and Bentley as. res. viii. 244).

1018 B. C. (= 939 y. 8 mo. + "9 + 6 + 9 + 4 years" of both Maneth. tables), Psōusēnnēs succeeded by Nēphērhērēs, third king of the Twenty-first dynasty. The name of king Patenankh-Nebkanofre, apparently of this dynasty, has been found on the monuments (Leps. k. pl. 68); the order of succession not given.

"1017 B. C. = 36th year of Tchao-wang" (Chinese chron. table), beginning of the Twenty-eighth cycle.

1015 B. C. (= 1002 y. 116 $\frac{4}{8}$ d. + "12 years before the building of Solomon's temple" of Jos. a. j. viii. 3. 1, and c. A. i. 18), Abibalus (the earliest Phoenician king known, the first portion of the Lists of Dios and Menander Ephes. being deficient) succeeded by his son Hiram; of the age of ("53 — 34" =) nineteen, and who reigned "thirty-four" years. Hiram (according to Menander Ephes., and Jos.) built in Tyre the first temple to Hercules (Samson).

Hadad, king of the Syrians at Damascus, warring against David (Nicol. Damasc., in Jos. . . vii. 5. 1). The Syrians were defeated, and "David put garrisons in Syria of Damascus" (2 Sam. viii. 5 and 6).

1014 B. C. (= 989 y. 8 mo. + "9 + 6 + 9 years" of both Maneth. tables), Nēphērhērēs succeeded by Amēnōpthis, fourth king of the Twenty-first dynasty. His name and that of his wife Hesiemkheb have been found on the bricks of Kheb in the Hep-tanomide — (Birch, and Leps. k. pl. 43).

1012 B. C. (Asclep., and Strab. xiii. 1. 3), death of Orestes, after planning the Aeolic Migration. He was succeeded as Argive king by his son Tisamenus.

1011 B. C. (= 1071 — "60 years" of Thucyd. i. 12, and Strab. xiii. 1. 3, see also Cinaeth., and Pausan. ii. 18. 5), the Aeolic Migration assembled at Aulis under Penthilus another son of Orestes, and led by sea into the Troad. The expedition consisted in part of Boeotian fugitives from Arnē; driven out by the Thessali, who after a long absence were re-occupying the country from this time called Thessaly.

On their way, the city of Orchomenus captured by the fugitives, and annexed to Boeotia — (Thuc. iv. 76, Strab. ix. p. 401, and Sm. geogr. dict.).

About this time (991 + "about 20 years" of Clinton i. p. 108, see also Apollod. ii. 8. 2), Third invasion of the Peloponnesus by the Heraclidæ. Repelled by the Argive king Tisamenus, and their leader Aristomachus son of Cleodæus, slain.

Not earlier than 1010 B. C., the city of Cumæ South of the Troad founded by a Second expedition of Aeolian Greeks: assembled under Cleues and Malaus at the time of the First expedition, but delayed in sailing at Locris — (Strab. xiii. 1. 3). Aeolian settlements were extended on the North coast of the Troad along the Propontis as far as the half-way promontory by Archelaus or Echelaus, son of Penthilus and grandson of Orestes.

1006 B. C. (= 1037 y. 240 $\frac{1}{2}$ d. — "40 years" of ten lunations of 1 K. ii. 11, and 1 Chron. xxix. 27), David succeeded by his son Solomon, third Jewish king. Solomon is historically mentioned and called "king of Jerusalem" by the Greek writers Dios, and Menander Ephesius (Jos. a. j. viii. 3. 1, and c. A. i. 18).

1005 B. C. (= 998 y. 8 mo. + "9 + 6 years" of both Maneth. tables), Amēnōphthis succeeded by Osōhōr, fifth king of the Twenty-first dynasty. The name of Hor Petukhanu has been found on contemporaneous monuments — (Leps. k. pl. 43).

"1004 B. C. = the beginning of the Cali Yug or Iron Age" among the Hindus (Graha Munjari tables, and Bentley as. res. viii. p. 244), Bhutagetu reigning not earlier than this date

1003, December (= 1005 y. 116 $\frac{3}{4}$ d. — "4th year" of 1 K. vi. 1 and 2 Chron. iii. 2, Josephus c. A. i. 18 to ii. 2 giving "12th year of Hirom" and "612 years" after the exclusion of the Hyksos = 1002, = Jewish date of the Exodus 1312 — "40 — 8 — 32 — 18 — 62 — 20 — 20 — 7 — 33 — 22 — 3 — 3 — 20 — 40 — 40 — 4 years" of Euseb. i. p. 77 and ii. p. 300 = 372 years of ten months = 310 years of twelve months), the temple at Jerusalem commenced by Solomon. (The above period of "612 years" is also given by Theophilus of Antioch; with slight variation, by Clemens Alexandrinus; and in one instance, even by Eusebius. See Clint. i. p. 306 to 311).

The מנמל תבואה twkym brought in Solomon's ships (1 K. x. 22, and 2 Chron. ix. 21) are referred by Hieronymus and Syriac and Hebrew authorities to the *peacock*. The bird has been already noticed; but the word "twkym," I am informed by Rev. Mr. Hoisington is Tamil; the *Tamil language* therefore already in existence (see cinnamon).

In reference to the מנמל תבואה "almug trees" brought up the Red Sea in Solomon's ships, — I ascertained, that to this day, the wooden joists for supporting floors and the flat roofs at Mocha, are imported ready-hewn from Zanzibar.

"1001 B. C. = 1st year of Mou-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

Ninety-ninth generation. Jan. 1st, 1000, mostly beyond youth: the prophet Ahijah (1 K. xi. 29 and 2 Chron. ix. 29). Shimei of Bahurim (1 K. ii. 8, and 36 to 46); Rezon king of Damascus and Syria (1 K. xi. 24), Hezion grandfather of Ben-hadad (1 K. xv. 18), Abdemon of Tyre (Dius and Menand. Ephes. in Jos. c. A. i. 17): and among Greeks, the Heraclid chieftain Hippotus, father of Aletes (Oenom., and Pausan. ii. 4. 3), Autesion father of Theras and Argia (Strab. viii. p. 347, and Pausan. ix. 8).

999 B. C. (= 989 y. 8 mo. + "9 years" of both Maneth. tables, the Euseb.-Maneth. table also giving 1128 — "130 yrs" = 998), Osōhōr succeeded by Psinahēs, sixth king of the Twenty-first dynasty. The name of king Petuhanu occurs on contemporaneous monuments — (Leps. k. pl. 43).

Stamped *leather* bands, according to Birch, have been found on mummies of the time of the Twenty-first dynasty. — Similar bands of *morocco* leather, stamped with the name of a king of the Twenty-third dynasty, were found on the mummy recently unrolled in Boston. I procured at Thebes pegged *morocco shoes*, saturated with bitumen and therefore taken from mummies; also, part of a sash of soft leather having the margin cut, as if by machinery, into lace-like fringe.

997 B. C. (= 1003 — "7 years" of ten lunations of 1 Kings vi. 38), completion of Solomon's temple.

992 B. C. (= 1169 — "92 — 85 years" of Diodorus in Euseb. i. 36, and Syncell.), "Third" change in naval dominion; leaving the Pelasgians, the "Empire of the sea" acquired by the Thracians. — Held by them "seventy-nine" years.

991 B. C. (= 1071 — "80 years" of Herodot. ix. 26, Thucyd. i. 12, Eratosth., and Apollod.; compare Hom. il. iv. 40 to 53, and a date probably marking the same event in Egyptian chronological tables, the Egyptian Chronicle giving 1413 — "194 — 228 years" = 991 = 1417 — "32 — 6 — 12 — 12 — 5 — 1 — 19 — 51 — 61 — 20 — 60 — 5 — 7 — 135 = 32 — 6 — 12 — 12 — 5 — 1 — 19 — 209 — 130 years" of the Afr.-Maneth. table), Fourth invasion of the Peloponnesus by the Heraclidæ, led by Temenus, Aristodemus, and Chresphontes, sons of Aristomachus; and Argive power overthrown: an event called also the "return of the Heraclidæ" or the "Dorian conquest." Previous attempts by land having failed, the attack was made by sea; and as the worship of Hercules came from Phœnicia (Herodot.), it is worthy of note, that Hiram and Solomon were now reigning. — Friendly relations between an Arab tribe and the Boeotians and people of the Peloponnesus, on account of Hercules, continued in the days of Agatharchides 95; and a continuous bond of friendship between the Lacedæmonians and Jews, is mentioned by Josephus a. J. xii. 4. 10 and xiii. 5. 8.

Cypselus son of Aepytus, reigning in Arcadia at the time of the Dorian invasion — (Pausan. viii. 5. 3. 4., and Clint. i. p. 92).

The worship of the Pelasgian Juno at Argos, and of the Pelasgian and Lelegian Diana in Laconia, adopted and continued by the Dorian settlers (Pausan. iii. 14. 2, iv. 4. 2, 31. 3, and Clint. i. p. xiii).

990 B. C. (= 989 y. 8 mo. = 332 + "6 + 4 + 6 + 20 + 21 y. 4 mo. + 6 + 120 y. 4 mo. + 163 + 44 + 44 + 44 + 49 + 130 years" of the Euseb.-Maneth. table = 975 y. 8 mo. + "14 years" of the Afr.-Maneth. table, see B. C. 991), Psinahēs succeeded by Psōusēnnēs II., seventh king of the Twenty-first dynasty. The name of king Piseu II. occurs on the temple of Khons at Thebes, with evidence that he was at the

same time a priest (Glid. analect., and Leps. k. pl. 43); but according to Birch, he may belong earlier in the dynasty.

The same year = "12th year of Mou-wang" (of the Li-tai-ki-sse, and Pauth. p. 96), tribute brought by the Western barbarians to China, including large two-edged swords, and cloth by Lie-tseu called "ho-hoan;" according to Pauthier, of *asbestos*. — Cloth made of "asbeston" is mentioned by Anaxilaus, and Pliny xix. 4: a vein of "salamandre" from which cloth is made in the province of Ghinghintas in Central Asia, is described by Marco Polo 60.

986 B. C. (= "7 + 13 = 20 years" of ten lunations of 1 Kings vi and vii, and 2 Chron. viii. 1), completion of Solomon's palace, or "his own house."

The 914 ndr of Proverbs xxv. 20 — is admitted to be *natron*; an impure carbonate of soda found at the bottom of lakes in Egypt and the neighbouring Desert countries: the "ndr" is also mentioned by Jeremiah ii. 22; the "litrôn" or "nitrôn" by Herodotus ii. 86, and Strabo; the "nitrum," by Columella, and Pliny; and one of the natron lakes of Egypt is described by Forskal p. xlv.

The 9792 zbwb of Ecclesiastes x. 1 — is clearly the *house fly*, *Musca* . . . Swarms of flies "muiaōn" are mentioned by Homer il. ii. 469; the "musca" and "muscarium" or fly-flap, by Varro, Cicero, and Martial. Eastward, the house-fly was observed by myself to be aboriginally introduced throughout the inhabited islands of the Pacific. By Polynesians too, the insect may have been first introduced into America: but numbers were doubtless brought by European colonists.

Sinapis Allionii of Syria and Egypt. A species of *wild mustard* called in Egypt "karilli" (Forsk.) or "qarilleh" (Del.), and the 11911 hrwl of Proverbs xxiv. 31, — Job xxx. 7, and Zephaniah ii. 9, may be compared: *S. Allionii* was observed by Forskal around Alexandria; by Delile, an abundant weed in flax-crops, its leaves sold at Cairo and eaten as cress. As transported to Europe, is described by Jacquin hort. v. ii. pl. 168, and the younger Linnæus (Ait.).

~~X~~ *Malus sylvestris* of Europe and Caucasus. Called in Britain *apple*, in Anglo-Saxon "æpl" or "æppel," in Welsh "afal," in Sweden "äple," in Denmark "æble," in ancient Danish "epli," in Germany "apfel," in Old High German "aphol," in Lithuanian "obelis" or "obolys," in Lettonian "ahboli" (Prior), in Bretagne and Cornwall "aval," in Polish "gablon," in Russian "jablon," in Illyrian "jabluka," in Biscay "sagara" (Moritz.), in Italy "melo selvatico" or "meluggino" and the cultivated fruit "mela" or "pomo" (Lenz), in Greece "agriōmēlia" (Sibth.) or by the Turks Tartars and Hungarians "alma" (Moritz.), in Egypt "tiffah" (Del.), in which we recognize the 1171 dphwh of Proverbs xxv. 11, — Cant. ii. 3 and viii. 5, and Joel i. 12: *M. sylvestris* was observed by Forskal, Delile, and Clot-Bey, in the gardens of Egypt; by Forskal, under cultivation on the mountains of Yemen; and fruit was seen by myself at Mocha, worn in turbans for ornament. and as throughout the Arab countries hardly edible, chiefly prized for its odour. Farther North, the "glukumalōn" of Sappho, and Theocritus xi. 39, is identified by Dioscorides with the "mēlimēla;" the "mēlēa agria" is mentioned by Theophrastus caus. vi. 24, and Dioscorides; and *M. sylvestris* was observed by Sibthorp, and Fraas, on the mountains of Greece and seldom cultivated. Westward, the "pomum" is mentioned by Cato, by Cicero as pleasant to the sight and taste and also fragrant; a "sanguineus" blood-red variety is mentioned by Pliny xv. 15, also the blushing "appiana" obtained by Appius Claudius grafting on the "cotoneo," and its name continued in the French "pomme d'api" (Pers., and A. Dec.): to the time of Tacitus 28, the Germans lived partly on "agrestia poma;" piles or posts of wild apple occur in the earliest lake-villages of Switzerland, also intermingled larger fruit of a variety that appears to have been cultivated (Troyon p. 16 to 40, and Heer). *M. sylvestris* is termed "m. s. fructu valde acerbo" by Tournefort inst. 634: is known to grow wild in middle Europe and on Caucasus (Ledeb.), and is cultivated as far as Lat. 64° (A. Dec.). Eastward from Caucasus, is called in Sanscrit "seba" (Pidd.), in Hindustanee "seb" (D'roz.); was observed by Burns under cultivation in Scinde, by Royle at Cashmere, by Graham "in gardens Bombay" but "the Deccan suits better;" by Bunge in Northern China, and according to Loureiro is called in Chinese "pim-po." By European colonists, was carried to Northeast America, where it continues abundantly cultivated throughout our Northern and Middle States.

Solanum cordatum of Tropical Arabia. Called there "hadak" (Forsk.), and the 1411 hthk of Proverbs xv. 19, — and Micah vii. 4, is referred to a prickly *Solanum* by Abulfadli, and Celsius: the "hadak" is mentioned also by A. A. Elnabati, by Ebn Baitar as growing in Yemen, abounding also in a garden at Mataria near Cairo: *S. cordatum* was observed by Forskal in Yemen, its stem somewhat prickly and berries as large as a pea.

Solanum sanctum of Nubia, Tropical Arabia, and as far as the Dead Sea. Called in Nubia "kaderambes" (Del.), in Yemen "beikaman" or "soræj sahan" (Forsk.); and the tree of Solomon — is identified by Hermes with the "siradsch elkuthrub," mentioned also by Eltamini, and Ebn Baitar: "thēnthra karpōphōra mēlāis ēmphērē" at the Taricheas lake, are mentioned by Strabo xvi. 2. 45; apples of Sodom fair to the eye but when plucked becoming dust and ashes, are men-

tioned by Josephus b. j. iv. 8, and Tacitus : *S. sanctum* was observed by Rauwolf 73 (Spreng.), and Hasselquist, in Palestine, is known to be "the species commonly met with at the Dead Sea" (Daub.); was observed by Delile around cultivated land at Syene; by Forskal p. 47, frequent in Yemen and the seeds with the surrounding pulp used to coagulate milk. Farther East, the Brahmans of the mountains in the time of Porphyrius abst. iv. 17 lived on cow's milk coagulated by herbs; and according to Forskal the berries of all species of *Solanum* have this property.

Rumex roseus of Egypt and the South side of the Mediterranean. Called in Egyptian "jëjrë" (Kirch.), at the present day in Egypt "hommeyd" (Del.) or "hemsis" (Forsk.): the 𐤓𐤓𐤕𐤓 𐤓𐤓𐤕𐤓 𐤓𐤓𐤕𐤓 of Proverbs xxiv. 31, — or "kymwsh" of Hosea ix. 6, or "kmwsh" of Isaiah xxxiv. 13, may be compared: the "hummadh elbakar" is mentioned by Ebn Baitar: *R. roseus* was observed by Forskal p. 77, and Delile, in sandy situations near Rosetta; by Sibthorp, on Cyprus; and by Desfontaines i. p. 320, in cultivated ground in Barbary.

985 B. C. = "17th year of Mou-wang" (Lie-tseu, Sse-ma-thsian, the Li-tai-ki-sse, and Pauth. p. 97), journey of Mou-wang to mount Kouen-lun and the "dominions of the mother of the Western king;" the first instance of a Chinese emperor visiting a foreign country.

About this time ("78 to 100 years after the fall of Troy," Eratosth., Crates, Clint. p. 359, and Sm. b. d.), Homer composing poetry. — The tomb of Homer is mentioned in the Scylacean periplus 58, and Strabo x. 5. 1, as on Iōs: a small island whose proximity to Cadmean Thera is significant; in consideration of the like proximity of Hesiod's residence to Cadmean Thebes. In pronunciation "Iōs" is readily converted into "Hīōs;" the claim to Homer by the inhabitants of the latter island, may therefore be compared.

The ΕΓΟΛΛΟΕ of Homer il. xviii. 414 and od. xx. 151 — is admitted to be *sponge*, *Spongia officinalis*: wiping with "spōggōs" is mentioned by Aristophanes, Plato, Theopompus, Demosthenes, and Athenaeus; "spongia" and "spongiosa," by Cicero, and Pliny; and to the present day, the commercial demand for sponge, I am informed, is in great part supplied from the Mediterranean.

The ΘΕΕΙΟΝ of Homer il. xiv. 415 and od. xxiii. 50 — is admitted to be *sulphur*: "thēēiōn" is also mentioned by Araros, and Dioscorides: and "sulphur," by Vitruvius, Ovid, Seneca, and Martial.

That the Strait between Italy and Sicily was known to Homer, is inferred by Polybius from the capture there of ΔΕΥΦΙΝΑΕ *porpoises* and ΚΥΝΑΕ *sharks* mentioned in od. xii. 95: — in the time of Polybius, the capture was effected from boats by means of a sort of *harpoon*; the wooden shaft falling off, leaving a long line attached to the infixed barb (Strab. i. 2. 15).

Calypso's isle, termed by Homer od. i. 50 "Ogugië the navel of the sea" — is referred by Callimachus to "Gauthōn" or Gozo (Strab. i. 2. 37); and if the adjacent island of Malta be included, the epithet is at least applicable.

The ΚΑΕΕΙΤΕΡΟΙΟ *kassitērōio* or tin mentioned by Homer il. xi. 25, xviii. 474 and 613, may have come from the Cassiterides: the source in the days of Herodotus iii. 115 of the tin brought to Greece. The Cassiterides are generally admitted to be the Scilly Isles near Cornwall: and as the Thracians held the sea, the report to Artemidorus (Strab. iv. 5. 6) of sacrifices after the fashion of Samothrace to Ceres and Proserpine "on an island near Britain," claims attention; especially, as the sacrifices were in all probability established by Greek traders. Plates of tin have been unrolled in mummies not much later than Homer: as in one at London (. . . .); and in one belonging to the Twenty-third dynasty, at Boston. (See bronze.)

Papaver somniferum of the Mediterranean countries. Called in Britain *garden poppy* or *white poppy*, and its product *opium* (Prior), in Germany "mohnblume" (Grieb), in Italy "papavero" (Lenz), in Greece "paparōna" or "aphiōni" (Fraas) or by the Turks "casch casch" (Sibth.). in Egypt "abou el-noum" (Del.); in which we recognize the ΜΗΚΟΝ of the gardens with drooping head likened by Homer il. viii. 306 to that of a dying warrior: — the juice of the "mēkōnōs" extracted solely from its head, is mentioned by Theophrastus ix. 8. 2; "mēkōniōn" or "opion" is mentioned by Mnesidemus, is condemned by Diagoras, and Erasistratus, is according to Andreas adulterated at Alexandria and therefore not absolutely blinding, and the process of procuring it from the "mēkōn kēpētē" or "papaveris sativi" is described by Iollas, Dioscorides, and Pliny xx. 76; the two varieties, white-seeded and black-seeded, are also distinguished by Dioscorides, and Galen: *P. somniferum* was observed by Sibthorp, and Fraas, cultivated and springing up spontaneously in the Peloponnesus. Farther South, the "mēkōn" is called in Egyptian "nanti" (Syn. Diosc.) or "nēman" or "phaki" (Kirch.) or "hulan" (Edw.); opium is mentioned by Rhazes, and Abdallatif; continues one of the principal productions of Egypt, and *P. somniferum* was observed under cultivation there by Delile, Clot-Bey, and myself; by Forskal, under cultivation on the mountains of Yemen. Westward, the "mēkōn" is identified in Syn. Diosc. with the "papavēr" of the Romans; Tarquinius Superbus in reply to an envoy seeking advice cut off "papavera in horto altissima" (Plin. xix. 53): *P. somniferum* is cultivated in Italy and middle Europe for ornament and the bland oil from its seeds, continues springing up spontaneously during several years as far even as Britain; and "*P.*

setigerum" growing throughout the Mediterranean countries is regarded by Moris, and A. Decandolle, as its indigenous state. Eastward from Syria, the cultivated form is called in Persian "kooknar" (Ainsl.), in Hindustanee "koknar" or "post" or "khash khash" (D'roz.), in Sanscrit "khaskhasa" (Pictet, and A. Dec.); is known to be "cultivated to a great extent in Malwa" in central Hindustan, and was observed by Graham "in gardens" around Bombay; by Bunge p. 4, in Northern China; by Thunberg, in Japan and called "iesoku," or usually "kes." By European colonists, was carried to Northeast America, where it continues a garden flower, and escaping from cultivation has been observed "near dwellings in some places" (A. Gray).

Cicer arietinum of the Mediterranean countries. Called in Britain *chick-pea* or *chiches* (Prior), in France "pois chiche" (Nugent) or "garvance," in Spain "garbanzo," in Illyrian "slanutak" (Mor.), in Germany "kicher," in Italy "cece" or "sisaro" (Lenz), in Greece "rōvizia" (Forsk.) or "rēvithi" (Sibth.), in Egypt "melan" and the seeds "homos" (Forsk.); and the ΚΥΑΜΟΕ described by Homer il. xiii. 589 as rebounding from the winnowing-floor, — may be compared (a name by later generations transferred to a different plant): the seeds resembling a ram's head, may account for the prejudice of the Egyptians against eating "kuamōs" (Herodot. . . .), and from them adopted by Pythagoras: the "kriōs ērēvinthōs" is mentioned by Sophilus, Diocles, Theophrastus viii. 5. 1, Athenaeus ii. 54, and as a second kind by Dioscorides: *C. arietinum* was observed by Forskal, Sibthorp, and Fraas, cultivated and springing up spontaneously from Crete to Constantinople; by Forskal, Delile, Clot-Bey, and myself, abundantly cultivated at the present day in Egypt; and is known to grow seemingly wild around Caucasus (Pallas, and Ledeb.). Westward, the "cicer" or "cicer arietinum" is mentioned by Horace, Columella, Pliny, Palladius, and Isidorus Hispalensis: *C. arietinum* is termed "c. sativum flore candido" by Tournefort inst. 389; was observed by Forskal under cultivation near Marseilles; is known to be abundantly cultivated in Italy and Spain, occurring besides in some instances seemingly wild (Pers., A. Dec., and Lenz). Eastward from Caucasus, the "ērēvinthōs" was unknown in India when visited by Alexander (Theophr. iv. 4. 9): *C. arietinum* is called in Sanscrit "chennuka" (Pidd.), in Hindustanee "chenna," in Bengalee "chuna" or "boot-kaley," in Tamil "kadalay" (Drury), in the environs of Bombay "chunna" or "hurburree" according to Graham and "extensively cultivated in some parts of the Deccan and Goozerat for feeding horses," the acid from all parts of the plant found by Christie journ. mad. 13 collected at Madras and used instead of vinegar in curries: was observed by Mason v. 467 "exotic" and cultivated "extensively by the Burmese," and called "ku-lu-bai." By European colonists, was carried to the West Indies, where it is said to continue under cultivation; and to Northeast America, where I have found the seeds well known in market in our Middle States.

Lupinus termis of the West Mediterranean countries. A *lupine* called in Egyptian "tharmōs" (Kirch.), at the present day in Egypt "termis" (Forsk.), in which we recognize the ΕΡΕΒΙΝΘΟΕ of Homer il. xiii. 589, its seeds rebounding in like manner from the winnowing floor, — mentioned also by Alexis, Polemon, Zeno (Athenaeus ii.), and according to Theophrastus viii. 3. 2 having the most woody stem of all kinds of pulse: "ērēvinthōi lēukōi" are mentioned by Euryphon 2 morb. 69, Diocles (Athen. ii. 44), and Theophrastus viii. 5. 1 to 6. 5, and the "ērēvinthōs" is further distinguished by him, and Dioscorides, from the "kriōs ērēvinthōs": *L. termis* is no longer to be found in Greece, but continues extensively cultivated in Egypt, its seeds eaten, its stems furnishing fuel (Clot-Bey) and the best charcoal for making gunpowder (Forsk., and Del.). Farther East, the seeds imported into Hindustan are called in Hindustanee "turmis" or "baqillae misri," but have no Sanscrit name (Roxb., Pidd., and D'roz.), nor are lupines cultivated (Royle him. 194). Westward from Greece and Egypt, *L. termis* is known to grow to all appearance wild from Italy and Sicily to Sardinia, Corsica, and Southern Spain (Bertol., Guss., Moris, Boiss., and A. Dec.).

Ranunculus sceleratus of Europe and Northern Asia. Called in Egypt "zaghlil" and its bruised leaves used against "psoram" (Forsk. p. lv), in Italy "sardonio" or "sardoa" or "appioriso" (Targ.): sarcastic smiling ΕΡΔΑΝΙΟΝ is mentioned by Homer od. xx. 303, and convulsive imitation in a dying man perhaps already known to be caused by an herb: — the "sarthōniōs gēlōs" is mentioned by Plato polit. i. 317; the "sardoa herba" by Virgil; the plant in question is described by Pausanias x. 17 as "sēlinō"-like and growing chiefly about springs; is identified by Oribasius exc. 124, and in Delet. pharm. 14 with a kind of "vatrahīōu" that when eaten induces delirium and convulsive movements of the lips like laughter, giving rise to a proverb (compare *Atropa belladonna*). The fourth kind of "vatrahīōn" is described by Dioscorides as small, its flower "galaktizōn" (in one manuscript "hlōōthēstērōn," and in Pliny "luteo"), and leaves flowers and tender stem applied externally to remove "psōras": *R. sceleratus* was observed by Forskal, and Sibthorp, in wet places around Smyrna and Constantinople and on mount Haemus; by Forskal, and Delile, as far as Cairo; is known to grow also in the Crimea and in Siberia. Westward, is described by Fuchsius . . . , and Gerarde . . . ; is termed "*r. palustris apii folio lavis*" by Tournefort inst. 291; and is known to grow throughout middle and Northern Europe as far as Sweden and Norway (fl. Dan. pl. 371, Pers., and Wats.).

Eastward from the Caspian, was observed by Roxburgh in Hindustan, and is known to occur in Anam (Dec., Steud., and Lindl.). Across the Atlantic, is known to occur from Lat. 67° (Hook.) to Kentucky (Short), and being semiaquatic possibly indigenous, observed by myself in the outskirts of towns from the Lower St. Lawrence to Philadelphia, and not in wild situations. Clearly by European colonists, was carried to Buenos Ayres and Valparaiso (Hook.). The leaves according to Lindley are "said to be used by beggars to produce ulcers."

Atropa belladonna of Europe and the adjoining portion of Asia. Called in Britain *dwale* or *deadly nightshade* (Prior), in France "belle-de-nuit" (Nugent), in Germany "tollkirsche," in Italy "belladonna" or "solano maggiore" (Lenz); and probably the real origin of the proverb in question: — the "struhnōs manikōs" of Theophrastus vii. 15. 4 and ix. 11. 6 is referred here by Scarlatius: the account by Dioscorides as far as the black flower and soft black berries like those of ivy, seems to correspond: A. belladonna was observed by Sibthorp on mount Athos. Westward, is described by Anguillara p. 90, Dodoens p. 456, and F. Columna phyt. pl. 12 (Spreng.); is termed "belladonna majoribus foliis et floribus" by Tournefort inst. 77; is rare even in Northern Italy (Lenz); but is known to grow in mountainous wooded situations as well as in waste places throughout middle Europe as far as Britain (Jacq. austr. iv. pl. 309, and Pers.). By European colonists, was carried to Northeast America, where it "has escaped from gardens in one or two places" (A. Gray). The berries according to Lindley are "sweetish" and very dangerous, inducing "intoxication accompanied with fits of laughter and violent gestures" and finally "convulsions and death:" the plant is used medicinally as narcotic, and "especially in producing a dilatation of the pupil when its infusion is dropped into the eye."

Phillyrea latifolia of the Mediterranean countries. Called in Italy "fillirea" (Lenz), in Greece "aglanthinia" or "phullika" or "phulliki" (Sibth.), and the ΦΥΛΗ shrub of dense woods described by Homer od. v. 477, — is referred here by Hogg: the "philurēa" is enumerated by Theophrastus i. 9. 3 as evergreen; the "phillurēa" of Dioscorides large as the "kuprō" with leaves broader than those of the olive and fruit as in "shinō," is referred here by writers: and the "utm" of Elbekri, Gafeki, Ebn Joljol, and Ebn Baitar, is referred here by Sontheimer: P. latifolia was observed by Sibthorp, Chaubard, and Fraas 93, frequent from the mountains of Crete and the Peloponnesus throughout the Greek islands; and by Clot-Bey, in the gardens of Egypt. Westward, is figured by Matthioli pl. (Spreng.), and Clusius hist. pl. 51; is termed "ph. folio leviter serrato" by Tournefort inst. 596; was observed by Hogg "not uncommon in the woods of Sicily" (Hook. journ. b. 1834); and is known to grow wild in Italy and other parts of Southern Europe (Pers., and Lenz).

Rhamnus alaternus of the Mediterranean countries. Called in Italy "alaterno" (Lenz), in Greece "kitrinōxulon" (Sibth.) or "phulliki" or on Crete "elaitrinōs?" (Fraas), and possibly the shrub in question: — the "philukē" described by Theophrastus iii. 3. 3 to v. 7. 7 as an evergreen shrub always leafy, is referred here by Sprengel: R. alaternus was observed by Sibthorp, Chaubard, and Fraas, frequent in bushy tracts in company with the preceding and the wild olive from Zacynthus to Attica. Westward, the "alaternus" is mentioned by Columella vii. 6. 1; by Pliny xvi. 45, among trees bearing no fruit and never planted, regarded as condemned by religion and unpropitious: R. alaternus is described by Clusius hist. i. pl. 50; is termed "alaternus" by Tournefort inst. 595; and is known to grow in Italy, Spain, and on the Balearic Islands (Pers., and Lenz).

Cynodon dactylon of Tropical Eastern Asia. A grass called in Italy "gramigna" or "gramegna" or "capriola" (Lenz), in Greece "agriatha" (Sibth.), in Egypt "nedjil" or "nisjil," in Yemen "ubal" or "sabak" (Forsk.), in Egyptian "makrōsthēn" (transl. Sept.) or "anōuphi" (Syn. Diosc.); in which we recognize the ΑΠΟΕΤΙΝ of Homer od. vi. 90, — springing up on the paternal estate of Aristodemus and terminating through his suicide the First Messenian war (Plut. superst. 8), figured by Polygnotus (Paus. x. 31), when in flourishing condition according to Democritus one of the signs of water (geopon. ii. 6), termed "ēilitēnēs" creeping by Theocritus xiii. 42, mentioned also by Aristotle an. v. 19, Theophrastus, Polybius, Diodorus i. 43, Athenaeus viii. 4, Apuleius, and Paulus Aegineta: C. dactylon was observed by Forskal, Sibthorp, Bory, and Fraas, frequent from the Peloponnesus to Tenedos, its roots as in the days of Dioscorides employed in decoction as diuretic (Walp. trav. p. 432); is known to occur in waste ground along the Taurian mountains (Bieb.). Westward, the "agrōstis" or "amaxitis" or "aigikōn" is identified in Syn. Diosc. with the "iēval" of the Numidians, "aparia" of the Spanish, and "gramēn" of the Romans; the "corona graminea" was bestowed on L. Siccus Dentatus tribune in 454 B. C. and victor in one hundred and twenty battles, subsequently on others enumerated by Pliny xxii. 5; the "gramen" is mentioned also by Livy, Columella vi. 31, and as "vulgatissimum" by Pliny xxiv. 118: C. dactylon is described by Dalechamp, and Lobel; is termed "gramen dactylon radice repente sive officinarum" by Tournefort inst. 520; was observed by Forskal on Malta and near Marseilles; is known to occur also in Barbary and along the Atlantic as far as Cornwall in Britain (Pers., Dec., and Wats.). Farther South, the "agrōstis" is enumerated by Agatharchides as growing in the countries along the Red

Sea: *C. dactylon* was observed by Forskal, and Delile, in Egypt, employed according to Clot-Bey especially for feeding cattle; by Forskal in Yemen; and is known to occur on Madagascar, the Mauritius Islands, and in Austral Africa (Boj.). Eastward, is called in Bengalee "doorba," in Telinga "gericha," in Tamil "arugam-pilloo," by English residents *kuriallee grass* (Drury); was observed by Graham around Bombay and on the Deccan "abundant everywhere and in general use for feeding cattle," and considered by the brahmins "sacred to Ganesha;" by Retz, and Roxburgh, in other parts of Hindustan, according to W. Jones as. res. iv. 242 "the sweetest and most nutritious pasture for cattle;" is enumerated by Mason as indigenous in Burmah; is known to grow also in China and on Luzon (Kunth); but in Australia, I found its progress inland at least encouraged by residents. Farther East, *C. dactylon* was observed by myself on New Zealand and throughout the rocky clusters in the Pacific, usually along the seashore, but to all appearance introduced by the ancient Polynesians into the Hawaiian Islands. Westward from Europe, may have drifted without human aid to the American shore, but has become "troublesome in light soil," occurring in cultivated and waste ground from Lat. 41° to Georgia, Natchez, and the West Indies (Walt., Pursh, Ell., Nutt., Chapm., and A. Gray).

981 B. C. (= 1002 y. 116 $\frac{4}{8}$ d. + "12 — 34 years" of Phœnician annals in Menand. Ephes., and Jos. c. A. i. 18), Hiram succeeded as king at Tyre by his son Baleazar; thirty-six (= "43 — 7") years old, — and who reigned "seven" years.

In or about this year (1 Kings x. 4, and 2 Chron. ix. 3), the queen of Sheba visiting Jerusalem. (She appears to have come from the Abyssinian coast, and is claimed by the Abyssinians as one of their queens).

Brucea antidysenterica of Abyssinia. A shrub growing especially in the valleys of the low country and called "wooginoos," — considered a most valuable remedy in dysentery and severe cases of diarrhœa (Bruce trav. v. pl. 69, and Grev.). Unknown as a remedy in Europe (the "brucine" and "brucea bark" of druggists belonging to *Strychnos nux-vomica*, according to Guibourt, and Lindley). Botanical specimens have however been brought to Europe, and are described by Miller pl. 25, and L'Heritier pl. 10.

Hagenia Abyssinica of Abyssinia. A Meliaceous? tree twenty feet high and called cusso; indigenous in the high country, — planted besides near churches, and considered a specific against worms (Grev.).

Rosa Abyssinica of the mountains of Abyssinia. — Probably the "sweet-brier" observed by Bruce on the Taranta mountains (Grev.).

Brayera anthelmintica of Abyssinia. A Rosaceous tree called there "cabotz" as early perhaps as this date: — its dried flowers sold in small packets, and according to Brayer are an effectual remedy for tape-worm when all other medicines have failed (Kunth, and Lindl.).

Cordia Africana of Abyssinia. An ornamental tree called "wansey" and about twenty feet high; — to which divine honours are paid by the Seven tribes of Galla, their representatives meeting under the shade to choose a king; who is crowned with a chaplet from this tree, and has carried before him wherever he goes a sceptre of the wood: *C. Africana* was observed by Bruce, and Salt, "common in Abyssinia and planted in all the towns" (Grev.). And from transported specimens, is described by Lamarck (Steud.).

980 B. C. (= 1071 — "33 — 12 — 1 — 8 — 37 years" of Castor in Euseb.). Not later than this date, the formal change of Dynasty at Athens, Thymoetes, son of Oxyntes and the last of the Theseidæ, succeeded by Melanthus of the fifth generation from Neleus. Melanthus, driven out of his kingdom of Messenia by the Dorians, found refuge with a large body of followers in Athens, and was there elected king (Herodot. v. 65, Strab. ix. p. 393, and Paus. ii. 18. 7).

976 B. C. (= 975 y. 8 mo. = 339 + "6 + 4 + 6 + 20 + 21 y. 4 mo. + 6 + 120 y. 4 mo. + 42 + 25 + 17 + 6 + 45 + 8 + 6 + 7 + 12 + 44 + 44 + 44 + 49 + 35 + 9 + 6 + 9 + 4 + 41 years." of the Euseb.-Maneth. table, the Afr.-Maneth. table giving 1078 — "26 — 46 — 4 — 9 — 6 — 7 yrs" = 978), accession of Sēsōghōsis, Sēsōghis, or Shishak, head of the Twenty-second dynasty. The name of king Sesonk occurs on a stela at Silsilis, and on moveable articles — now in the "museums of London, Paris, and Berlin" (Glid. analect.).

The great unfinished hall of the temple at Karnak commenced by king Sesonk.

Jeroboam fleeing to Shishak in Egypt before — the death of Solomon (1 K. xi. 40 and 2 Chron. x. 2).

974 B. C. (= 981 — "7 years" of Phœnician annals in Menand. Ephes., and Jos. c. A. i. 18), Baleazar succeeded as king at Tyre by his son Abdastratus; twenty (= "29 — 9") years old, and who reigned "nine" years.

973 B. C. (= 1005 y. 116 d. — "40 years" of ten lunations of 1 K. xi. 42 and 2 Chron. ix. 30), Solomon succeeded by his son Rehoboam; fourth Jewish king.

After "three days" (1 K. xii. 5 to 20) division of the Jewish nation; Jeroboam becoming king over the revolted portion.

To render himself secure, Jeroboam next sought to make a distinction in religious worship; and "ordained a feast in the eighth month, on the fifteenth day of the month, like unto the feast that" is "in Judah:" called also "the month which he had devised of his own heart" (1 K. vi. 38, and xii. 26 to 33). In ingrafting a calendar *year of twelve lunations* upon the Mosaic institutions, the new festival would be initiated in ("10" + $2\frac{1}{2}$) the thirteenth month:— which may perhaps explain the circumstance of the "eighth" month "bwl" having become the Third month of the Muslims.

971 B. C. (= 1071 + "about 100 years" of Clint. i. p. 96 and 134), the Minyae expelled from Lemnos and the island occupied by Pelasgians from Attica. — Pelasgians continued on Lemnos in the days of Darius (Herodot. iv. 145, v. 26, and Pausan. vii. 2).

Not earlier than this date (Graha Munjari tables, Puranas, and Bentley as. res. viii. p. 244), Dipticetu reigning in Hindustan.

969 B. C. (= 972 y. 357 $\frac{5}{8}$ d. — "5th year" of Rehoboam, 1 K. xiv. 25 and 2 Chron. xii. 2), capture of Jerusalem by Shishak king of Egypt. A record of this event, with an accompanying portrait of king Sesonk, has been discovered by Champollion on the walls of the temple at Karnak.

One hundredth generation. May 1st, 967, mostly beyond youth: the prophets Shemaiah, and Iddo (1 K. xii. 22, 2 Chron. ix. 29, xii. 15, and xiii. 22).

In the reign at Athens of Codrus son of Melanthus (Euseb., and Clint.), irruption into Asia Minor of Amazons and Cimmerians.

965 B. C. (= 974 — "9 years" of Phoenician annals in Menand. Ephes., and Jos. c. A.), at Tyre, Abdastratus slain by the four sons of his nurse; and succeeded by the eldest of them, — who reigned "twelve" years.

962 B. C. = "30th year after the Return of the Heraclidæ" (of Didym., and Clint.), capture of Corinth by the Heraclidæ or Dorians under Aletes; who established himself there as king (Diod., and Paus. ii. 4. 3).

961 B. C. = "about thirty years after the Return of the Heraclidæ" (of Clint. i. p. 131 and 140, see Herodot. iv. 147, and Strab. viii. p. 347), Eurysthenes and Procles, twin sons of Aristodemus and Argia, having attained majority, installed as kings of Sparta. Their uncle and guardian Theras retiring with a colony to the island of Calliste, from him called "Thera." Theras and his sister Argia were of Cadmean descent, in the "sixth" generation from Oedipus (Callim. h. Ap. 74, and schol. Apollon. iv. 1764).

959 B. C. (= 1071 — "33 — 12 — 1 — 8 — 37 — 21 years" of Castor in Euseb. i. p. 134 = 931 + "8th + 20 years" in Hieronym. vers., see also Conon 26), Codrus king of Athens slain in battle against the Dorians; under the belief, that his own death would cause the defeat of the enemy. He was succeeded by his son Medon, who by a change in the form of government, was made archon for life.

After the war with Codrus (Strab. ix. p. 393), the city of Megara not far from Athens, occupied by the Dorians.

"958 B. C." (according to astronomers) the date implied in Hesiod's remark respecting the rising of the Pleiades. Hesiod of Ascra in Boeotia composing poetry in the Fifth or Iron Age, after the conclusion of the Fourth containing the men who fought at Thebes and Troy (op. 155 to 175). His father may have taken part in founding Aeolian Cuma, but he himself had never crossed the sea, except only as far as Euboea (op. 219 to 648).

Viscum album of Europe and the adjoining portion of Asia. Called in Britain *mistletoe*, in Anglo-Saxon "mistiltan" (Prior), in Germany "mistel" (Grieb), in France "gui" (Nugent), in Italy "visco albo" (Lenz), in Greece "ixia" or in Laconia "mëlla" (Sibth.), in which we recognize the "mella" growing on the oak according to Hesiod — (Plin. xvi. 11, compare Theophrast. iii. vii. 5): the "uphear" of the Arcadians growing on pines and spruces, is distinguished from the "ixia" by Theophrastus caus. ii. 17. 1 and 2; is mentioned also by Pliny xvi. 93, and Hesychius; V. album was observed by Sibthorp, Chaubard, and Fraas, on mountains as far as the Peloponnesus growing on *Abies picea* and sometimes on the oak; by Kotschy, on spruces on the Taurian mountains (Lenz). Westward and Northward, the druids of Gaul when in rare instances the "viscum" was found on the oak, collected it with religious rites on the "sixth day of the moon," the beginning of their months and years (Plin.): V. album is termed "v. baccis albis" by Tournefort inst. 610; is known to grow in Italy and throughout middle Europe as far as Britain (Pers., Engl. bot. pl. 1470, and Pollini).

Loranthus Europæus of the East Mediterranean countries and Siberia. A kind of *mistletoe* called in Italy "visco quercino" (Lenz), in Greece "ōxōs" (Belon, and Sibth.) or "ixōs" (Fraas); possibly the "viscum" growing according to Hesiod together with the preceding on the oak — (Plin.): the "ixōu" whose leaves are prescribed in Int. affect. 93, is mentioned also by Aristotle, and Athenæus; the "ixia" called in Euboea "stëlis" and distinguished by its fruit, is described by Theophrastus caus. ii. 17 as growing on the oak, terebinth, and many other trees, and the term "ixōu"

is applied to its juice; "ixōs" is also mentioned by Dioscorides as the product of a shrub growing on the oak: L. Europæus was observed by Belon i. 59, Sibthorp, and Fraas, from the Peloponnesus to mount Athos, and by Chaubard growing on the oak; by Jacquin pl. 30, on oaks in Austria, is known to grow also in Siberia, its berries yellowish (Pers.). Westward, "viscus" birdlime is mentioned by Plautus, and Juvenal, and the plant producing it by Varro vii. 7, Virgil, and Pliny: L. Europæus is known to grow in Italy (Pollini, and Lenz); *bird-lime* is made from its berries there as well as in Greece, and its wood is sold in the drug-shops under the name of "viscum quernum" (Spreng., and Lenz). Farther South, "viscum quercinum" was found by Forskal employed medicinally in Egypt.

Boletus igniarius of Northern climates. A kind of *spunk* or woody mushroom called in Germany "zunderschwamm" or "feuerschwamm" (translated by Grieb German tinder and "schwammbuchse" tinder-box), in Italy "lingua cattiva" or "esca" (Lenz), in Greece "ēska" (Fraas) or "iska" (Sibth.), and possibly the "viscum" attributed to Hesiod by Pliny, and the Aeolic "viskōs;" the verb "iskō" to assimilate, seems also connected with this plant: — "mukētēs" growing on oaks on and near the roots, are mentioned by Theophrastus iii. 7. 5; B. igniarius was observed by Sibthorp in the Peloponnesus, and by Fraas on oaks. Westward, "ignis esca" is mentioned by Livy; B. igniarius is termed "agaricus pedis equini facie" by Tournefort inst. 562; is known to grow in Italy and throughout middle and Northern Europe (Bull. h. fr., and Sowerb. pl. 132).

Marsdenia erecta of the East Mediterranean countries. An Asclepiaceous plant called in Greece "psōphīōs" (Fraas); and the "ippōmanēs" of Hesiod — is identified through Syn. Diosc. with the "apōkunōn," described by Dioscorides as a shrub with long tough branches and pod-like fruit, its leaves full of yellow juice and mixed in bait to kill dogs, foxes, wolves, and panthers, and referred here by writers: in the added Synonyms the "apōkunōn" is identified with the "kunōmōrōn" or "kunōkramvē," and under these three names is mentioned by Galen fac. simpl. vi. p. 835: M. erecta was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout Greece; is known to grow also in Syria (Pers.). Westward, the "paralasis" of the prophets, or "kunōkramvēn" or "kunōktōnōn" or "kunaghōn" or "parthaliaghēs" is further identified in Syn. Diosc. with the "vrassika rōustika" or "kanina" of the Romans; the account of the "apocyni" by Pliny xxiv. 58 seems in part taken from Dioscorides, but he adds medicinal uses of the seeds: M. erecta is described by Matthioli p. 774 (Spreng.); and is termed "apocynum folio subrotundo" by Tournefort inst. 92. In experiments made in 1580, the seeds according to Clusius hist. i. p. 126 proved fatal to dogs. (See *Doronicum pardalianches* and *Delphinium peregrinum*).

Scolymus Hispanicus of the Mediterranean countries. Called in Germany "golddistel" (Lenz), in Greece "kēphalaggathō" (Forsk.) or "skōlūmvrōs" or "skōlūmōs" (Sibth.), in Egypt "lælech" (Forsk.); in which we recognize the ΕΚΟΛΥΜΟΕ of Hesiod op. 580 flowering in the hot season, — mentioned also by Alcaeus, Eratosthenes, Xenocrates; by Numenius, and Athenæus ix. 12, as edible; termed "phullakanthōs" by Theophrastus vi. 4, its edible root becoming milky; and according to Dioscorides, the young plant eaten as greens: S. Hispanicus was observed by Belon i. 18, and Sibthorp (Walp. p. 245), eaten in Greece; and by Forskal, Sibthorp, and Chaubard, abounding from the Peloponnesus to Constantinople. Farther South, is called "hnōus" in Egyptian (Syn. Diosc.); and was observed by Forskal p. 145, and Delile, around Alexandria and Cairo. Westward, the "skōlūmōs" is identified in Syn. Diosc. with the "stōuvōulōum" of the Romans; is described by Pliny xxi. 56 as flowering late and during the remainder of the season successively, its leaves losing in drying the power of pricking: S. Hispanicus was observed by Clusius hist. ii. p. 153 in Spain, the root and young plant eaten; by Desfontaines, in Barbary; is termed "s. chrysanthemus" by Tournefort inst. 480; is known to grow also in Italy and Southern France (Lam. fl. fr., and Pers.).

Scolymus maculatus of the Mediterranean countries. Called in Greece "asprōagkatha" or "skōlūmvrōs" (Fraas), in Egypt "lehlah" (Del.), and included perhaps in the "skōlūmōs" of Hesiod, — for the young leaves were found by Fraas eaten in Greece: S. maculatus was observed by him, and Sibthorp, from Zacynthus throughout Greece and the Greek islands to Smyrna; by Hasselquist, in Palestine; and by Delile, in Lower Egypt. Westward, is included by Clusius with the preceding species, and both observed in Spain, as appears from his figures (Spreng.); is distinguished as "s. chrysanthemus annuus" by Tournefort inst. 480; and is known to grow in Italy, Barbary, Portugal, and Southern France (Pers., and Lenz).

Alcea rosea of the East Mediterranean countries. Called in Britain *rose mallow* (Nugent) or *hollihock*, by Huloet dict. "holy hoke," by old writers "alcea hortulana" (Prior), in France "passe-rose" (Nugent), in Greece "mōlōhē ēmēra" or "thēnthrōmōlōhē" (Sibth.), and possibly included in the ΜΑΥΑΧΗ of Hesiod op. 41: — the garden kind is mentioned by Diphilus Siphnius (Spreng.); and "malahai" perishing in the garden, by Moschus iii. 106: A. rosea was observed by Forskal, Sibthorp, and Chaubard, from the Peloponnesus and mountains of Crete to the Dardanelles, cultivated besides for its flowers which are used medicinally. Westward, the "malache" or "moloche" whose

top follows the sun, is mentioned by Columella x. 247: the "malahē kēpētū" is identified in Syn. Diosc. with the "malva örtēnsis" of the Romans: *A. rosea* is termed "malva rosea folio subrotundo" by Tournefort inst. 94; was observed by Forskal in gardens on Malta; and is cultivated for ornament from Spain throughout middle Europe (Cav. ii. pl. 28 f. 1, and Pers.). Eastward from Syria, was observed by Graham "in gardens" near Bombay; by Mason, "exotic" in Burmah; by Kaempfer, and Thunberg, cultivated everywhere in Japan and called "fujoo," or usually "kibatsisso." By European colonists, was carried prior to 1669 (Joss.) to Northeast America, where it continues a favourite garden flower.

Alcea ficifolia of the East Mediterranean countries. A larger kind of *hollihock* often confounded with the preceding, but called in Egypt "khatmyeh" (Del.) and agreeing better with the "malahē" of Hesiod, — and "malahē kēpētū" of Dioscorides more suitable for food, in the added Synonyms identified with the "anthēma" of Pythagoras, "thiathēsma" of Zoroaster, and "aigōs splēn" or "ōura muōs" of the prophets. the "malahē" is described by Theophrastus i. 3. 2 as growing as tall and big as a spear in six or seven months: *A. ficifolia* was observed by Hawkins, Sibthorp, and Chaubard, wild in Crete and the Peloponnesus; is known to grow also in Siberia (Pers.). Farther South, is called in Egyptian "hökortēn" (Syn. Diosc.) or "katmis" (Kirch.); "malvas" in Arabia said to furnish a staff in the seventh month, are mentioned by Pliny xix. 22; the "khatmi" is mentioned by Rhazes, Avicenna, and Abd-allatif; and *A. ficifolia* was observed by Forskal p. lv and mat. med., and Delile, under cultivation in Egypt, its leaves cooked and eaten, and leaves and flowers imported besides from Asia Minor for medicinal use. Westward, the "malope" of the Greeks is identified by Pliny xx. 84 with the larger "malva sativa:" *A. ficifolia* is termed "a. rosea hortensis maxima folio ficus" by Tournefort inst. 98; and is cultivated for ornament from Spain throughout middle Europe (Cav. ii. pl. 28. f. 2). By European colonists, was carried to Northeast America, where it continues in gardens, accompanying the preceding species.

Phaseolus max of Tropical Arabia and Hindustan. Erect (Pers.), and called in Nubia "kache-ryngy" (Del.), in Yemen "koschari," (Forsk.), in Palestine "maseh" (Rauwolf); in which we recognize the *MAZA* of Hesiod op. 590, — Herodotus, Achæus, Cratinus, Aristophanes acharn. 835, Xenophon, and the "mikron phasiōlōn" from Alexandria mentioned by Alexander Trallianus vii. 2. 8: the "maseh" or "maddj" is mentioned by Maserjawia, Rhazes, Avicenna, Serapion, and Ebn Baitar, is identified by Ebn Batuta with the "koshira," came according to Ebn Djoldjol from Yemen where it is called "aktan," and in the days of Abd-allatif was not sown in Egypt but was imported by druggists from Syria; "Dolichos" seeds imported from "Aleppo" and called "maseh," were seen by Forskal mat. med. in the drug-shops of Egypt: *P. max* is termed "pisum indicum" by Plempius; is well known in Persia (Del.); was observed by Rauwolf, and rabbi Schwarz ii. 2, under cultivation in Palestine; by Delile, under cultivation at Syene, and by Forskal p. 214 also in Yemen. Eastward, the "macha" or "masha" is mentioned in the Institutes of Manu ix. 39, and by D'havantari, and Susrutas iv. 6 to 35: the black-seeded variety called *black gram* is less esteemed in Hindustan (Drur.), but according to Crawford, and Mason, v. 467, is one of the most common pulses of Burmah. *P. max* is described by Rumphius v. pl. 140 (Pers.); is perhaps the erect species seen by Blanco on the Philippines, in many places the principal food of the natives, and called in Tagalo "balatong" or "mongos." (See *P. mungo*).

"957 B. C. = 45th year of Mou-wang" (Chinese chron. table), beginning of the Twenty-ninth cycle.

956 B. C. = "21st year Sesonk;" the latest date in his reign found on the monuments — (Leps. k. tab. p. 19).

The same year (= 972 y. 357 $\frac{5}{8}$ d. — "17 years" of 1 K. xiv. 21), Rehoboam succeeded at Jerusalem by his son Abijah or Abijam, fifth Jewish king.

Allium roseum of the Mediterranean countries. Called in Greece "agriō krēmūthi" (Sibth.), the equivalent of $\dagger\vee\sim9\ddagger$ hbtzld of Cant. ii. 1, — and Isaiah xxxv. 1: *A. roseum* was observed by Delile on the Mediterranean border of Egypt near Alexandria; by Sibthorp, and Chaubard, in Crete and the Peloponnesus. Westward, the "allium in arvis sponte nascens" or "alum" is mentioned by Pliny xix. 34; *A. roseum* is described by Magnol xi. pl. 10, and Rudbeck; is termed "a. sylvestre sive moly minus roseo amplo flore" by Tournefort inst. 385; and is known to occur in cultivated ground in Italy, Barbary, and Southern France (Desf., Tenore, and Pers.).

Narcissus Orientalis of Syria and Palestine. The $\dagger\vee\wedge9\ddagger$ hbtzld of Canticles ii. 1, — and Isaiah xxxv. 1, is referred here by Sprengel: *N. Orientalis* was observed by Chateaubriand trav. ii. 122 abounding in the district of Sharon, between Joppa and Caesarea. Transported to Europe, is described by Rudbeck elys. ii. p. 52 (Pers.).

Juglans regia of Persia and the Himalayan mountains. Called in English gardens *walnut*, in France "noix" (Nugent), in Germany "wallnuss," in Italy "noce" (Lenz), in Greece "karuthia" (Fraas), in Egypt "gios" (. . .), in which we recognize the $\Sigma\Gamma\wedge\chi$ agwz of Canticles vi. 11, —

"jius" of C. E. Luka, and "jauwz" of Ebn Baitar: the "karua" is mentioned by Epicharmus, Sophocles, and Philyllus (Athen. ii. 38); "karua përsikē" by Theophrastus iii. 6. 2 to 14. 4, identified by Dioscorides with "k. vasilika," and the Greek name is quoted by Pliny xv. 24 as evidence that the tree came from Persia: the "thiōs valanōs" is mentioned by Diocles (Athen. ii. 42); "juglandium" shells were employed by Dionysius of Syracuse (Cic. tusc. v. 20. 58), and the "juglans" or "jovis glans" is mentioned by Varro, Virgil, and Palladius: J. regia is described by Bauhin (Pers.); is known to be cultivated from Italy throughout middle Europe as far as "Lat. 56°" (A. Dec.); was observed by Chaubard, and Fraas, cultivated in Greece and perhaps naturalized; by Clot-Bey, in Egypt, recently introduced; by Belon, and Hasselquist, in Palestine. Farther East, the sap is collected and employed medicinally in Circassia (Spencer, and Lindl.); the tree is known to grow wild Southward of Caucasus, and in the mountain forest of Talusch (Ledebo., and C. A. Mey.); and according to Roxburgh on the mountains North and Northeast of Hindustan and in Sanscrit called "ukshadu," or according to Piddington "unkotha;" was observed by Bunge p. 62 here and there in Northern China. By European colonists, was carried to Northeast America, where in our Middle States I have found it producing nuts of good quality.

Lawsonia alba of Hindustan. A shrub called in the gardens of Egypt and Yemen "henna" (Forsk.), in Nubia "kofreh" (Del.), in which we recognize the קֹפְרֵה kphr cultivated in Palestine according to Canticles i. 14 and iv. 13: — the "kuprōs" is mentioned by Theophrastus odor. 5 to 6, by Dioscorides as a woody plant growing at Canopus and Ascalon, by Pliny xii. 51 as growing as far as Cyprus: "phōinissan tē nēēn kuprōn" is mentioned by Antipater (Meleag. cor. i. 42); the ointment prepared from the leaves, by Posidonius, Celsus, Paulus Aegineta, by Dioscorides as turning the hair yellow (a practice unknown to Lucan iii. 238, but mentioned by Tertullian c. foem. ii. 6): mummies have been discovered having the finger-nails stained with *henna*; *L. alba* is described by Abul Fadli (Spreng.); was observed by Forskal, Delile, and myself, under cultivation in Egypt; by Rauwolf, in Palestine; by Forskal, under cultivation in Yemen; by myself, the fresh powdered leaves brought to market at Mocha and universally used by the Arab population. Eastward, Onesicritus, and Nearchus, found the Kathaians staining their beards "white, red, purple, and green" (Strab. xv., and Arr.): *L. alba* is called in Hindustanee "mayndie," in Telinga "goounta chettoo," in Tamil "maroodanie" (Drury); was observed by Rheede i. pl. 40 in Malabar; by Graham, "very common in gardens as a hedge plant" in the environs of Bombay; by myself, under cultivation there and the powdered leaves used even by the Hindu population; was observed by Roxburgh in other parts of Hindustan: by Mason v. 409 and 513, "exotic" in Burmah and called "dan," extensively cultivated, the "beautiful orange" dye from the leaves beat up with catechu and used by females to stain the finger ends: by Blanco, at Manila, but no native names are given.

Aquilaria agallocha of Tropical Eastern Asia. The imported product is called in English *lign-aloës* or *aloës wood* (Lindl.), in Egyptian "tshēnlavōs" (lex. Oxf.); and the ἄλῳδω ἄλῳδω of Canticles iv. 14, — giving out perfume according to Psalm xlv. 8, or the "alōēn" of John xix. 39, is referred here by writers: "agallōhōn" (a combination of two of its Pali and Sanscrit names "agalu" and "lauha," Royle, and Mason) brought from Arabia and India according to Dioscorides, is mentioned also by Pliny, Galen, Oribasius, Aetius, Isidorus, and Paulus Aegineta; "aghlajoon" or "indian ud," by Rhazes, Serapion, Avicenna, Ebn Baitar, and Persian medical writers: lign aloës was seen by Baumgarten iii. 4 at Damascus, by Alpinus in Egypt, and according to Forskal mat. med. is called there "oud kakaji." Eastward, is called in Hindustanee and Bengalee "ugoor" (Lindl.), is the wood of a large forest-tree in Sylhet on the Eastern border of Hindustan (Roxb.); is called according to Mason v. p. 499 in Burmah "a-kyau," and grows along the Tenasserim coast on the Mergui Isles, but the Selungs "as they profit by the trade endeavour to keep all in ignorance;" was observed by Bontius near Malacca; by Marco Polo 75 "leigne aloë" in Cochinchina, observed there also by Loureiro; and by Rumphius ii. 30, on the Moluccas (Spreng.).

Curcuma longa of the Malayan Archipelago. The imported product is called in English *turmeric* (Lindl.), in Armenian "khekhrym" (Gesen.), and as cultivated in Yemen "kurkum" (Forsk.); in which we recognize the كركم krkm of Canticles iv. 14: — the "kupēirōu" of India, resembling ginger according to Dioscorides i. 4, saffron-coloured and bitter when chewed, the ointment removing hair, an account repeated by Pliny xxi. 70, is referred here by writers: imported turmeric was seen by Alpinus iv. 13 in Egypt; and by Forskal, under cultivation among the mountains of Yemen. Eastward, *C. longa* is called in Hindustanee "zardchob" or "pitras" or "haldi," in Bengalee "halud" or "haridra" (D'roz.), in Telinga "pasoopoo," in Tamil "munjel" (Drury); was observed by Rheede xi. pl. 11 in Malabar; by Gibson and Graham, cultivated "in Bombay" and "the richer villages of the Deccan," the roots "much used for culinary purposes," also medicinally; by Roxburgh, under cultivation around Calcutta; by Mason, "exotic" in Burmah and called "hsa-nwen;" by Loureiro, in Cochinchina; by Blanco, well known to the natives throughout the Philippines and called in Tagalo "dilao," in Bisaya "dulao" or "calavaga" or "quinamboi," in Pampango "angai." An unguent of

the pounded roots according to Rumphius v. p. 166 rubbed by the Javanese all over their bodies as a preservative against cutaneous diseases; a practice among the Polynesians in former times, even among the Hawaiians, and I remarked the plant itself introduced and naturalized throughout the Feejeean, Samoan, and Taheitian groups.

955 B. C. (= 975 y. 8 mo. — “21 years” of both Maneth. tables), Sēsōghis succeeded by Osōrthōn, second king of the Twenty-second dynasty. The name of king Osarkon occurs on the great temple at Bubastis, on a vase (at one time owned by the Roman Claudia family), and on a papyrus. He continued the great unfinished hall at Karnak.

Orpheus according to Pliny xxv. 5 was the first to note the properties of plants (referring to some Orphic poem hardly earlier than this date): the scene of one at least of the poems attributed to Orpheus is clearly Egypt; and the personal existence of such a poet is denied by Aristotle an. i. 5.

Daucus carota of Europe and the adjoining portion of Asia. Called in Britain *carrot*, in France “carotte” (Prior), in Germany “mohre,” in Italy “carota” and the wild kind “pastinaca selvatica” (Lenz), in Greece “karōtta” or “agria thaukia” (Fraas) or “staphulōna” (Sibth.), in Egypt and Yemen “djizar” (Forsk.); in which we recognize the “staphylino” said to be “amatorium” by Orpheus (Plin. xx. 15): the name seems derived from the ancient use of red chalk, and in the addition to Homer il. ii. 765 “staphulē” signifies a mark: — the “staphulinōs” plant is mentioned by Dieuches, Philistion, Phanias of Eresus, Diocles, Cleophrantus, Athenaeus; the “staphulinōs agriōs,” by Theophrastus, the purple floret in the centre of its white umbels noted by Dioscorides; and the “karōtōn” is mentioned by Athenaeus: *D. carota* was observed by Forskal, Sibthorp, Chaubard, and Fraas, in fallow ground from the Peloponnesus to Constantinople and Smyrna; by Abd-allatif i. 6, Forskal, Delile, and Clot-Bey, under cultivation in Egypt and the seeds used as aphrodisiac; by Forskal, seemingly wild on the mountains of Yemen; is known to occur also in Abyssinia (A. Rich.). Westward, the “staphulinōs agriōs” is identified in Syn. Diosc. with the “karōtam” or “pastinaka” of the Romans, by Pliny xxv. 64 with the “pastinacam erraticam”; the “pastinaca” is mentioned by Hyginus, by Columella, and Pliny xix. 27, as cultivated, and the “carota” is mentioned by Apicius iii. 21: *D. carota* was observed by Forskal on Malta, as well as near Marseilles; is known to occur cultivated and seemingly wild in Algeria, Spain, and throughout middle Europe as far as Sweden (Pers., Munby, and Fries). Eastward from Caucasus, is known to occur throughout Siberia as far as Kamtschatka (Ledeb.): is called in Hindustanee and Bengalee “gajar” (D’roz.), was observed in Hindustan by Roxburgh, by Gibson and Graham “a staple article of food in the Eastern parts of the Deccan during the cold season;” is known to occur also in CochinChina and China (Dec.); in Japan, everywhere cultivated and called “kofuk,” or usually “nisji” or “iabu nensin” (Kaempf., and Thunb.); on the Loo Choo Islands (Beechy); on Timor (Decsne); and may therefore have been carried by Malays and Polynesians to Australia, New Zealand, and the Hawaiian Islands. Clearly by European colonists, was carried to Madeira and the West Indies (A. Dec.): to Northeast America, where it continues abundantly cultivated and in the dry-rooted form naturalized; to Patagonia and Chili (observed by myself); and to the Mauritius Islands (Boj.). Sown in rich soil according to Vilmorin, the root after successive generations becomes fleshy and edible, and in this form transferred to barren soil relapses in the course of generations into its original dry-rooted state. The root and seeds are enumerated by Lindley as employed medicinally.

Mentha aquatica of Europe and the adjoining portion of Asia. Called in Britain *water mint* (Bacon), in Germany “wasserrminze,” in Italy “menta” (Lenz), in Greece with other species “ēthiasmō” or “ēthuōsmōs” (Fraas), in Egyptian “tis” or “phērthrōumōnthōu” or “pērxō” or “makithō” (Syn. Diosc.); in which we recognize the “minthē” changed according to Orphic poems from a fruit-bearing large tree to a barren plant — (etym. gud. p. 395), identified in Syn. Diosc. with the “ēthuōsmōs,” the name changed by the Greeks (according to Pliny xix. 47) on account of the fragrance: “ēthuōsmōu rizan” is prescribed in Int. affect. 33; and the “ēthuōsmōn” of Theophrastus vii. 7. 1 may also be compared: *M. aquatica* was observed by Sibthorp, Chaubard, and Fraas, frequent along streams from the Peloponnesus to Smyrna; is enumerated by Clot-Bey Figari as long known in Egypt (i. e. in gardens). Westward, the “ēthuōsmōs” is identified in Syn. Diosc. with the “mēnthā” or “nēpētā” of the Romans; “the “nepetam” whose root is used medicinally is placed in the same genus with the “mentam” by Pliny xix. 47 and xx. 56: *M. aquatica* is termed “*m. rotundifolia palustris seu aquatica major*” by Tournefort inst. 189, “*m. palustris*” by Miller, “*m. hirsuta*” by Linnæus (Steud.); and is known to grow wild in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 638, Engl. bot. pl. 447, and Pers.). According to Bacon in his essay on gardens, the flowers “which perfume the air most delightfully” on “being trodden upon and crushed are three, that is burnet, wild thyme, and water mints, therefore you are to set whole alleys of them:” *M. aquatica* is among the species enumerated by Lindley as having “been in repute as stomachics and emmenagogues.” (See *M. rotundifolia* and *M. arvensis*).

953 B. C. (= 955 y. 357 $\frac{5}{8}$ d. — “3 years” of 1 K. xv. 2 and 2 Chron. xiii. 2), Abijam succeeded at Jerusalem by his son Asa, sixth Jewish king.

The same year (= 965 — “12 years” of Phœnician annals in Menand. Ephes., and Jos. c. A.), accession at Tyre of Astartus son of Delaiastartus; aged forty-two (= “54 — 12”), and who reigned “twelve” years.

952 B. C. (= 972 y. 354 $\frac{5}{8}$ d. — “22 years” of twelve lunations of 1 K. xiv. 20), Jeroboam succeeded at Tirzah (1 K. xiv. 17) by his son Nadab, second king of Israel.

950 B. C. (= 951 y. 228 $\frac{11}{8}$ d. — “2 years” of twelve lunations of 1 K. xv. 25), Nadab slain; and succeeded at Tirzah by Baasha, third king of Israel.

The same year (= 959 — “9 years” of Castor in Armen. vers. of Euseb.), Medon succeeded by his son Acastus, second hereditary archon of Athens. “Thirty-six” years are assigned to his rule by both Castor, and Eusebius.

Elæagnus angustifolia of middle Europe. A small tree called by the Turks “idæ” (Forsk.): the “kōtinōn” brought from the country of the Hyperborei (according to Pindar ol. 3, and Pausanias v. 7, by Hercules) to Athens, where it was planted in the temple of Erechtheus on the acropolis — and called “kallistēphanōn,” the tree afterwards burned by the Persians, a sucker surviving (Herodot. viii. 55), the leaves according to Aristotle mirab. 52 white on the upper surface instead of the under, is referred here by Camus: the “kōtinōs” is mentioned also by Theophrastus ii. 3, Theocritus v. 100, Moschus vii. 2, and is identified by Dioscorides with the “agriēlaia:” *E. angustifolia* is described by Tournefort cor. 53 as having the fruit “olivæformi subdulci;” was observed by Forskal under cultivation on Tenedos and at Constantinople, its yellow edible drupe as large as an olive and the flowers said to be strongly odorous; by Sibthorp, on Samos and near Smyrna; and by Hasselquist, in Palestine. Westward, is known to grow in somewhat moist situations among the Alps and Pyrenees (Pers.; see *E. Orientalis*).

949 B. C. (= 1071 — “80 — 42 years” of Apollod., Diodor., and Euseb. i. p. 166), Eurysthenes succeeded by his son Agis as one of the two kings of Sparta.

While Sous son of Procles was reigning jointly with Agis (Plut. lyc. 2, see also Ephorus in Strab. viii. p. 360), the revolted citizens of Helos subdued and reduced to *slavery*: apparently, the beginning in Greece of this institution “thōulēia.” The Lacedæmonians (according to Theopompus) “when they conquered the Achæans, and the Thessalians when they conquered the Perrhoebi and Magnetes, were the first who reduced to slavery the former occupiers of the country.” — (See also Simonid., Cic. div. ii. 43, Pausan., Athen. vi. p. 265, and Clint. i. p. 144 and 333).

The address of Mou-wang (quoted in the Chou-king iv. 27, Pauth. p. 196) contains an allusion to “black” marks made on the face of criminals; evidently *tattooing*.

“946 B. C. = 1st year of Koung-wang, of the Tcheou” or Fifth dynasty (Chinese chron. table).

943 B. C. (= 952 y. 357 $\frac{5}{8}$ d. — “10 years” of 2 Chron. xiv. 1 to 8), end of “ten years” of peace; employed by Asa in fortifying cities and preparing against invasion.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentley as. res. viii. p. 244), Dyutimah reigning in Hindustan.

941 B. C. (= 953 — “12 years” of Phœnician annals in Menand. Ephes., and Jos. c. A.), Astartus succeeded as king at Tyre by his brother Aserymus; (“54 — 9”) = forty-three years old, — and who reigned “nine years.”

The same year (= “130 years after the fall of Troy” of auct. vit. Hom., and Clint. i. p. 140, and “in the reign of Agis” of Pausan. iii. 2. 1., see also Strab. xiii. 1. 3), the outlying island of Lesbos, between Cumæ and the Troad, occupied by Aeolian Greeks under Graïs, son of Archelaus and great grandson of Orestes.

940 B. C. (before the “third month in the 15th year of the reign of Asa,” 2 Chron. xiv. 9, xv. 11, and xvi. 8), Osarkon or Zerah and his army of Ethiopians and Lubims, defeated at Mareshah by Asa king of Judah. Many “out of Israel” now placed themselves under the rule of Asa.

The same year (= 954 y. 8 mo. — “15 years” of both Maneth. tables), Osarkon succeeded by the third king of the Twenty-second dynasty. The name of king Take-lut occurs on contemporaneous monuments — (Leps. k. pl. 44).

939 B. C. (= “third month in the 15th year of the reign of Asa,” 2 Chron. xv. 10 to 15), a covenant among the people assembled at Jerusalem; prohibiting change of religion under penalty of death.

The same year (.). The accession of Osarkon II., fourth king of the Twenty-second dynasty, hardly earlier than this date. His name occurs on contemporaneous monuments, and on a statue — now in London (Glid. analect, and Leps. k. pl. 44).

“934 B. C. = 1st year of Y-wang, of the Tcheou” or Fifth dynasty — (Chinese chron. table).

The Li-ki, or Chinese Ritual,* is regarded as belonging to the "Tenth century B. C." — (A. Dec.).

One hundred and first generation. Sept. 1st, 934, mostly beyond youth: the prophet Jehu (1 K. xvi, and 2 Chron. xix. 1 and xx. 34).

932 B. C. (= 941 — "9 years" of Phoenician annals in Menand. Ephes., and Jos. c. A.), Aserymus slain, and succeeded as king at Tyre by his brother Pheles; forty-nine (= "50 — 0 y. 8 mo") years old, and who reigned "eight months."

931 B. C. (= 1071 — "80 — 60 years" of Philochorus, Eratosth., Aristarch., and Apollod. = 776 + "267 years" of Castor — 56 — 56, and "in the archonship of Acastus" at Athens, Cast. in Euseb. i. p. 131), the Ionic Migration. Colonists principally from Attica led by Neleus son of Codrus into Asia Minor; where they founded the cities of Ephesus, Miletus, and Teos, adopting however the worship of Diana anciently established "by the Amazons," and the other deities of the country. (The date is confirmed by Mimnermus, and by the silence of Homer respecting the Ionian cities of Asia; the addition to the Second book of the Iliad being clearly by a later poet). — During the next few years, other cities were built or occupied by the Greek colonists, as Smyrna, Colophon, Erythræ, and Phocæa.

The same year (= 932 — "8 months" of Phoenician annals in Menand. Ephes., and Jos. c. A.), at Tyre, Pheles slain and succeeded as king by a priest of Astarte or Ashtoreth named Eithobalus; aged ("68 — 32" =) thirty-six, — and who reigned "thirty-two" years.

"In the reign of Eurypon" or Eurytion, son of Sous and third Proclid king at Sparta, "a long war against the Arcadians of Mantinea;" who were living "under a popular government" — (Aristot. rep. ii. 6. 8, and Polyæn. ii. 13; see also Simonid., Herodot., Pausan. iii. 7. 1, and Plut. lyc. 2).

927 B. C. (= 949 y. 250 $\frac{22}{360}$ d. — "24 years" of twelve lunations of 1 K. xv. 33), Baasha succeeded by his son Elah, fourth king of Israel.

925 B. C. (= 926 y. 1 $\frac{1}{3}$ $\frac{14}{360}$ d. — "2 years" of twelve lunations of 1 K. xvi. 8 to 24), Elah slain and succeeded by Zimri; who, after reigning "seven days in Tirzah," was himself slain and succeeded by Omri, sixth king of Israel.

923 B. C. = "24th of Choiak in the 15th year of Osarkon II.," an *eclipse* of the moon expected or happened — (inscript. by his successor, and Birch).

919 B. C. (= 924 y. 167 $\frac{2}{3}$ $\frac{20}{360}$ d. — "6 years" of twelve lunations of 1 K. xvi. 23), the city of Samaria founded by Omri, for a new seat of government.

In the Peloponnesus, the Cynurians, a remnant of the Pelasgians and Ionians, subdued by Echestratus son of Agis and one of the two kings of Sparta; the third in the Agid line — (Pausan. iii. 2. 2 to 7. 2, see also Herodot. viii. 73).

"918 B. C." (Hieronym. and Clint i. p. 23, Diodorus' numbers giving 1169 — "92 — 85 — 79 years" = 913), "Fourth" change in naval dominion; leaving the Thracians, the "Empire of the sea" acquired by the Rhodians. — Held by them "twenty-three" years.

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentley as. res. viii. 244), Medhatithi reigning in Hindustan.

917 B. C. = "23d year of Osarkon II.," death of an Apis or sacred bull; the latest date in his reign found on the monuments — (Leps. k. tab. p. 19, and Birch).

The accession therefore of Sesonk II., fifth king of the Twenty-second dynasty, not earlier than this date. His name occurs on contemporaneous monuments — (Leps. k. pl. 45).

The same year (= 949 — "1 — 31 years" of Apollod., Diodor., and Euseb. i. p. 166), and "not long after the conquest of Cynuria" (Pausan. iii. 2. 2), Echestratus succeeded by Labotas as one of the two kings at Sparta; the fourth in the Agid line.

915 B. C. (= 939 y. 8 mo. — "25 years" of the Afr.-Maneth. table), accession of Takelôthis, sixth king of the Twenty-second dynasty. The name of king Takelut II. occurs at Karnak, and on a tablet — now in Turin (Glid. analact.).

While the Rhodians held the sea, "Elpias" (towards the Southeastern extremity of Italy) founded by them and the Coans; and by themselves unaided, "Parthênôpên" (Naples), and "Rothôn" (beyond the mouth of the Rhone): also according to some accounts, they colonized the

* *Amygdalus Sinensis* of China. The *scarlet-flowered peach* is clearly a distinct species; and the "tao" of the Chinese Ritual — (A. Dec.), and Book of Odes, quoted by Khoung-tseu ta hio ix. 6, may be compared. Eastward, the "tao" as appears from the Japanese Encyclopedia lxxxvi. 7 was brought from China to Japan: the "too" or "momu" was seen by Kaempfer v. 798 in Japan, and with var. "flore rubro pleno" is according to Thunberg planted in almost every garden "ob elegantiam florum." By European colonists, *A. Sinensis* was carried to Australia, and a tree observed in a garden there was said to produce fruit of good quality.

"Gumnēsiās" or Balearic Islands (Strab. xiv. 2. 10). The Rhodians were skilled in the use of the *sling*—(Sil. Ital. iii. 364): but in this particular their reputation was eventually eclipsed by the Balearic Islanders (see Lycophr., Diodor., Flor., and others).

913 B. C. (= 924 y. 160 $\frac{2}{3}$ d. — "12 years" of twelve lunations of 1 K. xvi. 23 to 31), Omri succeeded by his son Ahab, seventh king of Israel. Who married Jezebel, daughter of Eithobalus or "Ethbaal, king of the Zidonians"

Cuscuta Europæa of Europe and the adjoining portion of Asia. Called in Britain *dodder* (Prior), in Egypt "hamoul" (Del.); the "hamul elkattan of Egypt" is identified by Ebn Baitar with the "kuschut," and the $\tau\lambda\omicron\omicron\iota\omicron\tau\omicron\pi$ ktsyowd of Psalm xlv. 8 — may be compared: "keschut" seeds imported from Syria and taken internally as a cosmetic, especially by the Jews, were seen in Egypt by Forskal mat. med.; the living *C. Europæa* was observed by him, and Delile, around Cairo, and by Hasselquist in Palestine. Northward and Westward, is described by Linnæus; is termed "*c. vulgaris*" by Persoon, "*c. major*" by Decandolle (Steud.); is known to grow in middle Europe and as far as Denmark (Thuil., Lam. fl. fr., Engl. bot. pl. 378, and fl. Dan. pl. 199).

Cuscuta epilinum of Europe and the adjoining portion of Asia. Called in Germany "flachsseide" (Grieb, and Fraas), and from the name given by Ebn Baitar perhaps the species in question: — the "angina lini" is mentioned by Pliny xvi. 44: *C. epilinum* is described by Weihe; but in the absence of flax crops, was not seen by Fraas in Greece. By European colonists, was carried to Northeast America, where it was observed by Engelmann "sparingly introduced with flax-seed into the Northern States."

Cuscuta monogyna of the East Mediterranean countries. Possibly the species in question: — the "kathutas" is described by Theophrastus caus. ii. 17. 3 as a little Syrian herb growing upon trees, thorns, and other plants; twining around them, according to Pliny xvi. 92: a species of *Cuscuta* is distinctly described by Serapion (according to F. Adams): "*cuscuta*" seeds from the Thebaid are distinguished by Forskal mat. med.; and the living *C. monogyna* was observed by Berthe in gardens not far from Gizeh. Farther North, is termed "*c. orientalis viticulis crassissimis convolvuli fructu*" by Tournefort cor. 45; and was observed by Sibthorp on tamarisks near Smyrna.

912 B. C. (= 952 y. 357 $\frac{5}{8}$ d. — "41 years" of 1 K. xv. 10), Asa succeeded at Jerusalem by his son Jehoshaphat, seventh Jewish king.

The same year (= "1182" — a break of about 270 years, Lassen i. 473, and Buns. iv. 7. 1), accession of Gonarda III., the initial point of the Cashmere chronicle, hardly earlier than this date.

910 B. C. (= 911 y. 357 $\frac{5}{8}$ d. — "3d year" of 2 Chron. xvii. 7), by order of Jehoshaphat, "the book of the law" carried by a commission of princes, Levites, and priests, "throughout all the cities of Judah, and taught the people."

"909 B. C. = 1st year of Hiao-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

907 B. C. (= 1071 — "165th year" of Cyrill. adv. Jul. p. 11), Laosthenes reigning in Assyria; Silvius, at Alba in Latium; Agelas, at Corinth; and Labotas with a colleague, at Sparta. (The statement is however shown by Clinton to be taken from Eusebius' table).

In the joint reign at Sparta of Labotas with Prytanis son of Eurypion, war against the Argives (Aristot. rep. ii. 6. 8, and Pausan. iii. 2. 3 to 7. 2).

905 B. C. = "11th year of Takelut," mention of a deceased prince Usarkan. "Towards the close of the same year," death of queen Karumamma, a statue of whom — is now in the Louvre at Paris (Birch).

"904 B. C." (Euseb., and Clint. i. p. 23, Diodorus' numbers giving 1169 — "92 — 85 — 79 — 23 years" = 890), "Fifth" change in naval dominion. Leaving the Rhodians, the "Empire of the sea" acquired by the Phrygians. — Held by them "twenty-five" years.

Ervum ervilia of the Mediterranean countries. Called in Britain *ers* or *bitter vetch*, in France "*ers*" (Prior), in Germany "*erve*" (Fraas) or "*linsenwicke*," in Greece "*rōvithia*" or "*rōvi*" or "*ōrōvi*," in which we recognize the "*ōrōvōn*," a medimnus-measure (bushel and a half) constituting the price of blood among the citizens of Tralles for killing either a Lelegian or Minyan — (Plut. quaest. gr. 46): the "*ōrōvōs*" is mentioned also in the Hippocratic treatises Vict. acut. 11, 3 Morb. 30, 6 Morb. pop. 4. Int. affect. 1 and 25, and by Polemon diæt. 13, Demosthenes 598. 4, Aristotle h. an. iii. 21, Phanas of Eresus, Theophrastus, Dioscorides, and Galen: *E. ervilia* was observed by Sibthorp, and Fraas, frequent in Greece, cultivated as well as growing spontaneously in cultivated ground. Farther South, the "*ōrōvōs*" was known to Athenæus in Egypt; and *E. ervilia* as appears from Alpinus has been sometimes cultivated there. Westward, the "*ōrōvōs*" is identified in the Syn. Diosc. with the "*ōrōvōum*" of the Romans: the "*ervum*" is mentioned as an ingredient in the theriac of Antiochus Magnus, as having cured Augustus according to one of his own letters, and as cultivated in Italy (Plin. xviii. 38 and xx. 100); is mentioned also by Virgil ecl. iii. 100, Columella, and Palladius: *E. ervilia* is described by C. Bauhin pin. 346; is termed "*e. verum*" by Tournefort inst. 398; and is known to occur as a weed or sometimes cultivated throughout middle Europe as far

as Britain (Pers., Wats., and A. Dec.). According to Virey, the seeds are poisonous, producing weakness of the extremities when mixed with flour and made into bread (Lindl.).

902 B. C. = "14th year of Takelut II.," on the monuments — (Leps. k. tab. p. 19).

901 B. C. = "15th year of Takelut II.," death of an Apis or sacred bull — (Birch).

The same year (914 y. 8 mo. — "13 years" of both Maneth. tables, giving 902), Takëlôthis succeeded by the seventh king of the Twenty-second dynasty. The name of king Sesonk III. occurs on contemporaneous monuments (Leps. k. pl. 46).

One hundred and second generation. Jan. 1st, 900, mostly beyond youth: the prophet Elijah.

899 B. C. (= 931 y. 4 mo. — "32 years" of Phœnician annals in Menand. Ephes., and Jos. c. A.), end of the reign of the Phœnician king Eithobalus or Ethbaal. (On comparing the biblical account, the deficit of 18 or 19 years between Eusebius' numbers and their given sum, seems to fall after this event, rendering the dates of the succeeding reigns uncertain to the same amount). The List makes Eithobalus succeeded at Tyre by Badezar; aged thirty-nine (= "45—6"), and who reigned "six" years.

"897 B. C. = 13th year of Hiao-wang" (Chinese chron. table), beginning of the Thirtieth cycle.

Ornithogalum umbellatum of Europe and the adjoining portion of Asia. Called in Britain *star-of-Bethlehem* (Prior) translated into Welsh "seren Fethleem" (Davies), in Germany "vogel-milch" (Grieb), in France "ornithogale" (Nugent), in Italy "latte di gallina" (Lenz), in Greece "mōuniklia" or "agriōs krinōs" (Fraas); and the מן נאן נאן נאן thbywnym sold in Samaria besieged by Ben Hadad — (2 K. vi. 25) is referred here by Linnæus: the "ōrnithōs gala" is mentioned by Nicander (Athen. ix. 12); the "ōrnithōgalōn" by Dioscorides as having an edible bulbous root, umbelled flowers herbaceous outside and milky within; and is identified by Ebn Baitar with the "sasali" of Elgafaki: *O. umbellatum* was observed by Hasselquist in Palestine; by Sibthorp, Chaubard, and Fraas, frequent in cultivated and fallow ground from the Peloponnesus throughout Greece. Westward, the account of the "ornithogale" by Pliny xxi. 62 seems chiefly taken from Dioscorides; *O. umbellatum* is described by Dodoens pl. 221; is termed "o. u. medium angustifolium" by Tournefort inst. 378; is known to occur in fallow ground from Italy throughout middle Europe as far as Sweden (Hall., Pers., and A. Dec.); was already in Britain in the days of Gerarde p. 133, but is regarded by Ray, Babington, and Watson, as exotic and only naturalized. By European colonists, was carried to Northeast America, where it has become naturalized, occurring especially in the grass-grown clearings of New England.

"894 B. C. = 1st year of I-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"The same year" (. . . . Wilk. theb. and eg. p. 514), "money first coined of gold and silver at Argos" in Greece.

893 B. C. (= 899 y. 4 mo. — "6 years" of Phœnician annals in Menand. Ephes., and Jos. c. A.), not earlier than this date, the accession at Tyre of Matgenus; aged twenty-three (= "32—9"), and who reigned "nine" years.

892 B. C. (= 912 y. 291 $\frac{1}{4}$ d. — "22 years" of twelve lunations of 1 K. xvi. 29), Ahab and Jehoshaphat warring against the Syrians, and Ahab slain in battle. He was succeeded by his son Ahaziah, eighth king of Israel.

By Jehoshaphat, ships built at Ezion-geber on the Red Sea: servants of king Ahaziah were refused admittance; and "the ships were broken," and "went not" on the proposed voyage "to Ophir for gold" — (1 K. xxii. 48, and 2 Chron. xx. 36).

890 B. C. (= 891 y. 165 $\frac{1}{4}$ d. — "2 years" of twelve lunations of 1 K. xxii. 51), Ahaziah succeeded by his brother Joram, ninth king of Israel.

The war with the revolted Moabites brought to a close by the besieged king of Moab offering "upon the wall" his own son for "a burnt offering" — (2 K. iii. 4 to 27).

Cucumis? prophetarum of the Tropical Sahara from the Atlantic to Arabia. The ꞖꞖꞖꞖꞖꞖ gathered for Elisha — (2 K. iv. 39) is referred here by Linnæus: the "lifiyat" according to Abul Abbas Elhafits is called "alkam" in the Hedjaz, grows also in Phœnicia and Upper Egypt with fruit like that of Momordica but prickly, and according to Ebn Baitar is frequent in Upper Egypt and called "damahir." *C. prophetarum* is described by Linnæus, and Jacquin hort. pl. 9; is known to grow in Africa and Arabia (Pers.); was observed by myself in Upper Egypt, spreading on the soil of the Desert, its fruit covered with soft prickles. "*C. anguria*" observed by Forskal p. 168 near Mocha, may be compared; also the plant carried to the West Indies under that name (Mill. dict. pl. 33, and Pers.).

887 B. C. (= 911 y. 357 $\frac{1}{4}$ d. — "25 years" of 1 K. xxii. 42), Jehoshaphat succeeded at Jerusalem by his son Jehoram, eighth Jewish king. He married a daughter of Ahab (2 K. viii. 18).

In the reign of Jehoram (2 K. viii. 20), revolt of the Edomites. Who succeeded in establishing their independence, and "made a king over themselves."

"880 B. C." (Euseb. and Clint i. p. 23 and 166, Diodorus' numbers giving 1169 — "92 — 85 — 79 — 23 — 25 years" = 865, a difference that would carry back these numbers to one of the false-dates for the fall of Troy), "Sixth" change in naval dominion. Leaving the Phrygians, the "Empire of the sea" acquired by the Cyprians. — Held by them "thirty-three" years.

The same year (= 917 — "37 years" of Apollod., Diodor., and Euseb. i. p. 166), Labotas succeeded by his son Doryssus, as one of the two Spartan kings; the fifth in the Agid line.

879 B. C. (= 886 y. 357 $\frac{5}{8}$ d. — "8 years" of 2 K. viii. 17 and 2 Chron. xxi. 5), Jehoram succeeded at Jerusalem by his son Ahaziah, ninth Jewish king.

In company with Joram king of Israel, he warred against Hazael king of the Syrians at Damascus (2 K. viii. 28, and 2 Chron. xxii. 5).

"878 B. C. = 1st year of Li-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

The Chinese characters containing the sign for *silk* not found beyond the Tcheou dynasty — by Hiü-chin: silk is alluded to in the *Chinese inscription* on the Heng-chan mountain, erroneously attributed to Yu (Pauth. p. 48 and 54); and is mentioned in the Chou-King. Westward, "sērīka" or silk stuffs were seen in Hindustan by Nearchus (Strab. xv. i. 20): and were known in the Mediterranean countries to Horace, Propertius, Suetonius, and Martial; though the Chinese manufacture continued so rare and costly, that the emperor Elagabalus is accused of being the first Roman who wore a silken dress.

Morus alba of China and Japan. Called in English gardens *white mulberry*, in Egypt "tout" (Del.); and the "mulberry" mentioned in one of the three odes complaining of the cruelty of the emperor Li-wang — (preserved in the Chi-King, Pauth. p. 101), and in connexion with "silk-worms" in the Chou-King, may be compared: *M. alba* was observed by Bunge p. 60 "as though spontaneous" on the mountains of Northern China; by Kämpfer, and Thunberg, in Japan, regarded as indigenous and called "iammagua" or "kago kadsura." Westward, occurs growing spontaneously in the region South and Southwest of the Caspian (Mey., Hohen., and A. Dec.), but was unknown in the Mediterranean countries in the days of Pliny xv. 29. who asserts that the berries of the "moris" in the end turn black: seeds or cuttings according to some authorities accompanied the living silk-worms that were brought from Central Asia in the reign of Justinian; but Targioni found the opinion prevailing in Italy, that cuttings were "brought from the East in 1434 by Fr. Buonvicini:" the tree has become naturalized in Armenia, Asia Minor, Thrace, Greece, and Italy (Fraas, Griseb., and Poll.); was seen by Forskal in gardens at Constantinople; by him, Delile, and Clot-Bey, in the gardens of Egypt; and is known to be cultivated throughout middle Europe. By European colonists, was carried to Northeast America, where it continues in gardens; to the Tropical islands of the Pacific, observed by myself on the Taheitian and Hawaiian Groups; and to Hindustan (Royle him. 337, and Graham), but I was informed at Bombay that the cultivation does not succeed.

The same year (= 877 y. 317 $\frac{3}{4}$ d. = 889 y. 187 $\frac{3}{8}$ d. — "12 years" of twelve lunations of 2 K. iii. 1, the line of Judah giving 878 y. 357 $\frac{5}{8}$ d. — "1 year" of 2 K. viii. 26 = 877 y. 357 $\frac{5}{8}$ d.), Ahaziah, with Joram and his mother Jezebel, all slain by Jehu. Whose accession therefore synchronous with that of Athaliah, mother of Ahaziah.

The name of Jehu king of Israel occurs in cuneiform letters in an inscription at Nineveh — (according to . . . and Layard). This therefore the earliest inscription in *Assyrian* or *cuneiform writing* whose date is ascertained.

The deity on the Assyrian monuments having the human face and feet and the body of a fish, is clearly Oannes, already mentioned.

The two-humped or *Bactrian camel*, *Camelus Bactrianus*, is figured on the Nimroud obelisk and other monuments at Nineveh: — also at Persepolis, and on the Etruscan vases (Layard pl. 53 and 55, Bonom. pl. 178, and Mon. inediti pl. 50). The two-humped camel is described by Aristotle; and is the kind employed by the Tartars of Northeastern and Central Asia, to the Crimea and Caucasus. Though unknown farther South, in Arabia; the animal has probably been sometimes brought as a curiosity into Egypt.

"876 B. C. About this time" (Clint. i. p. 206 and 214), Second irruption of the Cimmerians into Asia Minor.

875 B. C. = "28th year of Sesonk III.," birth of an Apis or sacred bull; the latest date in his reign found on the monuments — (Leps. k. tab. pl. 19, and Birch).

872 B. C. (= 877 y. 357 $\frac{5}{8}$ d. — "6 years" of 2 K. xi. 3), queen Athaliah slain. Succeeded at Jerusalem by Joash or Jehoash, son of Ahaziah and now eleventh Jewish king.

870 B. C. (= 991 — "121 yrs" of the Egyptian Chronicle = 989 y. 8 mo. — "120 yrs" of the Afr.-Maneth. table, the Euseb.-Maneth. table giving 822 y. 8 mo. + "49 yrs" = 871 y. 8 mo., and the monuments 875 — "26 + 20th" = 869), Sesonk III. succeeded by Pekhi or Pamai, eighth king of the Twenty-second dynasty. His name — has been found only on the tablet of the Apis or sacred bull at the Serapeum (Birch).

869 B. C. = "2d year of Pekhi" or Pamai, on the monuments — (Leps. k. tab. p. 19).

One hundred and third generation. May 1st, 867, mostly beyond youth :

865 B. C. (859 y. 4 mo. + "7th year" of Phoenician annals in Jos. c. A.), accession at Tyre of Pygmalion as Phoenician king ; aged nine (= "56 — 47"), and who reigned "forty-seven" years.

About 861 B. C. (= 981 — "120 years" of Vell. Paterc. i. 7), a date for Hesiod, possibly marking that of some of the Hesiodic poems. The Theogony at least seems included in the alleged derivation of *Greek mythology* from Homer and Hesiod not more than "four hundred" years before Herodotus ii. 53.

859 B. C. (= 1002 y. 116 $\frac{4}{8}$ d. — "143 y. 8 mo." of Phoenician annals in Jos. c. A.), Carthage founded by Elissa also called Dido, a fugitive sister of Pygmalion. (The date is confirmed by the silence of Homer respecting Carthage, and by the Phoenicians under Cambyzes refusing to make war against their Carthaginian descendants, Herodot. iii. 19).

Glaucium luteum of the seashore of the Mediterranean and Atlantic as far as the Baltic. Called in Britain *sea poppy* or *horned poppy* (Prior), in Italy "papavero marino" or "papavero cornuto" (Lenz), in Greece "ualōpikra" (Fraas); in which we recognize the "mēkōn kēratitis" identified in Syn. Diosc. with the "sisimaka" of the Numidians : — the "mēkōn kēratitis" is mentioned by Theophrastus ix. 12; by Dioscorides as growing on the seashore, the flowers yellowish, and the fruit long and curved like a horn; *G. luteum* was observed by Sibthorp, Chaubard, and Fraas, frequent on the seashore of Greece and the Greek islands. Westward, the "mēkōn kēratitis" or "paraliōn" or "agrian mēkōna" or "thalassion" is further identified in Syn. Diosc. with the "pavōlōum mari-nōum" of the Romans; the wild "papaver" called "ceratitin" or "paralion" or "glaucion" is mentioned by Pliny xx. 78 as growing on the seashore; *G. luteum* is described by Tragus 46; is termed "g. flore luteo" by Tournefort inst. 254; and is known to grow in Italy, and along the Atlantic as far as Sweden (fl. Dan. pl. 585, Wahl. p. 1082, and A. Dec.). By European colonists, was carried to Northeast America, where according to A. Gray it continues in "waste places, Maryland and Virginia, not common."

Erodium malachoides of the Mediterranean countries. A species of *heron's bill* called in Egypt "djarna" or "garna" (Forsk.), the seeming origin of the Greek word "gēraniōn : " the "gēraniōn ētērōn," identified in Syn. Diosc. with the "iēgk" or perhaps "iēsk" of the Numidians, — and described by Dioscorides as of no medicinal use, having projections resembling a crane's head and bill, and "malahē"-like leaves, is referred here by Sibthorp : *E. malachoides* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to the Greek islands and Cyprus; by Forskal p. 123, and Delile, in Egypt, extending into the Desert and sought as feed by sheep, goats, and camels. Westward, the account of the "geranion" of the Greeks with leaves somewhat "candidioribus" than those of "malvae" seems chiefly taken from Dioscorides : *E. malachoides* is described by Matthioli p. 624 (Spreng.); is termed "g. folio althæa" by Tournefort inst. 268; was observed by Forskal near Marseilles; is known to grow also in Italy, Spain, and on the Canary Islands (Cav. iv. pl. 91, and Pers.).

Geranium tuberosum of the Mediterranean countries. Called in Greece "kālōgērōs" (Fraas), and the "gēraniōn" identified in Syn. Diosc. with the "iēskē" of the Numidians, — mentioned also by Theophrastus, . . . Athenæus, Paulus Aegineta, by Dioscorides as having a roundish sweet edible root and "anēmōnē"-like leaves, is referred here by writers : *G. tuberosum* was observed by Sibthorp, and Fraas, from the Peloponnesus to Cyprus, a frequent weed in cultivated ground. Westward, the "geranion" with "anemones" leaves is mentioned together with additional medicinal properties by Pliny xxvi. 68 and 90; *G. tuberosum* is described by Matthioli, Anguillara, Dodoens, and Lobel; is termed "g. tuberosum majus" by Tournefort inst. 267; and is known to occur in Dalmatia and Italy (Cav. iv. pl. 78, Pers., and Spreng.).

Tragium Columnæ of the Mediterranean countries. The "tragiōn allō" identified in Syn. Diosc. with the "ahōiōsim" of the Numidians or "sōvēr" of the Egyptians, — growing according to Dioscorides in mountainous and precipitous situations, its leaves in autumn emitting a goat-like odour, is referred here by Columna, and Sprengel : *T. Columnæ* was observed in Greece by Link, and Gittard (Bory). Westward, the "tragiōn allō" or "tragōkērōs" or "skōrpiōn" or "garganōn" is identified in Syn. Diosc. with the "salia" of the Dacians, and "kōrnōlaka" or "vitōuēnsa" of the Romans; *T. Columnæ* was observed by Columna phyt. pl. 17 in Italy, and by Villars ii. p. 605 in Southern France (Pers.).

Bunium ferulaceum of the East Mediterranean countries. Called by the Turks "topana," a name adopted by the Greeks (Sibth.), and the "giggithiōn" identified in Syn. Diosc. with the "trikta" of the Numidians or "thōrusastrōu" of the Egyptians or "athōriōu" of the Syrians, — produced according to Dioscorides chiefly in Syria and Cilicia, a little herb resembling "staphulinō agriō," its whitish and bitterish root eaten both crude and cooked; mentioned also by Galen fac. alim. ii. p. 640, and Paulus Aegineta, may be compared : *B. ferulaceum* is termed "bulbocastanum

creticum ferulæ folio semine oblongo" by Tournefort cor. 21; was observed by Sibthorp in cultivated ground on Cyprus, its root cooked and eaten. Westward, the "giggithiōn" or "lēpithiōn" is identified in Syn. Diosc. with the "visakōtōum" of the Romans; but seems known to Pliny xx. 16 only as cultivated in Syria, much resembling "staphylino" and possessing the same properties.

Euphorbia apios of the Mediterranean countries. Called in Greece "hamaiputhia" (Belon) or "phlōmaki" (Sibth.): the "apiōs" or "ishas" identified in Syn. Diosc. with the "thōrphath sathē" of the Numidians, — and mentioned by Theophrastus ix. 9. 5, by Dioscorides as a low plant with a pear-shaped root whose upper portion is emetic and the lower purgative, the whole producing combined effects, is referred here by writers: *E. apios* was observed by Sibthorp, Chaubard, and Fraas, on the mountains of Crete and Greece, its root to the present day employed among the peasantry for the purposes described by Dioscorides. Westward, the "apiōs" or "hamaivalanōn" or "linōzōstin" is identified in Syn. Diosc. with the "rathix silvēstris" of the Romans; the account by Pliny xxvi. 46 of the "apios ischas" or "raphanos agria" or "raphanum silvestrem" seems chiefly taken from Dioscorides; *E. apios* is described by Clusius hist. ii. pl. 190; and is termed "titthymalus tuberosa pyriformi radice" by C. Bauhin pin. 292, and Tournefort inst. 87.

Thelygonum cynocrambe of the Mediterranean countries. Called in Greece "tzingaki" or "xinkōhōrtōn" (Sibth.) or "xungīōhōrtōn" (= axungia, Fraas); and the "kunīa" identified in Syn. Diosc. with the "armas" or "asōumēslavōn" of the Numidians, — and described by Dioscorides as two span high, tender and whitish, with small round fruit close to the leaves, is referred here by Honorius Bellus: the "kunīa" is further identified in Syn. Diosc. with the "kunōkramvē" or "linōzōstis agria arrēn:" *T. cynocrambe* was observed by Sibthorp, Chaubard, and Fraas, in shaded rock-clefts in Crete and Southern Greece. Westward, is described by Bauhin prodr. 59, and Barrelier pl. 335; is termed "cynocrambe Dioscoridis" by Tournefort cor. 52, "t. alsinoideum" by Lamarck fl. fr.; was observed by Forskal near Marseilles; and is known to grow in other parts of Southern Europe (Pers.). Eastward from the Mediterranean, is said to occur also in the East Indies (Pers.).

Crepis biennis of Europe and the adjoining portion of Asia. The "sithilēas" of the Numidians — identified in Syn. Diosc. with the "sōghitēn" of the Greeks and "lampōuka" of the Romans, also the kind of wild "lactuca" called "hieraciam" by Pliny xx. 26, and the "lactuca sylvatica" of Apuleius Barbarus, are referred here by Fuchsius pl. 319, and Matthioli: *C. biennis* was observed by Matthioli pl. frequent in Italy; is termed "hieracium maximum chondrillæ folio asperum" by Tournefort inst. 470; is known to grow throughout middle Europe as far as Britain (Pers., and Engl. bot. pl. 149). Eastward, was observed by Forskal, and Sibthorp, in the district around Constantinople.

Scorzonera laciniata? of the Mediterranean countries. The "sithilēsathē" of the Numidians, — also called "sōghitēn" by the Greeks, and further identified through Syn. Diosc. with the "iērakiōn mikrōn" of Dioscorides and "intuvōum agrēstēm" of the Romans, is referred here by Fuchsius pl. 320, and Matthioli: *S. laciniata* was observed by Matthioli pl. frequent in Italy; is termed "s. laciniatis foliis" by Tournefort inst. 477; and is known to grow throughout middle Europe (Lam. fl. fr., Jacq. austr. pl. 356, and Pers.). Eastward, was observed by Sibthorp from the Peloponnesus to Constantinople.

Chrysocoma linosyris of Europe and the adjoining portion of Asia. Called in Britain *goldilocks* (Prior), in Germany "goldhaar," in Italy "spilli d'oro di foglia stretta" (Lenz); in which we recognize the "hrusōkōmē" identified in Syn. Diosc. with the "thōuvath" or "vōurhōumath" of the Numidians, — and described by Dioscorides as a span high, growing in stony and shaded places: *C. linosyris* was observed by Sibthorp in the environs of Constantinople. Westward, the "hrusōkōmē" or "hrusitis" or "hrusanthēmōn" or "amarantōn" or "thiōs pōgōn" is identified in Syn. Diosc. with the "iovis varva" of the Romans; the "chrysocome" or "chrysitis" is said by Pliny xxi. 26 and 85 to have no Latin name; *C. linosyris* was observed in Italy by Columna ecphr. i. p. 81; is described also by C. Bauhin; is termed "conyza linariæ folio" by Tournefort inst. 455; and is known to grow throughout middle Europe as far as Britain (Pers., and Engl. bot. pl. 2505).

Plantago psyllium of the Mediterranean countries. Called in Greece "psullōhōrtōn" (Sibth.); in which we recognize the "psulliōn" identified in Syn. Diosc. with the "ōuargōugōum" of the Numidians, — and described by Dioscorides as growing in waste and cultivated ground, its seeds resembling fleas, mentioned also by Galen: *P. psyllium* was observed by Forskal, Sibthorp, Chaubard, and Fraas, a frequent weed in vineyards and cultivated ground from the Peloponnesus throughout the Greek islands to Constantinople. Farther South, seeds were observed by Forskal mat. med. p. 167, and Delile, in the drug-shops of Egypt and called "qotneh," in which we recognize the "kutuna" of Rhazes, and "kuthuna seeds" of Ebn Baitar. Westward, the "psulliōn" or "psullēris" or "kataphusis" or "krustalliōn" or "kunokēphaliōn" or "kunōmuna" or "sikēliōtikōn" is identified in Syn. Diosc. with the "konithiis" of the Sicilians, and "silvakiōum" or "ērva

pōulikaria" of the Romans; the "psyllium" is mentioned by Celsus v. 2, and is identified by Pliny xxv. 90 with the "cynoides" or "cynomyia" or "sicelicon" growing in vineyards; P. psyllium is termed "p. majus erectum" by Tournefort inst. 128, and is known to grow in Barbary and in various parts of Southern Europe (Pers.). The seeds according to Lindley, "are peculiarly mucilaginous" and "a good substitute for linseed or marsh mallows."

Potamogeton densus of Europe and the adjoining portion of Asia. Called in Britain *frog's lettuce* (Prior): the "astirkōk" of the Numidians, — identified in Syn. Diosc. with the "thursiōn" or "alimōktōnōn" or "pōtamōgēitōn ētērōs" having leaves resembling those of the beet but thinner, more elongate, and more numerous, and slender stems loaded with reddish fruit astringent to the taste, may be compared: P. densus was observed by Sibthorp, Chaubard, and Fraas, in the streams of the Peloponnesus. Westward, the "pōtamōgēitōn ētērōs" is identified in Syn. Diosc. with the "kōathama" of the Dacians, "taurōuk" of the Gauls, and "vēnai phōliōum" or "ērvagō" or "glathiatōriam" of the Romans; P. densus is described by Linnæus, and is known to grow throughout middle Europe as far as Britain (Lam. fl. fr., Pers., Engl. bot. pl. 397. See P. crispus).

851 B. C. (= 880 — "29 years" of Apollod., Diodor. and Euseb. i. p. 166), Doryssus succeeded by his son Agesilaus as one of the two Spartan kings; the sixth in the Agid line.

The same year (= 877 y. 317 $\frac{3}{4}$ d. — "28 years" of twelve lunations of 2 K. x. 36), Jehu succeeded by his son Jehoahaz, eleventh king of Israel.

Anacyndaraxes or Acraxanes, father of Sardanapallus, reigning in Assyria — (Anchial. inscript., Euseb. i. and ii., and Syncell.).

At Nineveh, a gate of the Khorsabad palace fastened by "a huge wooden *lock*," — which is further described by Bonomi nin. iv. 1 as "like those still used in the East." The "mfth" of Isaiah xxii. 22 is further identified with the Egyptian "muftah," the large wooden *key* belonging to these locks.

In the sculptures at Khorsabad, an *umbrella* is figured — (Botta pl. 113). Umbrellas are also figured at Nimroud (Bonom. nin. iv. 2); and were observed by myself in paintings on the walls of the ancient caves at Adjunta in Hindustan.

At Khorsabad also, a *battering-ram* is figured, in use against a city wall — (Bonom. nin. iv. 1).

Also at Khorsabad, the punishment of *impement* is represented — (Botta pl. 55, and Bonom. nin. iv. 1). This barbarous punishment was sometimes employed by Darius (Herodot. thal. 159); and continues in use among the Persians and Turks.

Pinus sylvestris of Northern Europe and Asia, and mountains farther South. Called in Britain *Scotch fir* from growing on the mountains of Scotland (Prior), in Germany "kiefer" (Grieb), in France "pin sauvage" (Fée), in Italy "pino montano" or "pino selvatico" (Lenz); occurring in the buried submarine forests along the coast of France and Britain (Austen geol. soc. vi. p. 97); and "in Assyrian sculptures a fir-cone is the symbol of fire" — (Prior): the "pitus agria" growing according to Theophrastus iii. 1 on the mountains of Macedonia, is referred here by writers; and the "pinus silvestris" of Pliny xvi. 17 may in part belong here: P. sylvestris occurs in the debris of ancient lake-villages in Switzerland (Troyon); is termed "p. s. vulgaris Genevensis" by Tournefort inst. 586; was observed by Forskal on mountains not far from Marseilles; is known to grow in North Italy and throughout Northern Europe as far as Lat. 70° (A. Dec., and Lenz), also in Siberia (Pers.); was observed by Sibthorp on the Bithynian Olympus; and by Thunberg, in Japan.

The same year = "20th year of Pamai" death of the Apis or sacred bull that was born in the "28th year of Sesonk III.," aged "26 years" — (Birch).

The accession therefore of Sesonk IV., ninth and last king of the Twenty-second dynasty, not earlier than this date. His name occurs on contemporaneous monuments — (Leps. k. pl. 46).

848 B. C. (= 1071 — "80 — 49 — 49 — 45 years" of Apollod., Diodor., and Euseb. i. p. 166), accession of Charilaus grandson of Prytanis, as sixth Spartan king in the Proclid line; under the guardianship of his uncle Lycurgus.

The same year = "4th year of Sesonk IV.," death of an Apis or sacred bull — (Birch).

841 B. C. (= 827 + "14 years," Pauth. p. 104), the Chinese emperor Li-wang, on account of his cruelties, expelled from the throne, and the government conducted by ministers.

The same year (= 822 + "19 years" of Castor, Euseb., and Syncell.), at Athens, Diognetus succeeded by his son Pherecles, eighth archon for life.

The same year = "11th year of Sesonk IV.," death of an Apis or sacred bull — (Birch).

"837 B. C. = 42d year of Li-wang" (Chinese chron. table), beginning of the Thirty-first cycle.

836 B. C. (= 816 + "20 years" of Euseb. i. and ii., and Syncell.), accession of Sardanapallus, son of Anacyndaraxes, as Assyrian emperor.

The city of Anchiale, not far from Tarsus, founded by Sardanapallus; according to a monument there bearing his sculptured portrait with an inscription in Assyrian letters (described and quoted

by Choerilus, Hellanicus, Amyntas, Callisthenes, Aristobulus, Cleitarchus, Apollodorus, and Strabo xiv. 5. 9).

The *dulcimer* figured on the Assyrian monuments at Nineveh;—and is regarded by Bonomi nin. iv. 3 and pl. 202 as the “swmfnyh” of Daniel iii. 5, and the “sumphōnia” of the Greeks.

The *cymbals* also figured on the Assyrian monuments—(Bonom. pl. 201); and are found to have continued essentially the same to the present day.

The *tambourine* also figured on the Assyrian monuments—(Bonom. pl. 201); clearly the same musical instrument in use to the present day.

The *tamboura* or long guitar, figured on Assyrian monuments at Nimroud,—is identified by Bonomi iv. 3 pl. 114 and 115 with the “sbka” or *sackbut* of Dan. iii. 5; the same instrument continuing in use along the Euphrates and Tigris to the present day.

The *fallow deer*, *Cervus dama*, figured on the Assyrian monuments at Nimroud—(Bonom. pl. 150): the “dama” is mentioned by Horace, Pliny viii. 79; and as semidomestic, “timidi venient ad pocula damae,” by Virgil. At the present day, the fallow-deer is chiefly known as kept in parks throughout Europe; but was seen wild in Palestine by Hasselquist, and Schubert (Kitt. bibl. cycl. ii. p. 464).

834 B. C. (= 850 y. 257 $\frac{1}{8}$ d. — “17 years” of twelve lunations of 2 K. xiii. 1), Jehoahaz succeeded by his son Jehoash or Joash, twelfth king of Israel.

One hundred and fourth generation. Sept. 1st, 834, mostly beyond youth:

832 B. C. (= 871 y. 357 $\frac{5}{8}$ d. — “40 years” of 2 K. xii. 1, and 2 Chron. xxiv. 1), Jehoash succeeded at Jerusalem by his son Amaziah, twelfth Jewish king.

The Edomites defeated and their city Selah captured by Amaziah. The name Selah was changed to “Joktheel”—(2 K. xiv. 7): but from the time of the Romans, the city has been called “Petra,” at least by Europeans.

Amaziah next invited Joash king of Israel to battle, and was himself defeated. A portion of the wall of Jerusalem was now broken down by Joash—(2 K. xiv. 7 to 13), and the calendar of the conquerors (as will appear presently) was imposed on Judah.

831 B. C. (= 931 — “100 years after the Ionic Migration” of Apollodorus, Clem. Alex. i. p. 327), Agesilaus one of the two Spartan kings.

The same year (= 1071 — “240 years” of Apollod.), a date given for Homer, possibly that of some of the Homerid hymns (see Hesiodic poems).

Eryngium campestre of Europe and the adjoining portion of Asia. Called in Britain *eryngo* (Prior), in France “panicaud” (Nugent) or “chardon roulant” or “herbe à cent têtes” (Fée), in Denmark “hundred hoved” (Spreng.), in Germany “mannstreu,” in Italy “eringio” or “calcatreppo” (Lenz), in Greece “aggathia” or “phithaggathōn” (Sibth.); the ΕΚΑΤΟΝ: ΚΑΡΑ of the Hymn to Ceres 12—may be compared; also the “centum capita” or “eryngion candidam” celebrated among the Magians, Pythagoreans, and in the Sapphic legend respecting Phaon (Plin. xxii. 9): *E. campestre* was observed by Forskal around the Dardanelles, and by Sibthorp in Greece, but by Fraas only on high mountains. Westward, the “ēruggiōn” or “ēruggēn” or “ērmion” or “mōlu” is identified in Syn. Diosc. with the “sikōupnōēx” of the Dacians, “kartērai” or “kapitōulōum karthōus” of the Romans, “kiōtōukapēta” of the Spanish, and “hērthan” or “hitha” or “mountain herb” of the Numidians: *E. campestre* is termed “e. vulgare” by Tournefort inst. 327; was observed by Forskal near Marseilles: is known to grow from Italy, Morocco, and Portugal (Schousb., and Pers.) throughout middle Europe, in some instances clearly introduced, as far as Denmark (Ray, fl. Dan. pl. 554, Wats., and A. Dec.). Has been long used medicinally, and according to Lindley “a good deal of the candied root is still sold.”

Eryngium viride of the East Mediterranean countries. An allied species called in Greece “agkathia” or “phithagkatha,” more abundant (Fraas), and possibly the plant in question; as well as the “krōvusōs” of the Egyptians—identified with the “ēruggiōn” in Syn. Diosc.: the “ēruggiōn” of Theophrastus vi. 1. 3, Heraclides, Apollodorus, Nicander ther. 645, Plutarch sympos. vii. 2, its young leaves edible according to Dioscorides, is referred here by Fraas: *E. viride* is described by Link; was observed by Chaubard, and Fraas, abounding in Attica and the Peloponnesus; and the “*E. campestre*” called in Egypt “schakakel” and observed near the Mediterranean border by Forskal, and Delile, may also be compared.

Mentha pulegium of Europe and the adjoining portion of Asia. Called in Britain *penny-royal*, by old writers “puliol royal,” in Holland “poley” (Prior), in Germany “polei” (Grieb), in France “pouliot” (Nugent), in Italy “pulegio” (Lenz), on Malta “poleg” (Forsk.), in Greece “gluphoni” or “vlēhōni” or by the Turks “filis cun” (Sibth.), in Egypt “hoboq” (Del.); in which we recognize the “vlēhōna” identified by Dioscorides with the ἈΨΥΧΟΝ of the Hymn to Ceres 209,—Heraclitus, Aristophanes, Polemon diæt. ii, 1 Mul. morb. 606, Theophrastus ix. 16. 1, Theocritus, Nicander ther. 877, Plutarch garrul. 17, or the “vlēhōn” of Aristophanes pac. 712, Aristophon, and Athenaeus:

identified further in Syn. Diosc. with the "vlēhrōs" of Theophrastus caus. i. 7. 5, and others: *M. pulegium* was observed by Sibthorp, Chaubard, and Fraas, abounding in vineyards and fallow ground from the Peloponnesus throughout the Greek islands; by Alpinus, and Delile, in Egypt; is known to grow also as far as Caucasus (Lindl.). Westward, the "glēhōn" or "vlēhrōn" or "arsēnikanthōn" is identified in Syn. Diosc. with the "alvōlōn" or "gallis ōpsis" of the Gauls, "apōlēiōum" of the Numidians, "pōlēiōum" of the Romans; and the "pulejum" or "pulegium" is mentioned by Varro, Cicero, and Pliny: *M. pulegium* is termed "m. aquatica seu pulegium vulgare" by Tournefort inst. 189; was observed by Forskal under cultivation on Malta; is known to grow wild in Italy (Lenz), and from Teneriffe and Gibraltar throughout middle Europe as far as Britain (Pers., Engl. bot. pl. 1026, and Lindl.). By European colonists, was carried to Northeast America before 1669 (Jossel.), but has disappeared (excluded by substituting the medicinal use of the indigenous *Hedeoma pulegioides*); to Chili, where it has become naturalized (Lindl.). As in the days of Dioscorides, the plant continues in high repute as emmenagogue (Spreng., and Pereir.).

Gladiolus communis of the Mediterranean countries. Called in English gardens *corn flag* or *corn sedge* or *sword-grass* (Ainsw.), in France "glayoul" (Nugent), in Germany "siegwurz," in Italy "pancaciulo" or "gladiolo" (Lenz), in Greece "spathōhōrtōn" (Fraas) or "agriōkōrkōrōs" (Sibth.); and the ΑΑΑΑΑΙΔΑΕ of the Hymn to Ceres, — or "agallis" of Nicander fr. 2, may be compared: the "phasganōn" called "xiphōs" from resembling a sword, its root edible, is mentioned by Theophrastus vi. 8. 1 and vii. 13. 1; by Dioscorides, as growing mostly in cultivated ground, having nerved sword-shaped leaves, and a row of purple flowers; by Athenaeus xv. 31, as planted on graves of virgins: *G. communis* was observed by Sibthorp, Chaubard, and Fraas, frequent in cultivated ground at the opening of spring from the Peloponnesus to Cyprus. Westward, the "xiphōn" or "phasganōn" or "mahairōniōn" is identified in Syn. Diosc. with the "sēgētalēm" or "glathiōlōum" of the Romans; the "gladiolus" is mentioned by Pliny xxi. 38 to 68, Isidorus, and in the *Ortus Sanitatis* 211: *G. communis* is termed "g. floribus uno versu dispositis, major et procerior, flore purpureo rubente" by Tournefort inst. 365; was observed by Forskal near Marseilles; and is known to occur in Barbary, Italy, and other parts of Southern Europe (Mill., and Pers.).

830 B. C. (= 848 — "18 years" of schol. Plat. rep. x. p. 419 and of Suidas, Eusebius' numbers placing the event two years later), end of the regency of Lycurgus.

"828 B. C." (Callim., *Jul. Afr.*, and *Clint.* i. p. 140 and ii. p. 500 = 803 + "25 years" of the Euseb.-Maneth. table = 1417 — "194 — 172 — 130 — 49 — 44 years" of the Armenian Euseb.-Maneth. table = "51 — 61 — 20 — 60 — 5 — 7 — 135 — 130 — 120 years" of the Afr.-Maneth. table), at the command of the Delphic Oracle, and after sending an embassy to Egypt (Herodot. ii. 160), the Olympian games restored by Iphitus king of Elis: co-operating with Lycurgus, then or recently regent at Sparta (see Hermipp., *Plut.*, and *Athen.* xiv. p. 635).

The "disk of Iphitus" bearing an *inscription* — was preserved for some centuries; and is referred to by Aristotle and others, as an example of "ancient writing."

Anagallis arvensis of Europe and Northern Asia. Called in Britain red *pimpernell* or from its flowers closing before rain *poor man's weather-glass* (Prior), in Germany "gauchheil," in Italy "centonchio" or "erba grisetina" or "anagallide" (Lenz), in Greece "pērthikōulē" (Sibth.) or "kōrhēstra" (Fraas), by the prophets "aima ōphthalmōu" or "hēlithōniōn" (Syn. Diosc.); and the "kōrhōrōs" from its bitterness the subject of a proverb — according to Theophrastus vii. 7. 2, its leaves "ōkimōthēs," may be compared: the "anagallis" is mentioned in *Ulc.* 879; is described by Dioscorides as "kēhumēna ēpi gēs" diffuse, and the red-flowered kind is distinguished: *A. arvensis* was observed by Forskal, Sibthorp, and Chaubard, frequent in cultivated and fallow ground from the Peloponnesus to Constantinople, and according to Fraas eaten as greens; was observed by Forskal, and Delile, in Egypt; was received from both Egypt and Abyssinia by Decandolle; is known to grow also on mount Sinai (Decsne), and about Caucasus (Ledeb.). Westward, the red-flowered "anagallis" is identified in Syn. Diosc. with the "kōrkēraphrōn" of the Dacians, "sapana" of the Gauls, "masitipōs" of the Tuscans, and "makia" of the Romans; the "anagallida mas flore phoeniceo" is distinguished by Pliny xxv. 92: *A. arvensis* is described by Lyte; is termed "a. phoeniceo flore" by Tournefort inst. 142; was observed by Lenz in Italy, by Forskal near Marseilles; and is known to occur in cultivated ground as far as Sweden (*Vill. dauph.* ii. 461, Pers., and Fries). Eastward from Caucasus, is known to grow in Siberia (Ledeb.); also in Persia, employed there to prevent cataract in eyes of horses (*S. G. Gmel. trav.* iii. 349, and Spreng.); along the Himalayan mountains to Cashmere and Nepal (*A. Dec.*); was observed by Thunberg in Japan, purple-flowered; and by Beechey, on the Loo Choo Islands (Hook.). By European colonists, was carried to Madeira and the Azores (Barcl., and Wats.); to Northeast America, where it has become naturalized in open situations in our Atlantic States; to Mexico (Berland.) and California, observed by myself naturalized around San Francisco Bay; to Brazil, Buenos Ayres, and Chili (Saint-Hil., *A. Dec.*, and Poepp.); to Austral Africa (*Dec.*), the Mauritius Islands (Boj.), Australia (*Dec.*), and New Zealand (Raoul). The plant as appears from Lindley continues in medicinal use.

Anagallis latifolia of the Mediterranean countries. Called in Yemen "choda" (Forsk.), by the prophets "nuktëritis," in Egyptian "mikiëi" (Syn. Diosc.); and the "körhörös" of the proverb — is identified through Syn. Diosc. with the blue-flowered "anagallis:" the "körkörön" is mentioned by Aristophanes vesp. 239 as cooked and eaten; is also mentioned by Nicander ther. 626 to 864, and Hephaestion: the blue-flowered "anagallis," said to differ in some of its medicinal properties, is mentioned by Dioscorides, Archigenes, and Galen comp. med. ix. 2: *A. latifolia* was observed by Forskal on the mountains of Yemen as well as in Egypt; by myself on the river-flat of the Nile, the flowers larger and more showy and always blue; is perhaps the blue-flowered species seen by Fcrskal, and Sibthorp, as far as Constantinople. Westward, the blue-flowered "anagallis" is identified in Syn. Diosc. with the "asirrisoi" of the Numidians, and "mëkiatö" of the Romans; is distinguished by Pliny xxv. 92 as flowering earlier and avoided by cattle, but he includes both kinds under "anagallida" called "corchoron:" *A. latifolia* is described by Linnæus; is known to grow in Spain (Pers.), and in general according to A. Decandolle p. 572 farther South than the preceding species. (See *Gladiolus communis*).

Anagallis tenella of Europe and the adjoining portion of Asia. The "körhörös" — according to the scholiast of Nicand. having leaves always reclining on the ground, seems to agree better with this species: the "körhörös" mentioned separately from the "anagallis" by Galen simpl. vi, may also be compared: *A. tenella* was observed by Sibthorp on Crete. Westward, is termed "lysimachia humifusa folio rotundiore flore purpurascens" by Tournefort inst. 141; and is known to grow from Italy throughout middle Europe as far as Britain (Curt. lond. iii. pl. 15, Schmidt, and Pers.).

"In this year" (. . . Lacharme note to Chi-King iii. 3-9), war carried on by Suen-ouang against the barbarians of the country called Hoai or Hoai-Siu.

"827 B. C. = 1st year of Siouan-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

Stone monuments of the time of the emperor Siouan-wang — are preserved in a college at Pekin (Pauth.).

Mespilus Germanica of Eastern Europe and the adjoining portion of Asia. Called in Britain *medlar* (Prior), in France "neffier" or "nеспel," in Old French "melier" or "mesplé," in Old German and Danish "mespel" or "mispel" (A. Dec.), in current German "mispel," in Italy "nespolo" and the fruit "nespolo" (Lenz), in Greece "mëskoulëa" (Fraas); and the "neffier" is mentioned in a Siao-ya ode* — (Chi-King ii. 1. 2) according to Pauthier. Westward, the "mëspilou ëtëron" is identified through Syn. Diosc. with the "satanëiös" of Theophrastus iii. 12. 5 bearing larger and more spongy fruit, and one of the three kinds distinguished by the inhabitants of mount Ida: the "mëspilou ëtëron" is described by Dioscorides as resembling the "mëlö" even in its leaves but a smaller tree, its fruit edible subastringent round with a wide umbilicus and ripening slowly; is identified in the added Synonyms with the "ëpimëlitha" or "sëtanion;" and directions for the cultivation of "mëspilön" are given by Didymus (Geopon. x. 71): *M. Germanica* was observed by Sibthorp in woods in the environs of Constantinople, and besides cultivated; is known to grow wild also in Thrace and as far as Germany (Spreng.). Farther West, of the three kinds of "mespilis" the "setania" was not in Italy in the days of Cato (Plin. xv. 22), but had arrived before the time of Dioscorides, and the cultivation of "mespilus" is mentioned by Palladius iv. 10. 19: *M. Germanica* is termed "m. germ. folio laurino non serrato sive m. sylvestris" by Tournefort inst. 641; was observed by Lenz cultivated and seemingly wild in Italy; and is known to occur throughout middle Europe (Pers., and Wats.). By European colonists, was carried to Northeast America, observed by myself under cultivation in our Middle States.

825 B. C. = "27th year of Sesonk IV.," death of an Apis or sacred bull — (Birch).

"In this year" (Hieronym. and Clint. i. p. 166, Diodorus' numbers giving 787 + "45 years" = 832), "Seventh" change in naval dominion. Leaving the Cyprians, the "Empire of the sea" acquired by the Phœnicians — Held by them "forty-five" years.

From the time of the Phœnician occupation, the Balearic islanders celebrated as slingers; their skill in the art derived originally from their Rhodian ancestors — (see Strab.).

Schoenus nigricans of Europe and the adjoining portion of Asia. A sort of *rush*; and the "mëlagkrainas" of which some Balearic slings were made — (Strab. iii. 5. 1, and Sil. Ital. iii. 64), used besides for cinctures according to Philetas (schol. Strab.), and according to Theophrastus iv. 12 named from its black fruit, is referred here by Sprengel, and Fraas: the account by Pliny xxi. 69 seems taken from Theophrastus, but Dioscorides adds, that the fruit is round: *S. nigricans* is described by Morison iii. 8. pl. 10; is termed "gramen spicatum junci facie lithospermi semine" by Tournefort inst. 518; was observed by Sibthorp, Chaubard, and Fraas, frequent in the marshes of the

* *Populus dero* of Eastern Asia. A *poplar* called by the Ainos "dero" (Sieb.); and the "peupliers, yang," growing on Northern mountains according to a Siao-ya ode — (Chi-King ii. 2. 3, transl. Pauth.) may be compared: *P. dero* was observed by Siebold on the island of Yeso.

Peloponnesus; and is known to grow in marshes more or less maritime as far as Britain (Pers., and Engl. bot. pl. 1121).

822 B. C. (= 802 + "20 years" of Castor, Euseb., and Syncell.), at Athens, Pherecles succeeded by his son Aripbron, ninth archon for life. The same date, possibly marking the same event (= 991 — "121 — 48 years" of the Egyptian Chronicle = 1417 — "194 — 178 — 130 — 49 — 44 years" of the Euseb.-Maneth. table, the same table giving 339 "4 + 6 + 6 + 20 + 21 y. 4 mo. + 6 + 120 y. 4 mo. + 42 + 25 + 17 + 6 + 45 + 8 + 6 + 7 + 12 + 44 + 44 + 44 years" = 822 y. 8 mo., and the Afr.-Maneth. table + "4 + 3 + 2 + 38 + 20 y. 4 mo. + 6 + 124 y. 4 mo. + 150 y. 6 mo. + 40 + 6 + 89 years" = 822 y. 2 mo., also 1417 — "209 — 135 — 130 — 120 years" = 823 = 1413 — "209 — 135 — 130 — 21 — 15 — 25 — 13 — 42 years").

819 B. C. (= 818 y. $251\frac{1}{2}\frac{2}{3}$ d. = 834 y. $77\frac{3}{4}\frac{4}{5}$ d. — "16 years" of twelve lunations of 2 K. xiii. 10, or by the line of Judah 831 y. $357\frac{5}{8}\frac{0}{10}$ d. — "15th year" of 2 K. xiv. 23 = 817 y. $357\frac{5}{8}\frac{0}{10}$ d., or — "15th year" of twelve lunations = 818 y. $144\frac{1}{2}\frac{2}{3}$ d.), Joash succeeded by his son Jeroboam II., thirteenth king of Israel.

818 B. C. (= 865 y. 4 mo. — "47 years" of Phœnician annals in Menander Ephes., and Jos. c. A.), at Tyre, end of the reign of Pygmalion.

About this time (Herodot. iv. 15 . . .), Aristæas visiting the countries North of the Black Sea as far as the Issedones: — the Issedones are described by Herodotus iv. 24 as eating their dead parents; a custom extant in various parts of the East Indies.

From the Issedones, Aristæas obtained accounts of more distant tribes, Arimaspi, Grypi, and Hyperborei, of a nation "dwelling along the Northern Ocean on terms of peace with their neighbours" (a description applicable only to the Laplanders and Samoyedes). — On his return Aristæas embodied his observations in an Epic poem, which appears to have long continued among the Greeks their principal source of information respecting Northern countries. Accounts of the Polar night reached Greece as early at least as the days of Herodotus, who speaks of a people reported to "sleep six months of the year."

In or about "817 B. C." (Thucyd., and Clint. i. p. 141 and ii. p. 408), the Laws of Lycurgus, derived (according to Aristotle rep. ii. 10) "from those of Minos," adopted at Sparta: with the concurrence of Charilaus (according to Plutarch 5), and of Agesilaus (according to Pausanias iii. 2. 4, possibly like Herodotus and Justinus, referring the adoption to the time of the regency). *Written laws* were prohibited by Lycurgus.

Lupinus hirsutus of the Mediterranean countries. Called in Greece "lōupinia" and its seeds "lōupini" (Fraas), on Zacynthus "agriō lōupōnō" (Sibth.), in Egyptian "vrēhōu" (Syn. Diosc.); the only species found by Fraas cultivated in Greece, and there only in the district around Sparta, in seeming connexion with the diet of the ancient inhabitants: — "thērmōkuamōus" are mentioned by the poet Diphilus (Athen. ii.): the "thērmōs" as esculent, in the Hippocratic treatises, and by Alexis, Polemon, Timocles, Zeno; by Theophrastus viii. 1. 3 to 11. 8 as a cultivated pulse; and the "thērmōs ēmērōs," by Dioscorides, and in Geopon. ii. 37: *L. hirsutus* was observed by Sibthorp, Chaubard, and Fraas, wild from the Peloponnesus throughout the Greek islands; by Castagne, as far as Constantinople (A. Dec.); by Forskal, and Delile, in Egypt, in some instances intermingled in crops of *L. termis*, but whether purposely was not ascertained. Westward, is described by Bauhin hist. ii. 289, and Cupani i. pl. 156; is termed "*L. latifolius humilis hirsutus*" by Tournefort inst. 392; is known to grow wild in Portugal and Spain (Pers., Boiss., and A. Dec.); was observed by Shaw 393 in Barbary, and by Forskal near Marseilles.

Lupinus pilosus of the Mediterranean countries. Called in Greece "lupōuni" (Sibth.), and possibly included with the preceding: — the "agriōs ērēvinthōs" of Dioscorides ii. 126 may also be compared: *L. pilosus* was observed by Fraas near Sparta, not known to be cultivated; by Sibthorp, on the Greek islands. Westward, is termed "*L. peregrinus major vel villosus cæruleus major*" by C. Bauhin pin. 348, is described also by Tournefort inst. 392; and is known to grow in various parts of Southern Europe (Pers.).

Pisum elatius of the countries around the Black Sea. A species of *pea*, possibly the green ΦΑΞΗΥΟΞ forming the supper of the Spartan warriors — (Polemon, and Athen. ii. 46): *P. elatius* is however unknown in the cultivated state; is described by Steven, and Bieberstein, and according to Ledebour is indigenous around the Black Sea (Steud., and A. Dec.): the "*P. arvense*" seen by Sibthorp pl. 687 in cultivated ground about Constantinople, and by Moris in Sardinia, is referred to *P. elatius* by Grisebach spicil. i. p. 69. (See *P. arvense*).

Poterium spinosum of the East Mediterranean countries. A bushy spinescent plant called in Greece "aphanna" or "astōivē" (Sibth.) or "stōivatha" (Fraas), in which we recognize the ΕΤΙΒΑΕΙ beds of the Spartans — (Plut. 16): "stivatha" are mentioned in the Cyclic epigon., also by Herodotus, Euripides, Xenophon, Plato pol. ii. 372; and the "stōivē" plant, by Aristophanes ran. 1178, Dioscorides, by Theophrastus vi. 1. 3 as prickly separate from the leaves and by some called "phēōs:"

P. spinosum was observed by Honorius Bellus in Crete (Clus. ii. p. 303); by Sibthorp, Chaubard, and Fraas, abounding and occupying tracts of country from the Peloponnesus throughout the Greek islands; and is known to grow on Lebanon (Pers.). Westward, the “stōivē” or “stōviōn” is identified in Syn. Diosc. with the “stipam” of the Romans; but the account by Pliny xxi. 54 and xxii. 13 of the “stoebe” or “phleos” seems taken from Theophrastus and Dioscorides: *P. spinosum* is described by Pena and Lobel (Spreng.); is termed “pimpinella spinosa seu sempervirens” by Tournefort inst. 157; and is known to grow in North Italy (Lenz).

Lycopodium denticulatum of the Mediterranean Countries. A delicate moss-like species. The $\vee\vee\kappa\phi\omicron\lambda\epsilon$ mingled in $\epsilon\tau\iota\beta\alpha\epsilon\iota$ in winter in accordance with the Laws of Lycurgus — (Plut. 16), may be compared: *L. denticulatum* is termed “muscus denticulatus minor” by Tournefort inst. 556; is described also by Dillenius pl. 56 f. 1, and Linnæus; was observed by Sibthorp, and Chaubard, on rocks abounding from the Peloponnesus to Cyprus; is known to grow also in Italy, Corsica, Spain, Tunis, Tangier, and Teneriffe, its alleged presence in Poland being a mistake (Bory).

816 B. C. (= 776 + “40 years” of Euseb. i. p. 46, Diodorus ii. 21 giving 1820 — 1000 years or “thirty generations” = 820), death of the Assyrian emperor Sardanapallus, defeated by Arbaces the Mede and Belesis. Aripbron being at the time archon at Athens; a well-known synchronism, according to Syncellus; and admitted even by Eusebius i. p. 137.

815 B. C. (= “37th year of Sesonk IV.”; the latest date in his reign found on the monuments — (Leps. k. tab. p. 19).

811 B. C. (= 753 + “10 + 8 + 40 y’s” of the Afr.-Maneth. table), accession of Pētōuvatēs or Pētōuvastis, head of the Twenty-third dynasty. The name of king Petsibast occurs on contemporaneous monuments — (Prisse, and Leps. k. pl. 46).

Acacia gummifera of the Tropical Sahara as far as Arabia. Its exudation is called in English *gum arabic*, in Egyptian “kōmē” — (peripl. Erythr., and Kirch.); in which we recognize the “kōmmi” of the Egyptian “akanthē” mentioned by Herodotus ii. 96, the “gummi optimum ex Aegyptia spina” of Pliny xxiv. 65, and the “qwmā” of the Talmud (Buxt. lex. talm.): the “samgh turi” brought from Tor into Egypt is identified by Forskal mat. med. with “gummi arabicum,” said by other authorities to be procured in small quantities in the Sinai peninsula. The tree is called in Upper Egypt “toul” (Del.), in Yemen “talāh” (Forsk.), in which we recognize the “teil” tree of Isaiah vi. 13, and the “talh” loaded from top to bottom with its produce according to Mohammed kor. 56, mentioned also by Abd-allatif: *A. gummifera* was observed by Delile in Upper Egypt; by Forskal, in Tropical Arabia and its gum collected, but at Mocha I learned that the principal part of the gum arabic of commerce comes from the Somali country. Westward, *A. gummifera* is known to grow in Barbary as far as Mogador (Lindl.; see Inga sassa).

“806 B. C.” (argum. Chi-King i. 7. 1), Hoang-long prince of Tching.

804 B. C. (= 804 y. $49\frac{2}{3}$ d. = 818 y. $25\frac{1}{3}$ d. — “15 years” of twelve lunations of 2 K. xiv. 17), Amaziah slain, and the accession at Jerusalem of his son Azariah or Uzziah, thirteenth Jewish king: (the “15 years” allotted to Amaziah = 14 Julian years and 202 days, implying knowledge of the *Cycle of thirty lunar years* = 10,631 days. — This Cycle continues in use among the Muslims, and is sometimes termed the “Muslim Cycle”).

Caulis daucoides of the Tauro-Caspian countries. Called in Greece “vēlōni” (Sibth.), and the $\epsilon\lambda\omicron\nu$ lonē of Amos v. 7, Deut. xxix. 18, — Prov. v. 4, Jeremiah ix. 15. and xxiii. 15, and Lam. iii. 15 to 19, or the “apsinthōs” of Rev. viii. 11 rendering water bitter and deadly, may be compared; the frequent association of the “lōnē” with the “rash” suggesting some compound like the Greek “kōnēiōn,” and the allusion in Hebr. xii. 15 being figurative: the herb “balin” is said by Xanthus of Lydia to have restored a slain dragon to life (Plin. xxv. 5): *C. daucoides* was observed by Sibthorp, and Chaubard, in cultivated ground from the Peloponnesus to Constantinople; by Hohenacker p. 96 in the Suwant or Talysch country; and was received by Reichard from Egypt (Del.). Farther West, is regarded by A. Decandolle as introduced later than the Roman Period, the plant continuing unknown in Sicily and Sardinia; is described by Bauhin hist. iii. 2. p. 80, and Morison ix. pl. 14; is termed “c. dauci sylvestris folio echinato magno fructu” by Tournefort inst. 323, “conium Royeni” by Linnæus (Steud.); was already in Britain in the days of Ray, was observed by Desfontaines in Barbary, is known to occur also in Italy and throughout middle Europe, everywhere confined exclusively to cultivated ground (Jacq. austr. pl. 157, Pers., Guss., and A. Dec.).

Papaver dubium of the East Mediterranean countries. A kind of *poppay* called in Greece “paparōna” (Lenz), in Egyptian “nanti” (Syn. Diosc.): the $\epsilon\lambda\chi\eta$ rash of Amos vi. 12, Deut. xxix. 18 to xxxii. 32. — Job xx. 16, Psalm lxix. 21, Jeremiah ix. 15, and Lam. iii. 19, springing up in the furrows of the field and flowering beautifully as appears from Hosea x. 4, and yielding a juice according to Jer. viii. 14 to xxiii. 15, may be compared with the “mēkōn rōias” of Dioscorides having an oblong capsule with reddish seeds and flowers sometimes white, referred here by Sprengel: *P. dubium* was observed by Sibthorp, and Fraas, on the hills of the Peloponnesus and Attica; by Visiani iii. p. 99,

on grassy hills in Dalmatia; and is known to grow on the plains of the Crimea (Bieb.). Westward, the "mēkōn rōias" or "ōxutōnōn" is identified in Syn. Diosc. with the "papavēralis" of the Romans: *P. dubium* is regarded by A. Decandolle as introduced from Greece Westward, continuing unknown in 1837 in Sardinia, and in 1847 in Algeria; but had reached Britain before the days of Gerarde; is termed "p. erraticum capite longissimo glabro" by Tournefort inst. 238; was observed by Forskal near Marseilles; and is known to occur in Italy and throughout middle Europe as far as Denmark, always in cultivated ground (fl. Dan. pl. 902, Jacq. austr., Pers., and Lenz). By European colonists, was carried to Northeast America, where it has been observed in cultivated ground in our Middle and Southern States (A. Gray, and Chapm.).

Papaver rhoeas of the Tauro-Caspian countries. Called in Britain *corn poppy* or *redweed* or *cop-rose* (Prior), in Germany "klapperose" or "klatschrose" (Grieb.), in France "coquelicot" (Nugent), in Italy "rosolaccio" or "papavero erratico" or "p. selvatico" (Lenz), in Greece "paparōuna" or on Cyprus "pētēōs" (Sibth.), and possibly the plant in question: — the "mēkōn rōias" is described by Theophrastus ix. 12. 4 as an "agria" kind springing up in cultivated ground and bearing a red flower, the capsule as large as a finger-nail; the "mēkōn agria," by Dioscorides iv. 65 as having black seeds and by some called "pithitis," or from its flowing juice "rōias." *P. rhoeas* was observed by Sibthorp, Chaubard, and Fraas, in cultivated ground from the Peloponnesus to Cyprus, colouring whole tracts of country with its flowers at the opening of spring; by Bieberstein, in waste places and cultivated ground in the Crimea; by C. A. Meyer, in wild situations near Baku, Southeast of Caucasus; and by Delile, on the Mediterranean border of Egypt. Westward, the "rheam" of the Greeks is identified by Pliny xix. 53 and xx. 77 with the "papaver erraticum" growing in cultivated ground: *P. rhoeas* was already in Britain in the days of Gerarde; is termed "p. erraticum majus" by Tournefort inst. 238; was observed by Gussone naturalized on Sicily, but elsewhere occurs throughout Western Europe only as a weed in grain-fields (Pers., and A. Dec.). Eastward from Caucasus, is regarded as the "lala" of the Persian poets and is called "lala" by the Muselmén of Hindustan, as observed by Law "in gardens at Surat and Broach" (Graham); was observed by Kaempfer, and Thunberg, in flower-vases in Japan or sometimes springing up spontaneously, and called "reisjun" or usually "bidsinsoo." By European colonists, was carried to Northeast America, where it continues under cultivation as a garden flower. The plant according to Pereira, and Lindley, "is not known to be narcotic," the *syrupus rheados* made from the petals being "useful merely as a colouring matter."

802 B. C. (= 795 + "7 yrs" of Castor in Euseb. = 350 + "18 + 39" + erased 6 + "124 + 177 + 41 + 44 yrs" of the Egyptian Chronicle, the Eg. Chronicle also giving 822 — "19 yrs" = 803 = 759 + "44 yrs" of the Eg. Chron. and Euseb.-Maneth. table = 828 — "25 yrs." of the same table), at Athens Ariphron succeeded by his son Thespieus, now tenth archon for life.

Aegys on the frontier of Arcadia, conquered by Charilaus and his colleague Archelaus, seventh Spartan king in the Agid line. An oracle delivered to the two kings jointly, is preserved by Oenomaus (in Euseb. pr. v. 32 p. 226).

One hundred and fifth generation. Jan. 1st, 800, mostly beyond youth: the prophet Zechariah (2 Chron. xxvi. 5).

"799 B. C." (= 758 + "25 + 16 years" of Diodor., Euseb., and Clint. i. p. 130 and 160), Telestes being as yet a boy, death of his father Aristomedes or Aristodemus, and the accession of Agemon as ninth king of Corinth.

In the reign of Uzziah, an important change in warfare, through the invention of the *catapult*: described in 2 Chron. xxvi. 15 as "engines to shoot arrows and great stones."

795 B. C. (= 778 + "17 years" of Castor in Euseb. i. p. 137, and of Syncell.), at Athens, Thespieus succeeded by his son Agamestor, eleventh archon for life. "Twenty" years are however assigned to Agamestor by Eusebius.

The Spartans prospering under the Laws of Lycurgus became desirous of extending their authority over the Arcadians, and on consulting the Oracle were informed, That they could measure the territory of Tegea with a "shōinō" rope. Accordingly under the lead of Charilaus they attacked Tegea, and were defeated; but the Oracle was fulfilled through captive Spartans being bound with the rope brought for the above purpose. Part of this rope — was preserved in the temple of Minerva at Tegea to the time of Herodotus i. 66 (Pausan. iii. 2 to viii. 48, and Sm. b. d.).

Scirpus (Isolopis) holoschoenus of the seashore along the Mediterranean and adjoining portion of the Atlantic. A sort of *rush* called in France "scirpe jonc" (Fée), in Greece "kōphō vrūlō" (Forsk.) or "kōphōvrēlōs" (Sibth.) or "kōphōvrūrlōs" (Fraas); and probably furnishing the "shōinō" rope in question: — "shōininōs" made of rushes, is mentioned by Euripides cycl. 268; and "shōinōn" cord, by Aristophanes acharn. 22, and Demosthenes 1145. 6: the "ōlōshōinōs" is described by Theophrastus iv. 12. 1 to ix. 12. 1 as sharp-pointed, fleshy and soft and therefore more useful for textile purposes, is enumerated by Dioscorides iv. 52 as the third kind of "shōinōs ēlēia":

S. holoschoenus was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent in the sands of the seashore from the Peloponnesus throughout the Greek islands. Westward, "vincla juncea" are mentioned by Ovid. . . ; the "ölshöinōs" is identified through Syn. Diosc. with the "iōugkōum marinōum" or "manualēm" of the Romans; and the "holoschoenos" is enumerated by Pliny xxi. 69 to 71 as a kind of "iuncus:" *S. holoschoenus* is termed "iuncus acutus maritimus" by C. Bauhin theatr. 174, "s. maritimus capitulis rotundioribus glomeratis" by Tournefort inst. 528; is known to grow in Italy, Algeria, and along the Atlantic as far even as Britain (Pluk. pl. 40, Jacq. austr. pl. 448, Pers., Spreng., and Engl. bot. pl. 1612). "*S. Romanus*" having a slender stem, and known to grow from Siberia to Rome and Southern France (Pers.), observed by Forskal, and Sibthorp, from the Dardanelles throughout the Greek islands, is regarded as not distinct.

Fumaria parviflora of Europe and the adjoining portion of Asia. Called in Greece "staktēri" or "kapnōhōrtō" or "kapnō" (Sibth.), in which we recognize the "kapnōs" identified in Syn. Diosc. with the "knux" or "tōukin" of the Egyptians:—*F. parviflora* was observed by Delile around Cairo in Egypt. Farther North, the "kapnōs" is described by Dioscorides as a little bushy herb resembling coriander, altogether tender, the flower purple, juice improving vision and inducing tears, and hence the name; is mentioned also by Galen, and Paulus Aegineta: *F. parviflora* was observed by Sibthorp, and Chaubard, abounding everywhere in cultivated ground from the Peloponnesus throughout the Greek islands. Westward, the "kapnōs" or "kapnōgōrgiōn" or "hēlithōniōn mikrōn" or "pēristēriōn" or "kōruthaliōn agriōn" is identified in Syn. Diosc. with the "apiōum" of the Romans; the description by Pliny xxv. 99 of "capnos fruticosa" is chiefly taken from Dioscorides; *F. parviflora* is described by Clusius hispan. p. 375, and Tournefort inst. 422; is known to occur in cultivated ground in Italy, and throughout middle Europe as far as Britain (Engl. bot. pl. 590, Pers., and Lenz). Eastward from Egypt, is called in the environs of Bombay "pitpatra," and was observed there by Lush, and Gibson (Graham); by Roxburgh, Royle, and Wight, in other parts of Hindustan, having according to Drury "long been acclimatised" as far even as the Neilgherries, Bengal, and Nepaul, and employed medicinally.

Sedum amplexicaule of the East Mediterranean countries. Called in Greece "amarantōn" (Fraas); the "aēizōōn tō mikrōn," identified in Syn. Diosc. with the "ētiēikēlta" of the Egyptians, —and according to Dioscorides growing on walls and rocks, its root giving out many stems full of small terete sharp-pointed leaves, the central flower-stem a span high bearing a cyme of greenish-yellow flowers, is referred here by Fraas: *S. amplexicaule* was observed by Sibthorp, Chaubard, and Fraas, frequent on walls and in stony places in Attica and the Peloponnesus. Westward, the "aēizōōn tō mikrōn" or "pētrōphuēs" or "vrōtiōn" or "thēōvrōtiōn" or "krōvussōn" or "hēmēr-inēn" or "kēraunia" is further identified in Syn. Diosc. with the "vitalis" or "ērva sēmperviva" of the Romans; the account by Pliny xxv. 102 of the "aizoom" or "sempervivum minus" seems taken from Dioscorides, but he adds that the root is useless; and *S. amplexicaule* was observed near Naples by Tenore (Bory).

Peucedanum cervaria of the mountains of Southern Europe. Called in Germany "hirschwurzw" (Lenz): the "ēlaphōvōskōn" identified in Syn. Diosc. with the "hēmīs" of the Egyptians, —and according to Dioscorides cropped by deer as an antidote against snake-bites, its stem resembling that of "marathrō" or "livanōtithi," leaves "tērēvinthōu"-like and roughish, umbels of yellowish flowers and "anēthō"-like seeds, its white sweet root three fingers long by one thick esculent as well as the young stem, is referred here by Delarbre p. 429: *P. cervaria* is known to grow in Greece (Lenz). Westward, the "ēlaphōvōskōn" or "ēlaphikōn" or "nēphriōn" or "ōphigēniōn" or "ōphiōktōnōn" or "ērpuxē" or "lumē" is identified in Syn. Diosc. with the "askaōukau" of the Numidians, and "kērvī ōkēllōum" or "kērvina" of the Romans; the "elaphoboscon" pointed out by deer is described by Pliny xxii. 37 and xxv. 52 as an esculent ferulaceous plant with leaves of "olusatri," and medicinal properties not mentioned by Dioscorides are enumerated: *P. cervaria* is described by Tragus, and Lobel (Spreng.); was observed by Viviani in North Africa (Steud.); by Lenz, throughout Italy; and is known to grow in fallow ground in mountainous situations from Austria and Switzerland to the Pyrenees (Jacq. austr. pl. 69, Roth, Scop., Hall, and Lapeyr.).

Seseli annuum of the mountains of Southern Europe. A kind of *wild parsley* called in Germany "bergsilge," in Greece "agriōs maithanōs" (Fraas): the "ōrēōsēlinōn" identified in Syn. Diosc. with the "anōnim" of the Egyptians, —and described by Theophrastus vii. 6. 4 as having a slender root, leaves like "kōnēiō," fruit "anēthōn"-like but smaller and emmenagogue, by Dioscorides as a span high growing in stony mountainous situations, and having oblong aromatic "kuminō"-like fruits, mentioned also by Paulus Aegineta, is referred here by Fraas: *S. annuum* was observed by Sibthorp, and Fraas, on the mountains of Attica and Cyprus. Westward, the "ōrēōsēlinōn" or "pētrōsēlinōn agriōn" is identified in Syn. Diosc. with the "apiōum" of the Romans; but the account of the "oreoselinon" by Pliny xx. 46 seems taken from the Greek: *S. annuum* is described

by Morison iii. 9. pl. 8, and is known to grow in Pannonia and Southern Germany and France (Villars delph., Jacq. austr. pl. 55, Crantz, and Poll.).

Ambrosia maritima of the Mediterranean seashore. Called in Egypt "demsyseh" (Del.): the "amvrōsia" identified in Syn. Diosc. with the "mērsēō" of the Egyptians, — and according to Dioscorides branchy and three span high from a slender root, with small "pēganōu"-like leaves around the shooting of the stem, grape-like racemes never flowering but full of seed, wine-scented and entwined in garlands in Cappadocia, is referred here by writers: *A. maritima* is known to grow on the seashore of Cappadocia (Pers.); was observed by Chaubard around the Peloponnesus and Greek islands; by Forskal p. 160 and Delile, from Alexandria to river-islands near Cairo, and employed medicinally. Westward, the "amvrosia" or "vōtrus" or "vōtrus artēmisia" is identified in Syn. Diosc. with the "kaprōum silvatikōum" or "apiōum rōustikōum" of the Romans; but the account of the "ambrosia" by Pliny xxvii. 11 to 31 seems chiefly taken from Dioscorides: *A. maritima* is described by Lobel obs. p. 442, and Dodoens p. 35 (Spreng.); and is known to grow on the seashore of Etruria (Pers.).

Convolvulus arvensis of middle Asia. Called in Britain *bindweed* or *withwind*, in Anglo-Saxon "withwinde" (Prior), in Germany "acker-winde," in Italy "viticcio" or "vilucchio minore" (Lenz), in Greece "pēriplokatha," or by the Turks "sarmasjik" (Forsk.), in Egypt "o'lleiq" (Del.): in which we recognize the "ēlxinē" with long "pēriplēkōmēna" branches identified in Syn. Diosc. with the "apap" of the Egyptians, — further described by Dioscorides as growing in hedges and cultivated ground, its leaves ivy-like but smaller, juice somewhat purgative, and referred here by writers: the "pēriplokatha" is mentioned by the scholiast of Theocritus v. 128: the "ullaik," by Ishak ben Amran, Gafeki, Edrisi, and Ebn Baitar: *C. arvensis* is known to occur around Caucasus (Ledeb.); was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent in cultivated ground from Constantinople to the Peloponnesus; by Delile, around Rosetta and Cairo; was received by Choisy from Arabia and Abyssinia. Westward, the "ēlxinē" or "amēlxinē" or "mēlampēlōn" or "kissampēlōn" or "kissanthēmōn" is further identified in Syn. Diosc. with the "vōlōutōu laparōu" of the Romans: *C. arvensis* is described by Valerius Cordus, Fuchsius, Matthioli, and Dodoens (Spreng.); is termed "c. minor arvensis flore roseo" by Tournefort inst. 83; was observed by Munby in Algeria; by Forskal, on Malta and near Marseilles; and is known to occur in cultivated and fallow ground as far as Sweden (Bocc. mus. pl. 53, fl. Dan. pl. 569, and Fries). Eastward from Caucasus, was observed by Malcolm in Persia; by Gibson "common" on the Deccan and "flowering during the rains" (Graham), naturalized as observed by myself; is known to grow along the Altaian mountains and as far as Daouria and Northern China (Ledeb., and Bunge). By European colonists, was carried to Madeira and the Azores (Choisy, and Wats.); to Northeast America, where it has become a frequent weed; to Mexico, Buenos Ayres (Choisy), and Chili (C. Gay); to the Mauritius Islands, and Southeast Australia (Corder, and A. Dec.).

Scrophularia peregrina of the East Mediterranean countries. A species of *brownwort* called in Greece "vrōmōhōrtōn" (Sibth.): the "galiōpsis" identified in Syn. Diosc. with the "aithōpi" of the Egyptians, — and described by Dioscorides as growing in court-yards and along hedges and footpaths, resembling in stem and leaves the nettle but the leaves smoother and heavy-scented if bruised, flowers slender and purplish, is referred here by writers: *S. peregrina* was observed by Sibthorp, and Chaubard, throughout Greece precisely in the situations described by Dioscorides. Westward, the "galiōpsis" or "galēōvthōlōn" or "galēphōs" is further identified in Syn. Diosc. with the "ōurtika lavōnēm" of the Romans; but the account by Pliny xxvii. 57 of the "galeopsis" or "galeobdolon" seems taken from Dioscorides (including the name "galion" transferred by mistake from the succeeding article): *S. peregrina* is described by Anguillara, and Camerarius hort. pl. 43 (Spreng.); is termed "s. folio urticae" by Tournefort inst. 166; and is known to grow in Bosnia, Illyria, Italy, and as far as France (Lam. fl. fr., Pers., and Spreng.).

Ballota nigra of Europe and the adjoining portion of Asia. Called in Britain *black horehound* (Prior), in Italy "cimiciotto" or "marrubio bastardo" or "ballota" or "ballota nera" (Lenz), in Greece "pispēriza" (Sibth.); in which we recognize the "vallōtē," identified in Syn. Diosc. with the "aima Isiōnōs" of the prophets, and "asphōs" or "ēškē" of the Egyptians, — and described by Dioscorides as having several somewhat hairy tetragonal stems from a single root, and at intervals roundish leaves "prasiō"-like but larger and hairy, strong-scented and resembling "mēlissōphullōu," the flowers rotate around the stem: *B. nigra* was observed by Forskal, Sibthorp, and Fraas, in waste places from Greece and the Greek islands to Constantinople and Smyrna. Westward, the "vallōtē" or "mēlan" or "mēga prasiōn" or "prasiōn ētērōn" is further identified in Syn. Diosc. with the "apiōum" or "mēlitam" or "ōulkēraria" or "marrōuviōum" or "kanthēriniōum" of the Romans; the "marrubium nigrum" is mentioned by Castor, but the account by Pliny xx. 89 and xxvii. 30 of the "balloten" seems taken from Dioscorides: *B. nigra* is described by Fuchsius p. 154 (Spreng.); is termed "ballote" by Tournefort inst. 185; was observed by Forskal near Marseilles; and is

known to occur in waste ground from Italy throughout middle Europe as far as Britain (Engl. bot. pl. 46, Pers., and Lenz). By European colonists, was carried to Northeast America, where it continues in waste places in New England.

Hordeum murinum of Europe and the adjoining portion of Asia. Called in Britain *wall barley* or *mouse barley*, in Germany "maus-gerste" (Prior), in Greece "agriostakus" (Sibth.), in Egypt "abu stiri" (Forsk.); in which we recognize the "rōun stahuōs" identified in Syn. Diosc. with the "athnōn" of the Egyptians, — and "phōinix" of Dioscorides, growing in cultivated ground and upon freshly-daubed roofs, its leaves shorter and narrower than those of barley, and spike "aira"-like, mentioned also by Paulus Aegineta: *H. murinum* was observed by Forskal, Sibthorp, and Chaubard, frequent from the Peloponnesus to Constantinople and Smyrna; by Hasselquist, and Forskal, on the Mediterranean border of Egypt at Alexandria and Damietta. Westward, the "phōinix" or "phōinikōptērōn" or "rōun" or "aghinōpa" or "ōsthalēn" is further identified in Syn. Diosc. with the "palōlōu kōupinōm" of the Romans; and the "herba phoenicea," by Pliny xxii. 65 with "hordeum murinum;" *H. murinum* is described by Tragus (Prior); is termed "gramen spicatum vulgare secalinum" by Tournefort inst. 517; was observed by Forskal on Malta, and near Marseilles; and is known to occur throughout middle Europe as far as Denmark (fl. Dan. pl. 629, and Pers.).

788 B. C. (= 848 — "60 years" of Apollod., Diodor., and Euseb. i. p. 166), Charilaus succeeded by his son Nicander as one of the two Spartan kings; the seventh in the Proclid line.

"787 B. C." (Hieronym., and Clint. = 1169 — "92 — 85 — 79 — 23 — 25 — 33 — 45 years" of Diodorus in Euseb.), "eighth" change in naval dominion. Leaving the Phoenicians, the "Empire of the sea" acquired by the Egyptians.

783 B. C. (= 793 — "10 years" of both Maneth. tables), end of the reign of Psammōus. In the Afr.-Maneth. table, he is succeeded by "Zēt;" but no such king has been found on the monuments (see below, Vöhhöris).

"782 B. C. About this time" (Scymn., and Clint. i. p. 206). Sinope on the Black Sea founded or occupied by Greek colonists under Ambron of Miletus. Ambron was slain by the Cimmerians; who, with the Amazons, were making a Third irruption into Asia Minor.

Raphanistrum maritimum of the seashore from the Caspian along the Mediterranean and Atlantic as far as Britain. The *black radish* or *Spanish radish* is called in Germany "rettig" (Grieb), in Italy "radice" or "rafano" or "ramoraccio" (Lenz), in Greece when growing spontaneously "agria rapania" (Fraas sec. Gay); in which we recognize the "raphanum silvestre" or "agrion" identified by Pliny with the "armon" of the people of Pontus, — also the "amōrēan" kind of "raphanithōs" mentioned by Theophrastus vii. 4. 2, and the "armōrakian" of the Romans identified in Syn. Diosc., and by Pliny xix. 26 and xx. 12, with the "raphanis agria." "raphanithas" are mentioned by Epicharmus, Cratinus, Pherecrates, Eupolis, Metagenes, Amphis, Aristophanes, Antiphanes, Diocles of Carystus, Androcydes, Dioscorides, Galen, Athenaeus ii. 48, and are identified in Syn. Diosc. with the "thōrpath" of the Numidians, and "rathix nōstras" of the Romans: the "raphanus" is mentioned by Varro, Horace, Columella, and Pliny: the "raphanis agria," by Theophrastus . . . , by Dioscorides as medicinal and its leaves and slender root eaten as potherbs, and is identified by Galen fac. alim. ii. p. 622 with the "rapiam" of the people of Asia: *R. maritimum* is described by J. E. Smith, as observed on the seashore of Britain (Engl. bot. pl. 1643); is known to grow at Gibraltar (Gay); was observed by Moretti in Italy; seems frequent in Greece (Fraas, and Gay); is known to grow on the shores of the Caspian (A. Dec.); and according to Gay is cultivated in Siberia and Southern France, in the second year developing a fleshy root. (See *Raphanus sativus*).

"781 B. C. = 1st year of Yeou-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"779 B. C. About this time" (742 to 740 + "38 years" of Apollod., Diodor., and Euseb. i. p. 166, see also Ephor., Pausan. iii. 2. 6 and 7. 4, and Clint. i. p. 338), the first difficulty with the Mesenians: Teleclus, son of Archelaus and one of the two Spartan kings, slain in an affray at a temple of Diana. He was succeeded by his son Alcamenes, ninth king in the Agid line; and his colleague Nicander at once led an army into Argive territory. Of three extant sayings of Nicander (Plut. mor. p. 230), one refers to the Argives.

"778 B. C." (. . . Clint. i. p. 150), at Athens, Agamestor succeeded by his son Aeschylus, twelfth archon for life.

Asclepiadae, hereditary priests of Aesculapius, continuing in the practice of the healing art at Cnidus — (Sm. b. d.).

Daphne Gnidium of the Mediterranean countries. A low shrub called in France "garou" (Fée), in Greece "kausa" or "kapsa" (Fraas); in which we recognize the "casiam of Hyginus" identified by Pliny with the "cneoron" producing "granum Gnidium;" employed by the Asclepiadae of Cnidus, — and hence the name (Ruf. Ephes., and Orib. vii. 26): "kōkkōu knithiōu" of Int. affect. 8, and Theophrastus ix. 20. 2, "knēōrōu" of Democritus (geop. xv. 2. 37), Nat. mul. 29, Int. aff. 23, i Morb.

mul. 45. Apollonius Memphites, and "knēstrōn" of 1 Morb. mul. 111, are all identified in Syn. Diosc. with the "thumēlaia" of Dioscorides, a shrub growing in rough mountainous situations and producing "knithēiōs kōkkōs," its leaves also collected and dried and specially called "knēōrōn:" the "thumēlaia" or "purōs ahnēn" is further identified in Syn. Diosc. with the "apōlinōn" or "linōn" of the Syrians, named from the resemblance; the "thymelaeam" or "pyros achnen" or "cnestron" or "linum" of Greece and Asia is described from Dioscorides by Pliny xiii. 35 and xxi. 29; and "habb Cnidijeh" are mentioned by Ebn Baitar: D. Gnidium was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout Greece frequent in the situations indicated by Dioscorides. Westward, is described by Matthioli, and Clusius (Spreng.); is termed "th. foliis lini" by Tournefort inst. 594; and is known to grow in Italy, Barbary, Spain, and Southern France (Pers., and Lenz). Its properties according to Lindley are "like those of Mezereum" (see D. cneorum).

"777 B. C. = 5th year of Yeou-wang" (Chinese chron. table), beginning of the Thirty-second cycle.

"776 B. C." (= "2d year of the Athenian archon Aeschylus and in the reign of Uzziah," Euseb. and Clint., = 1413 — "51 — 61 — 20 — 60 — 5 — 7 — 135 — 130 — 120 — 40 — 8 years" and in the reign of "Pētōuvātēs" of the Afr.-Maneth. table, the Euseb.-Maneth. table giving $332 + 6 + 4 + 6 + 20 + 21$ y. 4 mo. + 6 + 120 y. 4 mo. + 163 + 44 + 44 + 10" = 776 y. 8 mo.), the First registered Olympiad: Coroebus declared victor.

"Sept. 6th" = "winter, on the first day of the tenth month in the 6th year of Yeou-wang" (Li-tai-ki-sse, Gaubil, and Pauth. 106), *eclipse* of the sun.

As early probably as this date, products of the Moluccas brought to China.*

* *Cocculus crispus* of the Equatorial portion of the Malayan archipelago, from Java to the Moluccas. A woody climber spreading over trees, called in Malay "putra-wali" (Lindl.), and from early times employed medicinally: — termed "funis felleus" by Rumphius v. pl. 44; and known to grow on Java, Baley, and Amboyna, the whole plant exceedingly bitter, a powerful febrifuge employed by the Malays in intermittents (Roxb., and Lindl.).

Hedera umbellifera of the Moluccas. A woody Araliaceous plant — termed by Rumphius ii. pl. 12 "pseudosantalum amboinense" as observed on the mountains of Amboyna, yielding according to Lindley "a blackish or dull brown resin with a very powerful aromatic or camphorated odour." The plant from transported specimens is described by Lamarck dict. i. 225.

Strychnos ligustrina of Timor and neighbouring islands. Having the aspect of the orange tree and called "caju-ular" or "caju-nassi" or "caju-bidara-puit" or "caju-bidara-laut" (Lindl.); and from early times in the Malayan archipelago its wood employed medicinally: — described by Rumphius ii. pl. 38 and termed "lignum colubrinum caju ular;" furnishing according to Blume rum. i. 68 the *lignum colubrinum* of Timor, formerly in the highest estimation, but omitted from modern practice (Lindl.).

Soulamea amara of the shores of the Moluccas. A Polygalaceous shrub or small tree, from early times used medicinally: — termed "rex amaroris" by Rumphius ii. pl. 41 from the "horrenda amarities" intense bitterness of all its parts, especially the roots and fruit. In the Malayan archipelago, according to Lindley, employed "with extraordinary success in cholera, and pleurisy, and most valuable as a febrifuge."

Sandoricum Indicum of the Eastern portion of the Malayan archipelago. An elegant Meliaceous tree called in Burmah "theet-to" (Mason), in Malay "santoor" (Graham), in Tagalo "santol" (Blanco); and from early times, its fruit eaten and sweet scented wood valued: — observed by Rumphius i. pl. 61 on the Moluccas (Pers.); by Blanco, well known on the Philippines. Westward, by Blume on Java, its root aromatic, stomachic and antispasmodic, employed in combination with bark of the root of *Xylocarpus obovatus* against leucorrhœa (Lindl.); by Mason v. 457 to 525, "exotic" in Burmah, affording "good timber" and the "fleshy acid pulp" of its mangosteen-like fruit highly relished by the natives; was observed by Roxburgh in Hindustan; and by Nimmo has been recently introduced into the environs of Bombay (Graham).

Cicca disticha of the Eastern portion of the Malayan archipelago. The country gooseberry is a small Euphorbiaceous tree called in the environs of Bombay "harpareewree" (Graham), in Hindustanee "harfaroorie," in Telinga "rassa useriki," in Tamil "arunelli," in Bengalee "nubaree" (Drur.), in Burmah "them-bau-hzee-phyu" (Mason); and from early times, its fruit eaten: — termed "cheramela" by Rumphius vii. pl. 33; and probably one of the species seen on the Philippines by Blanco. Westward, was observed by Mason v. 454 to 479 "exotic" in Burmah, planted all over the country, its fruit "highly" valued by the natives, and seeds employed as purgatives; was observed in Hindustan by Roxburgh, and Buchanan; by Rheede iii. pl. 47 and 48, in Malabar; by Graham, "pretty common in gardens, Bombay," its fruit of the "size of a gooseberry," having "an acid flavour," and "sometimes sold in the bazar."

Casalpinia nuga of the Moluccas. Woody, unarmed, when growing among trees climbing, and

"775 B. C." (Euseb., and Clint.), Arctinus, the earliest poet of the epic Cycle, at this time writing. One of his verses is important in Greek Mythology, from representing Jupiter dancing.

"774 B. C." (Euseb., and Clint.), in Italy, the two cities of Pandosia and Metapontum founded by Greek colonists.

771 B. C. (= 753 + "10 + 8 yrs" of the Afr.-Maneth. table, the Euseb.-Maneth. table giving + "10 + 9 yrs" = 772), Pētōubatēs succeeded by Osōrhō or Osōrthōn, second king of the Twenty-third dynasty. By the Egyptians, he was "called Hercules." The name of king Osarkon III. occurs on contemporaneous monuments — (Leps. k. pl. 46).

The mummy recently unrolled in Boston proved to be that of a person who died in this king's reign: the ovals of "Osorkon III." being stamped on leather bands.

Cyperus rotundus of Tropical and Subtropical Asia. The *nut-grass* is called in Greece "kupēirē" (Sibth.), in Egypt "sa'ed," in Nubia "magysseh" (Del.), and tubers unrolled from this mummy — appeared to me to belong here: the living *C. rotundus* was observed in Egypt by Delile. Farther North, the "kupēirōn" having a fragrant root is mentioned by Hippocrates vict. acut. 409; by Theophrastus iv. 10. 5 and od. 28 as difficult to extirpate, producing at intervals underground swellings, an ointment from its roots imported from the Cyclades; by Dioscorides, as occurring in cultivated ground and producing a plexus of olive-like roots; is identified in the added Synonyms with the "iōunkōum" or "iōunki radikēm" of the Romans, and the "iunci trianguli" by Pliny xxi. 69 with the "cyperon." *C. rotundus* is described by Morison viii. pl. 11; is termed "*c. r. vulgaris*" by Tournefort 527; was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout the Greek islands, troublesome in vineyards and its roots according to Hawkins placed on account of their fragrance among clothing; is known to occur also in Italy and other parts of Southern Europe (Gouan, Targ., and Steud.). Eastward from Egypt, is called in Bengalee "moothoo," in Telinga "shaka-toonga," in Tamil "koray" (Drury); was observed by Graham in the environs of Bombay, its roots "used both as a perfume and medicine;" by Rottler, and Roxburgh, in other parts of Hindustan, and according to Drury "is perhaps the most common species" as far as Bengal; is described also by Rumphius vi pl. 1; roots of a *Cyperus* that "taste like filberts" were seen by Mason v. p. 473 in Burmah; and *C. rotundus* by Thunberg in Japan, and called "kobusi" or "sanrio" By European colonists, was carried to America, probably to the West Indies or Florida, and extending thence has become exceedingly troublesome in cultivated ground in our Southern States; is termed "*c. hydra*" by Michaux. (See *Lathyrus amphicarpos*).

"In this year" (Lacharme note to Chi-King i. 6. 1) the Chinese emperor Yeou-wang defeated and slain by the prince of Chin assisted by the Western Tartars. Succeeded by his son Y-kieou, who took the name of Ping-wang.

"770 B. C. = 1st year of Ping-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

A vase inscribed with a decree of Ping-wang, ceding territory to the prince of Thsin, has been discovered in the province of Chen-si — (Pauth. 107).

from early times employed medicinally: — observed by Rumphius v. pl. 50 on Amboyna (Pers.), a decoction of the root used according to Lindley in calculous and nephritic complaints.

Nipa fruticans of the Eastern portion of the Malayan archipelago. A stemless palm with long hard loosely-pinnate fronds, called in Burmah "da-ne" (Mason), in Tagalo "sasa" or "nipa" (Blanco), and known from early times: — observed by Rumphius i. pl. 16, and Thunberg . . . ; by Blanco, and myself, wild on the seashore of the Philippines. Westward, by Mason "exotic" in Burmah, "very extensively cultivated" in Tavoy for its crude sap or toddy, which is boiled down into sugar, its leaves also used for thatching.

Eurycles Amboinensis of the Eastern portion of the Malayan archipelago. A fragrant white-flowering bulb called in Burmah "la-men" (Mason); in Tagalo "catongal," in Bisaya "catangal" or "abur" or "panabor" or "tonuar" or "talaonor" or "dausun" (Blanco), and from early times employed medicinally: — known to grow on Amboyna (Pers.); observed by Blanco in the sand of the seashore of the Philippines, its root used by the natives as emetic and purgative. Westward, was observed by Mason v. 431 to 807 "exotic" in Burmah, cultivated by the natives for ornament. Transported to Europe, the "*pancratium amboinense*" is described by Rudbeck elys. ii. 238. f. 17, and Linnæus (Pers., and Steud.).

Pachyma tuber-regium of the Moluccas. A tuberculated underground fungus large as the fist or even a child's head and called on Java "djamor bonkang," by the Malays "uba radja" or "culat batu," on Amboyna "ulathatu" (Lindl.), and from early times employed medicinally: — observed by Rumphius 120 pl. 57 on Amboyna; and used in the medicine of Eastern nations against diarrhœa, pains in the face, fevers, etc. (Fries ii. 243, and Lindl.).

Artemisia Indica of Eastern Asia. Called in Persian "arlemasaya," in Sanscrit "dana" or "dona" (Lindl.), in the environs of Bombay "doona" or "mustaroo" (Graham), in Hindustanee "mastaru" or "majtari," in Telinga "machipatri," in Tamil "machipattiri," in Bengalee "mastam" (Drur.), in Tagalo "tinisas" or "ca Maria" or "Santa Maria" (Blanco), in Japan "gai" or usually "iamogi" or "motjigusa" or "furs" (Thunb.); and perhaps the "armoise" collected, according to an ode of the time of Ping-wang* — (Chi-King i. 6. 8): the "ai" herb of Meng-tseu ii. 1. 9 dried for three years before being used medicinally, is referred to this genus by Stanislaus Julien: *A. Indica* is known to grow in China and Nepal (Lindl.); was observed by Kaempfer, and Thunberg, in Japan, and *moxa* made of the leaves; by Blanco, on the Philippines, long known and much used medicinally among the native women, and *moxa* made by the Chinese of the dried leaves. Westward, the "dona" flower was worshipped by the Hindus in the Festival of spring (Puranas, and H. H. Wils. ind. dram. ii. 264); and the "d'hyama" or "maruvaka" of Susrutas sutr. 28 to chikits. 22 and kalp. 7, is referred here by Hessler: *A. Indica* was observed by Roxburgh, and Wight, and Drury, on the high lands of Mysore and other parts of Hindustan; by Rheede x. pl. 45, in Malabar; by Graham, at "Poorundhur Fort" and "common on high lands in the Deccan;" by myself, at the Karli cave-temple; and according to Lindley, is considered "a powerful deobstruent and antispasmodic." (See *A. vulgaris*)

768 B. C. (= 804 y. 49 $\frac{2}{3}$ d. — "38th year" of twelve lunations of 2 K. xv. 8). Jeroboam II. succeeded by his son Zachariah, fourteenth king of Israel. Who reigned "six months" only.

767 B. C. (= 767 y. 97 $\frac{2}{3}$ d. = 804 y. 49 $\frac{2}{3}$ d. — "39th year" of twelve lunations of 2 K. xv. 13), Zachariah slain and succeeded by Shallum. Who, after reigning "a full month," was slain and succeeded by Menahem, sixteenth king of Israel.

The Assyrian emperor Pul invading the land, "a thousand talents of silver" paid him by Menahem, to be confirmed in the kingdom of Israel (2 K. xv. 19, and 1 Chron. v. 26). The emperor Pul or Phulus is mentioned by Alexander Polyhistor (in Euseb. i. 4 p. 18).

One hundred and sixth generation. May 1st, 767, mostly beyond youth: Jeiel the scribe (2 Chron. xxvi. 11), the prophet Hosea: the Greek poets Cinaethon, Eumelus, Antimachus of Teos, Cercops of Miletus, Creophilus, and Stasinus of Cyprus.

After the affray at the temple of Diana (Heraclid. p. 214, Strab. vi. p. 257, and Clint. i. p. 251), Rhegium in Southern Italy founded by Greek colonists from Chalcis in Euboea. The expedition was accompanied by fugitive Messenians from the Peloponnesus.

Clematis vitalba of Europe and the adjoining portion of Asia. A woody vine called in Britain *traveller's joy* (Prior), in Germany "teufelswirn" (Grieb), in Italy "vitalba" or "clematide" (Lenz), in Greece "agriōampeli" (Sibth.); in which we recognize the "ampelōn arsenōthēlun" investing a wild fig-tree on the site selected for the new city, in fulfilment of the "arsēna thēlus ōpuiēi" of the Oracle — (Diodor. viii. 25); also the "klēmatis" mentioned confusedly by Pamphilus (Galen simpl. med. vii. 31), by Dioscorides iv. 179 as climbing around trees like "smilax," and having acrid ulcerating leaves: *C. vitalba* was observed by Forskal, Sibthorp, and Chaubard frequent in hedges from the Peloponnesus throughout the Greek islands to Constantinople; is known to grow also in the Crimea (Lindl.). Westward, the account of the "clematida" by Pliny xxiv. 49 seems taken from Dioscorides: but *C. vitalba* is described by Lobel pl. 626; is termed "virgin's bower" by Gerarde (Prior), "*c. sylvestris latifolia*" by Tournefort inst. 293; was observed by Lenz in Italy, by Forskal near Marseilles, and is known to grow throughout middle Europe as far as Britain (Jacq. aust. pl. 308, Curt. lond. iv. pl. 37, and Pers.). Its "fruit and leaves" according to Lindley are "acrid and vesicant, dangerous taken internally; the latter have been used as a rubefacient." (Compare *Tamus Cretica*, dioecious but unknown in Italy).

"766 B. C." (argum. Chi-King i. 11. 3), war declared by Sian-kong, first king of Tsin, against the barbarians on the Western frontier. †

"764 B. C." (Pausan., Euseb., and Clint.), Polychares of Messenia declared the Fourth Olympic victor. — The injuries received by him twenty years later were the immediate cause of the First Messenian war.

* *Artemisia moxa* of China. About two feet high, hoary, branching, and shrubby, the proper *moxa weed* (Lindl.), and probably the "armoise" in question: — *A. moxa* was received by Besser. abr. 3 from China; is described also by Decandolle prod. vi. 121. *Moxa* according to Lindley is procured "from many other plants," and serves as a convenient mode of applying the actual cautery.

† *Prunus Kaempferi* of Eastern Asia. The *sour plum*: the "mœi" tree growing according to an ode of this period on mount Tchong-nan — (Chi-King i. 11. 5) is referred by Lacharme to a kind of plum with fruit altogether acid. A *Prunus* apparently differing from *P. domestica* was observed by Bunge under cultivation in China (A. Dec.); and the "*malus persica*" seen by Kaempfer, and Thunberg, in Japan, may also be compared.

"The same year = end of the Cali Yug, or Iron Age," among the Hindus (Graha Munjari tables, and Bentley as. res. viii. 244). The authorship of the First table not earlier therefore than this date.

763 B. C. (= 753 + "10 yrs" of both Maneth. tables), Osörhō succeeded by Psam-mōus, third king of the Twenty-third dynasty. The name of king Psimut occurs on the temple at Karnak, and on the ruins of a small building in the immediate vicinity — (Leps. k. pl. 46, and Glid. analect.).

759 B. C. (= 803 — "44 years" = 715 + "44 years" of the Egyptian Chronicle and Euseb.-Maneth. table = 753 + "6 years" of the Afr.-Maneth. table), accession of Vōhhōris the Saite, only king of the Twenty-fourth dynasty. The name of king Bokenrenf occurs on contemporaneous monuments — (Leps. k. pl. 46).

Echinops spinosus of the Desert and its borders from the Atlantic to Hindustan. A species of *globe thistle* called, in Egypt "khachyr" or "sjok edsjammel" camel thorn or thistle (Del., and Forsk.); and the Egyptian "sarshamōul" — (ms. Par.) may be compared; also the "akantha lēukē" of Hellenicus, Theophrastus, and Dioscorides: *E. spinosus* was observed by Forskal, Delile, and myself in the Egyptian Desert, sought for by camels according to Forskal although so full of thorns. Farther North, is termed "echinopus creticus capite magno aculeato" by Tournefort cor. 34; was observed by Sibthorp on Cyprus and the Greek islands, by Chaubard, in arid open situations in the Peloponnesus; and Westward, by Desfontaines ii. p. 310 in Barbary (Pers.). Eastward from Egypt, the "*E. echinatus*" of Roxburgh, and Graham, as growing on the Deccan, appeared to me identical.

"758 B. C." (= 746 + "12 years" of Diodor, Euseb., and Clint.), and (according to Diodorus' numbers) forty-one years after the death of his father Aristodemus, accession of Telestes as eleventh king of Corinth. Telestes was in the fifth generation from Bacchis.

757 B. C. (= 804 y. 49½²²/₈₀ d. — "50th year" of twelve lunations of 2 K. xv. 23), Menahem succeeded by his son Pekahiah, seventeenth king of Israel.

"The same year" (Aristot., Euseb., and Clint. i. p. 338), Ephori instituted, or at least invested with political importance by Theopompus, one of the two Spartan kings; the ninth in the Proclid line. (The accession of Theopompus, is however placed by Apollodorus' numbers seven years later). A saying of Theopompus is extant — (Plut. pol. præc. p. 816).

"756 B. C." (. . . argum. Chi-King i. 5. 1), death of Ou-kong, king of Ouei.

"In this year" (Euseb., and Clint. i. p. 156), on the Black Sea, Trapezus or Trebizond founded by Milesian Greeks from Sinope.

755 B. C. (= 804 y. 49½²²/₈₀ d. — "52d year" of twelve lunations of 2 K. xv. 27 = 756 y. 217½¹¹/₈₀ d. — "2 years" of twelve lunations of 2 K. xv. 23), Pekahiah slain and succeeded by Pekah, eighteenth king of Israel.

Isaiah i. 1 prophesying before the accession of Jotham. — and as late as the reign of Hezekiah.

Cuminum cyminum of Abyssinia. Called in English gardens *cumin* (Ainsw.), in French "cumin" (Nugent), in German "Romischer kummel," in Italian "comino" or "cymino" (Lenz), in Greece "kuminō" (Fraas), in Egypt "kammoun" (Del.), in Egyptian "thapēn" or "tapēn" (transl. Math.) or "tapn" (ms. Par.); in which we recognize the 𐤕𐤓𐤏𐤍 kmn cultivated in Palestine in the days of Isaiah xxviii. 25 to 27, — the "kuminōn" of Matthew xxiii. 23, and the Egyptian kind of Hippocrates (Plin.), and Dioscorides: *C. cuminum* was observed by Abd-allatif, Delile, Clot-Bey, and myself, a favorite object of cultivation in Egypt. Farther North, the "kuminōn" is mentioned by Aristophanes, Theophrastus, Nicander; "kuminōn ēmēron" by Dioscorides as cultivated especially in Asia Minor; and "kuminō" seeds imported from Smyrna were found by Fraas much used in Greece. Westward, the "cuminum" or "cyminum" is mentioned by Horace, Persius, Columella, and Apicius, doubtless the imported seeds, but a kind brought from Africa is enumerated by Pliny xx. 37: *C. cyminum* is described by Morison ix. pl. 2; and is occasionally seen in gardens in Italy and middle Europe (Cav. iv. pl. 360, Pers., and Lenz). Eastward from Palestine, was observed by Graham at Bombay, "cultivated in gardens" and called "zeera;" by Roxburgh, and Wight, in other parts of Hindustan, the seeds throughout according to Drury "being much in use as a condiment:" by Mason v. 496, "exotic" in Burmah and called "zee-ya," said to be "occasionally cultivated," the seeds "a common article in the market." As imported into Britain, the seeds according to Lindley although "carminative" are "chiefly used in veterinary surgery."

Pulicaria odora of the Mediterranean countries. Called in Greece "agriōskarphi" (Fraas), in Egypt "ghobbeyreh" (Del.), in Yemen "chaa" or "munis" or "neschusch" (Forsk.), by the prophets "krōnōs" (Syn. Diosc.); in which we recognize the 𐤕𐤓𐤏𐤍 notwtz of Isaiah vii. 19, — and lv. 13: *P. odora* was observed by Lippi in Egypt, by Delile in the Desert environs of Suez, and by Forskal p. 150 under cultivation everywhere in Yemen for its pleasant odour, edible leaves, medicinal use, and its flowers worn in garlands. Farther North, the "kōnuza arrēn" of Theophrastus vi.

2. 6 is described by Pliny xxi. 32 as coronary, its root called by some "libanotis;" the "livanōtis" is identified through Syn. Diosc. with the "kōnuzēs lēptōthriōiō" of Nicander ther. 875, and "kōnuza lēptē" of Dioscorides; and the "ēmērōu kōnuzēs" is mentioned by the scholiast Nic. ther. 70: P. odora was observed by Sibthorp, Chaubard, and Fraas, frequent from the Greek islands to the Peloponnesus and Constantinople. Westward, the "conyzam" sown for bees is mentioned by Pliny xxi. 41; P. odora is described by Columna ecphr. pl. 253; is termed "aster luteus radice odora" by Tournefort inst. 482, and is known to grow in Italy and Southern France (All., and Pers.). "P. undulata" known to grow in Egypt and as far as Senegal, is regarded by Decandolle as probably not distinct.

"In the autumn" (= 778 — "23 years" of Castor in Euseb., and Clint. i. p. 156), at Athens, Aeschylus succeeded by Alcmaeon, thirteenth and last archon for life.

754 B. C. (= 804 y. $49\frac{1}{2}\frac{2}{3}$ d. — "52 years" of twelve lunations of 2 K. xv. 2 and 2 Chron. xxvi. 3), Uzziah succeeded at Jerusalem by his son Jotham, fourteenth Jewish king. (According however to Julius Africanus, Jotham was king during the archonship of Aeschylus. See above).

"In or about this year" (Percev. i. 49), accession of Yarob as ruler of Yemen. (The earliest of the descendants of Cahtan or Yoktan known to the Arabs).

753 B. C. = "last year of Vōhhōris," death of an Apis or sacred bull — (Birch).

The same year (= 1413 — 660 years = 351 + "18 + 39" + erased + "124 + 177 + 44 years" of the Egyptian Chronicle = 759 — "6 years" of the Afr.-Maneth. table), end of a phoenix. Marked in the Maneth. tables by "a lamb speaking," and by the "burning of the captive king Vōhhōris" (see Introd. p. . .).

Vōhhōris was burned by Savakōn, head of the Ethiopian or twenty-fifth dynasty (Maneth.). Savakōn is mentioned also by Herodotus, and Diodorus. The name of king Sabak occurs on the portals of Luxor and Karnak, on a statue — now in Rome, and on some article (now in Florence, Glid. analect.).

"In the autumn" (= 755 — "2 years" of Castor, Euseb., Syncell., and Clint. i. p. 156), at Athens by a change in the form of government, Charops son of Aeschylus made archon for "ten" years.

752 B. C. = "2d year of Sabak," death of an Apis or sacred bull — (Birch).

"750 B. C." (Hieronym. and Clint.), "Ninth" change in naval dominion. Leaving the Egyptians, the "Empire of the sea" acquired by the Milesian Greeks.

"748 B. C." (Clint. i. p. 160 and 247), Eighth olympiad, Phidon king of Argos presiding. The first *coining of money* with inscriptions, is attributed to Phidon; by whom also, a system of *weights and measures* was established (Herodot., Aristot., Strab., Plin., and others). His brother Caranus founded the Macedonian monarchy.

"747, Feb. 26th" (. . . Blair, and Clint. i. p. 278), *era of Nabonassar*. The king reigning at Babylon who (according to Berosus and Alexander Polyhistor in Syncell. p. 209) destroyed the records and everything relating to his predecessors, in order that he might himself head the List of Babylonian kings.

"746 B. C." (Pausan. ii. 1. 1, and Clint.), Telestes slain; and the accession of Automenes, twelfth king of Corinth.

"745 B. C." (. . . Clint.), a change at Corinth in the form of government; kings replaced by annual magistrates called "prytanes."

"In this year" (. . . Lacharme note to Chi-King i. 10. 4), the kingdom of Kiu-gouou detached from Tsin by king Tchao-heou, and presented to his uncle Tching-chi.*

"744 B. C." (. . . argum. Chi-King i. 7. 1), death of Ou-kong, prince of Tching.

"743 B. C." (Pausan. viii. 5, and Clint. i. p. 92), Aechmis reigning in Arcadia.

"The same year" (Pausan. iv. 5. 4, and Clint.), beginning of the First Messenian war. Alcamenes, leader of the Spartan army, being a colleague of Theopompus. — The war (according to Tyrtæus) continued "nineteen" years.

742 B. C. = "12th year of Sabak;" the latest date in his reign found on the monuments (Leps. k. tab. p. 21). Sabak concluded a treaty with Assyria, and his clay seal — has been found among the ruins of Nineveh (Birch).

"In this year" (Euseb., and Clint., see also Pausan. iv. 5. 4), at Athens, the accession of Aesimides, another son of Aeschylus, as second Decennial archon.

* *Pachyma*? . . . of China. A *fungus* called "hoelen," large as a child's head, is considered by the Chinese a valuable medicine (Lindl.): the "fou-ling" collected towards the South on mount Cheou-yang, according to an ode of the kingdom of Tang — (Chi-King i. 10. 12), described by Lacharme as growing near old pines and disagreeable in flavour, but strengthening the stomach and sold at a high price, may be compared.

740 B. C., "before the fifth year of the Messenian war" (Pausan. iv. 7, and Clint. i. p. 337), Alcamenes succeeded by his son Polydorus, colleague of Theopompus and tenth Spartan king in the Agid line.

738 B. C. (= 753 y. 250 $\frac{8}{10}$ d. — "16 years" of twelve lunations of 2 K. xv. 33 and 2 Chron. xxvii. 1), Jotham succeeded at Jerusalem by Ahaz, fifteenth Jewish king.

Besieged in Jerusalem by Pekah king of Israel and Rezin king of Syria (2 K. xv. 37, xvi. 5 to 10, and 1 Chron. v. 26, see also Nicol. Damasc.), Ahaz sent for aid to Tiglath-pileser the Assyrian emperor: who, improving the opportunity, captured Damascus and put an end to the *Syrian kingdom*. Rezin, the last of "ten generations of kings" from Hadad (contemporary with David), was slain.

"735 B. C." (. . . Lacharme note to Chi-King i. 3. 10), Tchouang-kiang queen of Ouei.

"In this year" (Thucyd., and Clint.), in Sicily, Naxos founded by Greek colonists from Chalcis in Euboea, led by Theucles.

"734 B. C." (Euseb., and Clint., see also Timaeus, Diodor., Strab., and Plut.), after leaving on Corcyra or Corfu a colony in charge of Chersicrates, Syracuse founded by the expedition from Corinth commanded by Archias. These settlements of the Corinthians appear to have been undertaken with some regard to the purposes of commerce.

One hundred and seventh generation. Sept. 1st, 734, mostly beyond youth: the prophets, Micah, and Joel: the Greek poets, Prodicus of Phocaea, Diodorus of Erythræ, Augias of Troezen, and Hegesinus; the composer of music, Olympus the younger (Clint. i. p. 345); the Boeotian lawgiver, Philolaus.

"733 B. C." (= 747 — "14" = 731 + "2 years" of Astron. can. and Clint. i. p. 278), Nabonassar succeeded by Nadius, as king of Babylon.

"732 B. C." (Euseb. and Clint., see also Pausan. i. 3. 2), at Athens, Aesimenes succeeded by his son Clidicus, third decennial archon.

"The same year" (Euseb. and Clint.), "Tenth" change in naval dominion. Leaving the Milesians, the "Empire of the sea" acquired by the Carians, or Carian Greeks. — Held by them "sixty-one" years.

Among other evidence of the extent of the voyages of the Carians, is "Karikôn-têihôs;" a city on the West coast of Africa, North of the Desert — (mentioned by Hanno, Ephorus, C. Ptolemæus, and Stephanus Byzantinus, C. Mull. geogr. min. i. p. 4).

"731 B. C." (= 726 + "5 years" of Astron. can., and Clint. i. p. 278), Nadius succeeded by Chinzirus and Porus, as king of Babylon.

"730 B. C." (= 734 — "5th year after Syracuse" of Thucyd. vi. 3, and Clint.), in Sicily, the two cities of Leontium and Catana founded by Greek colonists.

728 B. C. (= 759 — "31 — 6 yrs" of the Afr.-Maneth. table, the same table giving 715 + "14 yrs" = 729, and the Euseb.-Maneth. table + "12 yrs" = 727), Savakôn succeeded by his son Sévihôs, second king of the Twenty-fifth dynasty. "Twelve" years only are assigned to his reign in the Euseb.-Maneth. table. The name of king Sabatok occurs "on a small ruined temple at Karnak" — (Glid. analect.).

The same year (= "about the fourth year of the Twelfth Olympiad," Cinc. Al., and Clint.), the date for the founding of Rome — given by Cincius Alimentus; derived perhaps while a prisoner with Hannibal and the Carthaginians (see 722 B. C.).

At Caere in Etruria, and at Ardea and Lanuvium in Latium, there were *paintings* more ancient than the founding of Rome (Plin. . . ., and Bryan dict. paint.). A painting of Atlanta and Helen in a ruined temple at Lanuvium is specified.

Lotus rectus of the Mediterranean countries. Called on Zacynthus "melilôtôn thêlukôn (Sibth.), possibly therefore the "meliloton" or "sertulam campanam" worn in garlands by the ancient Italians, — its odour saffrony as well as the flower, "ipsa cana" the plant hoary, and with short leaves (Plin. xxi. 29); mentioned also by Celsus v. 11, and "serta campanica" by Cato 107, Ovid fast. iv. 440, and Vegetius iii. 6: the "mêlilôtôs" growing in Campania is described by Dioscorides as "atônôn" weak-scented, and is identified in the added synonyms with the "sêrtoulam" or "trupatiôm" of the Romans: *L. rectus* is described by Morison ii. pl. 18; is termed "l. lybica" by Rivinus tetrap. pl. 78, "l. villosus altissimus flore glomerato" by Tournefort inst. 403; and is known to grow in Southern France, its stem "pubescente villosa" and leaflets "obovatis" (Pers.). Eastward, the "sêrtoulam" of the Romans is further identified in Syn. Diosc. with the "thêrmouthis" of the prophets, and "aimêith" of the Egyptians: "mêlilôtinôus" garlands are mentioned by Alexis, and Nicander ther. 897; and Theophrastus vii. 15. 3 speaks of many different kinds of "lôtôs" including one called "mêlilôtôs;" *L. rectus* was observed by Sibthorp, and Chaubard, from Crete and the Peloponnesus to Constantinople. (See *Melilotus officinalis*).

727 B. C. (Schmitz . . ., see also Archiloch., and Strab. xiv. 1. 40), Magnesia on the Meander captured and destroyed by the Treres, a Cimmerian tribe. The presence of these barbarians, encamped in wagons and threatening ruin, is described and deprecated in a poem by Callinus. A

painting of the battle-scene by Bularchus, — was purchased less than eleven years afterwards by the Lydian king Candaules (Plin. vii. 38, and xxxv. 8).

Tilia Europæa of middle and Northern Europe. Called by Chaucer "linde," in the ballad of Robin Hood "lyne," in current English *linden* or *line* or *lime* (Prior), in Welsh "pisgwydden," in German "linde," in Finnish "lehmus," in Slavonian "lepa" or "lipa," in Morduan "pikscha" (A. Dec.), in France "tilleul" (Nugent), in Italy "tiglio" or "tiglia" (Lenz); and doubtless furnishing implements in use among the Treres: — the "tilia" is mentioned by Virgil, and Columella, by Pliny xvi. 30 as growing in the mountain valleys of Italy: *T. Europæa* is known to grow in Italy (Lenz) and throughout middle Europe as far as Finland, the inner bark much used in the North for cordage (fl. Dan. pl. 553, Pers., and Prior). By European colonists, was carried to Northeast America, where it continues to be sometimes planted for ornament. The flowers, according to Host, and Lindley, are used in "infusion in Austria with much success in vertigo and spasms."

The same year (= 717 y. $287\frac{1}{2}\frac{1}{2}$ d. + "9 years" of twelve lunations of 2 K. xvii. 1 and xv. 30), Pekah slain and succeeded by Hoshea, nineteenth and last king of Israel.

"726 B. C." (. . . Blair . . .), the Spartans defeated by the Messenians under Aristodemus and despairing of a speedy termination of the war, send home permission to "their wives to prostitute themselves."

"The same year" (= 721 + "5 years" of the Astronom. can., and Clint. i. p. 278), Chinzirus and Porus succeeded by Jugæus, as king of Babylon.

723 B. C. (= 738 y. $58\frac{3}{4}\frac{3}{4}$ d. — "16 years" of twelve lunations of 2 K. xvi. 2 and 2 Chron. xxviii. 1), Ahaz succeeded at Jerusalem by his son Hezekiah, sixteenth Jewish king.

A *postal establishment* at this time in Palestine: at least, royal proclamations and official letters were delivered regularly by couriers (2 Chron. xxix. 3 to xxx. 10).

"The same year" (Tyrt., Pausan. iv. 13. 5, and Clint.), shortly after the suicide of Aristodemus (see *Cynodon dactylon*), the Messenian war closed by the capture of Ithome by the Spartans under Theopompus. A portion of the Messenians abandoning their country, sailed under Alcidas to Southern Italy and settled in Rhegium.

"722 B. C. (= 616 + "132 yrs." of ten lunations of pontif. reckoning, Sm. biogr. dict. . .), not earlier than this date, founding of the city of Rome. The date is confirmed by historic probability, and by Cicero tusc. i. 1, who makes Romulus contemporary with the Greek poet Archilochus.

The selection by Romulus of "a healthy spot in an infected region" (Cic. de republ.) reveals the presence of the *Italian malaria*: — five hundred years later, soldiers protested against being quartered in the unhealthy environs of Rome (Liv.); field-labor, according to Cato re rust., cannot be undertaken in summer in places where the atmosphere is unhealthy; the unhealthy atmosphere in Apulia and near Brundisium, is mentioned by Caesar bell. civ.; and the owners of unhealthy estates are counselled by Varro to sell, or abandon them altogether (Schouw plants and man vi.).

The innovation of wreathing mortals as early at least as Romulus, — a practice among the Romans confined to warlike deeds (Plin. xvi. 4).

Ostrya vulgaris of the countries on the North side of the Mediterranean. The *hop-hornbeam* is called in Italy "carpine nero" or "carpinella" or "ostria" (Lenz), in Greece "ōstrua" (Sibth.), and the "arbori infelici" of the laws of Romulus — (Just. Lips., and Dion. Hal. ed. Reiske), signifying gallows according to Cicero . . ., may be compared: the "carpinus atra" is mentioned by Cato 31; the "ostryn" or "ostryam," by Pliny xiii. 37 as "solitariam circa saxa aquosa," but his account seems taken chiefly from Theophrastus: *O. vulgaris* is described by Micheli pl. 104, and is known to grow in Italy and other parts of Southern Europe (Scop., Pers., and Lenz). Eastward, the "ōstrus" or "ostruan" is described by Theophrastus iii. 10. 3 as the only one of its kind, and allied in its aspect and bark to the beech, its fruit in shape and colour resembling barley, and wood hard, but regarded inauspicious if brought into a house, inducing difficult parturition and a miserable death: *O. vulgaris* was observed by Sibthorp on mount Athos and the Bithynian Olympus.

Celtis Australis of Barbary. A species of *nettle-tree* called in Germany "zurgelbaum," in Italy "perlaro" or "bagolaro" or "giracolo" (Lenz), in France "micocoulier" (Fée), in Greece "mikrōkōukki" (Fraas) or "mikrōkōukōuli" or "glukōkōkka" or "kēratha" (Sibth.), in Spain "almez" (Spreng.), in which we recognize the "mis" identified by Ebn Baitar with the "lotos;" exotic in Italy but a tree in the Vulcanali as old as Rome, planted by Romulus after his victory "de decumis" — (Masur.), one in the area Lucina known in the "three hundred and seventy-ninth year of Rome," and an earlier third to which the hair of Vestal virgins was carried, the "celtin" with blackish wood in request for flutes being identical (Plin. xiii. 32 and xvi. 85): *C. Australis* is described by Anguillara . . ., and Camerarius pl. 155; is termed "c. fructu nigricante" by Tournefort inst. 612; occurs in various parts of Southern Europe, a tree near Aix in Provence being more than five hundred years old (Fée, and Lenz p. 15); and is known to grow wild in Barbary (Duham. i. pl. 53, and Pers.). Eastward, the "livus aulōs" Lybian flute is mentioned by Euripides alc. 346 and troad. 544: the

"lōtōs" with blackish wood is mentioned by Theophrastus iv. 2. 5; the "lōtōs thēnthrōn," by Dioscorides as a big tree with sweet edible fruit larger than a grain of pepper: *C. Australis* was observed by Sibthorp, and Chaubard, frequent from Crete and the Peloponnesus to Constantinople; by Belon, in Syria; and is enumerated by Clot-Bey and Figari as recently introduced into Egypt. The wood is according to Sprengel highly esteemed, being hard heavy and blackish.

Agrostenma coronaria of Europe and the adjoining portion of Asia. Called in France "coquelourde" (Fée), in Germany "gartenrade," in Italy "cotonella" or "coronaria" or in gardens "veludini" (Fraas); in which we recognize the "luhnis stēphanōmatikē" identified in Syn. Diosc. with the "vallariōn" of the Greeks, and "gēnikōularis" or "vallaria" of the Romans: the "vallaris" wreath according to Livy was bestowed on him who first entered the enemy's works, and the "frondea" given by Romulus to Hostus Hostilius for entering Fidenæ — (Plin. xvi. 5) may therefore be compared: *A. coronaria* is termed "lychnis coronaria Dioscoridis sativa" by Tournefort inst. 334; and is known to grow wild in North Italy and Switzerland (Pers., and Lenz). Eastward, the "luhnis" is enumerated among coronary plants by Theophrastus vi. 8. 3; the "luhnis stēphanōmatikē" woven in garlands has according to Dioscorides a flower like that of "lēukōiō" but purple; is identified in the added Synonyms with the "athanatōs" or "akulōniōn" or "skēptrōn," with the "aima apōkathēmēnēs" of the prophets, and "sēmēōn" of the Egyptians: *A. coronaria* was observed by Sibthorp, Griesebach, and Fraas, on high mountains from Parnassus to Athos, Olympus, and Hæmus.

"The same year" (Euseb., and Clint.), at Athens, accession of Hippomenes of the family Medontidæ, as fourth Decennial archon.

"721 B. C." (= 709 + "12 years" of the Astronom. can., and Clint. i. p. 278), Jugæus succeeded by Mardocempadus as king of Babylon.

"March 19th, three hours and twenty minutes before midnight" (as reduced by Ptolemy to the meridian of Alexandria, Blair . . .), *eclipse of the moon*. The first of the *Babylonian eclipses*; — a series that has proved of great service to historians and chronologists.

"The same year" (Scymn., Diodor., and Clint.), in Southern Italy, the city of Sybaris founded by Greek colonists.

The same year (= 717 y. 287 $\frac{1}{8}$ $\frac{1}{8}$ d. + "3 years" of twelve lunations of 2 K. xvii. 5), Hoshea having "sent messengers" to the king of Egypt "So" (Sēvihōs), the Assyrian emperor Shalmaneser entered Palestine, and laid siege to Samaria.

"720, March 8th, fifty minutes before midnight" (as reduced by Ptolemy to the meridian of Alexandria, Blair), second *Babylonian eclipse of the moon*.

"In spring, in the Second month, on the cyclic day 'y-sse' of the 51st year of Ping-wang" (Khoun-tseu, the Li-tai-ki-sse, and Pauth. p. 107), *eclipse of the sun*.

"Sept. 1st, four hours and twenty minutes before midnight" (as reduced by Ptolemy to the meridian of Alexandria, Blair), third *Babylonian eclipse of the moon*.

"The same year" (. . . Gaubil), death of Ping-wang. He is the last emperor mentioned in the Chou-king.

"Dresses made of herbs by the barbarians of the islands" mentioned in the Chou-king ii. 1. 11, — (Pauth. p. 48): an early notice of the *East Indian* tribes.

Stagmaria verniciflua of the Eastern portion of the Malayan Archipelago. Varnish is mentioned in the Chou-King ii. 1. 5, and as one of the products of Yen — (Pauth. p. 47). *S. verniciflua*, a tree of considerable size, was observed by Rumphius ii. pl. 86 in the Moluccas and is termed by him "arbor vernicis;" is called in Malay "kayo rangas;" is fully described by Jack; and according to Lindley, "yields one of the celebrated hard black lackers or *varnishes* of China. The "bernice arbor" of Vincentius Bellovacensis, is referred here by Sprengel.

Gossypium Indicum of Tropical Eastern Asia. The *cotton* shrub is called in Bengalee "kapas" (D'roz.), in ancient Sanscrit "karpasi" (Ritter), in Tamil "paratie" or "van-paratie," in Telinga "puttie" (Drury), in Burmah "wa" (Mason), in Tagalo "bulac" (Blanco): "cotton thread" manufactured in the province of Yu, is mentioned in the Chou-King — (Pauth. p. 49): *G. Indicum* has been cultivated in China from the Ninth century (Schouw p. 149); is said to have been introduced "from China" into Japan so late as "1558–70 A. D." (Jap. centen. comm. 74); was observed by Blanco on the Philippines, where seeds of several cultivated varieties, some with very sparse fibres, were shown me; by Mason, "exotic" in Burmah, but farther North according to Wallich grows along the Irawadi and rivers of Martaban (A. Dec.). Westward, is mentioned in the Institutes of Menu (transl. bramin. and Deslongch.); seems included in the wool-bearing tree from which according to Herodotus iii. 106 the people of India make their clothes; and "karpasōs" of Barygaze (Baroach) is mentioned in the Erythraean Periplus: *G. Indicum* was observed by Rheede i. pl. 31 under cultivation in Malabar; by Graham, "the staple article of the commerce of Bombay," cultivated from Guzerat to Dharwar and Coimbatore, as well as in Bengal (Roxb., and Drury). Farther West, a cuirass made of "ēiriōisi apō ulō" was sent by Ahmes II. to Greece (Herodot. iii. 47): "krphs" is men-

tioned in Esther i. 6; "carbasina" by Caecilius, Lucretius, Cicero, and Varro; the living plant was introduced before the time of Strabo into Susiana, Egypt, and other Mediterranean countries (Plin., Ebn Alvam, and Schouw 22); and in the time of Pliny xix. 2. 3 the Egyptian priests wore cotton garments: *G. Indicum* was observed by Tournefort, Forskal, and Chaubard, under cultivation in Greece; by myself, on Malta; by Forskal, Delile, and myself, in Egypt; by myself, a few stocks in a court-yard at Mocha; and again a few, all in languishing condition, on Zanzibar. By European colonists, was carried to Northeast America, where it continues extensively cultivated in our Southern States, and by a peculiar process the "sea-island" modification has been developed; to the islands of the Pacific, observed by myself naturalized on the Hawaiian Islands. When carried North, is annually killed by the winter frosts, but is not properly an herbaceous plant.

Citrus Sinensis of Tropical Eastern Asia. The *mandarin orange* is called in Tagalo "naran-gitas" or "sintoris" (Blanco), in Burmah "shouk-lieng-mau" (Mason), in Tamil "kitchlee," in Hindustanee "koda" (Drury); and the orange mentioned in the Chou-King ii. 1. 11 as cultivated in the province of Ying — (Pauth. p. 48) may be compared: *C. Sinensis* was observed by myself throughout the Malayan archipelago, the only kind of orange (with a solitary exception at Manila); by Mason v. p. 453 and 760, "exotic" in Burmah, distinguished by the natives and sold in large quantities. Westward, "naranga" and "nagaranga" are mentioned in the Ayurvédas (Susrut.): "melarancie assai ma tutte dolci" were found by Vasco de Gama in 1498 in Hindustan: *C. Sinensis* was observed by myself the only kind cultivated there from Bombay to Aurungabad; and according to Drury, "is found in the Northern Circars" where it is called "cumbala naba," and "is indigenous in Silhet and on the slopes of the Neilgherry mountains." Farther West, the "round atrodj" according to Masudi (quoted by Makrizi) was brought "from India subsequent to the three hundredth year of the Hedjra" (912 A. D.) "and first planted in Oman, and which lost in Syria and Egypt much of its original odour and colour:" the "limum mokhattam" was seen by Abd-allatif in Egypt, of a brighter red than the narandj" (*C. aurant.*) "round and a little flattened, and as if impressed with a seal" (at the apex); the "limun hælu," by Forskal, and is described by Delile as "fructu aurantii-formi cortice lævi medulla dulci:" *C. Sinensis* was observed by myself in the imaum's plantation on Zanzibar; and as transported to the Mediterranean countries is termed "aurantium dulci cortice sinense" by Ferrari hesperid. pl. 433, is described also by Tournefort inst. pl. 390, and Miller (Pers.); and var "myrtifolia" has become frequent in Northern greenhouses.

Citrus decumana of Tropical Eastern Asia. Called by European colonists *shaddock* or *pum-malo* (Graham) or "pampel-moes" (Rumph.), in Tagalo "lucban" (Blanco); and the "yeou" cultivated in China according to the Chou-King ii. 1. 11, — is referred here by Pauthier p. 48: *C. decumana* was observed by Loureiro p. 572 frequent in Anam and China, and from China according to Rumphius ii. pl. 24 was introduced into the Malayan archipelago; was observed by Blanco on the Philippines; by myself, a large tree under cultivation from the Tongan and Feejeean islands throughout the Malayan archipelago; by Mason v. p. 452 "exotic" in Burmah and the fruit inferior in quality. Westward, is exotic in Hindustan, as shown by the name "batavi nimboo" (Roxb., and Drury); was observed there under cultivation by Wight, Graham, and myself; and farther West, by myself on Zanzibar. The fruit has been sometimes carried up the Red Sea to Egypt, where "lemons large as water-melons" were seen by Abd-allatif; and the "kabbad" by Ebn Ayyas, described as an "orange of extraordinary bigness" by Vansleb; also to Jerusalem, as appears from rabbi Schwarz ii. 1. By Capt. Shaddock, seeds were carried to the West Indies before the visit of Sloane i. p. 41 (Pluk. alm. p. 239), and the tree continues under successful cultivation, as appears from Macfadyen p. 131 (A. Dec.) and from fruit imported into the United States.

Aleurites triloba of the Eastern islands of the Malayan archipelago to the Samoan. The *candle-nut* is a large tree called on the Hawaiian and Tahitian islands "tutui," on Tongatabu "tuitui," on the Marquesan islands "ama" and the Samoan "lama" meaning torch or candle (Hale), in Tagalo "lumban" (Blanco); and the "tong" tree growing according to the Chou-King ii. 1. 9 on the Southern portion of the Y mountain — (in Kiang-nan), and according to Gaubil affording an oil esteemed in China for its great utility, may be compared: *A. triloba* was observed by Blanco frequent on the Philippines, and the oil from its nuts sold by the natives; by Rumphius ii. pl. 58, on the Moluccas (Pers., and Steud.); by myself, to all appearance indigenous on the Feejeean and Samoan islands: but clearly by Polynesian colonists carried to Tongatabu, where it was regularly cultivated by the natives; to Tahiti, where it was observed by Forster prod. 360, and has become naturalized throughout the Interior; and to the Hawaiian Islands, where the nuts were strung together for candles. Westward from the Philippines, is called in Bengalee "bangla-akrot," in Telinga "natu-akrotu," in Tamil "nattu-akrotu" (Drur.), in the environs of Bombay "japhal" (Graham); is known to occur on Ceylon (Pers.), where its oil is called "kekuna" oil (Drur.); was observed by Roxburgh, and Drury, from Bengal to the Northern Circars and Travancore; by Graham, seemingly wild "in the Southern Mahratta country about Belgaum," and planted "in gardens Bombay;" by myself, only under cul-

tivation.* By European colonists, was carried to the Mauritius Islands, where according to Bojer it is almost naturalized; to Brazil, observed by myself planted for ornament around Rio Janeiro. Its oil, exported at first by residents of the Hawaiian Islands, has now become generally known in commerce.

"719 B. C. = 1st year of Hing-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

718 B. C. (= 722 y. 233 $\frac{1}{8}$ d. — "6th year" of twelve lunations, 2 K. xviii. 10), Samaria captured by the Assyrians under Shalmaneser; terminating the kingdom of the Ten tribes. The conquered Israelites were removed and placed "in Halah and in Habor" by "the river of Gozan, and in the cities of the Medes." — (The river Gozan is identified by Rennel geogr. Herod. with the Ozan, flowing through Gilan into the Caspian Sea). The account of the Colchians by Herodotus ii. 104 may be compared, as affording at least many points of resemblance.

"717 B. C. = 3d year of Hing-wang" (Chinese chron. table), beginning of the Thirty-third cycle.

"716 B. C." (= 546 + "170 years" of Herodotus, and Clint.), death of the Lydian king Candaules, and accession of Gyges, head of a new dynasty.

The luxurious costume and habits of his countrymen of Samos, described in a poem by Asius.

Daphne argentea of the Peloponnesus and Greek islands. Called on Samos "sarōmatahi" (Tourn.), and used there for brooms and for procuring a yellow dye as early probably as the time of Asius: — observed and distinguished from *D. tartonraira* by Wheeler, and Tournefort trav. ii. 135, regarded also as a distinct species by Sibthorp and Smith: termed "thymelæa seu tartonraire lini foliis argenteis" by Tournefort cor. 41 as observed by him on Samos; by Sibthorp, on Samos and Salamis, but more abundant around Corinth.

715 B. C. (= 759 — "44 years" of the Egyptian Chronicle and Euseb.-Maneth. table), Sēvihōs succeeded by Tarakōs or Tarkōs, third king of the Twenty-fifth dynasty. He is mentioned in 2 K. xix. 9, and by Strabo i and xv. The name of king Taharka occurs at Medinet-abu, also on mummy-cases, and in inscriptions as far up the Nile as Gebel Barkal in Upper Nubia.

The Second epoch in Nubian or Ethiopian history (according to Lepsius eg. and sin. p. 17 and 152), begins with Taharka: by whom and his immediate successors, magnificent buildings were erected; all (it is inferred) in the Egyptian style of art. The oldest structures of real *Ethiopian workmanship* are probably those at Gebel Barkal, and are "perhaps not earlier than Taharka."

Ruta tuberculata of the Egyptian Desert. Called in Nubia "geryg el-ghazal," in Egypt "megennynneh" (Del.) or "mæddjenninæ" (Forsk.), in Egyptian "mtōtf" or "ftōtf" (Kirch., and ms. Par.), and as early doubtless as this date the juice mixed in water by the women of Egypt to wash the head and lengthen the hair, — as witnessed by Forskal p. 86: the plant was observed by Forskal, and Delile, in the Desert around Cairo.

"712 B. C." (Euseb., and Clint.), at Athens, accession of Leocrates, fifth Decennial archon.

"The same year" (Mela i. 19, and Clint.), on the Propontis, Astacus founded by Greek colonists from Megara. — At the end of "four hundred and forty-eight years," the name of the city was changed to Nicomedia.

Medicago arborea of the East Mediterranean countries. Called in Greece "triphullōklatha" (Fraas); and the "cytissus" discovered on Cythnus and carried thence to other Greek islands and the cities of Greece — (Plin. xiii. 47 and xviii. 43), or "kutisōs" of Archilochus (schol. Nic. ther., and Gesn. præf. Trag.), Cratinus, Eupolis, Democritus, Amphiloehus, Aristomachus, Polemon diæt. ii. 25, 1 Morb. mul. 73, Antilochus (schol. Nic. ther. 617), Theocritus, mentioned by Aristotle iii. 21 as given to cattle, by Dioscorides as planted near hives to attract the bees, is referred here by Honorius Bellus, and writers generally: *M. arborea* was observed by Sibthorp, and Fraas, on rocks in Attica and on the Greek islands. Westward, the "kutisōs" or "tēlinēn" or "lōtōn mēgan" or "triphullōn" is identified in Syn. Diosc. with the "triphōliōum maiōus" of the Romans; the "cytissus" is mentioned by Virgil, Hyginus, Columella, but continued rare in Italy in the days of Pliny: *M. arborea* is described by Maranta, and Lobel ii. pl. 46; is termed "*m. trifolia frutescens incana*" by Tournefort inst. 412; is known to occur in Italy (Pers., and Lenz), and has become frequent in other parts of Southern Europe (Fée).

711 B. C. (= 710 y. 938 $\frac{8}{8}$ d. = 717 y. 287 $\frac{1}{8}$ d. — "14th year" of twelve lunations of 2 K. xviii. 13), an Assyrian army under Sennacherib, traversing Palestine against rumoured opposition from "Tirhakah king of Ethiopia," and threatening Jerusalem, destroyed in one night — (2 K. xix. 9 to 35, and Herodot.).

* *Bambusa arundinacea* var. *nana*. The "small bamboo" mentioned in the Chou-King ii. 1. 11 as growing in the Southern provinces of China — (Pauth. p. 48) is probably this dwarf variety. According to Mason v. 525, "the Chinese dwarf bamboo" introduced "from Penang" into Burmah, "makes a pretty hedge, and when cut annually, looks like an English quick-set hedge."

710 B. C. (2 K. xix. 36 and 37), returning to Nineveh, Sennacherib was assassinated by his sons Adrammelech and Sharezer; who "escaped into the land of Armenia." The revolt of the Medes, and consequent *dissolution of the Assyrian Empire* (an event placed at this date by Josephus and Herodotus, but Ctesias has 1071 + "1000 — 1360 years" = 711, and in Euseb. ii. from the same point "25th of Teutamus," — 7 — "40 — 30 — 40 — 38 — 45 — 30 — 20 — 50 — 42 — 20 years" = 709): leaving to Esarhaddon, son and successor of Sennacherib, only the reduced kingdom of Assyria proper.

"The same year" (Dionys., and Clint.), the city of Crotona in Southern Italy founded by Greek colonists.

"709 B. C." (Herodot., and Clint.), the Medes having gained independence and power, commencement of the "fifty-three" years attributed to their leader Deioces. (A year later is indicated by other authorities, 776 + 43 — "28 — 30 — 40 — 13" = 708 = 776 + "40 — 28 — 20 — 30 — 30 years" of Euseb. i = 816 — "28 — 50 — 30 years of Ctesias in Diodor. ii. 32).

"The same year" (= 704 + "5 years" of Astronom. can., and Clint. i. p. 278), Mardocempadus succeeded by Archianus, as king of Babylon. At Jerusalem (709 y. 20 $\frac{5}{6}$ d. = 694 y. 183 $\frac{1}{6}$ d. + "15 years" of twelve lunations of 2 K. xx. 6, and Isai. xxxviii. 5), recovery of king Hezekiah from sickness. — (For the arrival of the Babylonian embassy mentioned in 2 K. xx. and Isai. xxix., see below).

"July 17th," on the "first day of the Seventh month in the 11th year of Houan-wang" (Khoungtseu, the Li-tai-ki-sse, and Pauth. 107), total *eclipse of the sun*.

Ephedra distachya of the shores of the Mediterranean. An Equisetum-like shrub called in Greece "pōlukōmpōs" (Sibth.): the "tragōs" moistening its gray beard in the sea indicated by the Oracle to Phalanthus — (Diod. viii. 21), described by Dioscorides as a shrubby and decumbent plant growing by the seaside, leafless, with numerous red berries large as a grain of wheat pointed and very astringent, identified in the added Synonyms with the "traganōs" or "skōrpion," is referred here by writers: *E. distachya* was observed by Sibthorp, Chaubard, and Fraas, on rocks exposed to the sea throughout Greece and the Greek islands, and farther inland on mount Athos and by the roadside near Smyrna. Westward, the account of the "herba tragos" by Pliny xxvii. 116 seems chiefly taken from Dioscorides: *E. distachya* is described by Ruellius, Dalechamp, Camerarius, and Barrelier pl. 731; is termed "e. maritima minor" by Tournefort inst. 663; and is known to grow on stony hills exposed to the sea in Barbary and Southern Europe (Pers., and Spreng.).

"708 B. C." (Hieronym., and Clint.), the city of Tarentum in Southern Italy founded by Phalanthus and the "Parthenians" (expatriated Spartans of illegitimate birth).

In this year (= "Ol. 18th" of Xanthus, see also Hellan., and Glaucus of Rhegium), Terpander. His improvement in combining *poetry with instrumental music* (Clem. Alex., and Plut. mus. 3) hardly later than this date. Terpander composed hymns, some of them in hexameter verse (Sm. b. d.).

The Homerid hymn to Mercury 51 containing an account of the seven-stringed lyre (the invention of Terpander), not earlier than this date.

Hedera helix of the Himalayan mountains. Called in Britain *ivy*, in Anglo-Saxon "ifig," in Old High German "ēbah" (Prior), in current German "epheu" (Grieb), in France "lierre" (Nugent), in Italy "ellera" or "edera" (Lenz), in Greece "kissōs" (Sibth.), in Egyptian "hēnōsirīs" or "shēnōsirīs" (Plut. is. and osir.); in which we recognize the ΚΙΣΣΟΣ mentioned in the Homerid hymn to Dionysus or Bacchus 40, — also by Anacreon (anthol. pal. vi. 134 and vii. 29), Pratinas, Pindar, Cratinus, Sophocles, Theophrastus, Erasistratus, Theocritus, Semus Delius, Dioscorides, Athenaeus xiv. 16, and that Harpalus attempted without success to introduce into Media (Plin. xvi. 62): the "kissōs" is mentioned also in 2 Macc. 6. 7: *H. helix*, I was informed, has not been successfully cultivated in Egypt; was observed by Hasselquist on mount Tabor in Palestine; by Forskal, Sibthorp, Chaubard, and Fraas, seemingly wild from the Peloponnesus throughout the Greek islands. Westward, the "kissōs" or "nusiōn" or "thiōnusiōn" or "pērsis" is identified in Syn. Diosc. with the "sōuvitēs" of the Gauls, and "silva matēr" or "ēthēra" of the Romans; the "edera" or "hedera" is mentioned by Cato III, Horace, Ovid fast. iii. 766, Columella, and Tacitus: *H. helix* is termed "h. arborea" by Tournefort inst. 613; and seems at least completely naturalized in Europe, clinging to trees and rocks from Italy as far as Sweden (Curt. lond., Pers., Spreng., and Lenz). Eastward from Palestine, Alexander was informed by priests of Bacchus on the Upper Indus that the "kissōs" there grew only on mount Meros: *H. helix* was observed by Royle wild on the Himalayan mountains (Kitt. bibl. cycl. ii. p. 203 to 217). By European colonists, was carried to Northeast America, where its cultivation for ornament is increasing in our Middle States. Is mentioned according to Lindley "as a sudorific, and was once reputed to prevent drunkenness."

"In this year" (Xanth., Clem. Alex., and Clint.), the poet Archilochus leaving Paros in company with a colony for Thasos.

Prunus insititia of Europe and the adjoining portion of Asia. Called in Britain *wheaten plum*

(Ainsw.) or *bullace*, by Turner "bulles," by Treveris "bolays," by Galfridus pr. pm. "bolas" (Prior), by the Bretons "belosse" or "bolosse" (Le Gall), in France "prunier sauvage" (Fée), in Germany "haferpflaume" (Lenz), in Greece "agriothamaskēnia" (Sibth.) or "kōrōmēlēa" (Fraas); in which we recognize the ΚΟΚΚΥΜΗΥΟΝ of Archilochus, — Hipponax, Aristophanes, having a round nucleus according to Theophrastus iv. 2. 10, and further noticed by Nicander, Dioscorides, and Pollux i. 232: *P. insititia* was observed by Sibthorp, and Fraas, wild in Greece and as far as Smyrna; is known to grow also about Caucasus (Ledeb.); and cultivated varieties may be included in the "barkuk" of Egypt and Yemen, the possible origin of the Greek name. Westward, the "prunum cereum" is mentioned by Virgil, "prunus silvestris" by Columella, and "ingens turba prunorum" by Pliny xv. 12: *P. insititia* occurs in debris of Swiss lake-villages belonging to the Stone Age (Heer); is termed "*p. sylvestris præcox altior*" by Tournefort inst. 623; is known to grow wild in Italy and throughout middle Europe (Linn., Pers., Bertol. fl. ital., and A. Dec.). By European colonists, cultivated varieties were carried to Northeast America, where they continue in our gardens intermingled with prunes or damsons under the common name of *plum* (see *P. domestica*).

Cratægus tanacetifolia of the East Mediterranean countries. Called in Greece "trikōkkia" (Sibth.), in which we recognize the "trikōkkōn" identified by Dioscorides with the ΜΕΓΙΛΥΟΝ of Archilochus, — Eubulus, Superfœt. 25, Theophrastus iii. 12, Agatharchides 96, and others, a thorny tree with edible fruit which resembles a small "mēlō" and contains three bony granules; mentioned also by Pollux i. 233, and "mēspilōn" water prescribed by Hippocrates vict. acut. 62: *C. tanacetifolia* is termed "*m. orientalis tanacetifolia villosa magno fructu pentagono e viridi flavescente*" by Tournefort cor. 44 and trav. ii. pl. 172, and was observed by him, Sibthorp, and Fraas, on all the high mountains of Greece.

"704 B. C." (= 404 + "300 years" of Thucyd. i. 13 and Clint., see also Herodotus, and Diodor. xiv. 42), *trireme galleys*, a new and larger class of sea-going vessels, built for the Samians by Aminocles of Corinth. — Row-galleys continued in use on the Mediterranean in the days of Baumgarten, and Cervantes: and even now, the term "galley-slave" has hardly become obsolete in the English language.

"The same year" (= 702 + "2 years" of the Astronom. can., and Clint. i. p. 278), at Babylon, end of the reign of Archianus.

703 B. C. (Beros., Alex. Polyhist., and Clint. i. p. 278), after reigning "thirty days" at Babylon, Hagisa slain and succeeded by Marudach Baldanes. Who reigned "six months;" and is regarded (by Josephus and Eusebius) as the king who "sent letters and a present" to Hezekiah at Jerusalem (2 K. xx. 12, and Isai. xxxix. 1, see above). The embassy is proof, that Babylon was now independent of Assyria.

"702 B. C." (= 699 + "3 years" of the Astronom. can., and Clint.), Marudach Baldanes slain, and the accession of Elibus or Belibus as king of Babylon.

"The same year" (Euseb., and Clint.), at Athens, accession of Apsander, sixth Decennial archon.

One hundred and eighth generation. Jan. 1st, 700, mostly beyond youth: the Greek poet Tyrtaeus, and the Messenian bard Theoclus (Blair).

"699 B. C." (= 693 + "6 years" of the Astronom. can., and Clint., see also Beros., and Alex. Polyhist.), "in the third year of Elibus," Babylon captured by an Assyrian king, and placed under the rule of his son Apronadius (On comparing 2 K. xvii. 24 and Ezr. iv. 2 to 10, the Assyrian king is found to be Esarhaddon; the son Apronadius corresponding to "Asnapper," who established colonists from Babylon, Cuthah, Ava, Hamath, and Sepharvaim "in the cities of Samaria instead of the children of Israel.")

"696 B. C. = 1st year of Tchoung-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

The same year = "20th year of Taharka," on the monuments — (C. Mull. fr. Man. p. 593).

695 B. C. (= 722 y. 233¹/₆ d. — "29 years" of twelve lunations of 2 K. xviii. 2 and 2 Chron. xxix. 1), Hezekiah succeeded at Jerusalem by his son Manasseh, seventeenth Jewish king.

"693 B. C." (= 692 + "1 year" of the Astronom. can., and Clint.), Apronadius succeeded by Regibalus, as king of Babylon.

In this year = "23d year of Taharka," invasion of Egypt by the Assyrians under Esarhaddon; who has left a record of his passage on the rocks at Nahr-el-Kelb, close to the tablet of Ramesse II. (Birch.) His capture of the city of No — (On or Heliopolis) is mentioned by Nahum iii. 8.

"The same year" (. . . Suid., and Clint.), Simonides the iambic poet. He was contemporary with Archilochus (Clem. Alex. i. p. 33), and led a migration from Samos to the neighbouring island of Amorgos (Strab. x. p. 487, Steph. Byz., and Tzetz. xii. 52).

The ΒΑΚΚΑΠΙ ointment of Simonides of Amorgos — (Clem. Alex. pæd. ii. 8), or "vakharis" of Hipponax, Aeschylus, Magnes, Ion, Achæus, Epilycus, Cephisidorus, and Athenæus xv. 40, may

be compared with the "bachur" ointment of the Arabs. As prepared by Arab colonists in Spain and Portugal, the ingredients are enumerated by Jao de Souza vestig. arab.

Inula conyza of Europe and the adjoining portion of Asia. Called in Britain from its fragrant root *ploughman's spikenard* (Pryor, and Cockayne); in which we recognize the "nardum rusticum" identified by Pliny xxi. 16 with the "bacchar quoque radicis tantum odoratae" of which ointment was made by the ancients — according to Aristophanes: the "vakharis" of Nat. mul. p. 535 to 549, Vict. acut., Lucian lexiph. p. 187, and Athenaeus xv. 41 is defined by Erotian voc. Hipp. as a plant as well as kind of ointment, and the plant is described by Dioscorides as a fragrant coronary herb with whitish and purple flowers and a cinnamon-scented root: *I. conyza* was observed by Sibthorp in the environs of Constantinople. Westward, the "bacchare" plant worn in garlands according to Virgil for protection against evil speaking, is referred here by Anguillara, and Gerarde p. 647; *I. conyza* is described also by Tragus, and Matthioli; is termed "c. major vulgaris" by Tournefort inst. 454. "*conyza squarrosa*" by Linnaeus; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 622. Engl. bot. pl. 1195, Pers., and Spreng.).

The same year (= 661 y. 100 $\frac{3}{4}$ d. + "37 years" of ten lunations, Sm. b. d.), Romulus succeeded by Numa Pompilius, second king of Rome. — The tomb of Numa in the Janiculum is mentioned by Pompeius Festus (Paul. Diac.).

Lathyrus sativus of the Mediterranean and Tauro-Caspian countries. Called in Britain *chickling vetch*, in France "gesse" (Nugent) or "pois quarrées" (Forsk.), in Germany "platterbse" (Grieb), in Italy "cicerchia" (Lenz), in Greece "agriolathōuri" (Sibth.) or "lathōuri" (Fraas), in Egypt "gilban" (Del.); in which we recognize the "lathurōn," one of the legumes among the Romans prohibited to persons leading a chaste life — (Plut. qu. rom. 95): the "cicerula" is mentioned by Columella ii. 10. 19, by Pliny xviii. 32 to xxii. 72 as "minuti ciceris inaequalis angulosi veluti pisum," is also mentioned by Palladius ii. 5: *L. sativus* is termed "l. s. flore fructuque albo" by Tournefort inst. 395; was observed by Forskal under cultivation near Marseilles; is known to occur cultivated and springing up spontaneously in Italy, Algeria, Spain, and as far as Switzerland (Pers., Boiss., and A. Dec.). Eastward, the "lathurōs" is mentioned by Anaxandrides, Alexis by Theophrastus viii. 3 as having a compressed stem resting on the ground: and the "djilban," by Ebn Djoldjol, and Ebn Baitar: *L. sativus* was observed by Sibthorp, and Fraas, in mountainous cultivated ground in the Peloponnesus and on Parnassus; by Delile, and Clot-Bey, under cultivation in Upper Egypt and the seeds given to cattle; is known to occur both cultivated and seemingly wild about Caucasus and in the province of Talusch (Ledeb., and C. A. Meyer). Farther East, has Bengalee but no Sanscrit names (Pidd., and A. Dec.); is called "lang" in Guzerat, where it was observed by Law "commonly cultivated" and "very pretty when in flower" (Graham).

Lathyrus cicera of the Mediterranean countries, and as far as Caucasus. Called in France "gesse chiche" (Fée), in Germany "grosse platterbse" (Fraas); and probably included in the prohibited "lathurōn": — the "cicera" is mentioned by Columella ii. 10 as employed for feeding cattle; the "columbinum" kind "quod alii venerium vocant candidum rotundum leve," by Pliny xviii. 32 to xxii. 72: *L. cicera* is described by Dodoens pempt. 523; is termed "l. sativus flore purpureo" by Tournefort inst. 395; and is known to occur cultivated and springing up spontaneously from Trieste and Northern Italy to Algeria and Spain (Pers., Boiss., A. Dec., and Lenz). Eastward, was observed by Sibthorp, Dænzer, and Griesebach, from the Peloponnesus to Thrace and Asia Minor; and is known to grow seemingly wild about Caucasus (Ledeb., and C. A. Meyer). By Columbus, "vitches" were carried to the West Indies (F. Columb. 53), but at the present day their cultivation seems unknown in America.

"692 B. C." (= 688 + "4 years" of the Astronom. can., and Clint.), Regibalus succeeded by Mesesimordachus, as king of Babylon. The same date (= 604 + "20 + 21 + 21 + 8 + 18 years") is given by Alexander Polyhistor for the accession of the Assyrian king Senecherimus.

"The same year" (Euseb., and Clint.), accession of Eryxias, seventh Decennial archon at Athens.

"691 B. C." (Euseb., and Clint.), the art of *welding together silver and iron* discovered by Glaucus of Chios, a celebrated statuary in metal. A specimen of his workmanship, "a silver bowl having an iron base," — was sent nearly a century later by the Lydian king Alyattes to Delphi (Herodot. . .); and its "iron base, chased with figures of animals, insects, and plants" remained extant in the days of Pausanias x. 16, and of Athenaeus v. p. 210.

"690 B. C." (Euseb., and Clint., see also Philosteph., and Athen. vii. p. 297), in Pamphylia on the Southern coast of Asia Minor, the city of Phaselis founded by Greek colonists under Lacius.

"Not earlier than this year" (. . . Clint.), the Second musical school at Sparta founded by Thaletas of Crete.

The same year = "26th year of Taharka;" the latest date in his reign found on the monuments (Leps. k. tab. p. 21).

Not earlier therefore than this date (the Euseb.-Maneth. table giving $339 + 6 + 4 + 6 + 20 + 21$ y. 4 mo. $+ 6 + 120$ y. 4 mo. $+ 42 + 25 + 17 + 6 + 45 + 8 + 6 + 7 + 12$ years" = 690 y. 8 mo.), end of the reign of Tarakos or Taharka. In the Euseb.-Maneth. table, he is succeeded by the Ethiopian Ammêris. The name of queen Amuniritis occurs on contemporaneous monuments (Leps. k. pl. 46). The successor of Taharka is called Urdamani in the Assyrian annals, — and Rutamen by Birch hist. 178.

A coffin dated in the reign of queen Amuniritis, — and now in the British museum, is described by Birch.

Melilotus officinalis of Europe and the adjoining portion of Asia. Yellow-flowered and called in Britain *melilot* (Prior), in France "mélilot" (Nugent), in Germany "melilote" (Grieb), in Italy "meliloto" or "loto domestico" or "tribolo" or "trifoglio odorato" (Lenz), in Greece "triphulli" (Fraas), or "nēhaki" (Sibth.), and possibly the "thērmōuthis of the prophets or "aimēith" of the Egyptians — identified in Syn. Diosc. with the "mēlilōtōs;" described by Theophrastus caus. vi. 14 and od. 34 as giving out its lasting odour when dried; by Dioscorides, as produced of the best quality in Attica, and at Cyzicum, and around Carthage: the "yellow-flowered melilot" is also mentioned by Avicenna (Lobel hist. p. 501): *M. officinalis* was observed by Sibthorp, and Fraas, frequent in moist situations throughout Greece and the Greek islands; is enumerated by Clot-Bey as long known in Egypt, and dried "melilothus" was observed there in drug-shops by Forskal. Westward, a "melilotus" growing everywhere "recens nec candicans" herbaceous and not hoary "et croco quam simillima" is distinguished by Pliny xxi. 37; the "melilotus" of Palladius xi. 14. 8 may also be compared: *M. officinalis* is described by Matthioli p. 809; is termed "melilotus officinarum germaniæ" by Tournefort inst. 407; and is known to occur in Italy and throughout middle Europe as far as Denmark (fl. Dan. pl. 934, and Pers.), in Britain regarded by Watson and others as a naturalized exotic. By European colonists, was carried to Northeast America, where it continues in cultivated and fallow ground in our middle and Southern States (A. Gray, and Chapm.); also to Southeast Australia, where it has become naturalized, even in the Interior (Corder, and A. Dec.). Its odour in herbaria according to Sprengel has continued perceptible more than an age: and the decoction according to Lindley is sometimes used medicinally.

Melilotus alba of middle Asia. The *white-flowered melilot*, by some writers regarded as not distinct, — was already in Italy in the days of Pliny xxi. 37, who enumerates the "candida" as the most odorous kind of "melilotos:" *M. alba* is termed "m. officinarum germaniæ flore albo" by Tournefort inst. 407; and is known to occur throughout middle Europe as far as Britain, where it is regarded by Watson and others as exotic and introduced (A. Dec.). Eastward, the "white-flowered" kind is distinguished by Avicenna (Lobel hist. p. 501): *M. alba* was observed by Forskal, and Sibthorp, from Thessalonica to Smyrna; by Wight, Law, and Graham, "in pasture grounds" in the environs of Bombay and other parts of Hindustan. By European colonists, was carried to Northeast America, where it continues in fallow ground and in open situations near the sea, to all appearance naturalized.

"688 B. C." (= 680 + "8 years" of the Astronom. can., and Clint.) at Babylon, end of the reign of Mesesimordachus.

In this year (= 759 — "31 — 6 — 40 yrs" of the Afr.-Maneth. table), accession of Stēphinatēs or Stēphinathis; head of the Twenty-sixth dynasty. Tnephahtos is mentioned by Diodorus i. 45. 2, Tehnatis by Plutarch is. and os. 8; and according to a papyrus, Tafnekht made himself master of Lower Egypt, as far as Heracleopolis (see Birch). The name of king Kasto or T-h-k occurs on contemporaneous monuments, and according to Lepsius he married Amuniritis.

"687 B. C." (= 559 + "128 years" of Herodotus i. 130, and Clint.), beginning of the *Median Empire*: Deioces being formally established ruler, and his dominions extending as far West as the river Halys in Asia Minor.

The city of Ecbatana built for the new seat of government by Deioces. Who also was accused to deliver his *judgments in writing* — (see Herodot. i. 100, and Esth. i. 19).

"685, in the autumn" (Pausan. iv. 15. 1, but Clinton i. p. 180 and 253 thinks probably six years later), revolt of the Messenians against the Spartans, commencing the Second Messenian war. — The war continued "seventeen" years.

"684 B. C." (. . . Clint. . .), Perdicas succeeded by Argæus, fifth king of Macedonia.

"683 B. C." (the seven Decennial archons occupying "69 years" according to Clinton), a change at Athens in the form of government; Eryxias succeeded by Creon, the first Annual archon.

"681 B. C. = 1st year of Li-wang II., of the Tcheou" or Fifth dynasty — (Chinese chron. table).

In this year (= 688 — "7 yrs" of both Maneth. tables = 664 + "15 yrs dodecarch. + 2 yrs anarch." of Diodorus . . .), Stēphinatēs succeeded by Nēhēpsōs, second king of the Twenty-sixth dynasty. Nēōhavin is mentioned by Alexis autarch. (Athen. x. p. 418): the name of king Ankhepi or Pankhi occurs on contemporaneous monuments, — and is placed next after queen Amuniritis by Lepsius k. pl. 4 According to

the above-mentioned papyrus, the revolted Tafnekht was subdued by Pankhi, king of Ethiopia, residing at Noph or Napata (see Birch).

"680 B. C." (= 667 + "13 years" of the Astronom. can., and Clint.), accession of Asaridinus, or Esarhaddon retaining for himself the city of Babylon.

"678 B. C." (= 716 — "38 years" of Herodotus, Clint.), Gyges succeeded by Ardys as king of Lydia.

"676 B. C. = 1st year of Hoi-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"The same year" (Sosib., Athen. xiv. p. 635, Jul. Afr., and Clint.), "Carnea" or contests with the harp, instituted in Laconia.

"675, Oct. 10th," on the first day of the Tenth month in the "2d year of Tchoun-wang" (Khong-tseu, the Li-tai-ki-sse, and Pauth. 107), *eclipse of the sun*.

In this year (= 313 + "362 yrs" of the Vishnu-Purana, H. H. Wils. ind. dram. ii. 137), in Hindustan, accession of the first "of the ten Saisunaga princes."

The same year (= 681 — "6 yrs" of the Afr.-Maneth. table). Nēhaō is placed here in the Afr.-Maneth table, — but in the Euseb.-Maneth. table (688 — "12 — 7 — 6 yrs" = 663) under Psammetichus.

"674 B. C." (Hieronym. and Clint., see also Thucyd. iv. 25 and Mela i. 19. 33), on the Asiatic shore of the Bosphorus, Chalcedon founded by Greek colonists from Megara under Archias. — "Seventeen" years later (Herodot. iv. 144). Byzantium directly opposite founded also by Megaran Greeks; the city continues flourishing to the present day under the name of Constantinople.

"671 B. C." (Euseb., and Clint.), "eleventh" change in naval dominion. Leaving the Carians, the "Empire of the sea" acquired by the Lesbian Greeks. — Held by them "sixty-nine" years.

"669, May 27th" = "first day of the Sixth month in the 8th year of Hou-wang" (Khong-tseu, the Li-tai-ki-sse, and Pauth. 107), *eclipse of the sun*.

Zizyphus jujuba of Hindustan. The *jujube tree* or *wild blere* is called in Hindustanee "bier," in Bengalee "kool," in Telinga "rengha" (Lindl.) or "reygoo," in Tamil "elendie" (Drur.), in Burmah "hzee" (Mason); and "more than twelve hundred years" ago was introduced by the way of "Persia" into China — (Li-chi-tchin, and others): the "jujube" is mentioned in an ode attributed to Tcheou-kong, and in one written about B. C. 661 (Chi-King i. 9. 3 and i. 15. 1, and Lacharme); the "eul" or "tsao" cultivated and its fruit eaten, by Thseng-tsi, Thseng-tseu, Koung-sun-tcheou, and Meng-tseu ii. 5. 14 to 8. 36: *Z. jujuba* was observed by Cibot mem. chin. iii. p. under frequent cultivation in China; by Blanco, cultivated and seemingly wild on the Philippines, and its fruit called "manzanitas"; is termed "mansana arborea" by Sonnerat pl. 94; was observed by Rumphius ii. pl. 36 on the Moluccas, its bark employed as a remedy for diarrhoea (Lindl.); by Mason v. 458, "exotic" in Burmah but "often found apparently growing wild," its "small sour berry a great favourite with the Burmese and Karens." Westward, the "koli" tree is mentioned by Budhaghosha parab. xxvi: *Z. jujuba* according to Royle is the most common species in Northern Hindustan; was observed by Roxburgh, Ainslie, and Wight, from Bengal throughout the peninsula; by Rheede iv. pl. 41, in Malabar; by Gibson, and Graham, in the environs of Bombay "common almost everywhere," and "very abundant in the Kandesh jungles, particularly towards the Taptee;" its fruit according to Drury "is eatable," and leaves on their "under side as well as young branches and petioles covered with dense tawny tomentum." (See *Z. melanogona*).

"668 B. C." (= "first year of the 28th Olymp." of Pausan. iv. 23. 2), after eleven years siege, the city of Ira captured by the Spartans: terminating the Second Messenian war. (Pausanias' date is however regarded by Clinton i. p. 190 and 253, as probably "six" years too early).

"Nov. 10th" = "first day of the Twelfth month" (Khong-tseu, the Li-tai-ki-sse, and Pauth. p. 107), *eclipse of the sun*.

One hundred and ninth generation. May 1st, 667, mostly beyond youth: the prophet Nahum: among the Greeks, Polymnastus of Colophon, who improved the Spartan music.

"The same year" (= 647 + "20 years" of the Astronom. can., and Clint.), Asaridinus or Esarhaddon succeeded by Saosduchinus, now king of Babylon. (The accession of the Assyrian king Sammuḡhes is placed by Alex. Polyhistor a year later, = 604 + "20 + 21 + 21," with an additional year assigned to his reign: as though the two names belonged to the same king).

Manasseh king at Jerusalem bound with fetters by "the captains of the host of the king of Assyria," and carried (not to Nineveh) "to Babylon" (2 Chron. xxxiii. 11).

"665 B. C." (Euseb., Ael. xii. 50, and Clint.), at Sparta, first performance of the gymnopaedia, the songs on the occasion including some by Alcman.

Lactuca scariola of Europe and the adjoining portion of Asia. Called in Britain *lettuce*, in Scotland "lattouce" (Prior), in France "laitue" (Nugent), in Germany "salat" (Grieb), in Italy "lattuga" or "lattuca" (Lenz), in Greece "marōliōn or "marōuli" (Fraas) or "thrithax" (Zalikogl.), in Egypt "khass" (Del.) or as heard by myself "khūss," in Egyptian "iōv nsōtshē" (Ming.) or

"ōuf" or "ōv" (ms. Par., and Kirch.) or "ēmvrōsi" (Syn. Diosc.): in which we recognize the 'laktōuka' identified in Syn. Diosc. with the ⌘ ΠΙΔΑΚΑ of Alcman, — Hipponax, Cratinus, Polemon diæt. ii. Theophrastus, Athenaeus iii. 82, and "thrithax ēmērōs" esculent according to Dioscorides: the "thrithax" was already in Egypt when invaded by Cambyzes (Herodot. . .): the "khass" is mentioned by Ebn Baitar: *L. scariola* was observed in Egypt under cultivation by Abd-allatif, Forskal, Delile, Clot-Bey, and myself; by Forskal, under cultivation among the mountains of Yemen; by Fraas, under cultivation in Greece; by him, and Sibthorp, in shaded situations in its original state, is known to grow also about Caucasus and as far as the Altaian mountains (Ledeb., and C. A. Meyer). Westward, the "thrithax ēmērōs" is identified in Syn. Diosc. with the "laktōuka" of the Romans; the "lactuca" according to Pliny xix. 38 was known to the ancient Italians in one variety only; is mentioned also by Varro, Horace, Celsus, Columella, and Martial: *L. scariola* is described by Hermann parad. pl. 91, and Morison iii. 7. pl. 2; is termed "*L. sylvestris costa spinosa*" by Tournefort inst. 473; and is known to grow from Italy throughout middle Europe as far as Denmark (Ray, Engl. bot. pl. 268, fl. Dan. pl. 1227, and Wats.), is besides abundantly cultivated. Eastward from Caucasus, is called in Persian and Hindustanee "kahu" (Roxb., and D'roz.), but seems devoid of a Sanscrit name; was observed by Royle him p. 247 in the gardens of Northern Hindustan; by Graham, in the environs of Bombay; and by Roxburgh, Wallich, and Wight, farther South and East: by Mason, "exotic" in Burmah; by Loureiro, in Anam; by Kaempfer, and Thunberg, under cultivation in Japan and called "kantats," or usually "futsu kusa" or "too tsisa." By European colonists, was carried to Northeast America, where it continues abundantly cultivated; to the island of Tristan d' Acunha (A. Dec.); and according to Loureiro, to Macao in Southern China. The inspissated juice according to Lindley is sold under the name of *thridace* or *lettuce opium*. (See *L. virosa*).

Calendula arvensis of the Mediterranean countries. A kind of wild *marigold* called in Germany "feld-ringelblume," in Italy "fior rancio selvatico" or "fiorrancio campestre" (Lenz), in Greece "graias t'atrahti" (Fraas), in Egypt "tob a'yny" or "kahleh" (Del.); in which we recognize the ΚΑΛΧΑΝ of Alcman, — or "kalhē" of Epicharmus, Numenius (schol. Nic. ther. 257), Nicolaus of Damascus, and Athenaeus xv. 28: *C. arvensis* was observed by Sibthorp, Chaubard, and Fraas, frequent in waste and cultivated ground from the Peloponnesus throughout the Greek islands; by Forskal, Delile, and myself, on the river-flat of the Nile as far as Cairo. Westward, the "calthula" garment is mentioned by Plautus; the "caltha" by Vitruvius, Virgil ecl. ii. 50, and the "flammeola caltha" by Columella x. 307: *C. arvensis* is described by Columna phyt. pl. 13 (Spreng.); is termed "caltha arvensis" by Tournefort inst. 499; was observed by Lenz seemingly wild in Italy; and is known to occur in cultivated ground as far as middle Europe (Scop., and Pers.).

Gnaphalium Orientale of the East Mediterranean countries. The ΕΝΙΧΡΥΣΟΝ mentioned as coronary by Alcman, — Ibycus, Cratinus, Themistagoras, Athenaeus xv. 27, or "ēliōhrusōu" of Theophrastus ix. 19 having a slender superficial root, hard stem, whitish leaves, and golden flowers, with which whoever is crowned will it is believed become illustrious, is referred here by Honorius Bellus (Clus. p. 300): Pliny xxi. 38 adds, that the Magians crown themselves with "heliochrysos," thinking that honour and reputation belong to it: *G. Orientale* is termed "elichrysum orientale" by Tournefort inst. 453; was observed by Sibthorp on Crete; and is known to grow in Barbary (Lam. ill. pl. 693, and Pers.).

Gnaphalium stoechas of the Mediterranean countries. The *gold-everlasting* is called in Germany "gold-immortelle" (Lenz), in France "immortelle" (Nugent), in Greece "kalōkōimithikis" or "thakrua tas panagias" (Sibth.) or "amaranthōn" (Fraas); and possibly the "ēlihrusō" of Alcman; — clearly the "amarantōn" or "hrusanthēmōn" identified in Syn. Diosc. with the "ēlihrusōn" of Dioscorides with which images of the gods were crowned, placed besides among clothing to keep out moths: Ptolemy was careful to crown the gods of Egypt with "heliochrysum" (Plin. xxi. 96); the "ēlihrusōn" is mentioned also by Theocritus i. 28, Nicander ther. 625, and the scholiast: *G. stoechas* was observed by Delile on the Mediterranean border of Egypt; by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands. Westward, is described by Valerius Cordus f. 65, and Barrelier pl. 409; is termed "elichrysum seu stoechas citrina angustifolia" by Tournefort inst. 452; was observed by Forskal near Marseilles; is known to grow from Italy as far as middle Europe (Lam. fl. fr., and Pers.); and wreaths of its flowers are often seen in our modern cemeteries.

Sesamum Orientale of Equatorial Africa. Called in French and English gardens *sesame* (Nugent), in German "sesam," in Italy "sesamo" (Lenz), in Greece "sisami" (Forsk.) or "sēsami" or "sēsami" or "sōusami" (Fraas), in Egypt "semsem," in Yemen "djyldjylan" (Forsk.), in Egyptian "sēmsēm" or "susamēn" (ms. Par., and Kirch.) or "ōkē" (ms. Par.); in which we recognize the ΣΑΕΑΜΟ of Alcman, — or "sēsamōn" of Stesichorus (or perhaps Ibycus, Athen. iii. 75 to iv. 72), Crates, and Hippocrates; cultivated for its oil in Babylonia in the days of Herodotus i.

193, and Strabo xvi. 1; in Egypt also in the days of Theophrastus . . . , Dioscorides, and Pliny; and its culture in Italy mentioned by Columella ii. 10. 18, Pliny, and Palladius: *S. orientale* continues well known in Italy (Lenz); was observed by Forskal, Chaubard, and Fraas, under cultivation from the Peloponnesus to Tenedos, the seeds plastered on bread; by Abd-allatif, Forskal, Delile, and Clot-Bey, under cultivation in Egypt; was ascertained by myself at Zanzibar to be cultivated in the neighbouring portion of Africa; and Westward in the same Equatorial portion, is known to have been long cultivated along the Atlantic (Hook.): Eastward from Arabia, is called in the environs of Bombay "gingelie" or "tul" (Graham), in Bengalee "til," in Telinga "noowooloo," in Tamil "yellow cheddie" (Drury), in Sanscrit "tila" (Roxb.): "sesama ab indis" is mentioned by Pliny xviii. 10; "tila," in the Institutes of Menu: *S. Orientale* was observed by Rheede ix. pl. 55 in Malabar; by myself, in the environs of Bombay, cultivated according to Graham for its oil and "a very common plant springing up in uncultivated places and flowering towards the close of the rains:" by Roxburgh, and Royle, in other parts of Hindustan; and by Burmann pl. 38, on Ceylon. Farther East, by Mason v. p. 504. "exotic" and called "hnan" in Burmah, "largely cultivated by the Karens" and the seeds sold to the Burmese, who use the oil in curries and for burning; by Rumphius v. p. 204, cultivated and naturalized in the Malayan archipelago and called in Malay "widjin;" by Blanco, on the Philippines, and called in Tangalo "linga," in Bisaya "longa," in Pampango "langis;" by Thunberg, in Japan and called "koba;" and is called "moa" in China (Rumph.). By European colonists, was carried from Equatorial Africa across the Atlantic to Brazil (Piso, and A. Dec.), has become naturalized in Tropical America, and as far as Florida.

Cyperus esculentus of the Mediterranean countries. Called in Italy "dolcichini" or "baccici" (Lenz), in Greece "kipērōs," in Egypt "hab el aziz" (Forsk.); and the ΚΥΡΑΙΡΟΝ of Alcman — may be compared: the "kupēirōn" by some called "zēnnan" according to Democritus has a root aromatic in flavour (geopon. ii. 6): the "malinathallē" buried in sand not far from the Nile and giving out leaves like "kupēirō," becomes according to Theophrastus iv. 8. 12 as large as a "mēspilōn" and is cooked and eaten: seeds of *C. esculentus* according to Wilkinson have been found in ancient Egyptian tombs: the living plant was observed by Forskal, and Delile, in Lower Egypt; by Forskal, near Constantinople, the root large and edible with an aromatic flavour; by Gittard, in the Peloponnesus. Westward, is described by Morison iii. pl. 11; was observed by Desfontaines i. p. 43 in Barbary; by Tenore pl. 101, and Lenz, in Italy; is known to grow also in Southern France (Villars, and Pers.).

"The same year = beginning of the Tenth manwantara" among the Hindus (Graham Munjari tables, and Bentley as. res. viii. p. 244).

"664 B. C." (= 404 + "260 years" of Thucyd. i. 13, and Clint.), *naval combat* between the Corinthians and their colonial descendants of Corcyra or Corfu. Regarded by Thucydides as the earliest one known to the Greeks.

"Three hundred and forty-one kings" preceded Psammetichus, according to the statement of Egyptian priests to Herodotus ii. 142. In the Afr.-Maneth. table, one hundred and thirteen kings being named, the unnamed kings of the Seventh, Eighth, Eleventh, Thirteenth, Seventeenth, and Twentieth dynasties, make up the required number, $113 + 70 + 27 + 16 + 60 + 43 + 12 = 341$. The exclusion therefore may be remarked of the unnamed kings of the Ninth, Tenth, Fourteenth, Sixteenth, Nineteenth, and duplicated Seventeenth dynasties.

VI. GREEK ASCENDENCY.

The same year (= 610 + "54 years" of Herodotus and the Afr.-Maneth. table, the Euseb.-Maneth. table giving $570 + 25 + 17 + 6 + 45$ years" = 663 = 688 — "12 — 7 — 6 yrs"), accession of Psammētīhōs or Psammetichus, fourth king of the Twenty-sixth dynasty: an occasion marked by the first introduction into Egypt of a body of Greeks (Herod. ii. 154). He married a daughter of king Pankhi — (Birch).

From about this date, the Egyptian monuments no longer present representations of manners, occupations, and the mechanic arts; may also be recognized by a difference in style, a general want of care in sculpturing hieroglyphic characters, and by the reduplication of the deities; the cat-headed deity being especially frequent.

The name of king Psametich occurs on contemporaneous monuments, on stones from a temple begun by him near Naharieh (Leps. eg. and sin. 43); in the great unfinished hall at Karnak, in the quarries at Tura, on the rocks near Philæ, on an obelisk (now in Rome), and on a papyrus and other moveable articles (now in the museums of Europe).

"Under the Psammetichi" (Leps. eg. and sin. p. 28 and 118), a third canon of proportions for

the human figure makes its appearance in the Egyptian sculptures. — This new rule or canon is that mentioned by Diodorus; and continued unchanged until the time of the Roman emperors.

"661 B. C." (. . . Lacharme note to Chi-King i. 9), the kingdom of Ouei incorporated in the kingdom of Tsin by prince Hien-kang

In this year (= 635 y. 147 $\frac{2}{3}$ d. + "32 years" of ten lunations, Sm b. d.), Numa succeeded by Tullus Hostilius, third king of Rome.

Prasium majus of the Mediterranean countries. A Labiate plant called in Greece "phas-sōhōrtōn" (Sibth.), equivalent to the "peristereona" identified by Pliny with the "sagmina" employed by Tullus Hostilius in concluding alliance with the Albans — (Liv. i. 24. 4): the "peristereona" is further identified by Pliny xxii. 3 and xxv. 59 with the "hierabotane" with which the temple of Jupiter was swept and purified, and which was carried to enemies by the "verbenarius" in the Roman army: *P. majus* is described by Morison iii. pl. 21; is termed "galeopsis hispanica frutescens teucris folio" by Tournefort inst. 186; is known to grow about Rome as well as in Sicily and Morocco (Pers.). Westward, the "erva saggouinalis" or "krista gallinakēa" or "pherraria" or "trixalis" or "ēxōupērans" of the Romans is identified in Syn. Diosc. with the "pēristērēōn orthōs," named according to Dioscorides from doves loitering around, mostly single-stemmed from a single root, and a span high with incised greyish leaves: the "pēristērēōn orthōs" or "pēristērion" or "trugōnion" or "iēra vōtanē" or "philtrothōtēs" or "vōunion" is further identified in Syn. Diosc. with the "ēras thakruōn" or "aima ērmōu" or "aima galēs" of the prophets, and "pēmpsēptē" of the Egyptians: the "pēristērēōn orthōs" is mentioned also by Aetius, and Alexander Trallianus: "pastus columbarum" occurs in a translation of Avicenna, and the "aiaranuthali" of Ebn Baitar may also be compared: *P. majus* was observed by Sibthorp, and Chaubard, on rocky hills from the Peloponnesus to Caria in Asia Minor. (See *Verbena officinalis*, *V. supina*, and *Sisymbrium officinale*).

"660 B. C." (Euseb. and Clint., see also Ephor., Aristot., Strab. vi. p. 260, and Clem. Alex. i. p. 399), in Italy, laws made by Zaleucus for the Greek colonists at Locris. Regarded as the earliest collection of *written laws* possessed by the Greeks.

"The same year (= 17th year of the emperor Huivam = 58th year of the 35th Chinese cycle," Kaempfer. ii. 2, and art de verif.), "Third and last epoch of Japanese history," the Nin-O of the Japanese, or "era of Sinmu" (see below).

"In this year" (. . . Lacharme note to Chi-King i. 4. 6), Oen-kong, son of Y-kong king of Ouei. — He was killed in battle against the barbarians of the North.

"657 B. C. = 20th year of Hwei-wang" (Chinese chron. table), beginning of the Thirty-fourth cycle.

Ricinus communis of Tropical America? The *castor-oil plant* is called in Germany "wunderbaum," in Italy "ricino" or "ricino commune" (Lenz), in Greece "krōtōnēia" or "kōllōkiki" (Sibth.) or "kiki" (Fraas), in Egypt "kharoua," in Nubia "rouagy" (Del.), in Yemen "tebscha" or "djar" (Forsk.), by the prophets "aima purētōu," in Egyptian "susthamna" or "trixin" (Syn. Diosc.), in Sanscrit "eranda," in Hindustanee "arend" or "arendi," in Bengalee "bherenda," in Telinga "amadum" (Lindl.), in Tamil "valluk" or "sittamunak" (Drur.), in Burmah "kyet-hsoo" (Mason), in Tagalo "lingansina" or "tangantangan," in Ylocano "tangantangan" or "tavatavang sina" (Blanco), in Japan "fima," or usually "karagi" or "karagasju" or "Chinese goma" (Thunb.); and the "ricin" is mentioned in an ode attributed to Tcheou-kong — (Chi-King i. 15. 1, transl. Lacharme): *R. communis* was observed by Kaempfer, and Thunberg in Japan, employed for making ink; by Mason v. 492, "exotic" in Burmah, very extensively cultivated by the Karens for its seeds, used to fix colours; by Roxburgh, and Wight, in Bengal and peninsular Hindustan; by Rheede ii. pl. 32, in Malabar; by myself, cultivated and naturalized as far as Bombay, according to Graham "common about villages all over the country" and its oil "generally used in lamps by the natives;" by Forskal, among the mountains of Yemen, seemingly wild; by myself, seemingly wild on Zanzibar; by Grant, "everywhere near dwellings" on his route to the Nile, its leaves having virtues among the Negro tribes, and its oil used for ointments. Farther North, the "sillikupriōn" or "kiki" is mentioned by Herodotus ii. 94 as cultivated in Egypt for its oil, and springing up spontaneously in Greece; its cultivation in Egypt is also mentioned by Strabo xvii. 2, but according to Pliny xv. 7 the plant was unknown there in ancient times: the "kiki" or "krōtōn" is mentioned also in Nat. mul., 2 Morb. mul. 79, Plato tim. 60, Theophrastus i. 10. 9, Nicander ther. 676, Diodorus i. 34, Galen, Hieronymus, Hesychius, is compared by Dioscorides to a small fig-tree, its leaves like those of the plane but larger; is identified in the added Synonyms with the "sēsēli kupriōn," and with the "lōupa" or "rikinōum" of the Romans; and the "cici" or "ricinum" was in Spain as well as Italy in the days of Pliny xv. 7: the "kykywn" is mentioned in Jonah iv. 6; "kyk" oil according to the Talmudists is one of the five kinds permitted by Tradition in sabbath lamps (Royle in Kitt. bibl. cycl.); and the "kherwa" is mentioned by Avicenna, and Serapion: *R. communis* was observed by Forskal, Delile,

and Clot-Bey ii. 38, under cultivation in Egypt for its oil; by Sibthorp, Chaubard, and Fraas, in waste places and sometimes cultivated, from Cyprus to the Peloponnesus; by Matthioli 771, in Italy; by Lobel, and J. Bauhin, under cultivation in Southern Europe (A. Dec.); by Ray, and Gussone, naturalized on Sicily; by Desfontaines ii. 355, and Reuter, in Barbary. Eastward from Japan, was observed by myself naturalized on the Feejeean Islands, and strings of its seeds used as candles; naturalized also from Polynesian introduction on New Zealand and the Hawaiian Islands. Farther East, is called by the Caribs "lamourou" (Descourt. i. and ii. pl. 127), their knowledge of the plant therefore not derived from Europeans; was observed by E. James seemingly wild at the junction of the Canadian and Arkansas rivers: but from European introduction is cultivated in our Atlantic States and along the Ohio.

"656 B. C." (Clint. i. p. 194 and 274), Deioeces succeeded by Phraortes, second Median emperor: regarded by Clinton as the "Arphaxad" of the Book of Judith i. 1 to 15.

"655, Aug. 19th," in the "Ninth month in the 22d year of Hoi-wang" (Khong-tseu, the Li-tai-ki-sse, and Pauth. 107), *eclipse of the sun*.

"The same year" (. . . Clint.), the Bacchiadæ expelled from Corinth; Cypselus establishing himself there as king.

About this time (Percev. i. 54), Himyar, son of Abdshams and great grandson of Yarob, ruling Yemen. His brother Cahlan was the progenitor of various Bedouin tribes.

"654 B. C." (Hieronym., and Clint.), on the Northern shore of the Black Sea, the city of Olbia or Borysthenes founded by Greek colonists.

"651 B. C. = 1st year of Siang-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"648, Feb. 1st" (. . . Blair), the Thoth of this Nabonassar year. "Having shifted twenty-five days in one hundred years."

"647 B. C." (= 625 + "22 years" of the Astronom. can., and Clint.), Saosduchinus succeeded by Chinaladanus, as king at Babylon. (The accession of the "brother of Sammaghes" as Assyrian king, is placed by Alex. Polyhistor two years later, = 604 + "20 + 21," with "21 years" only assigned to his reign; the two accounts possibly referring to one and the same person).

"646 B. C." (. . . Clint.), Argæus succeeded by Philippos, sixth king of Macedonia.

Not earlier than this date (Graham Munjari tables, Puranas, and Bentley as. res. viii. p. 244), Bhurisenā reigning in Hindustan.

"644 B. C." (Ma-tuan-lin, E. Biot, and Humb. cosm. iv.), the earliest recorded fall of an *aerolite* in China.

641 B. C. (= 694 y. 183 $\frac{1}{2}$ d. — "55 years" of twelve lunations of 2 K. xxi. 1, and 2 Chron. xxxiii. 1), Manasseh succeeded at Jerusalem by his son Amon, eighteenth Jewish king.

"640 B. C." (Herodot. iv. 152, and Letronne), Colaeus of Samos on his way to Egypt visiting Platea. Sailing thence, he was driven by continual adverse winds into the Western portion of the Mediterranean, and even "as if led by the divinity" through the straits into the Atlantic: the Greeks not for the first time seeing the main ocean (see above, Carians).

639 B. C. (= 641 y. 51 $\frac{17}{8}$ d. — "2 years" of twelve lunations of 2 K. xxi. 19, and 2 Chron. xxxiii. 21), at Jerusalem, Amon slain by his servants; and succeeded by his son Josiah, nineteenth Jewish king.

In this year = "26th year of Psammetichus," death of the Apis or sacred bull that was born in the "26th year of Taharka" — (Birch).

"The same year" (Herodot. iv. 156, and Clint.), first settlement of Greeks on the Lybian or North African shore. At Platea, under the direction of Battus.

Thapsia silphium of the Lybian Desert. The "silphiōn" plant discovered in the following year (638 = "7 years before the building of Cyrene," Theophr. . . , and Plin. xix. 15) in the district around the Greek settlement; — figured on coins of Cyrene, and celebrated among the Greeks for the medicinal and culinary properties of its concrete juice: imported "silphiōn of Cyrene" is mentioned by Herodotus iv. 169, Aristophanes, Antiphanes, in the Hippocratic treatise 1 Morb. 4, and by Nicander, and Strabo xvii. 3; was already rare in the days of Scribonius Largus xvi. 67; was known to Dioscorides iii. 84, the plant now so rare that a stem sent from Cyrene to the emperor Nero was the only one procured within the remembrance of Pliny xix. 15: T. silphium was re-discovered in 1818 in its original locality by P. Della Cella, in journeying by land from Tripoli to Egypt.

In the same district (Aristot. animal. viii), there were originally no "phōnōntēs vatrahōi" *frogs* having voice, *Rana temporaria*? — implying therefore, that these animals were after some years imported by the Greek settlers. The frogs now frequent all over the island of Madeira, I was assured had been imported by residents.

637 B. C. After "two years" stay, Battus and his companions, leaving behind only one man, returned to Greece. But before the close of "this year" (Herodot. iv. 157, and Clint.), second settlement by the Greeks on the Lybian shore. At Aziris, also under the direction of Battus.

"635 B. C." (Herodot. iv. 157, and Clint.), in Lydia, the city of Sardis captured by the Cimmerians; who had again entered Asia Minor.

The same year (= 616 + "24 years" of ten lunations, Sm. b. d.), Tullus Hostilius succeeded by Ancus Marcius, fourth king of Rome.

Mentha arvensis of Europe and middle Asia. Called in Britain *mint*, in France "*menthe*" (Nugent), in Germany "*minze*" (Grieb), in Egyptian "*atshinsthōi*" or "*ashinnsthōi*" or "*asinstōi*" (transl. n. test.); in which we recognize the "*menta*." of the early Romans, who deduced the name from "*mintha*," — commended for its taste and odour by Pliny xix. 47 to xx. 53 "*grato menta mensas odore percurrit in rusticis dapibus*" agreeably scenting rustic banquets; mentioned also by Cicero, and Ovid met. x. . . ; its use in cookery, by Apicius; its cultivation according to Columella, and Pliny, renewed from the "*mentastrum*" or "*silvestre*" kind, growing in fallow ground and in the time of Pompeius found to remove "*elephantiasin*" white scurf on the face: *M. arvensis* is described by Lobel adv. p. 217; is termed "*m. arvensis verticillata hirsuta*" by Tournefort inst. 189; was observed by Forskal on Malta; is known to grow in fallow ground as far as Denmark (fl. Dan. pl. 512, Thuil., All., Lam. fl. fr., and Pers.), and is besides cultivated. Eastward, the "*ēthuōsmōn*" enumerated by Matthew xxiii. 3, and Luke xi. 42 as cultivated in Palestine, by Dioscorides as medicinal and a condiment, mentioned also in Geopon. xii. 24, may be compared: *M. arvensis* was observed by Sestini in the environs of Constantinople (Sibth.); by Delile, in the gardens of Egypt; and is known to grow about Caucasus (Royle). Farther East, is known to grow along the Himalayan mountains as far as Cashmere (Royle in Kitt. bibl. cycl.); was observed by Graham "in gardens" in the environs of Bombay; by Roxburgh, in other parts of Tropical Hindustan. By European colonists, was carried to Northeast America, where it continues under cultivation, and according to A. Gray has been found springing up spontaneously "Penn. and Ohio, rare, odor like that of decayed cheese." Is one of three species enumerated by Lindley as having "been in repute as stomachics and emmenagogues." (See *M. aquatica*, and *M. crispa*).

"634 B. C." (Herodot., and Clint.), Phraortes slain by the Assyrians; and succeeded by his son Cyaxares, third Median emperor. Whose siege of Nineveh was arrested before the close of the year by Scythians from beyond the Black Sea overrunning Asia Minor. — The Scythians remained "twenty-eight" years, and extended their incursions as far as Palestine.

One hundred and tenth generation. Sept. 1st, 634, mostly beyond youth: the Egyptian priest Sonchis preceptor of Solon: the Jewish prophets, Zephaniah, and Habakkuk: the Greek poets, Aristoxenus of Selinus, Lesches of Mytilene, Xanthus, Pisander of Camira, and Mimnermus.

"633 B. C." (. . . Clint.), at the mouth of the Danube, the city of Istru founded by Milesian Greeks.

"631 B. C." (Euseb., and Clint.), in Lybia, the city of Cyrene founded by Greek colonists under Battus.

Continuing South, the Scythians were dissuaded by Psametik from entering Egypt; but on their way back, some of their number plundered the temple of the Uranian Venus in Ascalon, of the deity called "*Alilat*" by the Arabians. This was the oldest temple of Venus known to Herodotus i. 105 to iii. 8, having preceded and given rise to that on Cythera built by the Phoenicians, and the one on Cyprus. The origin of the Enarean Scythians was attributed to the above-mentioned desecration.

Tilia argentea of Eastern Europe. A *linden* tree called in Greece "*phlamōuria*" (Fraas) or "*lipa*" or "*philōuria*" (Sibth. app.); in which we recognize the "*philurēn*" used in divination by the Enarean Scythians, an art according to their account taught them by Venus — (Herodot. iv. 67), furnishing the splints or stays worn by the poet Cinesias, accused by the orator Lysias (Ruel i. 138): the "*philura*" is mentioned also by Xenarchus, Aristophanes av. 1378, and Athenaeus xii. 76 to xv. 24; by Theophrastus iv. 4. 1 and caus. 11. 19. 2 as not flourishing in the gardens of Babylon, the under surface of its leaves whitish, and a "*thēlēia*" kind distinguished: *T. argentea* was observed by Sibthorp, and Fraas, on mountains from the Peloponnesus to Constantinople; by Griesebach p. 136, in Macedonia; by Waldstein and Kitaibel, in Hungary; and "*lipa*," one of the above names current in Greece, is (according to Moritzi and A. Decandolle) Slavonian. Farther South, the importation into Egypt of timber of "*nafhaur*" or "*tilia*" is enumerated by Forskal p. lvi. (See *T. Europæa*).

"630 B. C.," and "in the reigns of Psammetichus and Cyaxares" (Strab. xvii. 1. 18, and Clint.), in Egypt, the city of Naucratis founded by Milesian Greeks.

"629 B. C." (= 678 — "49 years" of Herodot. i. 16, and Clint.), Ardys succeeded by Sadyattes, as king of Lydia.

"626, Feb. 3d." In "spring, on the day Kouei-hai, in the second month in the 26th year of Siang-wang" (Khoung-tseu, the Li-tai-ki-sse, and Pauth. 107), *eclipse of the sun*.

About this year (Percev. i. 55), Malik, son of Himyar, obtaining possession of Oman, maintained the independence of the province against his brother Wathil.

"625, Jan. 27th" (= 604 + "21 years" of the Astronom. can., and Clint.), Chinaladanus succeeded by Nabopolassar as king at Babylon. (By Alex. Polyhistor, "twenty" years only are assigned to his reign; but in another place where he is called "Sardanapallus, 21" are given. See also Syncell. p. 210).

"The same year" (Diog. Laert., and Clint.), Cypselus succeeded by his son Periander, as king of Corinth. By some writers, Periander is enumerated as one of the "Seven sages."

"623 B. C." (Herodot., and Clint.), commencement of war between the Lydian king Sadyattes and the Milesian Greeks. — The war continued "eleven" years.

The same year (= 639 y. 73 $\frac{2}{3}$ d. — "18th year" of twelve lunations of 2 K. xxii. 3, and 2 Chron. xxxiv. 8), the lost "book of the law" given by Moses, discovered in the temple at Jerusalem by the high priest Hilkiah, and brought to king Josiah.

"621, Saturday April 22d, five hours after midnight" (as reduced by Ptolemy to the meridian of Alexandria, Blair), Fourth Babylonian *eclipse of the moon*.

"The same year = 33d year of Siang-wang" (the Li-tai-ki-sse, Sse-ma-thsian, Gaubil, and Pauth.), death of Mou-koung prince of Thsin; at whose funeral "one hundred and seventy-seven" persons immolated themselves; a custom now first introduced into China from the "Tartars of the West." — The custom is mentioned as existing among the Scythians, by Herodotus.

"The same year" (Tat., Clem. Alex., and Clint.), the Laws of Dracon adopted at Athens.

620 B. C. = "45th year of Psametik," the date (according to Boeckh and Franzius) of the *carliest Greek inscription* known; that at Abousimbel in Nubia, recording the passage of king Psametik's army and presenting the following forms of letters, . . . Α, Δ, Ε, Θ, Κ, Λ, Μ, Ν, Ψ, Φ, Χ, Ψ.

The "Third" epoch in Nubian or Ethiopian history (according to Lepsius eg. and sin. 17, 29, 152 to 219), is that of kings independent of Egypt: the kings of Meroe, whose dominion extended not only over Upper Nubia, but as far down the river as Philæ. — At Meroe, near Begeraueh, the names of "fifteen" different kings were found by Lepsius p. 152; and among "about thirty different names of kings and queens" at the pyramids there, he remarked the "emblems of Sesurtessen" used "for the fourth time as the throne name of an Ethiopian king." The temple of Amara was "built by the kings of Meroe and Naga:" and Napata continued to be a residence of the "Ethiopian kings even in the time of Herodotus." The *Ethiopian demotic* was "more in use and more generally known than hieroglyphic" writing; was "similar to the Egyptian demotic in its characters" of "between twenty-five and thirty signs," and was in like manner "read from right to left;" but there is a "constant separation of words by two points:" the Bega language of the Bishari, is regarded by him as "most probably the key to the ancient Ethiopian inscriptions written in simple characters."

"618 B. C. = 1st year of King-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

"617 B. C." (= 629 + "12 years" of Herodot. i. 16, Clint. i. p. 184), Sadyattes succeeded by his son Alyattes, as king of Lydia.

"616 B. C." (= 578 + "38 yrs.," Sm. b. d.), Ancus Marcius succeeded by Tarquinius Priscus, fifth king of Rome, and the calendar Year of "ten months" abrogated (Jun. Gracchan.). Tarquinius Priscus was a son of Demaratus of Corinth, one of the expelled Bacchiadae.

Hardly earlier than this date (Graham Munjari table, Puranas, and Bentley as. res. viii. p. 244), Sucshetra reigning in Hindustan.

"In the reign of Alyattes" (Herodot.), the Cimmerians finally expelled from Asia Minor.

"613 B. C." (Humb. cosm. iv. 185), a *comet* observed in China: the earliest — in the collection of Ma-tuan-lin.

In this year = "52d year of Psammetichus," death of an Apis or sacred bull. Its mummified body was the first one deposited in the new gallery at the Serapeum; built together with additions to the great temple of Ptah at Memphis by Psammetichus — (Birch).

"612 B. C. = 1st year of Kouang-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

"April 28th." On the "first day of the Sixth month" (Khoung-tseu, Gaubil, and Pauth.), *eclipse of the sun*.

"610 B. C." (Euseb., and Clint.), escape from pirates of Arion the inventor of dithyrambic poetry. A commemorative votive offering of a small bronze statue of a man seated on a dolphin, was placed on the Tænarum promontory; — where it remained more than seven hundred years, being mentioned by Herodotus, and Aelianus xii. 45.

The same year (= 609 y. 10 mo. 2 d. + the portion of his "1st year" preceding the "first day" of the eleventh month "Epiphi" of the stela at Leyden = 570 + "25 + 6 + 16 years" of Herodotus — 7 years excess shown by stelæ), Psammētichos succeeded by Nēhaō II. fifth king of the Twenty-sixth dynasty. The name of king Nekau II. occurs at Rosetta (Glid. analect.), also on stelæ or sepulchral slabs.

609 B. C. (= 569 + "27th + 65 y. 10 mo. 2 days" of the stela at Leyden), the "first day of the month Epiphi in the first year of Nekau II.," not later than this date.

The same year (= 639 y. 73 $\frac{22}{100}$ d. — “31 years” of twelve lunations of 2 K. xxii. 1 and 2 Chron. xxxiv. 1), Josiah striving to arrest the march of an Egyptian army under Nekau II., slain in battle at Megiddo. He was succeeded by his son Jehoahaz. But at the end of “three months,” Jewish independence was overthrown by Nekau II.; who removed Jehoahaz to Egypt, and appointed his brother Eliakim king at Jerusalem, under the changed name of “Jehoiakim” (2 K. xxiii. 30, 2 Chron. xxxvi., and Herodot. ii. 159).

608 B. C. (= 570 — “35th year . . . on the 2d of Paopi + 71 y. 4 mo. 6 days” of the stela at Florence), “first day of Paoni in the third year of Nekau II.”

607 B. C. = “4th year of Nekau II.,” the latest date in his reign found on the monuments (C. Mull. fr. Man. p. 594). But the “9 years” shown by stelæ to be deficient in the Afr.-Maneth. table, probably belong to this reign; especially as Herodotus’ account corresponds.

Cucumis melo of the Southern border of the Caspian. Called in Britain, France, and Spain *melon* (Prior), in Germany “melone,” in Italy “melone” or “popone” (Lenz), in Greece “pépōnia” or “karpōusia” (Fraas), by the Turks and Tartars “kaun” (A. Dec.) and one variety in Egypt “qaoun” (Del.), the seeming origin of the Hebrew קָמֶלֶךְ kykywn in Jonah iv. 6, — and early Greek “kikuōn:” the “sikuōn” is mentioned by Alcaeus, Laches, and Matron; the “sikuthiōn,” by Phrynichus; the “sikuōn,” by Praxilla, Cratinus, Aristophanes *acharn.* 520, Polemon *diæt.* ii., Anaxilaus, Theophrastus, Zenobius *iv.* 21, and that of Antioch is identified by Athenaeus *iii.* 4 with the “sikuōnian” of Megalopolis, and “sikuan inthikēn:” the “sikuan tōn pepōna” is mentioned by Speusippus; the “sikuōs pepōn” by the comic poet Plato, Theopompus (*Athen.* ii. p. 68), Aristotle *probl.* xx. 22, by Aeneas Tacticus 29 as used in smuggling spear-heads; the “pepōn” by Cratinus (*Athen.*), Florentinus (*geopon.* xii. 20), by Dioscorides as diuretic, and Galen *fac. alim.* ii. 5 expressly states that the inner portion containing the seeds is not eaten: *C. melo* was observed by Chaubard, and Fraas, under cultivation in Greece; by Abd-allatif, Forskal, Delile, and Clot-Bey, under cultivation in Egypt; by myself, the fruit in market at Mocha and Muscat. Westward, “melones” are mentioned by Columella *xi.* 3. 53, Palladius *iv.* 9. 6, and “pepones” by Pliny *xix.* 23 to *xx.* 6: *C. melo* is described by Matthioli *pl.* 368, and Dalechamp *pl.* 623; but in Southern France, according to Olivier de Serres, began to be extensively cultivated only “in 1629.” Eastward from Syria, is called in Persian and Hindustanee “kharbuza” (A. Dec.), also in Hindustanee “jamali,” in Bengalee “phuti” (D’roz.), and though having no Sanscrit name (Roxb., and Pidd.) is “cultivated all over India” (Graham): was observed by Mason *v.* p. 456 “exotic” in Burmah and called “tha-khwa-hmwæ,” a “very indifferent” kind “cultivated by the natives generally;” by Loureiro *p.* 726, in Anam and China, also an indifferent kind; by Blanco, well known on the Philippines and called in Tagalo “tabogo;” by Kaempfer, and Thunberg, abundantly cultivated in Japan and called “tenkwa” or usually “kara uri,” the term “kara” signifying exotic from China. By Columbus, was carried to America (*F. Columb.* 53), where it continues under cultivation, and in the United States is called *musk-melon*; and by the Portuguese (according to Rumphius *v.* 404) was carried to the Malayan archipelago. (See *Ricinus communis*).

In the reign of Nekau II. (Herodot. *iv.* 40), Africa circumnavigated, and as far as known for the first time. (In passing around the Southern Extreme of Africa, the navigators landing at intervals doubtless met with tribes belonging to the *Hottentot Race* of man; living on the spontaneous productions of the country, — as for the most part to the present day).*

* *Aphyteia hydnora* of Austral Africa. The lower portion constituting the fruit, eaten by the Hottentots and by various quadrupeds — (Thunb., and Pers.).

Euclea undulata of Austral Africa. The fruit eaten by the Hottentots — (Thunb. *trav.* iii. 4).

Brabejum stellulifolium of Austral Africa. The fruit eaten by the Hottentots, — and used for coffee (by the colonists?), according to Thunberg *ii.* 2.

Strelitzia of Austral Africa. The fruit eaten by the Hottentots — (Thunb. *iii.* 4).

Schotia speciosa of Tropical and Austral Africa. The beans eaten by the Hottentots — (Thunb.). Farther North, growing also in Senegal (Jacq. *rar.* i. *pl.* 75, and Pers.).

Myrica cordifolia of Austral Africa. The wax on the berries eaten by the Hottentots, — and used for candles (by the colonists), according to Thunberg: the plant described also by Burmann *afr.* *pl.* 98 (Pers.).

Stapelia incarnata of Austral Africa. Eaten by the Hottentots — (Thunb.).

Stapelia articulata of Austral Africa. Eaten by the Hottentots — and colonists (Thunb., and Mass. *pl.* 30). As transported to Europe, described by Aiton.

Zamia cycadifolia of Austral Africa. The pith among the Hottentots, a substitute for bread — (Thunb. *iii.* 4). Transported to Europe, *Z. cycadifolia* is described by Jacquin *fragm.* *pl.* 25, and Gaertner.

"606 B. C. = 1st year of Ting-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

The same year (= 608 y. 322 $\frac{2}{3}$ d. — "4th year" of twelve lunations, Jerem. xlv. 2), defeat of the Egyptian army under Nekau II. described in burning words by Jeremiah xlv. Before the close of the year (Herodot. i. 106, and Clint.), capture and destruction of Nineveh by the Medes under Cyaxares and their Babylonian allies.

The $\eta\mu\epsilon$ smyr of Jeremiah xvii. 1, may be compared with "smiris" the Greek name of *emery*, which when pulverized is used in gem-engraving. — The "shmyr" is also mentioned in Ezech. iii. 9, Zach. vii. 12; and the "smiris" or "smuris," by . . . The mineral is procured from . . ., one of the Greek islands; and this locality continued the chief or only source of commercial supply until the recent discovery of a locality in New England.

Juniperus drupacea of Syria. The imported berries of a species of juniper are called in Egypt "arar" (Forsk. mat. med.), in which we recognize the "arar" of Ebn Baitar, and 9090 oror growing in the wilderness according to Jeremiah xvii. 6 and xlviii. 6: — "arkēuthithōn mēizōna" are among the ingredients of "kuphi" incense enumerated by Manetho (Plut. is. and osir. 80): two kinds of "arkēuthōs" are also mentioned by Dioscorides i. 103 to 105, one having berries as large as a "karuōu:" J. drupacea was found by Labillardiere ii. pl. 8 on mount Casius in Syria, its fruit tubercular and subrotund, three times longer than the leaves; and Robinson journeying from Hebron among Desert mountains to Petra met with a species of juniper "ten or fifteen feet" high abounding in rocky situations, but in the valleys becoming a larger tree, its berries having something of "the aroma of the pine." (See J. macrocarpa, and J. excelsa).

Sapindus emarginatus of Tropical Hindustan. A kind of *soapnut* imported "from India" was found by Forskal, and Delile, employed in Egypt to wash the finer woollens, and called "ryteh:" in which we recognize the $\dagger\eta\eta\eta$ bryd used in washing according to Jeremiah ii. 22, — and Malachi iii. 2. Eastward, S. emarginatus, a tree of medium size, is called in the environs of Bombay "rhetē" (Graham), in Bengalee "buro-reetha," in Canara "aratavala," in Telinga "konkoodoo," in Tamil "poovandie" or "ponnanga" (Drury); was observed by Gibson, and Graham, about villages from Guzerat to Bombay and the Deccan, the nuts "used medicinally" and "for washing the finer kinds of silk;" is known to occur also in Mysore, the Northern Circars, and Bengal (Roxb., Ainsl., Wight, and Drury). By European colonists, or at least recently, was carried to Burmah, where according to Mason v. p. 517 it "appears to flourish."

Cyanella Capensis of Austral Africa. Eaten by the Hottentots — (Thunb.). Transported to Europe, described by the younger Linnæus, Andrews pl. 191, and Jacquin hort. iii. pl. 35.

Licusscuxia edulis of Austral Africa. An Iris-like plant, the bulbous root eaten by the Hottentots, — and when cooked having the taste of potatoes (Burm., and Thunb. iii. 1). Transported to Europe, V. edulis is described by Delarbre, Linnæus, Andrews pl. 83, and Jacquin hort. iii. pl. 20.

Gladiolus plicatus of Austral Africa. Eaten there, — according to Thunberg. Transported to Europe, described by Jacquin rar. ii. pl. 237, and Gawler.

Aponogeton distachyon of Austral Africa. Its tuberous root broiled and eaten there — (Thunb. iii. 1, and Pers.). Transported to Europe, A. distachyon is described by the younger Linnæus, and Aiton p. 495; and has become naturalized in a stream near Montpellier (Godron, and A. Dec.).

Lobelia of Austral Africa. The root eaten by the Hottentots — (Thunb.).

Mesembryanthemum edule of Austral Africa. Growing in the sand of the seashore, the fruit eaten, and the juice employed medicinally — (Herm. lugd. pl. 245, Thunb. iii. 2, and Pers.). Transported to Europe, described by Dillenius pl. 212.

Mesembryanthemum emarcidum of Austral Africa. The flowers eaten by the Hottentots to quench thirst — (Thunb.). Transported to Europe, described by Haworth.

Albica major of Austral Africa. The stem chewed by the Hottentots to quench thirst — (Thunb.). Transported to Europe, flowered in 1633 at Paris and was termed "*ornithogalum luteovirens*" by Cornuti pl. 161; and as cultivated elsewhere, is described by Morison iv. pl. 24. Dryander act. holm. 1784, and Jacquin rar. pl. 36.

Hermas gigantea of Austral Africa. A large Umbelliferous plant used for tinder by the Hottentots — (Thunb.): corresponding therefore to the *Ferula communis* employed in the Mediterranean countries by Prometheus. From transported specimens, H. gigantea is described by the younger Linnæus suppl. p. 435, and Lamarck enc. iii. p. 121.

Anthyllis of Austral Africa. Cords made of the bark by the Hottentots — (Thunb.).

Fucus buccinalis of the sea-margin of Austral Africa. A gigantic seaweed, furnishing the Hottentots with trumpets.

Rhus of Austral Africa. The wood employed for bows by the Hottentots — (Thunb.).

Aloe dichotoma of Austral Africa. Furnishing the Hottentots with quivers for their arrows — (Patters. iter. pl. 3 to 5, and Thunb.).

"604, Jan. 21st" (Astronom. can., and Clint.), Nabopolassar succeeded by Nebuchadnezzar, as king at Babylon. He built the celebrated wall around the city (Abyden., and others, see also Dan. iv. 30); was the first Babylonian king who "acquired extensive dominion;" and reigned "forty-three" years (according to Alex. Polyhistor, and the Astronom. can.).

"The same year," on the "fourteenth day of the Ninth month" (Pauth. p. 111), "in the kingdom of Thsou" (now the provinces of Hou-pe and Hou-nan), birth of Lao-tseu, founder of the doctrine of Tao. — The Tao-te-king, written by him and containing his doctrines, has been translated by Pauthier.

In this year (= 552 + "52 years reign" of the Mahavamsi i. p. 28), accession of the Hindu king Bimsara.

603 B. C. = "8th year of Necho," in tablets at Hammamat — (Birch).

"May 17th" (Bayer, Hales, and Clint. i. p. 419), *eclipse of the sun*. Probably the one interrupting a battle on the Halys between the Medes under Cyaxares and Lydians under Alyattes, and terminating the war. The eclipse had been predicted by Thales (Herodot. i. 74).

Thales learned geometry and astronomy in Egypt, at this time considered the school of philosophy and source of all learning and science (Plut. is. x., and Leps. eg. and sin. p. 384); he first among the Greeks "found out the passage of the sun from Tropick to Tropick," and divided the year into "four" seasons (Eudem., and D. Laert. i. 23). He also thought the gods omnipresent, That all things are filled with them (Aristot. psych. i. 5).

601 B. C. (= 598 — "3 years" of 2 K. xxiv. 1, see also Ezek. xxi. 21), the Babylonian king Nebuchadnezzar having arrived "at the parting of the way," used *divination* by means of arrows, he also "consulted with images, he looked in the liver" (haruspicium of the Romans), and was directed to Jerusalem. — Divination with arrows is practised among the Arabians to the present day, and the arrows "acdah" are described by D'Herbelot as "without head or wing, they took three on which they wrote 1st 'command me Lord,' on the 2d 'forbid me lord,' the 3d blank" (J. Roberts introd. Sakaa Thevan in Orient. transl. lond.).

Erinna about this time composing poetry. She was known to Sappho, but "died at the age of nineteen" — (Sm. b. d.).

Carthamus lanatus of the Mediterranean countries. A thistle-like plant called in Italy "scardicione" or "ceceprete" (Lenz), in Greece "atraxulē" (Sibth.), or "tēs gunaikas t'atrahti" (Fraas), by the prophets "aphēthrōs," in Egyptian "hēnō" (Syn. Diosc.); and doubtless known to Erinna when she entitled one of her poems HAKATH distaff: — the term "atraktōs" is used for distaff by Herodotus iv. 162: the "knēkōu agrias" according to Theophrastus vi. 4. 5 more upright than the "ēmērō" kind and used by the women of antiquity for a distaff, is identified through Syn. Diosc. with the "atraktulis" of Dioscorides, resembling "knikō" though much smaller, leafy at the summit but the greater part naked and rough, used for an "atraktōu" by women: *C. lanatus* was observed by Sibthorp, Chaubard, and Fraas, frequent from Crete and the Peloponnesus to Cyprus: Westward, the "knikōs agria" or "atraktulis" or "amurōn" or "aspithiōn" is further identified in Syn. Diosc. with the "prēsēpiōm" or "phōūsōugrētis" or "klōnōuka rōustika" of the Romans; but the account by Pliny xxi. 53 to 107 of the "cnicon silvestris" with rigid stem employed in ancient times for a distaff and therefore by some called "atractylida," seems taken from the Greek: *C. lanatus* is described by Matthioli p. 593 (Spreng.), and Lobel pl. 13; is termed "cnicus atractylis lutea dictus" by Tournefort inst. 451; was observed by Lenz frequent in Italy, by Forskal near Marseilles, and is known to occur in waste places in other parts of Southern France (Dec. fl. fr., and Pers.).

Carlina corymbosa of the Mediterranean countries. Having general resemblance to the preceding, and also called in Greece "atraxulē," but sometimes "atraklutha" or "sumlaga" (Sibth.); and possibly a distaff-thistle, — the "knēkōu agrias" having according to Theophrastus black "karpōn" seeds: *C. corymbosa* was observed by Sibthorp, Chaubard, and Fraas, abounding from the Peloponnesus throughout the Greek islands to mount Athos. Westward, is termed "*c. umbellata apula*" by Tournefort inst. 500; and is known to grow in Carniolia, Italy, Barbary, and as far as France (Pers.).

"Sept. 20th." On the "first day of the Seventh month in the 6th year of Ting-wang" (Khoun-tseu, Gaubil, and Pauth. 108), *eclipse of the sun*.

One hundred and eleventh generation. Jan. 1st, 600, mostly beyond youth: the Chinese philosopher Lie-tseu (Pauth. p. 96): the prophet Obadiah: the Greek poets, Damophyle, Stesichorus, Chersias of Orchomenos, and Sacadas.

"The same year" (= 480 + "120 years" of Scymn. and Clint., see also Herodot., and Strab. iii. 4. 2), Massalia or Marseilles founded by colonists from Phocaea in Asia Minor. The Phocaeans according to Herodotus, were the first Greeks who made long *sea-voages*, as far as "Spain and Tartessus;" and according to Strabo, Maenaca near Malaga was their most Western settlement. — Their colonial descendants of Massalia soon became powerful enough to defeat the Carthaginians in a *naval combat*, mentioned by Thucydides i. 13.

The Gauls or French are regarded as having probably learned the art of making *iron* and *glass* from these Greek colonists: the Age of Iron commencing at about this date in France, Switzerland, and Northern Europe, as shown in the contents of tombs and by various debris (see Troyon p. 326 and 355).

Agrostemma coeli-rosa of the West Mediterranean countries. The "luhnis agria" identified in Syn. Diosc. with the "apokathēmēnēs taurōs" of the prophets, "sēmōura" of the Egyptians, — and described by Dioscorides as in every respect resembling the "ēmērō" kind (*A. coronaria*), its seeds in like manner employed against the sting of scorpions, may be compared: the "luhnis agria" or "tragōndōtōn" or "atōkiōn" or "iērakōpōthiōn" or "lampas" is further identified in Syn. Diosc. with the "intivōum agrēstēm" or "lapatōu kaphagōuina" or "stērithōs" of the Romans: *A. coeli-rosa* is described by Morison v. pl. 22; is termed "lychnis foliis glabris calyce duriore" by Tournefort inst. 337; was observed by Boccone sic. pl. 14, and Sibthorp, frequent in grain-fields in Sicily; is known to occur also in Barbary (Pers.).

Agrostemma flos-jovis of the mountains of Southern Europe. The "luhnis agria" or plant in question — is however referred here by Gesner hort. germ. f. 266 (Spreng.): *A. flos-jovis*, a tomentose species, is described by Boccone mus. pl. 42; is termed "lychnis umbellifera montana helvetica" by Tournefort inst. 334; is known to grow in Switzerland, Southern France, the Palatinate (Lam. fl. fr., and Pers.); and was observed by Sestini not far from Constantinople (Sibth.).

"599 B. C. (= 135 years after Syracuse," . . . Sm. b. d.), Camarina in Sicily founded.

Rhus cotinus of the Mediterranean and Tauro-Caspian countries. The *smoke-bush* is called in France "fustet" (Fée), in Germany "perücken-sumach," in Italy "scotano" or "cotino" (Lenz), in Greece "mpōia" (Fraas) or "hrusōxulōn" (Sibth.); in which we recognize the "hrusōxulōn" of schol. Theocr. or "thapsōs" identified with the ΕΚΥΘΙΚΟΝ: ΕΥΛΟΝ of Sappho — by Photius: the word "thapsinōs" yellow-coloured occurs in Aristophanes vesp. 1404; the "thapsō" plant is mentioned in connexion with colouring by Theocritus ii. 88, and Paulus Aegineta iii. 2; and the city of Thapsos was sometimes called Hrusoxulos: the "kōkkugēas" of Theophrastus iii. 16. 6, a small tree with "anthrālē"-like leaves and fruit dissipating in pappus (an account copied by Pliny xiii. 41) is referred here by writers: *R. cotinus* was observed by Sibthorp, Chaubard, and Fraas, abounding on the mountains of Attica and the Peloponnesus and its wood used for dyeing a beautiful orange, being (according to Daubeny) the *sumach* of commerce; is known to grow also in Siberia (Pers.). Westward, "in appenino frutex" in the days of Pliny xvi. 30 was called "cotinus ad linamenta modo conchylii colore insignis": *R. cotinus* is described by Dodoens pempt. 780; is termed "cotinus coriaria" by Tournefort inst. 610; and is known to grow in Carniola, Italy, and Southern France (Jacq. austr. pl. 210, Scop., Hall. helv., and Lenz). Eastward from Siberia, was observed by Nuttall to all appearance indigenous along the Arkansas river: but clearly by European colonists, was introduced into our Atlantic States, where it continues under cultivation for ornament.

Anethum graveolens of the Mediterranean countries. Called in Britain *anet* or *dill*, in Old Norse or ancient Danish "dilla" (Prior), in Germany "dill" (Grieb), in France "anet" (Nugent), in Italy "aneto" (Lenz), in Egypt "sjœbet," in Yemen "schibt" (Forsk.), in Egyptian "arahou" (Syn. Diosc.); in which we recognize the ΑΝΗΤΟ of Sappho, — Alcaeus (Athen. xv. 16), Theophrastus ix. 7. 3. or "anēthōn" of Aristophanes, Theophrastus i. 11. 2, Theocritus, Moschus, and Dioscorides; identified in Syn. Diosc. with the "gōnōs kunōkēphalōu" or "tribēs kunōkēphalōu" or "gōnōs ērmōu" of the prophets: *A. graveolens* was observed by Forskal, and Sibthorp, in Greece and at Constantinople both wild and cultivated; by Forskal, Delile, and Clot-Bey, under cultivation in Egypt; by Forskal, under cultivation in Yemen; and the "sabet" is enumerated by rabbi Schwarz as cultivated in Palestine. Westward, the "anēthōn" or "anikētōn" or "pōlgithōs" is further identified in Syn. Diosc. with the "pōlpōum" of the Dacians, "sikkiria" of the Numidians, and "anēthōum" of the Romans: the "anethum" is mentioned by Horace, Virgil, Columella, Pliny, Apicius, Palladius, and Apuleius: *A. graveolens* is described by Lobel pl. 776; is termed "a. hortense" by Tournefort inst. 318; and is known to be cultivated throughout middle Europe (fl. Dan. pl. 1572, and Pers.). Eastward from Syria, is known to occur at Astracan (Lindl.); was "occasionally seen" in Burmah by Mason v. p. 496, "exotic" and called "sa-mwot," the seeds "constantly for sale in the bazars:" may therefore through native tribes have reached Timor (Lindl.). Clearly by European colonists, was carried to Austral Africa (Lindl.); and before 1669 (Joss.) to Northeast America, where it continues sparingly cultivated. The fruits according to Lindley are "carminative and stimulant, and taken with food may be regarded condimentary."

598 B. C. (= 608 y. 322 $\frac{3}{4}$ d. — "11 years" of twelve lunations of 2 K. xxiii. 36, and 2 Chron. xxxvi. 5), Jehoiakim succeeded at Jerusalem by his son Jehoiachin. But after "three months," the city was captured by Nebuchadnezzar; who plundered the temple and royal palace, carried Jehoiachin with "ten thousand" of the principal men "into captivity" to Babylon, and appointed Mattaniah ruler of Jerusalem under the changed name of "Zedekiah." (The same date for these events, is deduced by Clinton i. p. 319 and 328 from the Babylonian regnal years in the Astronomical canon).

"597 B. C. = 11th year of Ting-wang" (Chinese chron. table), beginning of the Thirty-fifth cycle.

"596 B. C." (Clint., see Cic., Plut., and Diog. Laert.), Epimenides the priestly bard of Crete, now in old age, visiting Athens.

Ornithogalum Pyrenaicum of Europe and the adjoining portion of Asia. Called in Britain *French sparrow-grass* (Prior), in Greece "agria skulla" (Fraas); and the "ἐπὶ μὲν ἱθῆϊου skillēs" — distinguished by Theophrastus vii. 12. 1 as esculent, having narrower and smoother leaves than the others, an account copied by Pliny xix. 30, is referred here by Fraas: *O. Pyrenaicum* was observed by him, Sibthorp, and Chaubard, in the Peloponnesus and on the mountains of Crete. Westward, is termed "o. angustifolium majus floribus ex albo virescentibus" by Tournefort inst. 379; and is known to grow in Carniolia and middle Europe as far as Britain (Jacq. austr. pl. 103, Pers., and Sm. fl. brit. 363).

Ornithogalum stachyoides, given as a distinct species — but also called in Greece "agriōskilla" (Sibth.); the "asphōthēlōs" of Galen fac. alim. ii. p. 652 having a single root rivalling the squill in shape and bitterness, but in times of scarcity rendered edible by being prepared like lupines, is referred here by Dodoens pl. 209, and Sprengel: *O. stachyoides* was observed by Sibthorp frequent from the Peloponnesus throughout the Greek islands to Constantinople. Westward, is described by Renealmé pl. 90; is termed "o. majus spicatum alterum" by Tournefort inst. 379; and is known to grow as far as France (Lam. fl. fr., and Steud.).

"595 B. C." (. . . Clint.), commencement of war by the Amphictyons against Cirrha near mount Parnassus. Called the "Sacred war," — and continuing (according to Callisthenes) "ten" years.

In this year = "16th year of Necho," death of an Apis or sacred bull — (Birch).

The same year (= 589 + "6 years" of Herodotus, and the Afr.-Maneth. table), Nēhaō succeeded by Psammis or Psammōuthis or Psammēthiōs II., sixth king of the Twenty-sixth dynasty. The name of Psametk II. occurs on stones once part of a propylon at Memphis, on a sarcophagus at the bottom of the remarkable insulated pit at Gizeh discovered by Vyse, on stones employed in reparations at Thebes, on the rocks at Philæ, on foundation stones of Diocletian's column at Alexandria (Leps. eg. and sin. p. 42), on an obelisk (now in Rome), and on various articles (now in the museums of Europe).

His name occurs also in an "arched tomb" at Sakara (Glid. analect.); in the series with "stone vaulted roofs, whose single blocks have the correct concentric cut;" examples of the stone arch, as early as any in Rome, being "coeval with the Cloaca Maxima and Carcer Mamertinus" (Leps. eg. and sin. 74).

"594 B. C." (Sosicr. and Clint.), the *laws of Solon*, archon for this year, adopted at Athens. Including the Egyptian law on surveying land, by which every one was obliged to declare the amount of his income; — a law that continued in force in the days of Herodotus ii. 177 (Leps. eg. and sin.).

Defensive measures against the oppressions of the wealthier classes, were also provided in the laws of Solon; — and from this time, Athens began to acquire prominence in the affairs of Greece.

Solon, Thales of Miletus, Pittacus of Mytilene, and Bias of Ionia, were universally reckoned among the "Seven sages;" and with less unanimity, Cleobulus of Lindus, Myson of Chenes, and Chilon of Laconia: all of them contemporary persons who appear to have been chiefly statesmen.

"The same year" (= 559 + "35 years" of Herodot. i. 102, and Clint.), Cyaxares succeeded by Astyages, fourth Median emperor.

The hieroglyphic oval of king Psametk II. is in one instance accompanied with an inscription in *Assyrian or cuneiform writing*.

Inscriptions in *demotic or enchorial writing* occur also under the Twenty-sixth dynasty. Regarded by Birch, as "an outgrowth of the hieratic writing, which it superseded for the legal and ordinary purposes of life;" and as "an attempt to assimilate the Egyptian system of writing to the alphabetic Phœnician." — In the form of the characters, some general resemblance may be remarked between demotic and the "Arabic" writing of the present day.

"593 B. C." (Burm. hist., and Mason 39), the brother of the "seventeenth" king of Tagoung proceeding into the forest to hunt a wild boar that had committed ravages. — He ultimately chose the life of an ascetic; and his adopted daughter married the son of the king of Tagoung, and became the mother of king Dwattaboung.

The Mergui Archipelago along the coast of Burmah occupied by the Selungs or Salones, a Malayan tribe living in boats, as early probably as this date.*

* *Zalacca edulis* of the Moluccas. A palm called in Burmah "yen-gan-khyen" or "yen-gan-khyo" (Mason); and its trunk "as light and of the consistency of cork" used perhaps already for making the "unequalled" sea-boats of the Selungs: — *Z. edulis* was observed by Mason 459 to 544 "exotic"

592 B. C. = "4th year of Psametik II.;" the latest date in his reign found on the monuments — (C. Mull. fr. Man. p. 594).

"The same year" (Sosicr., D. Laert. i. 101, and Clint.), arrival in Athens of the philosopher Anacharsis; a relative of the king of Scythia (Southern Russia). The flute or pipe "aulōs" was at this time unknown in Scythia; but he brought certain inventions, including the "zōpura" *bellows*, and "amphivölōn agkuran," *many-pronged anchor* — (Ephor., and Strab. vii. 3. 9 and xv. 1. 22).

"591 B. C." (Parian marble, schol. Pind., and Clint.), Simon or Simonides being archon at Athens, first success of the Amphictyons under Eurylochos against Cirrha.

About this time (Abyden., and Euseb.), on the Persian Gulf at the mouth of the Euphrates, the city of Tērēthōn or Teredon founded by Nabuchadnezzar. — The city is called "Thirithōtis" by Nearchus (Arrian ind. 41); is also mentioned by Amyntas, Eratosthenes, Strabo, Pliny, Dionys. Perieg., Aelian. n. a. v. 14 and xvii. 16, Ammianus, and Stephan. Byzantius.

589 B. C. (= 570 + "19 years of the Afr.-Maneth. table, the Euseb.-Maneth. table giving 822 y. 8 mo. — "44 — 44 — 44 — 12 — 7 — 6 — 8 — 45 — 6 — 17" = 589 y. 8 mo. = 339 + "6 + 4 + 6 + 20 + 21 y. 4 mo. + 6 + 120 y. 4 mo. + 42 + 25 years"), Psammētīhōs II. succeeded by Ouaphris, seventh king of the Twenty-sixth dynasty; the Hophra of Jeremiah xlv. 30, and Apriēs of Herodotus. King Uahprahet completed the temple begun by Psammetichus near Naharieh (Leps. eg. and sin. 43); and his name occurs at Beghe in Nubia (Glid. analect.), on the rocks at Philæ, on stones (recently employed in building the citadel at Cairo), on an obelisk (now in Rome), and on moveable articles (now in the museums of Europe).

"The same year," or shortly afterwards (Sm. geogr. dict., see also Strabo xiii. 2. 3, and Clint.), arrival in Babylon of Antimenidas; regarded as the first Greek who reached that city. The visit is mentioned by his brother, the poet Alcaeus.

587, Jan. 2d (= 587 y. 107 $\frac{2}{3}$ $\frac{0}{10}$ d. = 597 y. 353 $\frac{0}{3}$ $\frac{0}{10}$ d. — "11 years" of twelve lunations of 2 K. xxiv. 18 and 2 Chron. xxxvi. 11), Zedekiah having rebelled, Jerusalem again captured by the Babylonians under Nebuchadnezzar. The city wall was now broken down, and the principal buildings and temple destroyed. (In Josephus, the interval from the Captivity of the ten tribes is "130 y. 6 mo. 10 days;" while the above computation gives 717 y. 287 $\frac{1}{3}$ $\frac{0}{10}$ d. = 587 y. 107 $\frac{2}{3}$ $\frac{0}{10}$ d. = 130 Jul. y. 6 lun. 2 $\frac{2}{3}$ $\frac{0}{10}$ days. The same year for the Destruction of the temple, is deduced by Clinton i. p. 319 and 329 from the Babylonian reigns in the Astronom. canon; is given by Clemens Alexandrinus, and is further identified by him with the "2d year of Hophra").

In this year (= "16th year of Bimsara," Mahavamsi. i. p. 28), Budha or Gautama "made his sermon."

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentley as. res. viii. p. 244), Havishman reigning in Hindustan.

"586 B. C." (= "tenth" year of Callisth., Demetr., and Clint.), Damasias being archon at Athens, conquest of Cirrha by the Amphictyons. The city captured by medicating the principal source of the supply of water — (Paus. x. 37. 7).

Veratrum album of Europe and the adjoining portion of Asia. Called in Britain *white hellebore* (Prior 109), in Italy "veladro" or "veratro" (Lenz), and perhaps the "ēllēvōrōu" whose roots were used for this purpose — (Paus.): the "veratrum" is identified by Pliny, xxv. 21 with the "sēsamōi-thēs," mentioned by Hippocrates vict. acut. 66 as purging upwards; by Dioscorides, as called on

in Burmah, its "red scaly fruit" often seen in bazar, but eaten by the natives only; is known to grow wild in dripping woods from Eastern Java and Baley to Banda (Pers., and Reinw.). From transported specimens, is described by Bauhin i. 401 (Spreng.).

Pandanus furcatus of Tropical shores from Burmah to the Samoan Islands. A strong-leaved *screw-pine* called in Burmah "tha bau" (Mason); and perhaps already used for making mats by the Selungs, — their "only means of livelihood" besides fishing at the present day (Wade, and Mason 100): *P. furcatus* was observed by Mason 521 in Burmah, growing "abundantly on the lowlands near tide-waters," and supplying "the large coarse mats in universal use;" was not seen by myself in the Malayan archipelago, but was frequent near the sea on the Feejeean and Tongan Islands, and clearly indigenous on mountain-summits exposed to the sea on the Samoan: by Polynesian colonists, was carried to the Hawaiian Islands, where it continues cultivated and naturalized; was perhaps also carried to Tahiti and throughout the Paumotuian coral-archipelago; and on the Radack and Caroline coral-archipelagos, in addition to the universal use for mats, the softer basis around the seeds is said to be eaten: on Wake's coral-island, which may have escaped the visits of natives, the *Pandanus* was absent. Westward from Burmah, the species from whose leaves matting and package-bags are made on the Mauritius Islands (Graham, and Drur.), may be compared.

Anticyra "ἑλλῆνῶρον" and mixed with "ἑλῦκὸς ἑλλῆνῶρὸς" (a mixture according to Pliny sternutatory): the "σῆσαμῶεῖθῆς" is mentioned also by Galen fac. simpl. viii. p. 120, and Erotian; and the "ἑλῦκὸν σῆσαμῶεῖθῆς" by Rufus Ephesius: the "ἑλλῆνῶρὸς" having "σῆσαμῶθῆ" fruit and used on Anticyra, is mentioned also by Theophrastus ix. 9. 2, together with the "ἑλλῆνῶρὸς ἑλῦκὸς" having according to some authorities "πρασῶθῆς" leek-like leaves: the "ἑλλῆνῶρὸς ἑλῦκὸς" is mentioned by Philonides, is described by Dioscorides as sternutatory and having plantain-like leaves, and is identified in the added Synonyms with the "vēratrōum alvōum" of the Romans: V. album was observed by Hawkins on the highest portion of mount Pindus; is known to grow also on Caucasus. Westward, the "veratrum" is mentioned by Lucretius as an acrid poison, also by Columella vi. 38. 3; and the "album veratrum" by Celsus iii. 23 to vi. 7. 5: V. album is termed "v. flore subviridi" by Tournefort inst. 273; and is known to grow in mountainous situations as far as Spain and Denmark (Jacq. austr. pl. 335, fl. Dan. pl. 1120, and Pers.). Its root according to Lindley is "a local irritant" inducing "violent sneezing," and if taken in large quantities "violent vomiting, purging, and other consequences that produce death."

Veratrum nigrum of Eastern Europe and the adjoining portion of Asia. An allied species, called in Greece in common with *Helleborus Orientalis* "σκαρπῆ" (Sibth.), and probably the "ἑλλῆνῶρῶν" in question: — V. nigrum was observed by Sibthorp on the mountains of the Peloponnesus; by Grisebach, in Albania; is known to grow also in Siberia (Pers.). Westward, the two kinds of "veratrum" according to Celsus v. 8 possess similar properties, and "veratrum nigrum" is separately mentioned by him, and Pliny xxv. 77: V. nigrum is termed "v. flore atro-rubente" by Tournefort inst. 273; is known to grow as far as Hungary and the mountains of Austria (Jacq. austr. pl. 336, A. Dec., and Lenz); and from transported specimens is described by Morison xii. pl. 4.

Helleborus niger of Europe and the adjoining portion of Asia. Called in Britain *christmas rose* from the time of flowering, or *black hellebore* (Prior), and possibly the "ἑλλῆνῶρῶν" in question: — "ἑλλῆνῶριαν" is a word used by Callias; "ἑλλῆνῶρὸς" and "ἑλλῆνῶριζέις," by Aristophanes vesp. 1489, Demosthenes, Diphilus, Lucian, and Athenaeus: the true "ἑλλῆνῶρὸς ἑλῦκὸς" according to authorities quoted by Theophrastus ix. 10. 1 is a low plant with deeply-lobed leaves, differing from the "mēlas" kind only in the colour of the roots, which is white: H. niger (with root-fibres "whitish internally," Lindl.) was observed by Sibthorp from mount Athos to the Peloponnesus; by Pococke, in Palestine; and roots of "helleborum album" were found by Forskal mat. med. in the drug-shops of Egypt. Westward, the "album" kind is distinguished by Pliny xxv. 21 as acting "vomitione," the Gauls tingeing their arrows with "elleboro" in hunting: H. niger is described by Lobel pl. 681; is termed "h. niger angustioribus foliis" by Tournefort inst. 272; is known to grow in mountainous situations in Italy and middle Europe (Jacq. austr. pl. 201, and Pers.). The fibres of the rhizoma according to Lindley continue to be employed medicinally, but have sometimes induced "vomiting" with delirium and violent convulsions terminating in death. (See H. Orientalis).

The war against Cirrha being over, the Pythian Games instituted by the victors — (Paus., and Clint.).

"585 B. C. = 1st year of Kien-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"The same year" (Sosicr., Diog. Laert., and Clint., see also Aristot. rep. v. 9. 22), death of Periander. He was succeeded as king of Corinth by his nephew Psammetichus.

"582 B. C." (Thucyd. vi. 4, and Clint.), in Sicily, Agrigentum founded by Greek colonists from the neighbouring city of Gela.

Synmu or Jinmu, first dairo of Japan, is placed as early as this date (although only 17 reigns are counted in ann. Jap. from 399 A. D.): he came, according to some writers, from the Loo-Choo Islands — (Klapr. note to San-kok 169). The succession continues in his family, the dairos for the last few centuries exercising only spiritual authority.

"In the reign of Jinmu, ending in 581 B. C." (Jap. centen. comm. 59), from his residence "in Kashiwara, in the province of Yamato," an order given to Wakanetsu Hiko-no-mikoto, one of his officials, "to manufacture various kinds of *pottery* to be used in the temples for religious festivals."

The soldiers of Synmu on one occasion made nets of the "katsoura" (tradit. myth); giving rise to the name Katsoura ti of the city or fort selected by his successor Soui Sei for the seat of government (ann. Jap. transl. Titsingh).*

"581 B. C." (Aristot., and Clint.), at Corinth, end of the reign of Psammetichus and of the Cypselidæ dynasty.

About this time (Percev. i. 55), Chammir, grandson of Himyar, ruling Yemen. — As he is said to have acknowledged the authority of the Persians, he must have continued reigning in the time of Cyrus.

* *Dolichos hirsutus* of Japan. The "katsoura" plant in question — is referred here by Klaproth: D. hirsutus was observed in Japan by Kaempfer pl. 41, and Thunberg.

As early perhaps as this date (Diod. xxxi . . .), marriage of Pharnaces, "king" of Cappadocia, with Atossa, sister of Cambyses the father of Cyrus.—Pharnaces became "the progenitor of the kings of Cappadocia" (Sm. b. d.).

Centaurea centaurium of the mountains of Italy. The "centaurion" attributed to Chiron but claimed for king Pharnaces and hence called "pharnaceon"—(Plin. xxv. 13 to 30, and Pomp. Fest) is sufficiently identified by Pliny with the "kēntauriōn mēga" of Dioscorides; having serrated leaves resembling those of the walnut, blue flowers, involute fruit as in "knikō," root two cubits long and full of red juice, and abounding in the Peloponnesus and Lycia and around Smyrna (but according to Pliny cultivated). Westward, the "kēntauriōn mēga" or "narkēn" or "marōnēn" or "plēktrōnias" or "hēirōnias" is identified in Syn. Diosc. with the "aima ēraklēōus" of the prophets (compare Pliny), and the "phiērriē" or "ōunēphēra" or "phēllērai" of the Romans; "centauria graveolentia" are mentioned by Virgil geor. iv. 270; the "centaurion," by Pliny as wild on the Alps; and *C. centaurium* is described by Matthioli, Clusius hist. ii. p. 10, and is known to grow from the Southern slope of the Alps along the mountains of Italy to Garganus in Apulia (Pers., Spreng., and Lenz).

"580 B. C." Some of the Greek inscriptions on the island of Thera (according to Franzus) are as early as this date. Among the forms of letters is Γ.

A Greek inscription of about this date (Boeckh, and Franz. 24) on a bronze plate found at Olympia, presenting the following form of the letter N.

About this time (. . . Parian marble), poetry combined with dramatic exhibitions by Susarion, and *Greek comedy* thus instituted.

"578 B. C." (= 534 + "44 yrs," Sm. b. d.), Tarquinius Priscus succeeded by Servius Tullius, sixth king of Rome.

"The same year" (Buddhist ann., and Buns. iv. 7. 2), Bimbisara, son of Bhattiya and friend of Buddha, establishing himself as king of Magadha, South of the Ganges.

In this year = "12th year of Hophrah or Apries," death of an Apis or sacred bull—(Birch).

Daniel and Job—are mentioned by Ezekiel; who was a son of Buzi, like Barachel the father of Elihu (Ez. i. 3 to xiv. 20, and Job xxxii. 6).

Succda baccata of Arabia and Egypt. Called in both countries "mullāah" (Forsk.), in which we recognize the 𐤎𐤏𐤕𐤍 mlwh of Job xxx. 4:—*S. baccata* was observed by Forskal p. 69 as far South as Lat. 19° in Arabia; and by him, Hasselquist, and Delile, throughout Lower Egypt to the Mediterranean.

Atriplex coriacea of Egypt. Called there "rætæm" (Forsk.), and therefore possibly the 𐤓𐤕𐤓𐤕 rdm of Job xxx. 4—(already referred with more probability to *Genista monosperma*). *A. coriacea* was observed by Forskal p. 175, and Delile, on the Mediterranean border of Egypt, in sands near the sea.

Aconitum album of Syria. The 𐤀𐤏𐤍𐤕 bashē of Job xxxi. 40—is referred by Celsius to an *aconite*; and the "bishā of Moses" is distinguished by Avicenna, and Ebn Baitar: *A. album* is said to be the only species growing in Syria, though "not anywhere very common" (see Royle in Kitt. bibl. cycl.).

Sedum confertum of middle Asia. Called in Egypt "hay a'lem" (Del.), and the 𐤔𐤏𐤍𐤕 hlmwd of Job vi. 6, that cannot be eaten without salt,—may be compared: *S. confertum* was observed by Forskal p. lv to lxvi in the gardens of Egypt, mixed with other food for women in childbirth.

"575 B. C." (Diodor., Euseb., and Clint.), "twelfth" change in naval dominion. Leaving the Lesbians, the "Empire of the sea" acquired by the Phocæan Greeks.—Held by them "forty-four" years.

"May 9th." On the "first day of the Sixth month in the 11th year Kien-wang" (Khoun-g-tseu, Gaubil, and Pauth. 108), *eclipse of the sun*.

The same year (= 597 y. 353 $\frac{2}{3}$ d.—"25th year" of twelve lunations=587 y. 107 $\frac{2}{3}$ d.—"14th year" of twelve lunations. Ezek. xl. 1), Ezekiel's vision of the restoration of Jerusalem.

Salix serotina of Syria and middle Asia. A *willow* called in Egypt "khalaf" or "ban" (Forsk.), at Aleppo "safsaf," in which we recognize the "tziptzaph" identified by rabbi Ben Melech with the 𐤔𐤕𐤕𐤕𐤕 tzptzphē of Ezekiel xvii. 5:—the "safsaf" is described by Rauwolf as a peculiar species from the flowers of which "a very precious and sweet water" is distilled; a practice according to Royle (in Kitt. bibl. cycl.) extending into Northern Hindustan: the "tziptzaph" is identified by Avicenna with the "chilaf," mentioned together with the oil from its flowers by Abu Hanifa, Gafeki, Temimi, and Ebn Baitar: *S. serotina*, observed by Sibthorp near Smyrna, and by Hasselquist in Palestine, was found by Alpinus 62, Forskal p. 170, and Delile, in the gardens of Egypt, and the water distilled from the barren flowers much used medicinally.

Rocella tinctoria of coast-rocks along the Mediterranean. A lichen called in commerce *archal* or "*orchil*" (Prior), and the "blue and purple from the isles of Elishah" brought according to Ezekiel xxvii. 7 to Tyre,—may be compared: the "phukōs" of Aristophanes thesm. 2, Theophrastus,

Diodorus, Dioscorides, Plutarch, and Clemens Alexandrinus, is referred here by Tournefort and others: *R. tinctoria* was observed by Tournefort, Sibthorp, and Bory, on the rocks and walls of Amorgos and other Greek islands, and exported both to Egypt and Britain. Westward, the "fucus" is mentioned by Plautus, Catullus, Cicero, Horace, Propertius, and Pliny: *R. tinctoria* was observed by Desfontaines on the ruins of Carthage, and is known to grow along the coast of Algeria, Spain, Southern France, Corsica, and the Balearic Islands (Bory).

The ۷47 wdn and ۷180 ۷299 brzl oshwd manufactured iron of Ezekiel xxvii. 19, — are referred by Gesenius to the city of Aden and its *damascus blades*: "swords of India" are mentioned by the Arab poet Ascha (De Sacy chrest.); and "lames de sabre damasquinées" are enumerated by Edrisi i. 51 as imported into Aden (Jaubert).

"572 B. C." (= "Ol. 52" of D. Laert., Nicol. Damasc., Clint., and Sm. b. d.), Croesus son of the Lydian king Alyattes made satrap of Adramyttium and the plain of Thebe. He commenced a career of successful conquest in Asia Minor.

Dipsacus sylvestris of Europe and the adjoining portion of Asia. Called in Britain *teasel*, in Anglo-Saxon "tæsel" from "tæsan" tease (Prior), in France "chardon" (Nugent), in Germany "karde" (Grieb), in Italy "dissaco" or "cardo da cardare" or "labbro di venere," and the wild kind "cardo selvatico" or "verga pastore" (Lenz), in Greece "skōultara" or "nērōkratēs" (Sibth.), in Egyptian "sēsēnēōr" or "hēir" or "mēlēta" (Syn. Diosc.); and knowledge of var. *fullonum* with hooked flower-bracts seems implied in the "gnaphōu" instrument with which Pantoleon was put to death by his brother Croesus, in the lifetime of their father — (Herodot. i. 92): the word "gnaptōmēnōi" occurs in Aeschylus pers. 568; "ēgnaptētō," in Sophocles aj. 1031; "knaphēion" fulling-mill, in Herodotus iv. 14; and the "knaphōn pēristihōēn" plant is mentioned by the comic poet Alcaeus, Antiphanes, Herodian, and the Etym. magnum; but the cultivated form together with the art of raising nap on woollen cloth has disappeared from Greece and Egypt: the "thipsakōs" of Dioscorides with a tall prickly stem surrounded at intervals by connate opposite leaves, is referred by writers to *D. sylvestris* in the wild state with straight flower-bracts; observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to Smyrna. Westward, the "thipsakōs" or "ōnōkarthiōn" or "aphrōthitēs lōutrōn" is identified in Syn. Diosc. with the "skiarē" of the Dacians, and "lavrōum vēnēris" or "karthōum vēnēris" of the Romans; the "carduus nondum fullonibus aptus" is mentioned by Serenus Sammonicus: *D. sylvestris* is described by Fuchsius 225; is termed "d. s. aut virga pastoris major" by Tournefort inst. 466; is known to occur along roadsides from Italy throughout middle Europe (Jacq. austr. pl. 402, and Pers.); and var. *fullonum*, described by Lobel ii. pl. 17, continues abundantly cultivated for manufacturing purposes. By European colonists, the wild form was carried to Northeast America, where I have occasionally met with it springing up spontaneously in our Northern and Middle States.

"571 B. C. = 1st year of Ling-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

"570 B. C." (Euseb., and Clint.), in Sicily, accession of Phalaris as king at Agrigentum. — He reigned "sixteen" years.

"The same year" (Clint. i. p. 214 and 236 = 526 + "44 years" of Herodotus and the Afr.-Maneth. table), Ouaphris succeeded by Amasis II. or Amōsis II., eighth king of the Twenty-sixth dynasty. The name of king Aahmas II. occurs at Beghe in Nubia (Glid. analect.), at Elephantine, on the rocks at Philæ, on stones (employed in building the citadel of Cairo), and on moveable articles (now in the museums of Europe).

Aahmes II. overthrew the independence of Cyprus (Herodot. ii. 178 and 182). He also permitted the Greeks to build a temple at Naucratis, near one of the mouths of the Nile; perhaps the first introduction of *Greek architecture* into Egypt.

One hundred and twelfth generation. May 1st, 567, mostly beyond youth: the Greek poet Eucamon of Cyrene; the musician Pythocritus; the philosopher Anaximenes; Cadmus of Miletus who first wrote history in prose.

The Greek philosopher Pherecydes, preceptor of Pythagoras, visited Egypt (Clem. Alex. i. p. 129, and Leps. eg. and sin. p. 385), and is regarded by Cicero tusc. i. 16 as contemporary with Servius Tullius, sixth king of Rome.

"564 B. C." (Euseb., and Clint.), at Delphi, Aesop arriving with presents from Croesus, giving rise to some dispute, slain by the Delphians.

"In this year" (= 544 + "20 years" of Herodot., and Clint.), Alalia in Corsica founded by Phocæan Greeks.

"563 B. C." (Buddhist ann., and Buns. iv. 7. 2), reform in the Hindu religion commenced by Buddha, now in his "35th" year teaching.

Mangifera Indica of Tropical Eastern Asia. Called in Sanscrit "amra" (Roxb., and Pidd.), in Bengalee "am," in Hindustanee "amba" (D'rozar.) in Telinga "mamadi-chitoo," in Tamil "man-gas marum" (Lindl.); and the shrine of the seven "manguiers" is mentioned in the Sutra Mandhatiri,

discourses of Budha with his pupil Ananda : — branches with leaves and fruit figured in cave-temples at Ellora were remarked by myself : the “an-mo-lo” was observed in Hindustan by Hiouen-Thsang, the “aniba” by Jordanus, the “anba” by Ebn Batuta, the “amba” by Nicolo Conti ; M. Indica by Garcias, C. Acosta, Rheede, and Graham ; by myself, abounding throughout the low country and but for the fine quality of the fruit readily mistaken for an indigenous forest-tree. Farther East, is said by the natives to “grow wild” in Burmah, and is enumerated as indigenous by Mason v. p. 447 ; was observed by Loureiro in Cochinchina, but is known in China and called “mong-kwa” (Bridgm.) ; is called in Tagalo “manga,” and was observed by Blanco, and myself, on the Philippines ; has only Sanscrit and Telinga names on Java and the neighboring islands (Crawf.), is regarded by Blume as exotic there and only naturalized, and was introduced within the memory of man into some remote portions of the archipelago (Rumph. i. p. 95, and A. Dec.). Westward, the “ambag” is mentioned by Ebn Haukal (Gildem.) : M. Indica was observed by myself abundantly planted on Zanzibar ; fruit brought to Mocha, produced as appears from Forskal in Yemen ; and seeds occurring even in Egypt. By European colonists, M. Indica was carried to the Mauritius Islands (Bojer) ; to Brazil, and thence in the middle of the Eighteenth century to the West Indies, where it is called *mango* (Hughes p. 177, and Macfad. i. p. 221) ; to the Hawaiian Islands, where at the time of my visit the trees were not full grown : is described by J. C. Scaliger, and C. Bauhin, from transported specimens. “M. sylvatica” regarded by A. Decandolle as perhaps not distinct, was observed by Vaupell “near Kennery caves” in the environs of Bombay (Graham), by Roxburgh i. p. 644 on the Eastern border of Hindustan in Sylhet ; and is enumerated by Mason v. p. 447 and 774 as indigenous in Burmah, distinguished by the natives and said by them to “grow wild.”*

Ficus religiosa of Tropical Eastern Asia. The *poplar-leaved fig* is called in Sanscrit “pippula” or “bodhi-drooma” or “chuladula” or “koonjurashuna” or “aswattha,” in Bengalee “aswat” or “asood,” in Telinga “rai,” in Cingalese “bogaha” (Lindl.), in Hindustanee “pippul,” in Tamil “arasum-marum” (Drur.) ; in which we recognize the “bodhi” tree under which Gautama discoursed — (Sutra Mandhatri) ; also the “iērōn aigēirōna” in the days of Artemidorus on the African side of the entrance to the Red Sea (Strab. xvi. 4. 14), carried there by Banyans or Hindu merchants : *F. religiosa*, introduced by them, was observed by myself at Muscat and on Zanzibar. Eastward, the “pi-po-lo” was seen in Hindustan by the Chinese traveller Hiouen-Thsang 8 : *F. religiosa* in Hindu mythology is the second “shadow-giving” tree on mount Meru, and from Guadama’s dream while

* *Shorea robusta* of Tropical Hindustan. The *saul* tree is called in Hindustanee and Bengalee “sal,” in Sanscrit “uswukurnika” or “sala” (Lindl.) ; in which we recognize the “salas” woods of the Sutra Mandhatri, — and the “sala” of the Institutes of Manu viii. 246, Bhavabhuti mal. ix., Kalidasa ragh. i. 14, and the Vishnu purana ii. 7 : *S. robusta* is known to grow from the Godavery to the Ganges at Hurdwar and along the base of the Himalaya as far as the Brahmaputra, sometimes exclusively occupying the forest (Roxb. cor. iii. pl. 212, Royle, and Bedd.) ; yields the resin known as *dammer* in the bazaars of Bengal, and its timber is highly valued and in very general use, being stronger than teak but not so durable (Drur.).

Syzygium jambolanum of Tropical Hindustan and Burmah. A large and handsome tree called in Sanscrit “jambu” (Pidd.), in Hindustanee “jambon,” in Bengalee “kallajam,” in Telinga “naredoo,” in Tamil “nawel” (Drur.), in the environs of Bombay “jamboul” (Graham) ; in which we recognize the “djambu” under which Gautama was sometimes seated — (Avadan. Asok., and Burn. i. 385), also the fourth and last “shadow-giving” tree on mount Meru in Hindu mythology (Mason v. 415) : the “djambu” is mentioned also by Valmiki ramayan. iv. 44 (transl. Gorr.) ; the rose-apple black with the ripening of its abundant fruit, by Bhavabuti maha-vir. v ; and the “kakajambu” of Susrutas chik. 24 is referred here by Hessler : *S. jambolanum* is described by Rumphius i. pl. 42 ; was observed by Rheede v. pl. 29 in Malabar ; by Graham, “in various parts of the Concan” and “the commonest tree on the table-land of Mahableschwur,” its fruit having “an astringent rough flavour” “sold in the bazaars ;” by Ainslie, Roxburgh, Wight, and Drury, as far as Tinnevely and Bengal, its timber valuable. Farther East, according to Mason p. 451, 511, and 745, seems known to the Burmese, and may yield the bark “used as a mordant for blue and black dyes” and the “small black plum” often “seen in bazar.”

Eragrostis? cynosuroides of Tropical Hindustan. Called there “cusa” or “cusha” (W. Jones) ; in which we recognize “Kusigramaka,” the name of a city in the Sutra Mandhatri, — and the “kusa” grass of the Vedas, or “darbha” of the Atharva Veda : eating with the tip of a blade of “kusa” grass is mentioned in the Dhammapada 70 : cinctures of “kusa” are mentioned in the Institutes of Manu ii. 43 ; and the “kusa” or “darbha” is prescribed medicinally by Dhanvantari (stanzas in Susrut. chikits. 5) : *E. cynosuroides* was observed by Graham in the environs of Bombay ; by Koenig, Retz, and Roxburgh, in other parts of Hindustan as far as Bengal ; and according to W. Jones asiat. res. iii. 255, its leaves are very long, serrated, and sharp-pointed.

sleeping beneath one is "the most sacred of trees with the Buddhists" (Mason v. 415 to 424); was observed by Rheede i. pl. 27 in Malabar; by Graham, in the environs of Bombay, "always to be met with planted about temples;" by myself, around temples and villages to the end of my journey inland; by Ainslie, Roxburgh, Wight, and Drury, in other parts of Hindustan, the natives very unwilling to cut it down, and the seeds leaves and bark employed medicinally. Farther East, was observed by Mason indigenous in Burmah, and called "nyoung-bau-de;" and is known to occur in Tropical China, paintings on the dried leaves being often exported. (See *F. populifolia*).

"562, March" (= 562 y. $28\frac{3}{8}$ d. = 597 y. $353\frac{3}{8}$ d. — "37th year" of twelve lunations, "the twelfth month on the seven and twentieth of the month" 2 K. xxv. 27, and Jerem. lii. 31), at Babylon, Jehoiachin released from prison by Evil-merodach "in the year that he began to reign," and provided with a "daily" maintenance from the royal table (according to oriental custom with captive kings, as witnessed by myself at Zanzibar. The date deduced by Clinton i. p. 319 to 329 from the Astronomical canon does not correspond, being "561, Jan. 11th" for the accession of Ilvarodamus or Evil-merodach. See below).

560 B. C. (= 538 + "17 + 0 y. 9 mo. + 4 years," and after reigning "two years," Beros. in Jos. c. A. i. 20), Evil-merodach slain, and succeeded as king of Babylon by his brother-in-law Neriglissor. — Who reigned "four" years. (See above).

"In this year" (Lacharme note to Chi-King i. 5. 7), Siang-kong reigning in China* (see birth of Confucius).

"The same year" (. . . Clint.), at Athens, supreme authority usurped by Pisistratus; who however continued to administer the government according to the laws of Solon. Pisistratus is regarded as the first Greek who collected a *Library* (A. Gell. vi. 17, and Athen. i.). This he rendered accessible to the public. He also caused the poems of Homer to be collected, collated, and written out in a connected form, under the charge of Onomacritus, Zopyrus, Orpheus of Croton, and Concyllus; the earliest instance on record of *editing* books.

Cirsium acarna of the Mediterranean countries. A *thistle* called in Greece "agri aggathō" (Forsk.) or "agriagkatha" (Fraas) or "asprē agkatha" (Sibth.); and the extensive "akanthōthēs" tract ordered to be cleared by Cyrus while inciting the Persians to revolt — (Herodot. i. 126) may be compared: the "agriagkathōn" is identified by Skarlatos with the "pōluakanthōs" of Theophrastus vi. 4. 3: *C. acarna* was observed by Forskal, Sibthorp, and Fraas, abounding from the Peloponnesus throughout the Greek islands to the Dardanelles, according to Chaubard often so abundant on arid plains as to prove impenetrable; is known to grow also farther East. Westward, the "polyacanthos" is enumerated among pubescent thistles by Pliny xxi. 56: *C. arcana* is termed "*c. polycephalos canescens aculeis flavescentibus munitus*" by Tournefort inst. 451, and is known to grow as far as Spain (Cav. i. pl. 53, and Pers.).

Onopordum Illyricum of the Mediterranean countries. Called in Greece "agkathi" or "gaithar-agkathō" (Sibth.), and possibly the thistle in question: — the "akantha" having dry pappus according to Theocritus iv. 50 and vi. 15, is referred here by Hogg: *O. Illyricum* was observed by Forskal, and Sibthorp, from the Peloponnesus throughout the Greek islands to the Dardanelles, according to Chaubard one of the most abundant thistles, and when the stem hardens in the autumn rendering certain places impassable. Westward, is termed "*carduus tomentosus acanthi folio angustiori*" by Tournefort inst. 441; was observed by Hogg in Sicily; and is known to grow also in Southern France (Lam. fl. fr., and Pers.).

"559 B. C." (Herodot., and Clint. i. p. 180, 204, and 259), Astyages succeeded by his son Cyrus; who uniting Media, founded the Persian empire.

In the "first" year of the reign of Cyrus (2 Chron. xxxvi. 22, and Ezr. i. to vi. 5), a decree issued by him, granting the Israelites permission to rebuild their temple at Jerusalem.

Carissa edulis of Tropical Arabia. Called in Yemen "antur" or "arm," and the 𐤀𐤓𐤕𐤁𐤀𐤃 planted in Babylonia according to the later Isaian prophecies xlv. 14, — may be compared: the "aran" according to Abu'l Fadli (Celsius, and Kitt. cycl. bibl.) is "said to be a tree of Arabia Petræa, of a thorny nature, inhabiting the valleys, but found also in the mountains, where it is however less thorny; the wood is said to be much valued for cleaning the teeth; the fruit is in bunches like small grapes; the berry is noxious while green and bitter like galls; as it ripens it becomes red, then black and somewhat sweetish, and when eaten is grateful to the stomach, etc., and seems to act

* *Cydonia Sinensis* of Eastern Asia. A species of *quince*: the "coignassier" of a Tcheou nan ode — (Chi-King i. 5. 10) may be compared: *C. Sinensis* was observed by Bunge under cultivation in Northern China, its fruit inferior in quality (A. Dec.). Westward, was carried to Bengal (Roxb. ii. 512); and by European colonists to the environs of Bombay (Graham). From transported specimens, is described by Poiret, and Thouin.

as a stimulant medicine;" is also mentioned by Ebn Baitar: *C. edulis* was observed by Forskal p. 63 frequent among the mountains of Yemen, the berries black and edible.

The 𐤎𐤍𐤏𐤍 Synym of the later Isaiah prophecies xlix. 12, is referred by Gesenius and others to China. And may therefore prove the earliest notice of the *Chinese* by a Western writer.

"556 B. C." (D. Laert., Cyrill, and Clint.), Chilon ephor at Sparta. Already mentioned as by some writers enumerated among the "Seven sages."

"The same year" (= 538 + "17 + 0 y. 9 months" of Berosus in Jos. c. A.), Neriglissoor succeeded as king of Babylon by his son Laborosoarchod: a boy, who reigned "nine months."

555 B. C. (= 538 + "17 years" of Berosus in Jos. c. A.), at Babylon, Laborosoarchod slain by conspirators, and succeeded by Nabonnedus. — Who reigned "seventeen" years, being the last king of Babylon.

"553 B. C." (. . . Clint.), in Sicily, Camarina "forty-six" years after its foundation captured and destroyed by the Syracusans.

"551 B. C." On the "thirteenth day of the Eleventh month or near the Winter solstice, in the 22d year of Siang-koung king of Lou" (Chinese chron. table), birth of Khoung-tseu or Confucius; "in the town of Tseou-y of the province" (now called Chan-toung).

550 B. C. (= 743 + "8th year" in Singal. ann., Burnouf ii. 487), Bimbisara succeeded by his son Adjatasatru, now king of Magadha on the Ganges. Sucriti in the Graha Munjari tables and Puranas (Bentley as. res. viii. 244) seems at least contemporary.

"Nearly two thousand four hundred years ago," according to the Cingalese, their ancestors came to Ceylon "from the Eastward" (Maunder). The colonists were doubtless acquainted with the *Negrillo Race* of man, either as inhabiting the Andaman Islands or farther South. — The Andaman Islands and their inhabitants are mentioned in one of the voyages of Sindbad.*

* *Elæocarpus than-lwen* of Burmah. A Tiliaceous tree that gave its name to the river Salwen, — or according to the pronunciation of residents the *salwen tree*; as pointed out by the natives to Mason v. 537.

Elæocarpus . . . *sp.* . . . of Burmah. Its hard and valuable timber used from early times for carts and in house and boat building: — observed by Mason v. 537 growing very abundantly in the neighbourhood of Rangoon, and not uncommon in some parts of Tenasserim.

Hopea odorata of Burmah. A Dipterocarpaceous tree called there "then-gan" (Mason); and from early times, *dammar* the general substitute for pitch and rosin procured from it: — observed by Mason v. 517 to 527 the most valuable indigenous timber tree of the Southern provinces, used there "for building purposes" and especially for "the best canoes." Westward, is described by Roxburgh.

Lateria pan-theet-ya of Burmah. Another Dipterocarpaceous tree, whose wood from early times was valued and employed by the natives: — observed by Mason v. 527 "common" in Tavoy and Mergui, its timber "whiter than Hopea and equally good."

Sterculia ornata of Burmah. A tree called there "shau-nee" (Mason), and from early times ropes made of its bark: — observed by Mason v. 487 to 520 one of the three trees from whose bark "ropes are more frequently made," and identified with the "*S. ramosa*" of McClelland yielding an "exudation similar to tragacanth." *S. ornata* is described by Wallich, and may therefore prove distinct.

Eriochlæna htwa-nie of Burmah. A Sterculioid tree, its red wood from early times used for paddles, rice-pounders, and building purposes: — observed by Berdmore (Mason v. 536).

Acacia kuk-ko of Burmah. A very large tree, used from early times for making canoes, and according to Burmese geography "an immense specimen growing on the great Eastern island: " — under the former Burmese government, according to Brandis, "a higher sum was required for permission to fell" the "kuk-ko" than for any other tree (Mason v. 529).

Inga bung-mai-za of Burmah. A tree, its hard and black heart-wood from early times used for small canoes and wooden bells for cattle: — observed by Berdmore, and Mason v. 529.

Aeschynomene paludosa of Burmah. Subaquatic, growing half under water, and called by the Burmese "pouk" or "nya" (Mason); its bark from early times used for making a coarse hemp: — observed by McClelland, and Mason v. 519.

Lagerstræmia hlee-za of Burmah. A Lythraceous tree, its red-coloured wood used from early times for paddles and for building: — observed by Berdmore, and Mason v. 538.

Penaptera . . . *sp.* . . . of Burmah. The *bitter-wood* is a small Combretaceous tree, from early times used for boats, said to be exempt from attacks of the teredo: — observed by Mason v. 533, its bark "sold in bazar to chew with betel," but is regarded by him as possibly not distinct from *P. arjuna*.

"549, June 19th." On the "first day of the Seventh month in the 23d year of Ling-wang" (Khoun-tseu, Gaubil, and Pauth. p. 108), *eclipse of the sun*.

"The same year" (Hieronym., and Clint.), in Sicily, Phalaris king of Agrigentum slain in an insurrection.

The metope-reliefs of Perseus and Medusa, and of Hercules and Kerkopes, on the central temple of the acropolis at Selinunt in Sicily, are referred to "the middle of the sixth century"—by Lubke and Lutrow; the remaining five Doric temples being regarded as later than this century.

548 B. C. = "23d year of Amasis II.," death of an Apis or sacred bull—(Birch).

"In this year" (Pausan., and Clint.), the temple at Delphi in Greece destroyed by fire, (according to Herodotus ii. 180) accidentally. The temple was rebuilt by the Amphictyons; Amasis II. of Egypt contributing.

"In this year (= Ol. 58" of Plin. ii. 6, and Sm. b. d.), the Obliquity of the Ecliptic discovered by Anaximander of Miletus. Who also constructed the first map on record (Blair).

"546 B. C." (Solin., and Clint.), in anticipation of aid from the Babylonians and Egyptians, and trusting to an oracle, war commenced by Croesus against the Medes and Persians. He was defeated in battle; and before the close of the year, the city of Sardis was captured and Lydian independence overthrown (Herodot. i. 77).

"544 B. C. = 1st year of King-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

"The same year" (Clint. i. p. 238, see Herodot.), in Asia Minor, the city of Phocaea besieged by the forces of Cyrus, and abandoned by the inhabitants; who sailed away in their ships.

Ibycus of Rhegium may have been at this time composing poetry.—He is said to have passed much time with Polycrates at Samos (Sm. b. d.).

Potentilla fragariastrum of Europe and the adjoining portion of Asia. The ΟΙΝΑΝΘΙΑΕΕ of Ibycus,—and others, described by Theophrastus vi. 6 to 8 as vernal and scentless with racemed white flowers, by Dioscorides as a span high, growing in stony places, and in the added Synonyms identified with the "kéraskōmiōn" or "lēukanthōn," may be compared: *P. fragariastrum* was observed by Sibthorp, and Chaubard, in the Peloponnesus. Westward, is described by Tournefort inst. 296; and is known to grow throughout middle Europe as far as Britain (Curt. lond. iii. pl. 20, and Pers.).

Hardly later than this date ("620 to 540," Franz), a Greek inscription, found near Petilia (Policastro) in Italy, presenting the following form of the letter Ο.

"543 B. C." (Singalese ann., Lassen, Buns. iv. 7. 2, and Burnouf ii. 487, "1116th year before the founding of Pegu" = 542, Mason ii. 20), in the "eighth" year of king Adjatasatru, death of Gaudama or Buddha, founder of Buddhism. On the "third week" afterwards, the First Buddhist council assembled by the high priest Kasyapa, Ananda not having as yet attained the state of ashat. The "sermon-books" were "committed to memory" by different priests (Mahavams. ii.).*

"In this year" (Fa-Hian, and roy. asiat. soc. vi. 247), a piece of ground bought by king Prasene's minister of Sravasti for a garden to a temple of Buddha.

"540 B. C." Not earlier than this date (Franz), the Greek inscription on a vase found at Agylla in Italy, presenting the following forms of letters: Τ, Ψ. Other inscriptions of about this date, present the forms: Β, Γ, Η, Ι, Υ.

Maba buxifolia of Tropical Hindustan and Burmah. A small Diospyroid tree called in Tamil "erumbelie," in Telinga "pishanna" (Drur.); in Burmah "mai-byoung" (Mason), and from early times its hard tough knotty wood selected by Tavoyers for anchors for large boats,—wooden anchors "laden with stones constituting the greater part in use" to the present day (Mason v. 543). Westward, was observed by Roxburgh cor. i. pl. 45, and Wight, in Hindustan, on the Circar mountains, its berries edible, agreeable to the taste, and its dark-coloured durable wood useful for various economical purposes (Drur.).

* *Garcinia Roxburghii* of the Siamese countries. Called on the Neilgherries "heela" (Drur.), in Burmah "tounge-da-lai" (Mason); and the yellow produced by a Clusoid tree adopted as the sacred colour by the Buddhists (Lindl.) as early perhaps as this date:—*G. Roxburghii* was observed by Mason v. 480 to 514 indigenous and very abundant in Tenasserim, its gum-resin affording "a beautiful permanent yellow varnish for metallic surfaces." Westward, is perhaps the tree regarded by Murray as carried from Siam to Ceylon: is known to occur on Ceylon (Drur.); was observed by Roxburgh cor. iii. pl. 298, Beddome, and Wight, in various parts of the peninsula; by Law, and Graham, in the vicinity of Bombay. "some very large trees" in "a grove at Belgaum;" its exudation "is semi-transparent, very adhesive, and unsuitable as a paint" (Drur.). "*G. gambogia*, *G. Zeylonica*" and "*G. cowa*" of Roxburgh, according to Graham, and "*G. kydia*, *G. papilla*" of Wight, and "*Cambogia gutta*" of Linnæus, according to Drury, are all identical.

The same year (= "60th olympiad"), the well-ascertained date of the poet Hipponax — (according to Pliny xxxvi. 4).

Chelidonium majus of Europe and the adjoining portion of Asia. Called in Britain *celandine* (Prior), in France "chelidoine" (Nugent), in Germany "schöllkraut," in Italy "celidonia" or "chelidonia maggiore" (Lenz), in Greece "hēlithōniōn" (Sibth.), in Egyptian "mōthōth" (Syn. Diosc.); in which we recognize the ΧΕΛΙΔΟΝΟΝ : ΦΑΡΜΑΚΟΝ of Hipponax, — "hēlithōniōn" supposed according to Aristotle to restore sight to young swallows, and the "hēlithōniōn mēga" of Dioscorides having acrid yellow juice and fruit like that of the "kēratitithōs mēkōnōs" horned poppy: the "chalidunium" is mentioned also by Arab writers: *C. majus* was observed by Sibthorp, and Fraas, around villages in Greece and seemingly wild on the Bithynian Olympus. Westward, the "hēlithōniōn mēga" or "paiōnia" or "krataia" or "panthiōs riza" or "philōmēthēiōn" is identified in Syn. Diosc. with the "krōustanē" of the Dacians, "thōna" of the Gauls, and "phaviōum" of the Romans: the "chelidonium maior" two cubits high with yellow flowers, is mentioned by Pliny xxv. 50; and two species of "chelidoniae," by Macer Floridus 52: *C. majus* is described by Dodoens, and Gerarde; is termed "ch. m. vulgare" by Tournefort inst. 231; and is known to occur in waste places from Italy to Denmark (fl. Dan. pl. 676, Pers., and Wats.). By European colonists, was carried before 1669 (Joss.) to Northeast America, where it continues a garden weed in our Northern and Middle States. Its juice according to Lindley "is a popular remedy for warts, and has been employed successfully in opacities of the cornea."

Brassica oleracea of the seashore of Northern Europe. Called in Britain *cale* or *cole* or *colewort* or *cabbage* (Prior), in France "chou" and the headed variety "chou cabus" (Nugent), in Germany "kohl," in Italy the headed variety "capuccio" or "cavolo capuccio" (Lenz), in Greece "lahanōn" (Sibth.), in Egypt "krumb" (Forsk.); in which we recognize the "kramvē" identified by Aristotle, and Athenaeus, with the ΠΑΦΑΝΘΕ of Hipponax, — Ananias, Epicharmus, and others, imitating a tree in its trunk according to Theophrastus i. 3. 4: known to the earlier Greeks in three varieties, and especially commended by Pythagoras, Dieuches, and Chrysippus (Plin. xx. 33): the "kramvē" is mentioned also in the Batrachomyomachia, and by Teleclides, Eupolis, Timaeus, Apollodorus of Carystus, Nicander; its leaves according to Diphilus Siphnius, and Dioscorides, deteriorating in Egypt after the first year, but seeds produced there commended for medicinal use: the headed or leafy variety of *B. oleracea* according to Clot-Bey deteriorates in Egypt; and the only kinds seen there by Alpinus were the "brassica raposa" *turnip-stemmed*, and the *cauliflower* called there "karnabid," in Greece "karnaviti" (Forsk.), by Florentinus "karnavathiōn" (geopon. ix. 28), and by Theodorus Ptochoprodromus "karnavathin:" *B. oleracea* was seen also by Forskal, and Delile, under cultivation in Egypt; and by Forskal, Sibthorp, Chaubard, and Fraas, under cultivation in Greece. Westward, the "kramvē kēpaia" is identified in Syn. Diosc. with the "vrassika" of the Romans; the "brassica" (from the Celtic "bresic") is mentioned by Cato 156, Columella, and the "brassica capitata" by Pliny: *B. oleracea* is described by Dodoens pempt. p. 626; is termed "b. maritima arborea seu procerior ramosa" by Tournefort inst. 220; is cultivated from Italy throughout middle and Northern Europe, and is known to grow wild on the sea cliffs of Northwestern France, Britain, and Denmark (Pers., Bosc, Bab., and Fries). Eastward from Syria, is called in Tartar "kapsta" (Moritzi), in Hindustanee and Bengalee "kobi" (D'roz.) or "kopee" (Pidd.), but has no Sanscrit name (A. Dec.); was observed by Graham in the environs of Bombay, "commonly cultivated during the cool season;" by Royle him. 70, in Northern Hindustan; by Mason, "exotic" in Burmah and called "them-bau-mung-la;" by Loureiro, under cultivation in Anam and China. By European colonists, was carried to Northeast America, where it continues abundantly cultivated; also to the islands of the Pacific, observed by myself naturalized on the Hawaiian Islands, Taheiti, Tongatabu, and New Zealand.

Mentha crispa of Europe and the adjoining portion of Asia. Called in Italy "sisembro" (Matth.): the ΜΙΝΘΗ, coronary according to Hipponax, — mentioned also by Cratinus (Athen. ii), by Theophrastus ii. 4. 1 and caus. ii. 16. 4 as a supposed degenerate form of "sisumvriōn" from neglected cultivation, may be compared: the "sisumvriōn" of Cratinus, Pherecrates, Strattis, Antiphanes, Philinus, Athenaeus xii. 78, mentioned as coronary by Theophrastus vi. 1. 1, Nicander, and Dioscorides, is referred here by Matthioli: *M. crispa* was observed by Sibthorp wild in the Peloponnesus; and is enumerated by Clot-Bey and Figari as long known in Egypt. Westward, the "sisumvriōn" or "aphrōthitēs stēphanōn" is identified in Syn. Diosc. with the "ōustērtilis" or "ēva vērērēa" of the Romans; the "sisymbrium" is mentioned by Ovid; by Pliny xix. 55 and xx. 91, as fragrant and growing near water, its branches pulled and cultivated: *M. crispa* is described by Rivinus mon. pl. 50; is termed "m. rotundifolia crispa spicata" by Tournefort inst. 189; and is known to grow near water in Italy, France, and middle Europe (Linn., Pers., and Dec.).

Mentha rotundifolia of Europe and the adjoining portion of Asia. Resembling and sometimes confounded with the preceding, called in Greece "agriōēthuōsmōs" (Sibth.), and possibly the

and the "aspalathōs" with which kings are chastised in Hades — (Plat. leg. 10) is referred here by Sprengel: the aspalathōs ētērōn" is distinguished by Dioscorides as white and scentless and inferior in quality: *G. horrida* was observed by Sibthorp, and Chaubard, and Fraas, frequent on mountains from the Peloponnesus throughout the Greek islands. Westward, the "frutex humilior" is further described by Pliny xxiv. 69 as growing in many places but "non ubique odoratus:" *G. horrida* is termed "genista-spartium minus saxatile aculeis horridum" by Tournefort inst. 645; was observed by Villars in Southern France, and is known to grow as far as Spain (Pers.).

"535 B. C." (Suid., and Clint.) in Greece, *tragedy* first exhibited by Thespis.

Peplis portula of Europe and the adjoining portion of Asia. Called in Britain *water purslane* (Prior), in Greece "anthraklēitha" or "anthrahnē" (Sibth.); in which we recognize the *ΑΝΔΡΑΧΝΗ* herb habitually used by Thespis — (Suid.), the salted "anthrahnē pōtamiē" of Polemon diaet. ii. 25, and the "anthrahnē" mentioned by Theophrastus vii. 1. 2 as cultivated, by Dioscorides as esculent, and by pseudo-Aristot. color. 5 as turning red in ripening: *P. portula* was observed by Sibthorp abounding in moist cultivated ground around Athens, and eaten in salads. Westward, the "andrachne" herb is identified by Pliny xiii. 40 and xx. 81 with the "portulacae" or "porcilaca" mixed in salads "in acetariis sumta;" the "portulaca" is mentioned also by Varro iv. 28, and Columella x. 356; *P. portula* is termed "glauca palustris flore striato clauso foliis portulacae" by Tournefort inst. 88, is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 64, and Pers.).

Hardly earlier than this date (Graha Munjari tables, Puranas, and Bentr.), Satya reigning in Hindustan.

One hundred and thirteenth generation. Sept. 1st, 534, mostly beyond youth: the poet Phocylides (writing in Greek but a Jew according to Bernays, note in Steinschn. i. 2); the Greek poets, Melanippides, Telesilla of Argos, and Lasus of Hermione; Choerilus the tragic poet; Theagenes of Rhegium (who wrote on Homer); the historians, Eugeon of Samos, Polyzelus, Deiochus of Proconnesus, Eudemus of Paros, Democles, Acusilaus, and Amelesagoras of Chalcedon.

"The same year" (= 509 + "25 yrs," Sm. b. d.), Servius Tullius succeeded by Tarquinius Superbus seventh and last king of Rome. In whose reign, Petronius Sabinus is said to have obtained from M. Tullius or M. Atilius the *Sibylline books* to take a copy of them (Val. Max i. 1. 14, and Dionys. iv. 62).

Tectona grandis of Tropical Hindustan and Burmah. The *teak* tree is called in the environs of Bombay "saag" (Graham), in Bengalee "segoon," in Telinga "teka," in Tamil "thaikoo marum" (Drury); in which we recognize the material of which ships were built at Tyle at the entrance to the Persian Gulf — that continued sailing "more than two hundred years" to the time of Theophrastus v. 6: *T. grandis* was observed by Rheede iv. pl. 27 in Malabar; by Graham, "in considerable abundance in the forests" along the Taptee "and in various parts of the" Concans; by myself, a fine large forest-tree frequent in the Concans or lower country along the sea; is known to grow from Goojerat to the end of the peninsula, and as far as Rajahmundry on the Eastern coast (Roxb. cor. i. pl. 6, and Drury); was observed by Mason v. p. 525 abounding in Burmah and called "kywon," furnishing "the staple timber" of the country; and is known to grow as far as Java (Rumph. iii. pl. 18, and Pers.). Westward, a tradition is mentioned by Eutychius of Alexandria that "saj" timber was employed for building the ark (Smith bibl. dict.); the "sadj" is mentioned also by Edrisi, Ebn Baitar; and is described by Forskal p. lvi as an incorruptible kind of wood imported from Hindustan for the keel of Egyptian vessels.

"In the second half of the Sixth century B. C." (Mason i. 2), founding by Budhists of the seaport city of Rangoon in Burmah.*

* *Pterospermum aceroides* or "tha ma jam wai-soke," and *P. subacerifolium* or "na-jee," both of Burmah. — In company with *P. acerifolium* "growing with teak in all the forests," attaining according to McClelland the girth of ten or twelve feet and a lofty height, the timber extremely valuable and strong as either teak or oak (Mason v. 536).

Grewia ta-yau of Burmah. A small Tiliaceous tree, from early times furnishing spars to vessels at Tavoy: — observed by Mason v. 537 growing "on the sea-board."

Berrya ammonilla of Burmah. A Tiliaceous tree, its light strong timber valued from early times. — and known in commerce as *Trincomalee wood*: growing according to Helfer on King's Island, opposite Mergui (Mason v. 537). Westward, is described by Roxburgh.

Latica koung-mu of Burmah. The largest Dipterocarpous tree in the country, from early times used for making large boats, — but yielding "no oil," and "its places of growth are usually of difficult access by water;" according to O'Riley, the wood is also "well adapted for spars for vessels" (Mason v. 528 to 757).

Aglaia spectabilis of Burmah. An Aurantiaceous tree, its light serviceable timber known from early times: — observed by McClelland (Mason v. 539).

"532 B. C." (. . . Sm. b. d.), supreme authority at Samos acquired by Polycrates.

"The same year" (Clint. i. p. 234, see also Herodot. i. 67, and Strab. vi. i. 1), on the Italian coast not far from Paestum, the city of Hyela or Elea or Velia founded by Phocæan Greeks.

"531, June 10th = first day of the Seventh month in the 24th year of King-wang" (Khong-tseu, Gaubil, and Pauth. p. 108), *eclipse of the sun*.

"530 B. C." (Athen. i. p. 3, and Clint. i. p. 372), a *library* founded by Polycrates king of Samos. Pythagoras after receiving instruction in Egypt from Onnuphis of Heliopolis (Leps. eg. and sin. p. 386), now at the age of "forty" quitting Samos (Aristoxen., Iamblich., and Porph.): all accounts make him contemporary with Polycrates and Tarquinius Superbus (Sm. biogr. dict.).

Anemone coronaria of the East Mediterranean countries. The *garden anemone* is called in Italy "anemone" or "anemolo" (Lenz), in Greece "paparōna" (Sibth.), in Arabic "schkiak naman" (Camus, and Spreng.); in which we recognize the "anēmōnē" identified in Syn. Diosc. with the "knikōs agria" of the prophets, ΑΤΡΑΚΤΥΛΙΕ of Pythagoras, — and "vēruliōs" or "ōrniōs kēraniōs" of Osthanes: the "anēmōnē" is mentioned also by Pherecrates, Theophrastus, Theocritus, Bion, Moschus, Athenaeus vi. p. 268, is prescribed in 1 Morb. mul. 598, and the "anēmōnē ēmērōs" according to Dioscorides has either red, pale, milk-white, or purple flowers: *A. coronaria* with flowers appearing in March and either scarlet, white, violet, or blue, was observed by Sibthorp, Chaubard, and Fraas, frequent on dry hills from the Peloponnesus throughout Greece. Westward, the "anēmōnē" is identified in Syn. Diosc. with the "hōuphphōis" of the Numidians, and "ōrki tōunikam" of the Romans; the "anemone" of cultivated ground, flowering only when the wind blows, is mentioned by Pliny xxi. 94: *A. coronaria* is described by Dodoens pl. 434 and 435, Lobel pl. 277; is termed "peregrinum" by Caesalpinus xiv. 9, "a. tenuifolia" by Tournefort inst. 278; was carried according to Clusius from Italy to Spain; has become naturalized in Italy, Sicily, Algeria, Sardinia, and Southern France (Munby, Moris, and A. Dec.); and is cultivated for ornament throughout middle Europe (Pers.). Is according to Christison, and Lindley, "among the most active of the poisonous species." (See *Parietaria officinalis*).

Anemone stellata of the Mediterranean countries. Also called in Italy "anemone" or "anemolo," but distinguished as "fiore stella" (Lenz), in Greece "agria paparōna" (Sibth.); in which we recognize the "agria anēmōnē," included through Syn. Diosc. in the "atraktulis" of Pythagoras, — and described by Dioscorides as larger with harder and broader leaves, and from its red flower confounded with "argēmōnē" and *roiatha mēkōna*: the "anēmōnē lēimōnia" enumerated among vernal plants by Theophrastus vi. 8. 1, may also be compared: *A. stellata* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout Greece, the flowers in Spring giving a bloody tinge in tracts. Westward, the account of the "silvestris anemone" by Pliny xxi. 94 seems chiefly taken from Dioscorides: *A. stellata* is described by Dodoens pl. 434; is termed "a. latifolia simplicis carneo flore" by Tournefort inst. 276; is known to grow wild in Italy and Switzerland (Pers.).

Calophyllum longifolium of the Siamese countries. A tree called in Burmah "tha-ra-bee" (Mason), and from early times used for spars: — observed by Mason v. 534.

Garcinia pa-ra-wa of Burmah. A Calophylloid tree, the largest of its genus, its timber from early times valued by the natives: — observed by Mason v. 534.

Walsura piscidia of Burmah. A large Meliaceous tree, its heavy and strong timber from early times familiarly known: — according to McClelland abundant in Pegu (Mason v. 539).

Connarus speciosus of Burmah. A large tree, its heavy and strong timber from early times familiarly known: — observed by McClelland, and Mason v. 532, its "remarkably bright scarlet pod" "often seen in the jungles."

Elæodendron integrifolium of Burmah. A Celastroid tree called "ksouk" (Mason), and its strong timber from early times familiarly known: — observed by McClelland, and Mason v. 544. Described also by Trattinick (Steud.).

Canarium geniculatum of Burmah. A large Terebinthoid tree, its timber valued from early times: — growing according to McClelland in the Pegu valley (Mason v. 539).

Acacia elata of Burmah. A large tree, its timber from early times familiarly known: — observed by McClelland, described also by Graham (Mason v. 529).

Terminalia violata of Burmah. A Combretaceous tree called "lai-bwai" (Mason), its timber — useful, as in all the species known to Mason v. 533.

Conocarpus robustus of Burmah. A very large Combretaceous tree, its strong timber from early times familiarly known: — growing according to McClelland in Pegu (Mason v. 541).

Tectona ternifolia of Burmah. An inferior species of teak called "ta-hat," and from early times familiarly known: — growing "on the banks of the Irawaddy," described also by Buchanan (Mason v. 526).

is besides cultivated as a garden flower (Lenz). Is enumerated with the preceding by Christison, and Lindley, "among the most active of the poisonous species." (See *Adonis æstivalis*).

Anemone (Pulsatilla) pratensis of the plains of Northern Europe and Asia. The "anēmōnē mēlaina," included through Syn. Diosc. in the "atraktulis" of Pythagoras, — and described by Dioscorides as more acrid than the preceding and having black "phulla" petals, may be compared: *P. pratensis* was observed by Sestini as far South as Constantinople (Sibth.). Westward, is termed "p. flore minore nigricante" by Tournefort inst. 284; is known to grow in open situations in middle Europe as far as Denmark (fl. Dan. pl. 611, Vill., and Pers.): and is enumerated by Stoerk, and Lindley, among medicinal plants. (See *Adonis autumnalis*).

Anemone (Pulsatilla) vulgaris of the plains of Northern Europe and Asia. An allied species, possibly the "anēmōnē mēlaina" in question: — *P. vulgaris* was observed also by Sestini as far South as Constantinople (Sibth.); is known to grow also throughout Siberia as far as Daouria (Dec., and Steud.). Westward, is termed "p. folio crassiore et majore flore" by Tournefort inst. 284; is known to grow in open situations in middle Europe as far as Denmark (fl. Dan. pl. 153, Engl. bot. pl. 151). The root according to Lindley is so acrid that the operator requires protection in pulverising it.

Sinapis nigra of Europe and the adjoining portion of Asia. Called in Britain *mustard* (Lindl.), in France "moutarde" (Nugent), in Germany "senf," in Italy "senape" or "senapa" (Lenz); in which we recognize the "sinapi" whose penetrating power is commended by Pythagoras — (Plin. xx. 87): the "khardal" of Badigoras (Pythagoras), Maserjavia, and Rhazes, is distinguished by Ebn Baitar: *S. nigra* was observed by Sibthorp in the Peloponnesus and around Constantinople; but according to Clot-Bey and Figari has only recently been introduced into Egypt. Westward, the phrase "teritur sinapi" occurs in Plautus (Beda orthogr.); the "sinape" or "sinapi" is mentioned also by Columella, and Palladius; by Pliny xix. 54 as growing wild, improved by being transplanted, difficult to exterminate where once sown, and one of three kinds "simile rapi foliis": *S. nigra* is termed "s. rapi folio" by Tournefort inst. 227; was observed by Lenz in Italy under cultivation as well as wild; and is known to occur in waste and cultivated ground throughout middle Europe (Pers.). By European colonists, was carried to Northeast America, where it continues springing spontaneously in cultivated ground and around dwellings. The seeds according to Lindley are employed medicinally in different preparations, including their flour "in the form of a poultice" as a local irritant.

Sinapis alba of Europe and the adjoining portion of Asia. Called in Britain *white mustard* (Lindl.), in Germany "weisser senf," in Italy "senape bianca" (Lenz), in Greece "agriōvrōuva" or "napi" or "sinapi" (Fraas); and possibly the "sinapi" of Pythagoras: — the phrase to look "napu" occurs in Aristophanes eq. 631; and the "napu" of Polemon diaet. ii. 25, the Hippocratic Affect. 40 and 1 Morb. mul 30, and Theophrastus, identified by Dioscorides with the "sinēpi" of Nicander and others, is referred here by Fraas: *S. alba* was observed by Sibthorp, Chaubard, and Fraas, frequent in the Peloponnesus both wild and in gardens; is enumerated by Clot-Bey and Figari as only recently introduced into Egypt. Westward, the "napu" is identified in Syn. Diosc. with the "sinapē" of the Romans; and one of the three kinds of "napy" or "sinapi" is described by Pliny xix. 54 as resembling the "erucæ": *S. alba* is termed "s. album siliqua hirsuta semine albo et rufo" by Tournefort inst. 227; was observed by Lenz wild in Italy: is cultivated and known to occur in waste ground throughout middle Europe (Pers.). By European colonists, was carried to Northeast America, where it continues under cultivation, and according to A. Gray has been found springing up spontaneously. The seeds "in their entire state" are according to Lindley a stimulating cathartic, and their flour is employed "in the composition of common *table mustard*."

Ruta Montana of the Mediterranean countries. A species of *wild rue* called in Greece "agriōs pēganōs" (Fraas); in which we recognize the "ruta silvestris" of Pythagoras — (Plin. xx. 51), and "pēganōn agriōn" and "ōrēinōn" of Dioscorides: the "ruta" distinguished from the "pēgana" by Cratinus (Athen.) may also be compared: *R. montana* was observed by Sibthorp, and Fraas, in mountainous dry situations in Asia Minor and Greece. Westward, the "pēganōn agriōn" and "ōrēinōn" or "rutēn ōrēinēn" is identified in Syn. Diosc. with the "rōuta mōntana" of the Romans; the account of the "ruta silvestris" by Pliny seems in part taken from Dioscorides; but *R. montana* is described by Clusius hist. ii. p. 136, is termed "r. silvestris minor" by Tournefort inst. 257, was observed by Desfontaines in Barbary, and is known to grow in Southern Europe as far as Switzerland (Thuill., and Pers.).

Ruta Patavina of the East Mediterranean countries. The kind of "ruta silvestris" distinguished as "marem" by Pythagoras, having smaller leaves herbaceous in colour or brighter green — (Plin. xx. 51), may be compared: *R. Patavina* was observed by Sibthorp on mount Parnassus; by Micheli n. g. xxii. pl. 19, near Padua in Italy (Pers.).

Ilex aquifolium of Europe and the Caucasian countries. Called in Britain *holly* or *holm* or *hollen*, in Anglo-Saxon "holen" or "holegn" (Prior), in France "houx" (Nugent), in Germany

"stechpalme," in Italy "alloro spinoso" or "agrifoglio" or "aquifolio" (Lenz), in Greece "ἰῶ-pōurna" (Hawk); in which we recognize the "aquifolia" whose flower is said by Pythagoras to congeal water, — identified by Pliny xxiv. 72 and xxvii. 40 with the "crataegon" or "crataegona" of Theophrastus iii. 15. 6, who describes it as a tree not large and the only one of its kind, bearing round berries turning yellowish or blackish in ripening: *I. aquifolium* was observed by Hawkins, Sibthorp, Grisebach, and Fraas, around Constantinople and on the mountains of Greece; by Tchihatcheff, in Asia Minor, but has not been met with beyond Caucasus (Pallas, Ledeb., Bieb., and A. Dec.). Farther South, the "krataigōs" or "krataigōn" was known to Athenaeus ii. 34 in Egypt. Westward, "vectes aquifolios" are mentioned by Cato; the "aquifolium" is described by Pliny xv. 29 and xvi. 38 as a tree bearing berries, its leaves prickly and not deciduous: *I. aquifolium* after the conversion of Britain was substituted in church ceremonies for the olive, and hence one of its English names *hulver* from the French "olivier" (Googe's *Naageorgus*, and Prior); is termed "aquifolium sive agrifolium vulgo" by Tournefort inst. 600; is known to grow on the Alps and Pyrenees and throughout middle Europe as far as "Lat. 62° 15'" in Norway (fl. Dan. pl. 508, Gunner, and A. Dec.). By European colonists, was carried to Madeira (Webb). The bark according to Lindley affords *bird-lime*, is besides employed medicinally together with the leaves and root.

Anthriscus sylvestris of Europe and the adjoining portion of Asia. Called in Britain *wild cicely* or *cow parsley* or *cow weed* or *hecks* or *hecksies* or *kixes*, in a manuscript of the Fourteenth century "keiex," the "stemmes both of this herbe and hemlocke" used according to Lyte "for quills and caxes to winde yarne upon" (Prior): the "cicutam" of Pythagoras, — Horace, Ovid, Seneca, Persius, the stem eaten but seeds noxious according to Pliny xxiv. 101 to xxv. 95, may be compared: the "kikōutam" of the Romans is mentioned also in Syn. Diosc. iv. 79; and a pandean pipe of seven "cicutis," by Virgil: *A. sylvestris* is described by Fuchsius p. 524 (Spreng.); is termed "ch. sylvestre perenne cicutæ folio" by Tournefort inst. 314; is distinguished as "magna ramosissima odore tetra" by Persoon; is known to grow wild on the mountains of Italy and Spain (Boiss., and A. Dec.), occurring besides in cultivated ground "a common weed" as far as Britain (Jacq. austr. pl. 149, Curt. lond. iv. pl. 24, Pers., and Lindl.). Eastward, was observed by Forskal, and Sibthorp, from the Peloponnesus to Constantinople; is known to occur as far as Caucasus (Lindl.); and was observed by Schimper among the mountains of Abyssinia. Is according to Lindley the "herba cicutariæ" of the shops, and is "reputed to be similar in its effects to hemlock only rather less narcotic." (See *Caucalis daucoides*).

Anthriscus vulgaris of Europe and the adjoining portion of Asia. Called in Britain *rough cicely* or *rough chervil* or *hemlock-chervil* (Prior); and possibly included with the preceding in the "cicutam" in question: — the "wudu ceruille" or "wudu cerfillu" of the Anglo-Saxon translation of Apuleius 86 may also be compared: *A. vulgaris* is termed "ch. sylvestre seminibus brevibus hirsutis" by Tournefort inst. 314; is known as "a common annual weed" on the borders of cultivated ground from Italy to Britain (Scop., All., Jacq. austr. pl. 154, Curt. lond. i. pl. 19, Pers., Steud., and Lindl.). Eastward, was observed by Sibthorp from the Peloponnesus to Cyprus; is known to occur also in the Crimea (Bieb., and Lindl.). The plant according to Lindley is "deleterious," and an instance of several persons poisoned by its being placed by mistake in soup is related by Burnett.

Mandragora officinalis of the Mediterranean and Tauro-Caspian countries. Called in Germany "alraun" (Grieb), in France "mandragore" (Nugent), in Italy "mandragora" (Lenz), in Greece "manthragōra" (Sibth.), in Palestine "yabrochak" (Royle), in which we recognize the "manthragōras" identified in Syn. Diosc. with the Egyptian "apēmōun," the "ēmionōus" or "gōnōgēōnas" of the prophets, ἈΝΘΡΟΓΟΜΟΡΦΟΝ of Pythagoras, — and "thiamōnōn" or "arhinēn" of Zoroaster: the "manthragōras" is mentioned by Euryphon 2 morb. 39, Alexis, Demosthenes 133. 1, Aristotle somn. 3, Apollodorus iii. 15, and Lucian tim., its root is prescribed in Locis in hom. 48, considered a love-charm according to Dioscorides, and Venus sometimes termed "manthragōritēs" according to Hesychius: the "manthragōras" is mentioned in the Septuagint translation of Gen. xxx. 14, confirmed by Josephus; the "ybrwhyn" in the Syriac translation, and the "ybruh" is mentioned by Abulfadli, Avicenna, and Ebn Baitar: *M. officinalis* continues known in Egypt from its imported root, enumerated by Forskal mat. med. as employed medicinally; was observed by Hasselquist, and Mariti ii. p. 195, growing in Palestine, its fruit edible "of the size and colour of a small apple, exceedingly ruddy, and of a most agreeable odour" (Royle in Kitt. bibl. cycl.); by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands, its fruit remaining during winter and the flowering of the succeeding Spring; is known to grow also in Siberia (Pers.). Westward, the "manthragōras" or "kirkaian" is identified in Syn. Diosc. with the "mala tērrēstria" or "mala canina" of the Romans; the "mandragora" is mentioned by Celsus v. 25, its fruit by Pliny xxv. 94 as sometimes eaten; and the "semihominis mandagoræ" by Columella . . . : *M. officinalis* is described by Platearius f. 241 (Spreng.), Tragus 126, Lobel pl. 267, and Stapel), is termed "m. fructu rotundo" by Tournefort inst. 76; and is known to grow in Italy, Switzerland, and Spain (Pers.,

and Lenz). The English term *mandrake* comes from the fraudulent substitution of a different root cut into human shape (Brown pop. err. ii. 6, and Prior).

Pimpinella anisum of Central Asia. The imported seeds called in Britain *anise*, in France and Germany "anis" (Nugent, and Grieb), in Italy "granelli d'anice" (Lenz), in Greece "anison" or "glukanisōn" and the plant "glukanthēs" (Fraas), in Egypt "yansoun" (Del.); in which we recognize the ANISEON commended by Pythagoras — (Plin. xx. 72), the Hippocratic writings, Evenor, Iollas, Dieuches, Dalion, Sosimenes, Heraclides, Tlepolemus, the best according to Dioscorides produced on Crete, and the next best in Egypt; the Egyptian kind is mentioned also by Columella xii. 51, and Pliny: *P. anisum* was observed by Delile, and Clot-Bey, under cultivation in Egypt; by Sibthorp, and Fraas, seldom cultivated in Greece, but springing up spontaneously in cultivated ground. Westward, the "anisōn" or "siōn" is identified in Syn. Diosc. with the "anisōm" of the Romans; and the "anisum" is mentioned by Celsus ii. 72, and Palladius: *P. anisum* is described by Matthioli ii. pl. 113; is termed "apium anisum dictum semine suaveolente" by Tournefort inst. 305; and is known to be sometimes cultivated as far as France (Pers., Targ-Tozz., and Lenz). Eastward from Syria, is called in Hindustanee "anisun" or "saunf," in Bengalee "jira," known to D'rozario as a kind of parsley; was not seen by Mason v. 496 in Burmah, though the seeds are "much used by the native" physicians; was observed by Kaempfer, and Thunberg, sparingly cultivated in Japan and called "kvaiko," or usually "uikjo" or "koikjo" or "kureno ommo" or "seri nisi." By European colonists, was carried before 1669 to New England, where Josselyn found the seeds seldom ripening. "The officinal preparations" according to Pereira, and Lindley, are in frequent medicinal use.

Origanum majorana of Persia? Called in Britain *marjoram*, in medieval Latin "majorana" (Prior), in France "marjoraine" (Nugent), in Germany "majoran," in Italy "maggiorana" or "amaraco" or "persa" or "samsuco" (Lenz), in Greece "masōuran" (Forsk.) or "mantziōurana" pronounced "manschurana" (Fraas), in Egypt and Yemen "mardakusj" or "mardakusch" (Forsk.); in which we recognize the "amarakōn" identified in Syn. Diosc. with the Egyptian "sōphō," the "muōūrōn" of the Armenians, "ōnōs iērōōs" or "ēkigōnōs isēōs" of the prophets, and ΟΡΑΜΒΗΕ of Pythagoras: — the "amarakōs" is mentioned also by Pherecrates, Chaeremon, Eubulus, Antiphones, Theophrastus, Nicander, Meleager, Dioscorides i. 68, and is identified by Diocles of Carystus with the "sampsōuhōn," produced according to Dioscorides iii. 41 of the best quality at Cyzicus and on Cyprus, and the next best in Egypt: "sampsuchum" is given as the Syrian and Egyptian name (Plin.); and the "naukratikē" wreath, mentioned by Anacreon, was according to Athenaeus of "sampsuhōs:" the "morsanjush" is mentioned by Avicenna: *O. majorana* was observed by Hasselquist, and Forskal, in the gardens of Egypt; by Forskal, under cultivation in Yemen; and by him, and Fraas, under cultivation in Greece as far as Constantinople. Westward, the "sampsuhōn" is mentioned as occurring in Sicily by Dioscorides; is identified in the added Synonyms with the "mai-zōurana" of the Romans; the "sampsucum" or "amaracus" is mentioned by Lucretius, Catullus, Virgil, Columella, and directions for its cultivation are given by Pliny xxi. 35: *O. majorana* is described by Morison iii. pl. 3; and is known to be cultivated from Italy and Portugal throughout middle Europe (Pers., and Lenz). Eastward from Arabia, is called in Hindustanee "marzanjosh" or "marwa" or "nazbo" (D'roz.); and was observed by Graham "in gardens" in the environs of Bombay. By European colonists, was carried to Northeast America, where it continues well known in gardens.

Sideritis montana of the Mediterranean countries. A horehound-like plant called in Germany "gliedkraut" (Grieb): the "sithēritis" identified in Syn. Diosc. with the Egyptian "sēnthiōnōr," the "gōnōn" or "aima titanōu" or "ōura skōrpiōu" of the prophets, ΓΑΡΑΜΙΡΟΝ of Pythagoras, — "voughthalmōn" of Osthanes, and "xanthōphanēa" of Andreas, may be compared: the "sithēritis" is described by Dioscorides as an herb a span or more high growing in stony places, its leaves "prasiō"-like but longer as in "ēlēlisphakōu" and "thruōs" as well as smaller and rough, stems quadrangular, not unpleasant to the taste and somewhat astringent, surrounded at intervals with whorled balls after the manner of "prasiōu" and containing black seeds, the leaves externally applied agglutinating wounds and arresting inflammation: *S. montana* was observed by Forskal, and Sibthorp, in stony places and on walls in Greece and Asia Minor as far as the Dardanelles and Smyrna. Westward, the "sithēritis" or "ēraklēian" is further identified in Syn. Diosc. with the "ōuthēthōni" of the Numidians, and "ōuērtōumnōum" or "sōlēastrōum" of the Romans; but the account of the sideritin "quadrato caule" by Pliny xxv. 19 seems chiefly taken from Dioscorides: *S. montana* is termed "marrubiastrum sideritidis folio caliculis aculeatis flore flavo cum limbo atro-purpureo" by Tournefort inst. 190; is known to grow in Italy and Austria (Jacq. austr. v. pl. 434, and Pers.).

Atriplex hortensis of Tartary. Called in Britain *orach*, in old English "arach," by Galfridus pr. pm. "arage," in France "arroche" (Prior), in Germany "melde" (Grieb), in Italy "bietolone" or "spinacione" or "atriplice" (Lenz), in Greece "vlita" or "spanakia" (Fraas), in Egyptian "ōhēi" (Syn. Diosc.); in which we recognize the "atriplex" condemned by Pythagoras — (Plin. xx. 83),

and J. Lydus mens. iv. 39; identified through Syn. Diosc. with the "atraxaxis" or "atraxaxun" or "anthraxaxis" of Pherecrates, Hippocrates, Diocles, Theophrastus, Lycus of Neapolis, Dionysius, Dioscorides, and Athenaeus ii. 57: A. hortensis was observed by Sibthorp, and Fraas, in cultivated ground in Greece and as far as Constantinople, rare; by Hasselquist, in gardens at Damietta; and is enumerated by Alpinus among the esculent plants of Egypt. Westward, the "atraxaxis" or "hrusolahanon" is identified directly in Syn. Diosc. with the "atriplikem" of the Romans; the "atriplex" is said by Solon Smyrnaeus to be cultivated with difficulty in Italy, incorrectly according to Pliny; is mentioned also by Columella x. 337, and Palladius: A. hortensis is described by Matthioli i. pl. 417, and C. Bauhin pin. 119; is termed "a. hortensis alba sive pallide virens" by Tournefort inst. 505; was observed by Lenz cultivated here and there in Italy; and according to Loudon, is cultivated to considerable extent in the neighborhood of Paris. Eastward from Syria, was observed by Lush, and Nimmo, under cultivation "as a spinage" in Bombay and on the Deccan (Graham), but no native name is given. By European colonists, was carried to Northeast America, where it was observed by Pursh, and myself, springing up in cultivated ground in our Northern and Middle States, but may have disappeared, being according to A. Gray "rarely cultivated as a pot-herb."

Pedaliium murex of the seashore of Eastern Africa and Hindustan. A prostrate herb called in Telinga "yea-nugapulleroo," in Tamil "ana-neringie," in Malabar "kaka-mooloo," in Hindustanee "burra-ghokeroo" (Drur.); and the "coracesia" and "callicia" said by the Magians and Pythagoras "aquam glaciari" — (Plin. xxiv. 99) may be compared: P. murex was observed by Rheede x. pl. 72 in Malabar; by Graham, as far as Bombay, "the fresh leaves have the property of thickening water and rendering it mucilaginous," by N. L. Burmann pl. 45, Ainslie, Roxburgh, and Drury, "common about Cape Comorin on the sea-shores" and as far as the "shores of Coromandel," its leafy stems thickening butter-milk, and its seeds used as diuretic in dropsy.

Gmelina parviflora of Southern Hindustan. A woody Verbenaceous plant, possibly included with the preceding: — observed by Roxburgh cor. pl. 32 in Coromandel, its leaves like those of P. murex having the power of rendering water mucilaginous (Pers., and Drur.).

"529 B. C." (Euseb., and Clint.), "Thirteenth" change in naval dominion. Leaving the Phocaeans, the "Empire" over at least the East Mediterranean waters, acquired by the Samian Greeks under Polycrates.

"The same year" (= 538 — "9 years" of Alex. Polyhistor in Euseb., see Clint. i. p. 258 and ii. p. 12), Cyrus slain in battle on the "plain of Dahar." His tomb (visited by Alexander, and described by Strabo, and Arrian) is extant near Murghab (Lubke and Lutrow). He was succeeded by Cambyses, second Persian emperor.

A hieroglyphic inscription on the rock on the Kosser road, in which the chief architect traces his lineal ancestors as far back as the "Twenty-fourth" generation, to an ancestral mother Nofratnue; "at a rough calculation about the end of the Nineteenth dynasty" (Leps. eg. and sin. 458).

"527 B. C." (. . . . Clint. app. 2), Pisistratus succeeded by his eldest son Hippias, now with his brother Hipparchus joint rulers of Athens.

The same year = "44th year of Aahmas II.," the latest date in his reign found on the monuments (C. Mull. fr. Man. p. 594).

Momordica (Ecbalinum) elaterium of the Mediterranean countries. The imported drug is called in Britain *elaterium* (Lindl), the plant in gardens *spurting cucumber*, in Germany "springgurke" (Grieb), in France "concombre élastique" (Fée), in Italy "elaterio" or "cocomero asinino" (Lenz), in Greece "pikra aggoura" (Forsk.) or "agriagkouria" (Sibth.), in Egypt "katte el homar" (Forsk.): an instance of "êlatêrjôn" from the "sikuôs agriôs" — lasting two hundred years, was known to Theophrastus ix. 14. 1 to 15. 6; "êlatêrjôn" is mentioned also by Aeschylus choeph. 962, Hippocrates; the "sikuôs agrôtêrôs," by Nicander ther. 867; and "sikuôs agriôs" growing about dwellings and in sandy situations, by Dioscorides: M. elaterium was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent among rubbish from the Peloponnesus throughout the Greek islands to Constantinople; by Forskal mat. med., its fruit imported from Syria and Sinai into Egypt, the plant itself was received from Egypt by Linnæus. Westward, the "sikus agriôs" or "êlatêrjôn" or "valis" or "vônvaliôn" is identified in Syn. Diosc. with the "kôusimêzar" of the Numidians, and "kôukômêrêm roustikôm" or "agrêstêm" of the Romans; "elaterium" from the "cucumin silvestrem" is mentioned by Pliny xx. 2: M. elaterium is termed "c. s. asinus dictus" by Tournefort inst. 104; was observed by Forskal near Marseilles; and is known to grow wild in Italy and other parts of Southern Europe (Pers., and Lenz). The extract according to Lindley is "a violent cathartic and hydragogue."

"526 B. C." (Clint. i. p. 236), Amôsis II. succeeded by Psammêhêritês or Psam-mênitôs, ninth king of the Twenty-sixth dynasty. Who reigned "six months" only (according to the Afr.-Maneth. table, and Herodotus iii. 14). The name of Psame-tik III. occurs at Karnak, and on a moveable article — now in Rome (Glid. analect.).

"525 B. C." (Clint. = "5th year of Cambyses," Maneth.), invasion of Egypt by the Persians under Cambyses, aided on their march by the galleys of Polycrates. Obtaining possession, Cambyses became the head of a new Egyptian dynasty, the "Twenty-seventh." Hieroglyphic ovals containing the name of Kambatet occur on the Kosser road, and on moveable articles (now in Cairo, and others in Rome, Glid. analect.).

At Thebes, Cambyses split in twain one of the colossal statues of Amenatop III. — This statue afterwards became the "vocal memnon," and when visited by Pausanias i. 42. 3, the upper half remained, lying neglected on the ground.

"In the time of Hipparchus" (Plut. vitios. pud., and Sm. b. d.), Xenophanes of Colophon maintaining the unity of the Deity, without beginning without end, the animating power of the universe, seeing everything, hearing everything, understanding everything, unlike man in mind and person, and who cannot be known. He denounced the imputing human passions and weaknesses in the poetical myths of Homer and Hesiod, and is quoted as the founder of *Eleatic philosophy*. He mentions Pythagoras, and the founding of the city of Elea or Velia, — and is mentioned by Heracleitus, and Epicharmus (D. Laert., and Sm. biogr. dict.).

He also maintained, that the land had risen out of the sea: shells occurring inland and in mountains; relics of fishes and seals in the quarries at Syracuse; an ΑΦΥΑ, *herring*, imbedded in rock on Paros; crusts of all marine productions on Mēlitō; and when the land sinking shall change back again into mud, mankind will perish, and a new creation will succeed (Orig. Philos. iv.). Perhaps the earliest *geological observations* on record.

The star-like "thiōskōūrōs," *electric lights* on the rigging of ships during storms, are attributed to the same cause as lightning by Xenophanes — (Stob. i. 25, Plut. plac. phil. ii. 18, and Galen xiii); are mentioned also by L. Seneca nat. i., and Pliny; and in the days of Columbus, were termed by Mediterranean sailors "the body of St. Elmo" (F. Columb. 46).

Cerasus avium of Europe, and as far as Caucasus. The *sour cherry* is called in Britain *mazzard* from the medieval Latin "manzar," explained by Galfridus pr. pm. as "spurius, pelignus" (Prior), in France "bigarreaux" (Pers.), in Greece "kērasia" (Fraas); in which we recognize the ΚΕΡΑΕΩΝ of Xenophanes — (Poll. vi. 46), Democritus (geopon. iv. 7), and Diphilus Siphnius; mentioned by Theophrastus iii. 13. 1 as a tree twenty-four cubits high, and distinguished as sour-fruited by Galen fac. simpl. vii. p. 22: *C. avium* was observed by Sibthorp, Chaubard, and Fraas, wild in the mountain woods of Greece; is known to grow also on Caucasus (Ledeb. ii. p. 6). Westward, a beam of "cerasus" forty cubits long by two in diameter throughout, is mentioned by Pliny xvi. 54: *P. avium* occurs in seeds in the debris of early lake-villages of Switzerland; is described by Bauhin, and Blackwell pl. 425 (Pers.); is known to grow wild in middle Europe (A. Dec.), is besides very generally cultivated. By European colonists, was carried to Northeast America, where it is cultivated indiscriminately with *C. cerasus*; and to the Mauritius Islands, where it was not seen flowering by Bojer.

524 B. C. = "6th year of Kambatet" or Cambyses on the rocks at Hammamat; the latest date in his reign found on the Egyptian monuments (C. Mull. fr. Man. p. 596, and Birch). In or "about this year" (Clint. i. p. 236, see also Herodot. iv. 165), submission to Cambyses of Arcesilaus III., sixth Greek king of Cyrenē.

"523, Wednesday July 16th, one hour before midnight" (as reduced by Ptolemy to the meridian of Alexandria, Blair), Fifth Babylonian *eclipse of the moon*; "above six digits eclipsed on the North part of her disk."

"522 B. C." (. . . Blair, and Clint.), Polycrates king of Samos put to death by Oroetes, the Persian prefect of Sardis. Anacreon by invitation of Hipparchus now left Samos to reside in Athens (Plat. hipparch. p. 228, and Sm. b. d.).

Smyrnium olus-atrum of Europe and the adjoining portion of Asia. Called in Britain *alisanders* or *horse-parsley*, in France "grande ache" or "ache large" (Prior), in Italy "macerone" or "smirnio" (Lenz), in Greece "skulōsēlinōn" or "maurōsēlinōn" (Fraas) or "agriōsēlinōn" (Sibth.); in which we recognize the "agriōsēlinon" identified through Syn. Diosc. with the ΚΟΨΕΙΟΝ (r ΕΛΥΡΝΕΙΟΝ of Anacreon — (schol. Nic. ther. 596), and "ippōsēlinōn" of Pherecrates, Aristotle probl. xx. 7, Theophrastus vii. 6. 3, eaten as a potherb according to Dioscorides, as either crude or cooked; known to Athenaeus in Egypt, and mentioned as occurring there by Apuleius Barbarus: *S. olus-atrum* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Cyprus and the shore of Caria in Asia Minor. Westward, the "ippōsēlinōn" is identified in Syn. Diosc., as well as by Pliny, with the "ōlōus atrōum" of the Romans; the "atrum olus" is mentioned by Plautus pseudol. iii. 2, Columella xii. 58, and as a cultivated plant by Pliny xix. 48: *S. olus-atrum* according to Beckmann was generally cultivated throughout Europe until superseded by celery "about the end of the Seventeenth century;" is described by Fuchs p. 327; is termed "s. Matthioli" by Tournefort inst. 316; was observed by Lenz wild in Italy; and is known to grow to all appear-

ance wild from Spain to Britain (Pers., Bromf., and A. Dec.). Its fruit according to Lindley "is carminative and used to be official."

Asplenium trichomanes of Northern climates. Called in Britain *bristle fern* (Prior), in Italy "tricomane" (Lenz), in Greece "pōlutrihi" (Sibth.); in which we recognize the "trihōmanēs" identified by Galen with the "kallitrihōn," and the latter by Scarlatos with the ΚΑΛΛΙΤΡΙΧΩΝ of Anacreon, — prescribed in potion in 7 Popular. 81: the "trihōmanēs" is described by Theophrastus vii. 14 as having a stem like that of "athiantōn mēlan" and numerous small leaves opposite each other; by Dioscorides, as resembling "ptērihi," small and smooth, with thin lentil-like leaves on blackish stems: *A. trichomanes* was observed by Sibthorp, Chaubard, and Fraas, frequent on shaded walls and rocks from the Peloponnesus throughout Greece; by Forskal, on mountain-summits in Tropical Arabia. Westward, the "trihōmanēs" or "ptēriōn" or "ōptērōn" is identified in Syn. Diosc. with the "kapillarēm" or "pinōulam" or "philiklam" of the Romans; the "trichomanes" is described by Pliny xxvii. 111 as resembling "adianto" but smaller and blacker: *A. trichomanes* is termed "trichomanes sive polytrichum officinarum" by Tournefort inst. 539, and is known to grow in Italy and throughout Europe (Engl. bot. pl. 576, and Lenz). Farther West is known to grow on Madeira (coll. sicc.); was observed by myself in clefts of rocks in our Atlantic States from Lat. 43° to 40°; by Nuttall, along the Arkansas; and is known to grow on the Alleghanies to their Southern termination (Chapm.).

"521 B. C." (= 529 — "7 y. 5 mo. — 7 months" of Herodot., Clint. i. p. 258 and ii. p. 16), Cambyses succeeded by Darius, third Persian emperor. Hieroglyphic ovals containing the name of Ntarius occur at Edfu (Leps. eg. and sin. 117), also on rocks on the Kosser road, on temples in the Oasis el Khargeh and Oasis of Ammon; and (according to Glid. analect.) on papyri in the Demotic character.

"The same year" (according to Blair) "is counted the 227th and 228th year of Nabonassar, as one began January 1st, the other December 31st."

520 (= 519 y. 138 $\frac{3}{8}$ d. = 587 y. 107 $\frac{3}{8}$ d. — 70 years of twelve lunations), end of the "three-score and ten years" of 2 Chron. xxxvi. 21; "in the second year of Darius" (according to Haggai i. 1, Zechariah i. 1 to 16, and Ezra iv. 24). — Zechariah vii. 1 to 5, speaking at Jerusalem in the "fourth" year of Darius, alludes to the completion of the period.

"519 B. C. = 1st year of Keng-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

518 B. C. = "4th year of his reign," Darius in Egypt offering a premium for the discovery of a new Apis or sacred bull — (Birch).

"April 9th." On the "1st day of the Fifth month in the 2d year of Khing-wang" (Khong-tseu, Gaubil, and Pauth. p. 108), *eclipse of the sun*.

In this year (= 550 — "32 years" of the Mahavamsi i. p. 29), end of the reign of Ajatasatru. His successor is called Udayibhadra — in the Asoka avadana (Burnouf introd. 358).

516 B. C. = "6th year of the reign of Darius," Ezr. vi. 15), completion of the new temple at Jerusalem. Described by Haggai ii. 3 as an inferior building, in the eyes of those who had seen the first temple, "in comparison of it as nothing."

Hardly earlier than this date (Graha Munjari tables, Puranas, and Benth.), Tapomurti reigning in Hindustan.

Desmodium triflorum of Tropical Asia. A procumbent diffuse trifoliate plant having no Sanscrit name (Roxb., and Pidd.), but called in Hindustanee "kodaliya," in Bengalee "koodaliya," in Telinga "moonoodna-mooddo" (Drur.); from early times supplying feed for cattle: — observed by Graham "common in the rains" in the environs of Bombay; by Wight, and Drury, "springing up in all soils and situations" in peninsular Hindustan, the fresh plant applied by the natives "to abscesses and wounds that do not heal well;" by Burmann pl. 54, on Ceylon; by Roxburgh, as far as Bengal; by Mason v. 478 to 767, indigenous in Burmah and the most valuable plant in the country for feeding cattle, being "a good substitute for clover and lucerne;" is known to grow also in China (Pers.), and as far even as Timor (Decaisne). Westward from Hindustan, possibly by Hindu or Arab colonists was carried to Zanzibar, observed by myself seemingly wild there; is known to grow also in Guinea (fl. Nigr.). Probably by European colonists was carried to the Mauritius Islands, observed there by Bojer; to the West Indies, for it is not mentioned by early writers though now well-known there (Swartz obs. pl. 6, Macfad., and A. Dec.), as also in Guayana (Pers.) and Mexico as far as Acapulco (Benth. bot. sulph.).*

* *Smithia sensitiva* of Tropical Hindustan and Burmah. A small decumbent pinnate-leaved annual, also from early times supplying feed for cattle: — observed by Graham "common in Bombay towards the close of the rains;" by Rheede ix. pl. 38, in Malabar; by Wight, in other parts of peninsular Hindustan; by Mason v. 478, in Tavoy, said to make "excellent hay."

"514, July or August" (. . . Clint.), at the time of the Panathenaia Magna, Hipparchus son of Pisistratus and ruler of Athens slain by conspirators.

"513 B. C." (Euseb., and Clint.), Fourteenth change in naval dominion. Leaving the Samians, the "Empire" over the Eastern waters of the Mediterranean acquired by the Spartans. — Held by them "two" years.

"511 B. C." (Diodor., and Clint. i. p. 174), in Southern Italy, the city of Sybaris destroyed by the inhabitants of Crotona, led by Milo the wrestler.

"The same year" (= 513 — "2 years" of Diodorus in Euseb.), Fifteenth change in naval dominion. Leaving the Spartans, the "Empire" over the Eastern waters of the Mediterranean acquired by the Naxian Greeks.

"Nov. 14." On the "first day of the Twelfth month in the 9th year of Khing-wang (Khoun-tseu, Gaubil, and Pauth. 108), *eclipse of the sun*."

"510 B. C.," and in the reign of Amyntas, ninth king of Macedonia (Herodot., Dexipp, Euseb., and Clint.), the dynasty of the Pisistratidæ expelled from Athens.

"509, Feb. 24th" (Blair), Tarquinius Superbus and family expelled from Rome, and government by consuls instituted. Shortly afterwards, the Romans subdued by Porsena lars or king of the Etruscans; a sceptre, golden crown, ivory throne, and triumphal robe, sent him by the senate, and the Romans prohibited by treaty from using *iron* for any other purpose but agriculture (Virg. aen. viii. 646, Tacit. iii. 72, Dionys. v. 34, and Plin. xxxiv. 39). — The Etruscan domination lasted only about three years, and was checked at Aricia by the united forces of Latium and the Greeks of Cumæ (Liv. ii. 15, and Dionys. vii. 5). To the Etruscan period are assigned by universal tradition the great architectural works in Rome of the Cloaca Maxima and the Capitol (Sm. geogr. dict.).

"The same year" (Sm. b. d., and C. Mull. geogr. min. i. 20), first treaty between the Romans and Carthaginians.

"508 B. C." About this time (Wesseling, and Clint. ii. p. 379), Darius crossing the Danube on his Scythian expedition. During "more than sixty days" that he continued North of the river, he appears to have reached central Europe.

The Paeonians of Lake Prasias, near the border of Macedonia, escaped the dominion of the Persians in consequence of having their village on piles or posts at a distance from the shore, communicating only by a narrow bridge (agreeing therefore with the lake-villages of ancient Switzerland). Within the village, polygamy was in vogue; young children were tied by the foot to prevent their falling overboard; and in the absence of hay, horses and beasts of burden were fed on fish (Herodot. v. 16, and Troyon p. 206). — In Norway and along the colder portion of the European coast, according to Thorm. Torffæus, cattle are fed on fish: I have seen a horse eat raw fresh-water fish here in New England.

"507 B. C." (. . . Sm. b. d.), P. Valerius Poplicola and M. Horatius Pulvillus consuls at Rome, and dedication by the latter of the temple on the Capitol.

"506 B. C." (. . . Sm. b. d.), after the return of Darius, Megabazus was left in charge of the countries West of the Bosphorus, and a saying of his in praise of the site of Byzantium has been preserved (Herodot. iv. 144). He sent to Amyntas the Macedonian king a demand for earth and water in token of submission; in complying a difficulty arose in which the Persian envoys were slain, and Megabazus was pacified by receiving in marriage Gygaæa daughter of Amyntas.

The conquests of Darius extending to or including a portion of Hindustan; at least, a satrap or local governor was appointed (Herodot.).

Zoroaster, according to the Zend Avesta, lived in the reign of Vitaçpa (Gushtap of the Persians or Darius Hytaspis): and Zoroaster of Proconnesus (according to Pliny xxx. 2) "paulo ante" a little before — Osthanes and the invasion of Greece by Xerxes.

Lactuca virosa of Europe and the adjoining portion of Asia. A species of *wild lettuce* called in Italy "lattuga selvatica" or "lattuga velenosa" or "scariola" (Lenz), in the environs of Constantinople "galatzitha" (Forsk.), in Egypt "libbeyn" (Del.), in Egyptian "iobonsos" (Apulei. 31); in

Ulmus integrifolia of districts more or less mountainous in Hindustan and Burmah. The *Indian elm* is called in Telinga "naulie" (Drur.), in the environs of Bombay "woula" or "keul" or "papura" (Graham); and from early times one of the trees selected to keep straw and unthrashed grain in the forks of the branches, out of the way of cattle: *U. integrifolia* was observed by Law in the Southern Mahratta country, by Auld in the Kandesh jungles, by Nimmo, and Graham, in the environs of Bombay, the leaves "deciduous in October" and the wood used for "the same purposes as that of" the English elm, for "carls, door frames, etc.;" was observed by Buchanan on the ghauts near Arcot; by Roxburgh cor. i pl. 78, on the Circar mountains (Pers.); is known to grow on the foot of the Himalaya (Drur.); and was observed by McClelland in the Prome district of Burmah (see *U. alternifolia*).

which we recognize the "laktōuka sulvēstris" of the Romans identified in Syn. Diosc. with the "aima titanōu" of the prophets, ΦΕΡΟΥΜΒΡΟΞ of Zoroaster, — and "agria thrithax" described by Dioscorides as bitter to the taste, with juice having similar properties and sometimes mixed with that of the poppy: *L. virosa* was observed by Sestini near Constantinople (Sibth.); by Forskal p. 215, at the Dardanelles and near Alexandria in Egypt; and by Delile, near Cairo. Westward, "lactucae atrae" abounding in milk "meconis vocatur a copia lactis soporiferi" is mentioned by Pliny xix. 38 as the only kind known to the ancient Italians, and hence the name "lactucae": *L. virosa* is described by Lobel, and Dalechamp p. 528 (Spreng.); is termed "l. sylvestris odore viroso" by Tournefort inst. 473; was observed by Forskal near Marseilles; and is known to grow along walls and hedges as far as Britain (Engl. bot. pl. 1957, and Pers.). Its inspissated "milky juice" according to Lindley "has been used as a substitute for opium." (See *L. scariola*).

Lactuca coriacea of the East Mediterranean countries. Called in Greece "agria marōulia" (Fraas); and possibly the "phērōumvrōs" of Zoroaster: — the thrithakinē agria" growing according to Theophrastus vii. 2. 8 to 6. 2 in cultivated ground, lower and more branchy than garden lettuce, leaves shorter and at length becoming prickly, and its acrid juice collected and used medicinally, termed "lahanōn agriōn" a wild esculent by Galen alim. fac. ii. 40, is referred here by Fraas: *L. coriacea*, described by Schultz bip., was observed by Fraas frequent in low cultivated ground in Attica and the Peloponnesus.

Citrullus colocynthis of the African and Arabian Desert, and as far as Hindustan. The *colocynthis* is called in Egypt and Yemen "hamdal," or sometimes in Yemen "dahak" (Forsk.), in Nubia "horky" (Del.); and the "kōlōkunthis" is identified in Syn. Diosc. with the ©ΥΜΒΡΗ of Zoroaster, — and "autōgēnēs" of Osthane; the "kōlōkunthis" or "kōlōkinthis" is prescribed in 1 Morb. mul. 108, is mentioned also by Aristotle probl. xx. 14, Rufus Ephesius, Galen, Marcellus, and the plant is distinctly described by Dioscorides. Westward, the "kōlōkunthis" or "sikuan pikran" is further identified in Syn. Diosc. with the "tōutastra" of the Dacians, and "kōurkōurvita silvatika" of the Romans; the "colocynthis" is mentioned by Pliny xx. 8, but in these countries as well as in Greece seems to have been known only from the imported fruit. Farther South, the "kōlōkuntha alēxanthrinē" is mentioned in Syn. Diosc.; the "hantsal," by Ebn Baitar: *C. colocynthis* is mentioned by Mesue, and other Arab writers (F. Adams); was observed by Forskal in the environs of Cairo, growing in the Desert, by Delile in Upper Egypt, and by Forskal in Yemen; is known to grow as far even as Austral Africa (Pers.), where the seeds according to Drury "constitute an important article of food." Eastward, is called in the environs of Bombay "indrayan" (Graham), in Bengalee "makhal," in Telinga "putsa-kaya," in Tamil "paycoomuti" or "varriecoomuttie" (Drury); was observed by Gibson "in great abundance on the sea shores of Guzerat," by Graham "on the plains of the Deccan" and "common in Salsette jungles," and according to Vaupell "there is a sweet variety which is edible and cultivated" (probably the same seen by myself wild on the Deccan, with deeply-lobulated leaves, and globular variegated fruit which in the unripe state was not bitter).

Citrullus pseudo-colocynthis of the plains of Northern Hindustan. Given as a distinct species, — but called "indrayun" or "bisloommbha;" the fruit "oblong," marked "with eight broad stripes," its "flesh very bitter" and substituted "for the true colocynth" (Royle ill. pl. 47. f. 2, and Lindl.).

Verbena supina of Central Asia? Perhaps the species called in Arabic at Lahore "ikmubaran" (Honigb. 419, and J. F. Wats. index). The "pēristērēōna uptiōn" of Zoroaster — (geopon. xv. 1), the Hippocratic steril. 13, Nicander ther. 860, Dioscorides, Galen, Aetius viii. 15, and Paulus Aegineta, is referred here by Sprengel: the "peristereona" was celebrated among the Magians (Plin. xxv. 59); the name derived according to Cratevas from its leaves incised after the manner of a dove's foot (schol. Nicand. ther.): the "pēristērēōn uptiōs" is identified in Syn. Diosc. with the "ērusiskēptrōn" of Pythagoras, and "pēmphthēmphtham" of the Egyptians: and the "ikmubaran" is mentioned by Maserjavia, and Ebn Baitar: *V. supina* was observed by Sibthorp near Smyrna and elsewhere in Asia Minor, in depressed situations subject to inundation; by Forskal, Delile, and myself, in Lower Egypt. Westward, is described by Dodoens p. 150, and Lobel . . . ; is termed "*v. tenuifolia*" by Tournefort inst. 200; and is known to occur in Spain (Pers.; see *V. officinalis*, and *Prasium majus*).

Bombax (Salmalia) Malabaricum of Tropical Hindustan and Burmah. The red-flowered cotton-tree is called in the environs of Bombay "saur" (Graham); and the "pembeh" of the Zend Avesta — is according to Ritter 9 a tree bearing cotton: wool-bearing trees were seen by Androstenes on Tyle, their leaves like those of the vine, and fruit as large as quinces containing wool of which cloth is woven (Theophr. iv. 7. 7, and Plin. xii. 21): *S. Malabarica* was observed by Rheede iii. pl. 52 in Malabar; by Law, and Graham, in the environs of Bombay, "a very large tree," its "leaves digitate, deciduous in the cool season and succeeded by large red flowers very conspicuous in the forest, as witnessed by myself on the Ghaut; was observed by Gibson as far as Guzerat; by Roxburgh cor. iii. pl. 247 in other parts of Hindustan, and is termed by him "b. heptaphyllum." Farther East, was

observed by Mason v. 487 to 520 "one of the most abundant forest-trees" in Burmah, the silky down around the seeds "used to stuff mattresses and pillows" and "has occasionally been made into cloth."

Cochlospermum gossypium of Tropical Hindustan and Burmah. The *yellow-flowered cotton-tree* is called in Tamil "tanakoo-marum," in Telinga "conda gongu-chettu" (Drur.); and possibly the tree in question;—agreeing better in the shape of the leaf with the wool-bearing trees seen by Androstenes: *C. gossypium* is termed "bombax gossypium" by Roxburgh, "b. grandiflorum" by Sonnerat voy. ii. pl. 133; was observed by Gibson in the Sautpoora jungles, by Auld in Candesh, by Graham "a large tree" wild on "chains of hills running inland from the Ghauts," also planted "in gardens," the capsule large as "goose's egg" and "filled with cotton;" by Roxburgh, Royle, Wight, and Drury, not uncommon in Southern Hindustan as far as Travancore and Coromandel, the trunk yielding *kuteera*, a gum substituted for tragacanth in Northwestern Bengal; is known to grow also on Ceylon (Lindl.). Farther East, was observed by Mason v. 520 in Burmah, its "down" used by the natives according to McClelland for stuffing "their pillows."

"504 B. C." (. . . Sm. b. d.), P. Valerius Poplicola and T. Lucretius Tricipitinus consuls, removal of Appius Claudius from the Sabine city of Regillum to Rome. He was received by the patricians, and lands assigned to his numerous followers; and was the first (according to Pliny xxxv. 3) who set up tablets or portraits of his ancestors in a public temple, that to Bellona.

Hardly later than this date, Hecataeus of Miletus visiting Egypt.—He is mentioned by Heraclitus (Sm. b. d.), and endeavoured to dissuade his countrymen from the proposed Ionian revolt. In his geographical work (written "after 524," Sm. b. d.) he mentions in the West, the city of "Mélitta" outside the Mediterranean on the Atlantic coast of Africa; and in the East, various people of Hindustan, the "Kallatiari" (named also by Herodotus), "Opiari, Gandarari," and the city of "Kaspapyrus" (C. Mull. geogr. m. i. p. xxiii).

Inula viscosa of the Mediterranean countries. Called in Greece "psullistra" or "kōnutza" (Sibth.), in Egyptian "kēti" (Syn. Diosc.); in which we recognize the ΚΟΝΥΣΑ of Hecataeus,—Pherecrates, Aristotle h. a. iv. 8, Theophrastus, and "kōnuza mēizōn" two cubits high according to Dioscorides and strong-scented, strewn to drive away venomous animals including insects, and the juice inducing abortion; identified in the added Synonyms with the "vrēphuktōnōs" or "anōuvias" or "ēthēmias" of the prophets: *I. viscosa* was observed by Sibthorp, Chaubard, and Fraas, abounding from the Peloponnesus throughout Greek islands; and is known to grow as far as Jerusalem (. . .). Westward, the "kōnuza mēgale" is identified in Syn. Diosc. with the "intuvōum" or "militaris mina" or "thēlliariōn" or "phēvriphōuga" of the Romans: *I. viscosa* is described by Clusius rar. p. 377 (Spreng.); is termed "virga aurea major foliis glutinosi et graveolentibus" by Tournefort inst. 484; was observed by Boccone xiv. pl. 7 in Sicily; is known to grow also in Barbary and Southern France (Lam. fl. fr., and Pers.).

Inula (Alunia) graveolens of the Mediterranean countries. Called in Greece "psullistra" (Sibth.), or "vrōmitza" (Fraas); and possibly included in the "kōnuza" of Hecataeus:—the "kōnuza thēlu" smaller according to Theophrastus vi. 2. 6, humble "kōnuza" of Nicander ther. 70, and "kōnuza mikra" only a foot high of Dioscorides, are referred here by writers: *A. graveolens* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands to Asia Minor; is known to grow also on the Mediterranean border of Egypt near Alexandria (Dec.). Westward, is described by Lobel adv. p. 146 (Spreng.); is termed "virga aurea minor foliis glutinosi et graveolentibus" by Tournefort inst. 484; and is known to grow near Montpellier and in other parts of Southern Europe (Pers., and Lenz).

The same year (= "69th. ol." of schol. Pind. rem. ii. 1), Cinaethus: supposed by ancient writers to be the blind poet of Chios who composed the Hymn to the Delian Apollo. This hymn contains perhaps no descriptive expressions derived through the sense of sight, and is quoted and considered ancient by Thucydides. but the *date-palm* on Delos found by Homer od. vi. 165 young and flourishing, is in this Hymn old enough for Apollo to have been born underneath:—this date-palm continued standing in the days of Euripides hec. 457 and iph. 1100, Callimachus hymn Del., and of Cicero leg. i. 1; but disappeared before the time of Pausanias viii. 48, and Athenaeus.

"502 B. C." (Euseb., and Clint.), Sixteenth change in naval dominion. Leaving the Naxians, the "Empire" over the Eastern waters of the Mediterranean acquired by the Eretrian Greeks.

"Nov. 19th, Monday, twenty-four minutes before midnight" (as reduced by Ptolemy to the meridian of Alexandria, Blair), Sixth Babylonian *eclipse of the moon*; "three digits eclipsed on the South part of her disk."

In this year (= 518 — "16 years reign" of the Mahavamsi iv.), Udayibhadra succeeded by his son Anurudde, now Hindu king.

"501 B. C." (. . . Sm. b. d.), at Rome, Postumus Cominius Auruncus and T. Lartius consuls, the dictatorship instituted; and T. Lartius (of Etruscan descent) appointed dictator.

One hundred and fourteenth generation. Jan. 1st, 500, mostly beyond youth : queen Esther (Munk. p. 471) : the Greek poets, Timocreon of Rhodes, Praxilla, and Cleobuline ; the comic poets, Phormis, Dinolochus, Euetes, Euxenides, Mylus, and Magnes ; the tragic poet, Phrynichus ; the philosophers, Heracleitus, and Parmenides ; the historians, Dionysius of Miletus, Charon of Lampsacus, and Hippias of Rhegium ; the sculptors, Ptolechos, and Calamis.

In this year (= "70th olymp." of Suidas . . .) at Athens, *satyric drama* invented and first exhibited by Pratinas.

"In or about this year" (Leps. eg. and sin. 442), the canal from the Nile to the Bitter Lakes, extended to the Red Sea by Darius, and the connexion first completed. The canal is represented by Lepsius as narrow and not intended for large ships : but the Persian ruins near Suez with *cuneiform inscriptions* and the name and statue of Darius, are described as all in "red granite ;" a material that probably came through the canal from Syene. The signet ring of Darius, containing "his name and title in cuneiform characters in three languages, Persian, Median, and Babylonian" — has been found at Suez (Birch).

"499 B. C." (Clint. . .), revolt of the Ionians ; who after burning the city of Sardis, were pursued and defeated near Ephesus. The Athenians now withdrew from the confederacy (Herodot. v. 99 to 102). The affair — led eventually to the invasion of Greece by the Persians.

Mago the Carthaginian military commander and agricultural writer, from being termed the father of Agriculture (Columell. i. 1. 13) seems to have at least preceded Democritus. (See Plin. xviii. 5).

Cladium mariscus of Europe and the adjoining portion of Asia. Called in Britain *twig rush*, from its tough twiggy branching growth (Prior) ; and the "junco" called by Mago "mariscus," to be cut for weaving mats from June to the middle of July — (Plin. xxi. 69), is referred here by writers : *C. mariscus* is described by Valerius Cordus (Spreng.), and Morison viii. pl. 11 ; is termed "scirpus palustris altissimus foliis et carina serratis" by Tournefort inst. 528 ; is known to grow throughout middle Europe as far as Sweden (flor. Suec. p. 35, Engl. bot. pl. 950, and Pers.). Eastward, was observed by Sibthorp, and Chaubard, in the marshes of Southern Greece. (Compare *Juncus spinosus*).

Juncus acutus of the seashore along the Mediterranean and North Atlantic. A species of *rush* called in France "junc maritime" (Fée), in Germany "strandbinse" (Fraas), in Greece "vōurla" or "vōurlō" (Sibth) : the "alterum genus juncorum" of Mago, — maritime according to Pliny xxi. 69 and the "oxyschoenon" of the Greeks, may be compared : the "ōxushōinōs" is mentioned in the *Batrachomyomachia* 164, Aristophanes ach. 230, as sharp-pointed by Dioscorides iv. 52 ; and the "shōinōs ōxus" is one of the three kinds distinguished by Theophrastus iv. 12 : *J. acutus* is described by Anguillara 264 (Spreng.), and Barrelier pl. 203 ; is termed "*j. acutus capitulis sorghi*" by Tournefort inst. 246 ; was observed by Sibthorp, Chaubard, and Fraas, abounding on the seashore of Greece and Crete, and used for basket-work (Walp. p. 243) ; by Forskal, and Delile, on the Mediterranean shore of Egypt ; and is known to grow along the sea from Italy and Barbary to Portugal and Britain (Savi, Desf., Brot., Dec., and Engl. bot. pl. 1614). Farther West, is known to grow on Madeira (herb. Schw.), and as far as our Atlantic seashore from New Jersey to Carolina and Florida (Pursh, Muhl., Ell., A. Gray, and Chapm.)

Iris pseudacorus of Europe and the adjoining portion of Asia. The *yellow iris* is called in Italy "acoro adulterino" or "iride gialla" (Lenz), in Greece "nērōkrinōs" or by the Turks "alak ingivi" (Sibth.) ; and a yellow-flowered kind is included in the "iris" identified in Syn. Diosc. with the "glathiōlōn" of the Romans : the "*gladiolum alterum*" called "cypiron" should according to Mago be cut to the root in July, and for three successive days carried under cover before sunset, nocturnal dew injuring cut marsh-plants — (Plin. xxi. 68) : *I. pseudacorus* is described by C. Bauhin pin. 34 ; is termed "*i. palustris lutea*" by Tournefort inst. 360 ; was observed by Lenz frequent in Italy ; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 494, Curt. lond. iii. pl. 4, and Pers.). Eastward, the "cypiron" of Apollodorus is identified by Pliny with the "*gladiolus*" growing on Crete and Naxos as well as in Phoenicia and Egypt ; and an "iris" having yellow flowers is expressly mentioned by Dioscorides : *I. pseudacorus* was observed by Sibthorp, Chaubard, and Fraas, frequent in marshy situations from the Peloponnesus to Constantinople.

Triglochin palustre of Northern climates. Called in Britain *arrow-grass* (Prior) ; the "sagittam" of the Romans called "pistanam" by the Greeks, to be peeled and dried according to Mago from the Ides of May to the end of October — (Plin. xxi. 68), may be compared : *T. palustre* was observed by Desfontaines in Barbary ; is known to grow in Portugal, and throughout middle and Northern Europe as far as Lapland and Iceland (Brot., fl. Dan. pl. 490, Hook., and Wats.). Eastward is known to grow in Tauria and throughout Siberia in both fresh-water and saline marshes (Gmel., and Bieb.) : and farther East, in Alaska, and throughout Canada in fresh-water and saline marshes to Ohio, Onondaga, and Lat. 49° in Newfoundland (Wats., Pursh, La Pylaie, and A. Gray). "*T. bulbosum*," figured by Barrelier pl. 271 and perhaps not distinct, was observed by Bory in the Peloponnesus.

"498 B. C." = "2d year of the Ionian war" (Herodot., and Clint.), Cyprus recovered by the Persians.

"In or about this year" (. . . Sm. b. d.), Amyntas succeeded by his son Alexander, now tenth king of Macedonia.

Sonchus asper of Europe and Northern Asia. The "*sonchos niger*" regarded by Clemporus as unfit for food, — but employed medicinally by Agathocles (Plin. xxii. 44), may be compared: as also the "*sôghôs*" described by Theophrastus vi. 3 as having prickly leaves, and by Dioscorides as "*agričthěstërôn*" and more prickly: *S. asper* has not been observed in Greece by modern travellers, but may have been confounded and overlooked. Westward, the "*sôghôs. trahus*" is identified in Syn. Diosc. with the "*kikêrvita aspêra*" of the Romans, and "*gathôuônêm*" of the Numidians; *S. aspera* is described by Fuchsius 8, and is known to grow in waste and cultivated ground nearly to the Arctic region (Fries, and A. Dec.). Eastward from Greece, is known to grow along the Altaian mountains and as far as Daouria (Ledeb.), and was obtained by Wallich 362 in Hindustan (herb. Dec.). By European colonists, was carried to Northeast America, where it was observed by La Pylaie on Newfoundland, by myself along salt marshes from Lat. 42° 30' to 38° in Maryland, by Chapman in Florida, and by Short in Kentucky; was carried to Brazil (Lund); to Chili (Pœppig); to Austral Africa (Drege); to Southwest Australia (Steetz); to New Zealand, where I found it naturalized; and to the Hawaiian Islands, occurring near the salt-works, to all appearance introduced with the wholesale manufacture of salt.

"495, July 22d." On the "first day of the Eighth month in the 25th year of Khing-wang" (Khoun tseu, Gaubil, and Pauth. 108), *et ipse of the sun*.

Hardly later than this date, Simonides in Thessaly composing his Epicinian ode on the victory of the Thessalian chief or king Scopas II. in the chariot-race. The death of Scopas II. and accession of Aleuas II. followed the recitation (Herodot. vii. 6, Phan., Callim., and Athen. x. p. 438).

The following forms of letters termed Simonidean, \mathcal{M} , \mathcal{X} , \mathcal{Q} , are as early possibly as this date. (See Franz).

"494 B. C." (. . . Sm. b. d.), A. Virginus Tricostus Caeliomontanus and T. Veturius Geminus Cicurinus consuls, and M. Valerius Volusus Maximus dictator, the populace of Rome withdrawing discontented to mount Sacer, persuaded to return and tribunes of the people and aediles of the people instituted.

"The same year" = "6th year" of the Ionian war (Herodot. vi. 21, and Clint.), *naval combat* near Miletus; the city captured by the Persians, and the war terminated. Soon afterwards, a drama by Phrynichus on the capture of Miletus so excited the feelings of the Athenians that its repetition was prohibited.

"In this year" (. . Sm. b. d.), victory in the chariot-race at the Pythian games gained by Xenocrates of Agrigentum through his son Thrasybulus, and the event celebrated by Pindar in his second ode in point of time.

Quercus suber of the West Mediterranean countries. The *cork oak* is called in Italy "*sughero*" or "*sovero*" or "*suvero*" (Lenz), in Greece together with the bark "*phëllôs*" (Fraas); in which we recognize the $\Phi\epsilon\lambda\lambda\omicron\varsigma$ of Pindar pyth. ii., — Aeschylus choeph. 499, Theophrastus, Lucian ii. 107, and Oppian h. iii. 374; its timber in the days of Pliny xvi. 13 sometimes imported into Greece: *Q. suber* is said by Fraas to occur in some instances in the Peloponnesus and Asia Minor (perhaps planted?). Westward, the "*phëllôs*" is described by Theophrastus iii. 16 as a tree of Italy and Spain; the "*suber*" is mentioned by Vitruvius, Sidonius, and as growing in Italy by Columella, and Pliny: *Q. suber* is known to grow also in Barbary and Spain (Duham. ii. pl. 80, and Pers.). Its imported bark must have reached Egypt at an early period; and mainly through European colonists, has become scattered almost universally over the Globe.

"492 B. C." (Herodot., and Clint.), the successful Persian fleet, proceeding under Mardonius against Greece, dispersed in part near mount Athos by a storm; and the portion of the forces that succeeded in reaching land led back to Asia. Macedonia was now compelled to submit to Mardonius, and its king Alexander became vassal to the Persians.

Under Darius (Lubke and Lutrow), commencement of the imperial palace at Persepolis: — the building into which Alexander threw burning torches; at the present day called "Tschihil Minar," being "the grandest and most wonderful monument" of Persian architecture extant.

Cichorium intybus of Central Asia. Called in Britain *succory* or *chicory*, in France "*chicorée*" (Prior), in Germany "*cichorie*" or "*wegewarte*" (Grieb), in Italy "*cicoria*" or "*radicchio*" (Lenz), in Greece "*rathiki*" or "*pikrôlithi*" or "*papathôulia*" (Sibth.), in Egypt "*sjikurie*" or "*hendeb*" (Forsk.) or "*cichorium*" (Plin.), in Egyptian "*hrintôu*" (ms. Par.) or "*annôtshër*" (Edw.) or "*iannôtshër*" (Kirch.) or "*agôn*" (Syn. Diosc.); in which we recognize the "*cichorium*" used for anointing by the Magians and called "*chreston*" or "*pancraton*" — (Plin. xx. 30), also the "*kihôriôn*" of Theophrastus vii. 9. 2 to ix. 12. 4, and Nicander alex. 429, identified by Dioscorides with the "*sêris agria*:" *C. intybus* was observed by Forskal, Sibthorp, Chaubard, and Fraas, around

cultivated ground from the Peloponnesus throughout Greece and the Greek islands; by Forskal, and Delile, a weed in Egypt and sometimes cultivated (A. Dec.); is known to occur also around Caucasus and in the Talusch country (Ledeb.). Westward, the "cichorium" of Egypt is identified by Pliny with the "erraticum intubum," in Syn. Diosc. with the "intuvōum agrēstēm" of the Romans; the "cichoreum" is mentioned by Horace i. 31. 17, and the "intybum" by Columella x. 111, and Palladius: C. intybus is described by Bauhin hist. ii. 1007; is termed "c. sylvestre sive officinarum" by Tournefort inst. 479; is known to occur in fallow ground and along roadsides from Italy nearly to Lapland (fl. Dan. pl. 607, Pers., and A. Dec.). Eastward from Caucasus, is known to grow as far as Lake Baikal (Ledeb.); was observed by Bunge in gardens and waste ground around Pekin, but regarded there as exotic; by Kaempfer, and Thunberg, abundantly cultivated as an esculent in Japan and called "kio," or usually "tsisa." By European colonists, was carried to Northeast America, where it has become naturalized, occurring especially along New England roadsides. The root, besides being used medicinally, is according to Lindley (A. D. 1838) "extensively cultivated, especially in France, as a substitute for coffee."

Cichorium endivia of Hindustan. Called in English gardens *endive*, in Spain "endivia" (Prior), in Germany "endivie," in Italy "endivia" or "e. maggiore" (Lenz), in Greece "ēmēra rathikia" (Fraas) or "rathikē," or by the Turks "hiddiba," in Egypt "hendibe" (Forsk.), in Egyptian "sarīs" (Akerblad) or "serin" — (Plin.); in which we recognize the "sēritha" of Epicharmus, and "sērīs kēpētēs" cultivated as an esculent according to Dioscorides: C. endivia was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Constantinople and Cyprus, cultivated and seemingly wild, its leaves eaten as a substitute for lettuce; by Forskal, and Delile, under cultivation in Egypt. Westward, the "serin" of the Egyptians is identified by Pliny xix. 39 to xx. 29 with the "cichorium sativum" or cultivated "intubum;" the herb called "seris" is mentioned by Varro iii. 10. 5; "amaris intuba fibris," by Virgil geor. iv. 120; and the "sērīn" of the Greeks a kind of "intubi," by Columella viii. 14. 2: C. endivia is described by Dodoens pempt. 634, and Bauhin hist. ii. p. 1007; is termed "c. latifolium sive endivia vulgaris" by Tournefort inst. 479; was observed by Forskal seemingly wild near Marseilles; and is known to be cultivated from Italy throughout middle Europe as far as Britain (Blackw. pl. 378, and Mill.). Eastward from Egypt, is called in Hindustanee "hindaba" or "kasni" (D'roz.), in Tamil "kashi" (Pidd.); was observed by Law, and Graham; "in gardens" from Surat to Bombay; is known to grow wild from Patna and Kamaon to Nepaul (Hamilt., Wall., and Dec.), and a species perhaps identical was observed by myself clearly indigenous on the Deccan. Farther East, is cultivated in Northern China (Lour., Staunt., and A. Dec.); was observed by Thunberg around Jedo in Japan, esculent and called "fanna tsisa." By European colonists, was carried to Northeast America, where it continues under cultivation in our Middle States.

Antirrhinum orontium of the Mediterranean countries. The *calves-snout* is called in France "mufflier rubicond" (Fée); in which we recognize the "antirrhinōn" regarded by the Magians as cosmetic and to be worn as an amulet — (Plin. xxv. 80), mentioned also by Hippocrates, by Theophrastus ix. 19. 2 as rootlets (annual) and having fruit like the nostrils of a calf, referred here by Matthioli and others: the "anarrhōn" is mentioned also by Nicander fr. 13, Dioscorides, and is identified in the added Synonyms with the "anarrinōn" or "luhnitha agrian," by Galen with the "vōukraniōn." A. orontium was observed by Sibthorp, and Fraas, in cultivated ground in Greece and on the Greek islands. Westward, the "antirrhinon" or "anarrhinon" or "lychnis agria" is described by Pliny as resembling flax: A. orontium according to Euricius Cordus has fruit like the head of a calf "tam exquisita similitudine ut etiam os et nares appareant" (Spreng., and Prior); is termed "a. arvense majus" by Tournefort inst. 168; was observed by Forskal on Malta and near Marseilles; and is known to occur in waste and cultivated ground in Sicily, Algeria, and throughout middle Europe as far as Britain (Pers., Guss., Munby, and A. Dec.).

Antirrhinum majus of the Mediterranean countries. Called in Britain *snap-dragon* (Prior), in France "grand mufflier" (Fée), in Germany "grosses lowenmaul," in Italy "bocca di leone" or "antirrhino" (Lenz), in Greece "agria phōuskōuni" (Fraas); and possibly the "antirrhinon" of the Magians: — clearly the flower having a lion's mouth mentioned by Columella x. 98: A. majus was observed by Sibthorp, Chaubard, and Fraas, on walls and rocks from the Peloponnesus and Cyprus to Constantinople. Westward, is termed "a. vulgare" by Tournefort inst. 168; was observed by Lenz in Italy; by Forskal, on Malta and near Marseilles; and escaping from gardens has become naturalized throughout middle Europe as far as Sweden (Fries); in Britain, was known to Gerard p. 439 only in gardens, is not included among spontaneously-growing plants by Ray and Dillenius, but in 1778 was found by Hudson completely naturalized, occurring even on cliffs (Bab., and A. Dec.).

491 B. C. = "31st year of Darius," birth of an Apis or sacred bull — (Birch).

"April 25th, Wednesday, ten hours and forty minutes after mid-day" (as reduced by Ptolemy to

the meridian of Alexandria, Blair), Seventh Babylonian *eclipse of the moon*: "two digits eclipsed on the South."

Medicago sativa of Tartary. Called in Britain *lucerne* or *medick* (Prior), in Italy "medica" or "erba medica" (Lenz), in which we recognize the "medica" brought by the Medes into Greece during the wars of Darius — (Plin. xviii. 43), or the "mēthikē" of Amphilochoi, Aristotle, Theophrastus viii. 7. 7., Epicurus, Strabo, Dioscorides, and Plutarch: *M. sativa* was observed by Sibthorp frequently cultivated in Greece for fodder, but as appears from Chaubard, and Fraas, its cultivation has nearly ceased: the plant is enumerated by Clot-Bey as introduced only recently under Mohammed Ali into Egypt, where it is called "bersym Heggiasy." Westward, the "medica" and its cultivation in Italy are mentioned by Varro, Virgil, Columella, Pliny, and Palladius; and its French and German name "lucerne" indicates that the plant reached middle Europe by the Greek or St. Gothard pass across Switzerland: *M. sativa* is described by Bauhin hist. ii. p. 381; is termed "medica major erectior" by Tournefort inst. 410; and is known to occur cultivated and naturalized in Italy, Sardinia, Algeria, Spain, and throughout middle Europe (Oliv. de Serres, Moris, Munby, and Wats.). Eastward from Greece, is known to grow wild from Caucasus to Cashmere and throughout Siberia (Bieb., Ledeb., and Royle); has no Sanscrit name (A. Dec.); was observed by Gibson, and Graham, "cultivated in the Deccan for feeding horses, also in Goozerat where it is coming fast into use." By European colonists, was carried to Northeast America, where though not thriving it continues under cultivation, and has even been found growing spontaneously (Darl., and A. Gray); also to Austral Africa (Drege).

"490 B. C." (Herodot., and Clint.), the Second Persian armament, commanded by Datis and Artaphanes, defeated by the Athenians under Miltiades at Marathon. The tumulus erected over the Athenian slain, — and mentioned by Pausanias i. 32. 3, remains to the present day (Sm. geogr. dict.). Aeschylus fought at Marathon. Natives of Hindustan may have been in the Persian army, for an Ἰνδοῖς is mentioned by Aeschylus suppl. 281. — "inthikōs" articles from Hindustan are mentioned by Sophocles antig. 102.

Erica multiflora of Europe. A species of *heath* called in Greece "rēkē" (Sibth.); in which we recognize the ΕΡΕΙΚΗ of Aeschylus ag. 286, — "ērīkē" of Eupolis, Plutarch symp. iv. 1, and the "ērīkē" described by Dioscorides as a tree-like shrub resembling the tamarisk but much smaller, whose flowers injure the quality of honey: *E. multiflora* was observed by Sibthorp abounding on the mountains around Athens, flowering in winter, and the honey collected from it by bees sold much cheaper than summer honey. Westward, the "mel ericaeum" is described by Pliny xi. 15 as of inferior quality and brought after the first showers of autumn, when the "erice" is alone in flower. *E. multiflora* is described by Clusius hist. i. pl. 42, and is known to grow in Italy and Southern France (Pers.; see *E. arborea*).

Erica herbacea of the Mediterranean countries. Called in Greece "riki" or "rēikē" or "ērīkē" (Sibth.); and possibly included in the ΕΡΕΙΚΗ of Aeschylus, — and Theophrastus i. 23: *E. herbacea* was observed by Sibthorp everywhere frequent in Greece. Westward, is termed "e. procumbens ternis foliolis carnea" by Tournefort inst. 603; and is known to grow as far North as Moravia (Jacq. austr. pl. 32, Pers., and A. Dec.).

Bellis sylvestris of the Mediterranean countries. Called in Greece "lēmōnōhōrtōn" (Sibth.); and possibly included in the ΑΝΘΕΑ: ΛΕΙΜΩΝΙΑ of Aeschylus, — and Aristophanes nub. 1364: *B. sylvestris* was observed by Chaubard in the Peloponnesus, vernal, and closely resembling *Bellidiastrum Michelii*, but devoid of pappus. Westward, is described by Cyrillo ii. pl. 4; and is known to grow in Italy and Barbary (Desf., Pers., Tenore, and Bory).

Morus nigra of the Tauro-Caspian countries. Called in Britain *mulberry* (Prior), in Germany "maulbeere" (Grieb), in France "mure" (Nugent), in Italy "moro nero" (Lenz), in Greece "mōrēa" or "sukamēnēa" (Fraas), in Egypt "tout chamy" Syrian mulberry (Del.), in Egyptian "nōuhi" (transl. Luke, lex. Oxf., and Kirch); in which we recognize the ΜΟΡΟΝ of Aeschylus phryg., changed from the original Attic name "sukamina" — (according to Galen fac. simpl. viii. p. 102); the "moron" is mentioned also by Sophocles, and Dioscorides, but Athenaeus ii. 36 found the term confined to the Alexandrians only: the "sukaminōs" is mentioned by Pythermus, Eubulus, Amphis, Philippides, Theophrastus caus. vi. 4, Hegesander, by Luke xvii. 6 as occurring in Palestine, and is identified with the "mōrēa" by Dioscorides: *M. nigra* was observed by Forskal cultivated for its fruit at Constantinople, by Chaubard under cultivation in the Peloponnesus, and by Forskal, Delile, and Clot-Bey, in the gardens of Egypt; is known to grow seemingly wild from Lenkoran South of the Caucasus as far as the Caspian (Pers., and Ledeb.). Westward, the "sukaminon" is identified by Celsus iii. 18 with the "morum" of the Romans, and the "morus" tree is mentioned by Horace, Columella v. 10. 20, Pliny xv. 27, and Palladius: *M. nigra* was employed to feed the silk-worms introduced in "1148 A. D." into Italy (Crescenzo, Targioni, and A. Dec.); continues abundant in Italy (Lenz), and is known to be planted throughout middle Europe. Eastward from the Caspian,

was observed by Kaempfer, and Thunberg, under cultivation in Japan and called "soo," or usually "kuwa." By European colonists, was carried to Northeast America, where it continues sparingly planted for its fruit; and "in 1837" to Bombay (Graham). The bark according to Lindley "said to be cathartic and anthelmintic."

Evonymus Europæus of Europe and the adjoining portion of Asia. Called in Britain *spindle-tree* or *prickwood* or *gadrise* from "being used to make skewers, shoemaker's pegs, and goads," in Germany "pinnholtz" (Prior), in France "fusain" (Fée), in Italy "fusaro" or "fussaggine" or "evonimo" (Lenz); and knowledge of the tree seems implied in the word "ēuōnumōs" signifying unlucky in Aeschylus prom. 488: — the "ēuōnumōn" tree is described by Theophrastus iii. 18. 13 as growing on mount Ordynnus in the island of Lesbos, its flowers having the direful odour of blood, fruit dividing in fours, and together with the leaves if eaten killing sheep and goats: *E. Europæus* is known to grow in the environs of Constantinople, also about Caucasus, and as far as the Tobol river in Siberia (Georgi, Ledeb., and A. Dec. p. 247). Westward, is described by Turner, Dalechamps, and Miller; was observed by Lenz frequent in Italy; and is known to grow throughout middle Europe as far as Lat. 60° 15' on Aland in the Baltic (Lam. fl. fr., and A. Dec.).

Evonymus latifolius of Europe and the adjoining portion of Asia. Possibly the species in question, — but agreeing better with the "tétragōnia" of Theophrastus iii. 4. 2 to 6: *E. latifolius* was observed by Sibthorp, Gittard, and Fraas, in woods on the Bithynian Olympus and other mountains as far as Arcadia in the Peloponnesus. Westward, is described by Miller; was observed by Scopoli, and Lenz, in Italy; and is known to grow as far as middle Europe (Jacq. austr. iii. pl. 289, Lam. fl. fr., and Pers.).

"487 B. C. (= 8 years before the Persian war," Suid., and Sm. b. d.), Chionides exhibiting comedy at Athens.

Saccharum Ravennæ of the East Mediterranean countries. A reedy grass called in Greece "samaki" (Sibth.); in which we recognize the Σ AMAKI of Chionides, — Lysippus, Eratosthenes, Julius Pollux, Hesychius, and Photius: *S. Ravennæ* is termed "gramen paniculatum arundinaceum ramosum panicula densa sericea" by Tournefort inst. 523; was observed by Sibthorp, Chaubard, and Fraas, frequent in marshy ground from the Peloponnesus to Constantinople; and is known to grow as far West as Italy (Zanon. i. pl. 24, and Pers.). Articles manufactured from this grass have doubtless been sometimes carried to Egypt.

About this time (Percev. i. 59), Abyan, a descendant of Himyar, ruling Yemen. — Near the entrance to the Red Sea, he founded or restored the city of Aden, named after him "Aden of Abyan."

486 B. C. = "36th year of Ntarius" or Darius; the latest date in his reign on the Egyptian monuments (C. Mull fr. Man.). Before the close of this year (= "4th year after the battle of Marathon and the year before the death of Darius," Herodot., and Clint.), revolt of the Egyptians against the Persians.

"The same year" (. . . Sm. b. d.), at Rome, Proculus Virginius Tricostus Rutilus and Sp. Cassius Viscellinus consuls, and an agrarian law proposed by the latter. — In the following year, he was condemned by the patricians and put to death.

"485 B. C." (Euseb., and Clint.), Seventeenth change in naval dominion. Leaving the Eretrians, the "Empire of the sea," or dominion over the Eastern waters of the Mediterranean, acquired by the Aeginetan Greeks. — Held by them until the Invasion by Xerxes.

The same year = "5th year after the battle at Marathon and five years before the Invasion of Greece" (Herodot., and Clint.), Darius succeeded by Xerxes, fourth Persian emperor. The hieroglyphic ovals of Hesira occur on rocks along the Kosser road; and his name in cuneiform characters, on an Egyptian vase (now in Paris, Glid. analect.).

As early probably as this year (Herodot. vii. 111), an Oracle of Dionysus on mount Haemus under the management of the Bessians of Thrace.

Tussilago farfara of Europe and the adjoining portion of Asia. Called in Britain *coltsfoot* or *cough-wort* (Prior), in France "pas d'âne" (Nugent), in Germany "hufattich," in Italy "farfaro" (Lenz), in Greece "hamailēukē" (Sibth.); in which we recognize the "vēhion" or "hamailēuke" identified in Syn. Diosc. with the Egyptian "saartha," and the "asa" of the Bessians — (by whom its alleviating power in asthma may have been discovered): the "vēhion" is mentioned by Hippocrates p. 400. 9, Moschion 123, by Dioscorides as having ivy-like leaves but larger green above and white beneath, and a flower-stem quickly perishing; is identified by Ebn Baitar with the "suala" of Avicenna: *T. farfara* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Constantinople; is known to grow also in the Crimea, Persia, Siberia (Lindl.); and dried "tussilago" was found by Forskal mat. med. in the drug-shops of Egypt. Westward, the "vēhion" is further identified in Syn. Diosc. with the "tōusilagō" or "pōustōulagō" or "pharphariam" of the Romans; and the "tussilago" or "farfarum" or "farfugium" is mentioned by Pliny xxiv. 85 to xxvi. 16; the name derived perhaps from the river Farfaro in the Sabine territory, mentioned by Ovid met. xiv. 330 (Spreng.): *T. farfara* is termed "t. vulgaris" by Tournefort inst. 487; is known

to grow from Italy throughout middle Europe as far as Denmark (fl. Dan. pl. 565, Lam. fl. fr., and Pers.), becoming often a troublesome weed. By European colonists, was carried to Northeast America, where it seems naturalized, extending along roadsides in Western New England and the neighbouring portion of New York; also to the "East Indies" (Lindl.). As in the days of Dioscorides, the smoke of the leaves continues to be inhaled "against dyspnœa" (Lindl.).

Andropogon angustifolius of Europe and the adjoining portion of Asia. A grass called in France "barbon pied de poule" (Fée); and the "ishaimōn" growing in Thrace, and said to stop the bleeding even of an opened vein — (Theophr. ix. 15. 3), stuffed in the nose according to Pliny xxv. 45, its leaves "asperis et lanuginosis," is referred here by writers: *A. angustifolius* was observed by Forskal, Sibthorp, and Chaubard, from the Peloponnesus to Constantinople. Westward, the "ischaemomem" according to Pliny grows also in Italy, and is tied on to arrest bleeding: *A. angustifolius* is termed "gramen dactylon angustifolium spicis villosis" by Tournefort inst. 520; and is known to grow in Switzerland and as far as Leipsic in middle Europe (Hall. hist. ii. 203, Jacq. austr. pl. 384, Roth germ. ii. p. 2. 546, and Schreb. lips. 46). *A. ischaemum* observed by Gerardi gallopr. pl. 4 in Southern France, described by Linnæus, and termed "a. villosus" by Lamarck fl. fr. (Pers., and Steud.), is regarded by J. E. Smith as distinct.

Tuber cibarium of Europe and the adjoining portion of Asia. Called in Britain *truffle*, by Parkinson "trubbes," in Italy "tartuffola" (Prior), in Germany "trüffel" (Grieb), in France "truffe" (Nugent), in Greece "iknōs" or "uthnōs" (Sibth.); in which we recognize the "tuber" identified by Pliny with the "iton" of the Thracians; — the "itōn" or "itnōn" is mentioned also by Galen, and Aetius; the "uthnōs," by Theophrastus i. 1. 11 to 6. 9, by Dioscorides as a roundish edible root dug in the Spring, and by Apollonius mirab. viii. 46, Galen, and Athenæus ii. 60: *T. cibarium* was observed by Sibthorp, and Fraas, from the Peloponnesus to Cyprus, sought for according to Walpole mem. 284 with a divining-rod; and was met with by Burckhardt on his journey through the region around Sinai (Kitt. p. 281). Westward, the "tuber" according to Pliny xix. 11 to 13 was met with by Lartius Licinius in Spain, is produced also in Italy, and of the best quality in Barbary; is also mentioned by Martial xiii. 47: *T. cibarium* is termed "tubera" by Tournefort inst. 565; and is known to grow throughout middle Europe as far as Britain (Bulliard h. fr. i. pl. 356, and Sibth. oxon. 398).

484 B. C. (= 502 — "18 years of two reigns" in the Mahavamsi iv.), Mudda or Munda succeeded by his son Nagadaseka, now Hindu king. He is called Kakavarnin in the Avadana asok. (Burn. i. 358).

"In this year = 2d year after the death of Darius" (Herodot., and Clint.), Egypt recovered by the Persians.

"In this year" (Gaubil pref.), the Chou-king compiled from ancient historians by Khoung-tseu or Confucius.

Zingiber officinale of Equatorial Africa. Its imported root is called in Britain *ginger*, in France "gingembre" (Nugent), in Italy "zenzere" or "zenzevero" (Lenz); and the plant in Yemen "zen-jebil" (Forsk.), in Sanscrit "ardrukum" or "shringuverum" (Lindl.), in Bengalee "adrak" or "ada" (D'roz.), in Hindustanee "sonth," in Telinga "ullum," in Tamil "ingie" (Drur.), in Burmah "khyenseing" (Mason), in Tagalo "luya," in Camarines "laya" (Blanco); and "gingembre" was not avoided by Khoung-tseu lun-yu x. 8 in his food: * — ginger continues to be preserved and exported in large quantities from China; was observed by Blanco under cultivation on the Philippines; by Loureiro i. 2, in Anam; by Mason v. 495 "exotic" and "cultivated to a small extent" in Burmah; is known to be extensively cultivated throughout Hindustan from the elevation of five thousand feet on the Himalaya to Cape Comorin (Drur.); was observed by Rheede xi. pl. 12 in Malabar; by Graham, as far as Surat. Westward from Hindustan, was observed by Forskal under cultivation in Yemen; by myself, the root brought in quantities from the Comoro Islands to Zanzibar, and recognized by Wanyamuesi from Interior Africa as a production of their own country; "ginger of Zanguebar" is mentioned by Abd-allatif; ginger brought principally from Abyssinia and called by Negroes "zymbane," was found by Cailliaud rare at Quamamil on the Nile; and the plant is regarded by Joebel as indigenous in Guinea (Drur.). Farther North, the "inthikōn" of Menestheus, Andreas, Xenocrates, and Dioscorides of Alexandria, is identified by Galen with the "ziggivēri" or "zingiber," mentioned by Celsus v. 23; by Dioscorides, as a peculiar plant growing mostly in "trōglōthutikē aravia," but by Pliny xii. 14 as growing within towns in "arabia atque troglodytica;" the Greek and Latin name is clearly geographical, derived from the source of supply, the island of Zanzibar. By European colonists, the plant was carried to the West Indies, where it is now extensively cultivated (Wright lond. med. journ.): and to the Mauritius Islands (Boj.). The root according to Lindley is "one of the most valuable of aromatics, carminative, stimulant, sialogogue."

* *Cucumis conomon* of Japan. The "melon" too bitter to be eaten and fit only to be suspended, mentioned by Khoung-tseu lun-yu xvii. 7, — may be compared: *C. conomon* was observed by Kaempfer v. 811 in Japan, according to Thunberg "everywhere cultivated," and a preparation of the fruit eaten by the natives, carried besides by the Dutch occasionally to Batavia and even to Europe.

"483 B. C." (Herodot., and Clint.), ostracism or banishment from Athens of the statesman Aristides. A transaction much celebrated.

"In this or the preceding year (= 245 yrs" after its foundation, Thucyd. vi. 4, and Sm. b. d.), Megara in Sicily destroyed by Gelon; who removed the principal citizens to Syracuse, including Epicharmus a pupil of Pythagoras. — Of the comedies of Epicharmus, the only one whose date is certainly known is the *Nasoi* "in 477."

The following form of the letter Θ is said to have been first used by Epicharmus (Aristot., and Plin. vii. 57).

Foeniculum vulgare of the Mediterranean countries. Called in Britain *fennel* or *fenkel*, in France "fenouil," in Germany "fenchel" (Prior), in Italy "finocchio" or at Verona "fenocio" (Lenz), in Greece "agriōmalathrōn" (Sibth.) or "marathrōn" (Fraas), in Yemen "sekamar" (Forsk.), in Egyptian "savin" (Kirch.) or "tshamar hōōut" (ms. Par.), in which we recognize the ΜΑΡΑΘΑ of Epicharmus, — Anaxandrides, Archestratus, Athenaeus ii. 47 to 83, or "marathrōn" of the Hippocratic treatises, Demosthenes, Theophrastus, Dioscorides, and Galen: *F. vulgare* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent in fallow ground from the Peloponnesus to the Dardanelles. Seeds called "schamer" are enumerated by Forskal mat. med. as brought for medicinal use "from Upper Egypt," and the living plant was seen by him under cultivation on the mountains of Yemen. Westward, the "marathrus" is mentioned by Ovid, and Columella; is identified by Pliny with the "foeniculum," mentioned by Celsus, and others; and a gum-like exudation procured from it in Iberia or Spain is mentioned by Dioscorides and Pliny xx. 95; *F. vulgare* is described by Lobel pl. 775, and Dodoens pl. 295; is termed "*f. vulgare minus acriori et nigriori semine*" by Tournefort inst. 311; is known to occur in cultivated and waste ground throughout middle Europe (Pers.), and has become naturalized in Britain (A. Dec.). Eastward from Arabia, was observed by Wight, and Graham, under cultivation in Hindustan and called "owa;" by Thunberg, cultivated in Japan from seeds brought from China, and called "sen rio" or "kure no womo." By European colonists, was carried to Northeast America, where it continues under cultivation in our Middle and Southern States; to Austral America, observed by A. Saint-Hilaire naturalized at Montevideo, by myself in other localities; and to the Hawaiian Islands, where also I found it naturalized. According to Lindley, "oil of *wild fennel* is obtained from the fruit."

Foeniculum dulce of the Mediterranean countries. Possibly the "maratha" of Epicharmus, — and others, mentioned as esculent by Dioscorides: *F. dulce* is described by C. Bauhin pin. 147; is usually considered by Italian writers "a cultivated variety of" the preceding, but is regarded by Decandolle, and Lindley, as a distinct species: is known to occur also in Portugal, and "oil of *sweet fennel* is obtained from the fruit" (Lindl.).

Sium sisarum of Eastern Asia. Called in Britain *skirret*, in old English "skyrwyt" or "skyrwort," in Holland "suiker-wortel" (Prior), in Germany "zuckerwurzeln," in Italy "sisaro" (Lenz); in which we recognize the ΣΙΣΑΡΟΝ of Epicharmus, — Opion, Diocles, Heraclides Tarentinus, Dioscorides, Soranus Ephesus, Galen, Athenaeus iii. 91, Paulus Aegineta, three roots of which according to Hicesius no one can continuously eat: *S. sisarum* seems no longer cultivated in Greece (Fraas). Westward, the "siser" is mentioned by Horace sat. ii. 8. 9, Celsus, Columella, roots from the cool climate of the Rhine were annually imported by Tiberius, and its cultivation in Italy is further mentioned by Pliny xix. 28 and xx. 17: *S. sisarum* is described by Tragus 912; and is known to be cultivated in Italy and middle Europe as far as Britain (Blackw. pl. 514, and Spreng.). Eastward from Greece, was observed by Burmann pl. 29 in Hindustan and called "ninsi;" is known to grow in China (Pers.); and was observed by Kaempfer amoen. pl. 818, and Thunberg in Japan, and called "mukago nisin" or "sjakuna." By European colonists, was carried prior to 1656 to Northeast America, being enumerated in Bradford's poem as successfully cultivated in New England, but has since disappeared.

Cynara cardunculus of the West Mediterranean countries. Called in Britain *cardoon* (Prior), in France "cardon" (A. Dec.), in Germany "kardon" (Fraas), in Italy "cardo" (Lenz): the ΚΑΚΤΟΣ of Epicharmus, — growing according to Theophrastus vi. 4 only in Sicily, the flowers changing into pappus and the stem called "kaktōs" and eaten, mentioned also in Delet pharm. 33, and by Pliny xxi. 57, is referred here by writers: *C. cardunculus* is described by Anguillara, and Dalechamp (Spreng.); is known to grow wild in Barbary and Southern France, is besides cultivated throughout middle Europe for the edible stalk and midrib of the leaves (Pers.). Eastward, is known to occur on Crete (Pers.); and the "kaktōs" was known to Athenaeus ii. 70 in Egypt. By European colonists, *C. cardunculus* was carried to Northeast America, observed by myself under cultivation in our Middle States; to Austral America, where it has become naturalized and abundant on the pampas or plains from the Uruguay and La Plata (A. Saint-Hil., and A. Dec.) to Patagonia, observed there by myself along the Rio Negro.

Origanum vulgare of Europe and the adjoining portion of Asia. Called in Britain *organy* (Prior)

or *wild marjoram* (Lindl.), in France "origan" (Nugent), in Germany, "dosten," in Italy "regamo" or "origano" (Lenz), in Greece "rigani" or "riganōn" (Sibth.), in which we recognize the ΟΡΙΓΑΝΟΝ of Epicharmus, — Ion, the comic poet Plato, Aristophanes eccles. 1022, Timotheus, Archestratus, Sotades, and the Arcadian kind of Athenaeus ii. 77: *O. vulgare* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to mount Athos; and is known to grow as far as Central Asia (Lindl.). Westward, the "origanum" is mentioned by Columella ix. 4. 2 as good for bees and their honey, by Pliny xxi. 29 as coronary, by Palladius as cultivated: *O. vulgare* is described by Brunfels, and Valerius Cordus (Spreng.); is termed "*o. sylvestre*" by Tournefort inst. 198; was observed by Lenz wild in Italy, and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 638, and Pers.). By European colonists, was carried to Northeast America, where it has become naturalized, observed by myself in wild situations in our Middle States. The plant according to Lindley yields *oil of thyme*, "a common remedy for" toothache; mixed also "with olive oil, as a stimulating liniment."

Origanum Smyrnum of the Mediterranean countries. Called in Greece "rigani," or by the Turks "sater" (Sibth.), and possibly included in the "ōriganōn" of Epicharmus: — the "ōriganōn" of Tenedos, celebrated by the ancients (Athen. i. 50), is identified by Forskal with a species observed on that and a neighbouring island, resembling *O. vulgare* but its flowers congested in a strobile: *O. Smyrnum* is described by Tournefort inst. 199; was observed by Sibthorp around Smyrna, and among heath around Constantinople; and "*O. Syriacum*" of Syria is regarded by Fraas as not distinct. Westward, "*O. glandulosum*" having the aspect of *O. vulgare* and observed by Desfontaines ii. p. 27 on the Atlas mountains, is also regarded as not distinct.

Lavandula spica of the Mediterranean countries. Called in Britain *French lavender* (Sibth.), in Italy, "spico gentile" (Spreng.), in Greece "kalōgērīkōhōrtōn" (Sibth.); and probably the ΙΦΥΟΝ of Epicharmus, — Theophrastus vi. 8. 3, Athenaeus ii. 83, identified with the "lavis" by Hesychius; and copied "tiphyon" by Pliny: *L. spica* is described by Dodoens pl. 273; is termed "*l. latifolia*" by Tournefort inst. 198; was observed by Sibthorp, and Chaubard, in the Peloponnesus and on the Greek islands; by Forskal, near Marseilles; and is known to grow in other parts of Southern Europe and in Barbary (Pers., and Lindl.). Probably by European colonists was carried to Hindustan, observed by Law "in gardens Belgaum" near Bombay (Graham). The plant according to Lindley "is not employed medicinally, but yields" *oil of spike*, "used by painters on porcelain and" in "varnishes for artists." (See *L. stoechas*).

Rumex patientia of Europe. A species of *dock* called in Britain *patience* or *passions* (Prior), in France "patience" (Fée), in Italy "pazienza" or "lapazio" or "romice domestica" (Lenz), in Germany "gemüs-ampfer," in Greece "xunēthra" (Fraas); in which we recognize the ΛΑΓΓΑΘΟΝ of Epicharmus, — Diocles, Athenaeus ii. 57 to 83, esculent and single-rooted according to Theophrastus i. 6. 6, and the "lapathōn kēpētōn" of Dioscorides: *R. patientia* was observed by Sibthorp, and Fraas, springing up spontaneously in gardens and fallow ground in the Peloponnesus. Westward, the time for sowing "*lapathum*" is indicated by Pliny xix. 54 to xx. 86: *R. patientia* is described by Dodoens pl. 648; is termed "*l. hortense folio oblongo, sive secundum Dioscoridis*" by Tournefort inst. 504; continues occasionally cultivated, and is known to grow wild in Italy and as far as Germany (Pers., and A. Dec.). By European colonists, was carried before 1669 (Jossel.) to Northeast America, but has disappeared.

Rumex crispus of Europe and the adjoining portion of Asia. The *curled dock* is called in France "patience crêpe" (Fée), in Germany "hasen-ampfer" (Fraas), in Greece "lapathō" (Sibth.); possibly therefore the "lapathōn" of Epicharmus: — the "lapathōn oxulapathōn" growing in marshes according to Dioscorides, hardened and somewhat pointed at the summit, is referred here by writers; the "lapathōn" is enumerated by Manetho among the ingredients of the Egyptian "kuphi" incense (Plut. is. and osir.); and according to Pliny xx. 85, leaves and roots of "*oxylapathon*" are used in making "pastillos," the leaves redder and more acute than in the "sativo" kind, and the seeds employed medicinally: *R. crispus* is termed "*l. folio acuto crispo*" by Tournefort inst. 504; was observed by Sibthorp, Chaubard, and Fraas, frequent in moist places from the Peloponnesus throughout Greece, and eaten as a potherb; is known as a weed in moist ground from Italy to Britain (Pers., Lenz, and Lindl.). Eastward from Greece, was observed by Thunberg frequent in Japan, along roadsides and on the margin of cultivated ground and called "gisigisi." By European colonists, was carried to Northeast America, where in our Northern and Middle States it has become "naturalized" and "a very common weed in cultivated and waste grounds" (A. Gray). The root according to Lindley is "astringent" and is employed "in decoction or ointment" as "a cure for the itch."

Chamaerops humilis of the West Mediterranean countries. The *palmetto* or dwarf palm is called by the Arabs "wakl" and its fruit "mokl" (Spreng.); the esculent ΕΑΑΤΑΝ of Epicharmus — (Athen. ii. 71) may be compared; the "phōinix" by some called "ēlatēn" or "spathēn" being according to Dioscorides the involucre of the fructification: the "hamairriphēis" is described by

Theophrastus ii. 6. 11 as a singular kind of palm growing on Crete and more abundantly on Sicily, continuing to flourish after the brain is removed, and when cut to the roots giving out new shoots; the fruit of "hamaizelôn phōihikôn" is mentioned by Dioscorides i. 149; the "palma agrestis," by Cicero verr. v. 33; "palma campestris" by Columella iii. 1. 2; and the "palma elate" of Pliny xxiii. 53 has "germina folia corticem" buds leaves and bark: fruit of a "Chamæriphis" was found by Delile in the drug-shops of Egypt: *C. humilis* is described by Anguillara p. 71, Matthioli, and Cæsalpinus; was observed by Desfontaines ii. p. 436 in Barbary; by Hogg in Sicily, covering hills like furze; is known to grow also in Southern Italy, Sardinia, the Balearic Islands, and Southern Spain, the roots and base of the young stem eaten (Pers., and A. Dec.); is besides sometimes cultivated, and was seen by Forskal in the Montpellier garden. By European colonists, was carried to Madeira, where it has become naturalized (Lemann); perhaps also to the Greek islands of Corfu and Zante (Martius).

"482 B. C." (Sm. b. d.), C. Julius Julius and Q. Fabius Vibulanus, consuls at Rome, marching unopposed against the Veientes and laying waste their territory.

Artemisia queen of Halicarnassus and the neighbouring islands, a vassal but voluntarily preparing to join the Persian fleet with "five beautiful ships" (Herod., and Paus. iii. 11. 3). Her brother or son Pigres is regarded as the author of the *Batrachomyomachia* (Plut. malign. her. 43, Suid., and Sm. b. d.).

Mentha sylvestris of Europe and Northern Asia, as far as the Altaian mountains. Called in Britain *horse mint* or *brook mint* or *water mint* (Prior), in Italy "sosebro matto" (Pollin.), in Greece "kalamithra" or "agriōethuōsmōs" (Sibth.), in Egypt "habaqbaq" (Del.), in Egyptian "sōumanas" (Edw.); in which we recognized the ΚΑΛΑΜΙΝΘΗ of Pigres batrach., — and "kalaminthē tritē" of Dioscorides resembling "ēthuōsmō agriō" but larger and its leaves longer: *M. sylvestris* was observed by Sibthorp, and Link (Chaub.), frequent in moist situations in Greece; by Forskal, and Delile, in Egypt; by Forskal, in Yemen; is known to grow also about Taurus and Caucasus (Royle). Westward, the "*sisymbrium silvestre*" not more than a foot high and by some called "thymbraeum," is mentioned by Pliny xx. 91: *M. sylvestris* is described by Tragus f. 8, and Anguillara (Spreng.); was observed by Pollini in Italy; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 484, and Pers.). Eastward from Caucasus, is known to grow among the Altaian mountains, and the Himalayan as far as Cashmere (Royle in Kitt. bibl. cycl.).

Calamintha officinalis of Europe and the adjoining portion of Asia. Called in Britain *calamint* (Prior), and according to Fraas frequent in the ditches of Attica; possibly therefore the "kalaminthē" of Pigres batrach., — and Aristophanes: *C. officinalis* was observed by Sibthorp, and Fraas, from Attica to mount Athos and Constantinople. Westward, the "calamintha" employed in cookery by Apicius, is referred here by Dierbach, and others: *C. officinalis* is described by Rivinus monop.; is termed "*c. vulgaris vel officinarum Germaniæ*" by Tournefort inst. 194; and is known to grow in stony places from Austria Italy and Spain as far as Britain (Scop., Lam. fl. fr., Pers., and Engl. bot. pl. 1676). Is according to Lindley "aromatic and slightly bitter," used "by country people in the form of tea as a grateful fever drink." (See *Mentha tomentella*).

"481, April 19th" = "first day of the Fifth month in the 39th year of Khing-wang" (Chinese annals, Gaubil, and . . .), *eclipse of the sun*.

"In the autumn" (Sm. b. d.), arrival of Xerxes at Sardis. Osthanes, earliest commentator on the Magian doctrines, accompanying Xerxes — (Plin. xxx. 2).

Anchusa paniculata of the Mediterranean countries. Called in Italy "buglossa" (Lenz), in Greece "vōuthōglōssōn" (Sibth.) or "vōithōglōssa" (Fraas); in which we recognize the "vōuglōssōn" identified in Syn. Diosc. with the Egyptian "antōn ērinvēsōr," the "gōnōs ailōurōu" of the prophets, and ἄννοϋχι of Osthanes: — the "vōuglōssōn" is described by Dioscorides as resembling the "phlōmō," its leaves spreading over the ground, rough with prickles like an ox's tongue: *A. paniculata* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus frequent throughout Greece. Westward, the "vōuglōssōn" is further identified in Syn. Diosc. with the "vōuthalla" of the Dacians, "ansanaph" of the Numidians, and "lōggaiṽōum" or "liggōua vōvōum" or "livanin" of the Romans: *A. paniculata* is described by Brunfels i. p. 111 (Spreng.); is termed "*b. angustifolium majus flore cæruleo*" by Tournefort inst. 134; was observed by Retz obs. i. p. 12, and Lenz, in Italy; and is known to grow as far as Madeira (Pers.).

Borago officinalis of Persia. Called in Britain *borage*, in France "bourache" (Prior), in Germany "borretsch" (Grieb), in Greece "vōuraza" (Forsk.) or "armpēta" (Sibth.) or "arnōpētra" (Lowndes), in Egypt "lissan et tōr" ox's tongue (Forsk.) and therefore possibly the "sannōuhi" in question: — the belief in "vōuglōssōn" causing "ēuphrōsunōn" hilarity if placed in wine, mentioned by Dioscorides, Pliny xxv. 40, and Plutarch sympos. i, seems at least the origin of the medieval proverb "ego borago gaudia semper ago:" the "lisan el tour" is described by Avicenna as an herb with broad leaves rough to the touch as well as its branches, the best having callosa-hirsute leaves

and procured in Khorasan; is mentioned also by Ebn Baitar: *B. officinalis* was observed by Forskal, and Delile, in the gardens of Egypt, and according to Alpinus, and Forskal mat. med., is employed medicinally; is known to occur springing up spontaneously at Aleppō (Pers.); was observed by Sibthorp, and Chaubard, in waste places from Cyprus to the Peloponnesus; by Forskal, in gardens at Constantinople. Westward, the "borago" is mentioned by Nicolaus Praepositus, and Matthaeus Sylvaticus pand. 42; *B. officinalis* is described by Gerarde p. 653; is termed "b. floribus cæruleis" by Tournefort inst. 133; was observed by Bertoloni seemingly wild in Italy (A. Dec.); and is known to occur in waste and cultivated ground as far as Britain (Engl. bot. pl. 36). By European colonists, was carried to Northeast America, where it continues "sometimes spontaneous in gardens" (A. Gray) in our Northern States. (See *B. Africana*).

Asarum Europæum of Europe and the adjoining portion of Asia. Called in Britain *folefoot* or *hazel-wort* (Prior) or from blended synonyms *asarabacca* (Parkins. th. 115), in Germany "haselwurz," in Italy "asaro" (Lenz) or at Verona "baccara" or "bacchara" (Pollin.), in Greece "asarōn" (Sibth.); in which we recognize the "asarōn" identified in Syn. Diosc. with the Egyptian "kērēeran," the "aima arēōs" of the prophets, and ΘΕΞΑΝ of Osthanes:—the "asarōn" is mentioned in 1 Mul. morb.; by Dioscorides as growing mostly in Pontus, Phrygia, and Illyria, in shaded mountainous situations and among its leaves having a flower close to the roots; is also mentioned by Paulus of Aegina: *A. Europæum* was observed by Sibthorp in the Peloponnesus, also in the environs of Constantinople; and "asarum" root imported from Greece was found by Forskal mat. med. used medicinally in Egypt. Westward, the "asarōn" was further known to Dioscorides as growing among the Ouestinōis in Italy; is identified with the "narthōn agrian" in the added Synonyms, and with the "narthōn rōustikōum" or "sōukkinōum" of the Tuscans, and "vakhar" or "pēripresam" of the Romans; and the account of the "asarum" or "silvestre nardum" by Pliny xii. 27 is only in part taken from Dioscorides: *A. Europæum* is termed "asarum" by Tournefort inst. 501; is known to grow in wooded situations from Italy throughout middle Europe as far as Denmark (fl. Dan., Pers., and A. Dec.). Eastward from the Mediterranean, the dried root and leaves of "asaroon" according to Moomina are brought from Syria to Hindustan; are enumerated by Ainslie mat. ind. as sparingly used there medicinally; and are called in Sanscrit "oopana," in Hindustanee "tuckir," in Telinga "cheppoo tatukoo." The plant according to Lindley is called in France "cabaret," because used it is said by drunkards "to produce vomiting," the roots being "purgative, emetic, and diuretic." (See *Inula conyza*).

"480, in the Spring" (Clint., and others), departure of Xerxes from Sardis, on his memorable Invasion of Greece.

The Indian auxiliaries in the army of Xerxes wore garments of cotton "apō xulōn;" were armed with bows of *bamboo* "kalamina," the arrows of the same material pointed with iron; and were led by Pharnazathres son of Artabatis — (Herod. vii. 65).

The Ethiopians in the army of Xerxes had spears pointed with the sharp horn of the "thōrkathōs" antelope — (Herod. vii. 68). The fashion continues unchanged, and an African spear pointed with the straight horn of an antelope, is now in the museum at Washington.

Chrysophyllum ? *sp.* of Eastern Equatorial Africa. A lofty tree called "chenjha" (Grant); possibly furnishing the wooden portion of the spears in question: — observed by Grant from "5° S. to 3° 15' N." on the Nile, its wood made into spear-handles, and a sweet drink obtained from its fruit.

Phoenix sp. of Eastern Equatorial Africa. A *wild date*, perhaps furnishing the bows four cubits long of ΦΟΙΝΙΚΟΣ: ΞΠΑΘΗΣ carried by the Ethiopians in the army of Xerxes — (Herodot. vii. 69): observed by Grant growing on the hill-sides, having no known uses, its fruit not edible.

On his way, the *camels* of Xerxes were attacked by *lions* — (Herodot.).

Alchemilla alpina of mountains in Europe and the adjoining portion of Asia. Called in Greece "lēōntōpōthiōn" (Sibth.), a name that seems to have arisen when lion-tracks were familiarly known: — the "lēōntikēn" or "kakalia" described by Dioscorides as growing on mountains, having a straight white stem, ample white leaves, the flower "vruō"-like or resembling that of the olive, may be compared: *A. alpina* was observed by Sibthorp on the Bithynian Olympus and in the Peloponnesus. Westward, the "leontice" or "cacalia" is described by Pliny xxv. 85 as growing almost exclusively on mountains, the seed like diminutive pearls pendent amid large leaves; *A. alpina* is termed "a. alpina quinquefolii folio subtus argenteo" by Tournefort inst. 508; is known to grow on the Appenines and mountains of middle and Northern Europe as far as Lapland (fl. Lapp. 61, Engl. bot. pl. 244, and A. Dec.) Iceland and Greenland (Hook.).

Alchemilla vulgaris of Europe and the adjoining portion of Asia. Called in Britain *lady's-mantle* or *lion's-paw* or *lion's-foot* or *padelion* (Prior); in which we recognize the "lēōntōpōthiōn" — or "lēukēōrōn" or "thōris" or "thōriktēris" or "thōruvēthron" of Syn. Diosc. iii. 100: *A. vulgaris* was observed by Sibthorp on the Bithynian Olympus and in the Peloponnesus; is known to grow also along the Taurian mountains and as far as the Altaian (Gmel, Bieb., and Ledeb.). Westward,

the "leontopodion" or "leuceoron" or "doripetron" or "thorybetron" is described by Pliny xxvi. 34 as growing in open situations and thin soil, the root "alvum sistit:" the "leonfot" is mentioned in the Anglo-Saxon translation of Apuleius 8: *A. vulgaris* is described by Tournefort inst. 508; is known to grow "in dry subalpine pastures" from Switzerland as far as the North cape of Lapland (fl. Dan. pl. 693, Sab., Wats., and Lindl.), Iceland, Greenland, and Labrador in Lat. 57° (Martins, Hook., and A. Dec.). According to Lindley, "the decoction slightly tonic."

Evax pygmaeus of the Mediterranean countries. The Egyptian "thaphnōinēs," or "aima krōkōthēilōu" or "krōkōmērion" of the prophets, is identified in Syn. Diosc. with the "lēontōpōthiōn," — described by Dioscorides as a little herb two fingers-breadth high having leaves four fingers (-breadth) long, whitish and more woolly next the root, blackish flowers in incised terminal heads, seeds not easily seen on account of the enveloping wool, a small root worn as a love-charm and to disperse swellings, and referred here by Fraas: *E. pygmaeus* was observed by Sibthorp, Chaubard, and Fraas, frequent in the Peloponnesus and on the Greek islands. Westward, the "lēontōpōthiōn" or "zōōnuhōn" or "aēōnuhōn" or "kēmōs" or "thamnamēnē" or "ithiōphutōn" or "phutōvasila" or "krōssiōn" or "krōssōphthōōn" is identified in Syn. Diosc. with the "minērkiōm" or "nēōumatōus" or "pallathiōm" or "phlammōula" of the Romans; the "cemos" according to Pliny xxvii. 35, from being used only as a charm will be passed in silence: *E. pygmaeus* is described by Barrelier pl. 127, is termed "*filago maritima capite folioso*" by Tournefort inst. 454; and is known to grow in the more Southern parts of Europe (Cav. pl. 36, Desf., and Pers.).

Glauicum phœniceum of the Mediterranean countries. The "lēontōpētalōn" — described by Dioscorides as growing in cultivated ground, a span or more high with numerous axils, terminal "ērēvinthōis"-like pods containing two or three small seeds, flowers "phōnika" and "anēmōnē"-like, "kramvē"-like leaves incised as in "mēkōnōs," identified in the added Synonyms with the "lēōntiōn" or "luhnis agria" or "parthalē" or "rapēiōn" or "mēkōn kēratitis" or "anēmōnē," may be compared: *G. phœniceum* was observed by Sibthorp, and Chaubard, in vineyards from the Peloponnesus throughout the Greek islands to Cyprus; and by Russel, at Aleppo (Spreng.). Westward, the "lēontōpētalōn" is further identified in Syn. Diosc. with the "sēmēn lēōninōm" or "kōuvilia marina" or "papavērkōulōm" of the Romans; the account of the "leontopetalon" or "rhapeion" by Pliny xxv. 72 seems taken from Dioscorides: *G. phœnicium* is termed "*g. hirsutum flore phœniceo*" by Tournefort inst. 254, "*chelidonium corniculatum*" by Linnaeus 724: is known to occur as a weed in Southern Europe, and even as far as London (Curt. lond. vi. pl. 32, and Pers.).

Leontice leontopetalon of the East Mediterranean countries. Called in Greece "tzakrō" or "pōurthala" (Sibth.); and possibly the "parthalē" identified in Syn. Diosc. with the "lēontōpētalōn" — described by Dioscorides, and referred here by Matthioli: *L. leontopetalon* is termed "*leontopetalon foliis costæ ramosæ innascentibus*" by Tournefort cor. 49; was observed by Sibthorp, Chaubard, and Fraas, frequent in waste and cultivated ground from the Peloponnesus to the Greek islands; is known to occur also in Asia Minor (Spreng.). Westward, is described by Camerarius 565, and Barrelier pl. 1029; and is known to occur in Italy (Pers.).

Forcing a passage at Thermopylae against the few Spartans under Leonidas, Xerxes entered Athens. His fleet however after successive *naval combats* was totally defeated at Salamis by Themistocles, leaving the "empire of the sea" to the Athenians (Diodor., and Clint.). And before the close of the year, Xerxes with a portion of his army withdrew into Asia.

"On the day of the battle of Salamis" or at least not later (Herodot. vii. 165. Diodor., and Justin xix. 2), at Himera in Sicily, the Carthaginians totally defeated, and their leader Hamilcar slain; leaving three sons, Hanno, Himilco, and Gisco.

"In this year" (Diodor., and Clint. ii. p. 340), accession of the Archaenactidae dynasty at Panticapæum or Bosphorus, on the Crimean shore of the Strait leading into the Azof Sea. The city, founded by Milesians, continued under the rule of Greco-Crimean princes; and with the district around, became "the granary of Greece and especially of Athens."

"479 B. C." (Herodot., and Clint.), "ten months" after the occupation by Xerxes, the city of Athens destroyed by Mardonius. In "September," the Persian army under Mardonius defeated at Plataea by the Greeks under Pausanias. — Soon after this victory (Lubke and Lutrow), building of the temple to Minerva on Aegina.

Scandix Australis of the East Mediterranean countries. An Umbelliferous plant called in Germany "östlicher körbel," in Greece "tzilimōnthia" or "kaukatithra" (Fraas) or "skanthiki" (Hon. Bell.): in which we recognize the "skanthix" sold according to scandal by the mother of Euripides — "thiaskanthikisēs" (Aristoph. ach. 454 to ran. 839, Theopomp., Gell. xv. 20, and Plin. xxii. 38): the "skanthix" is mentioned also as a potherb by Opion, Theophrastus vii. 7. 1 to 8. 1, Erasistratus, and the "skanthux" by Dioscorides as spontaneously-growing and eaten either crude or cooked: the "scandix" is further enumerated by Pliny xxi. 52 among the esculent plants of Egypt:

S. Australis was observed by Honorius Bellus eaten on Crete (Clus. hist. 199 to 300); is termed "s. cretica minor" by Tournefort inst. 326; was observed by Sibthorp, Gittard, and Fraas, in cultivated and fallow ground from the Peloponnesus to Caria and Cyprus. Westward, the account of the "scandix" by Pliny seems chiefly taken from the Greeks; but *S. Australis* is described by Columna ecp. 90, and C. Bauhin prod. 78 (Spreng.); and is known to occur in Austria and Southern France (Crantz, All., Lam. fl. fr., and Pers.).

Scandix pecten of Sicily. Called in Britain *shepherd's needle* or *Venus' comb* (Prior), in Italy "pettine di Venere" or "spiletton" (Lenz), in Greece "agria kaukalithra" (Fraas) or "santhuki" (Sibth.); and possibly connected with the above scandal: the "santhukōs" herb whose juice dyes garments "sarkōēthēs," was discovered by the Lydians — (J. Lydus mag. iii. 64), is mentioned by Democritus (geopon. vi. 19); and the "sandyx" dyeing the fleeces of lambs feeding on it, by Virgil (Plin. xxxv. 23): the cosmetic "paithērōt" of Alexis, Demetrius Poliorcetes, Aelian ix. 9, Athenaeus xiii. 23, and Hesychius, identified with the "caerrefolium" by Pliny xix. 54, may also be compared: *S. pecten* was observed by Sibthorp, Chaubard, and Fraas, in cultivated ground from the Peloponnesus to Cyprus and Constantinople: is known to occur also as far as the country South of Caucasus (C. A. Mey., and Hohen.). Westward, the "akikōulam" or "skanaria" of the Romans is mentioned in Syn. Diosc. ii. 167; the "veneris pectinem" named from resembling a comb, its root according to Pliny xxiv. 114 bruised with "malva" extracting substances imbedded in the flesh: *S. pecten* is described by Gerarde 884; is termed "s. semine rostrato vulgaris" by Tournefort inst. 326; is known to occur from Algeria Sardinia and Italy as far as Denmark (fl. Dan. pl. 844, Pers., Moris, and Munby), confined to cultivated ground except only in Sicily, where it was observed by Gussone i. 341 in wild situations (A. Dec.).

"The same year" (Pauth. p. 180), death of Khoung-tseu or Confucius, in his "seventy-third year." A "kiai" tree, planted near his tomb by his disciple Tseu-koung — is said to be still standing: and his descendants, much honoured in China, now number many thousands.

"478 B. C." (Diodor., and Clint.), in Sicily, Gelon succeeded by Hiero as king at Syracuse.

"In the Spring" (Herodot., and Clint.), Sestus on the Hellespont surrendered to the Athenians: giving them control of the commerce on the Black Sea. (Herodotus' history here closes; — though an event twenty-four years later, is incidentally mentioned).

Hardly later than this date (Herodot. iv. 43), Sataspes sent by Xerxes to circumnavigate Africa. Sailing from Egypt through the Straits into the Atlantic, he turned Southward and followed the African coast, passing Cape Soloe, and several months beyond reached a district inhabited by dwarfish people clad in "phōinikēē" palm-leaves and keeping "prōvata" sheep or cattle, and who on a landing being effected abandoned their towns and fled to the mountains (*Hottentot* tribes). More than half the distance remaining unaccomplished and finding his ship could proceed no farther (doubtless on account of the opposing winds and current) Sataspes turned back.

Phoenix reclinata of Subtropical Austral Africa. Possibly affording the "phoinikēē" in question: — known to grow in the interior region of Austral Africa (Pers.). From transported specimens, described by Jacquin frag. pl. 24.

"477 B. C. = 43d year of Keng-wang" (Chinese chron. table), beginning of the Thirty-seventh cycle.

"The same year" (Diodor. xi. 41, and Clint.), naval dominion having been acquired, beginning of the *ascendancy of Athens* among the States of Greece.

As early perhaps as this year, coins issued by the Macedonian king Alexander. He had accompanied the army of Xerxes but secretly favoured the Greeks; and sent by Mardonius after their naval advantage at Salamis, urged them to make peace. He subsequently warned them of the impending attack at Plataea; — and having proved his Greek descent, was the first of the royal family of Macedonia admitted as competitor at the Olympic games (Sm. b. d.).

His are the earliest *inscribed Greek coins*, and they present the following form of the letter Ξ.

"475 B. C." = 1st year of Youan-wang, of the Tcheou or Fifth dynasty (Chinese chron. table).

"In his reign" (Pauth. p. 186), the estates of the prince of Ou seized by Keou-tsien prince of Youe: several members of the dispossessed family retiring to Japan, being descendants of Tai-pe already mentioned. Wishing to punish an officer without disgracing him, Keou-tsien sent a sword with orders to *put himself to death*: the earliest instance of this custom on record.

Saccharum officinarum of the Moluccas? The *sugar-cane* is called in Burmah "kyan" (Mason); and has been known in China from a very ancient period — (A. Dec.): was observed by Mason "exotic" in Burmah; by Kaempfer, and Thunberg, under cultivation in Japan; by Rumphius v. pl. 74, and myself, under cultivation throughout the Malayan archipelago; by myself, on the Feejean Islands, cultivated and a juiceless form overrunning territory in regular cane-brakes, the absence of seeds being the only indication of foreign origin; on Tongatabu, and Taheiti, also inclined to become naturalized without the aid of seeds, but here as well as on the Samoan and Hawaiian

Islands clearly introduced by Polynesians. Westward from Burmah, is called in Sanscrit "ikshoo" or "rusala" or "poondra" or "kanguruka," in Telinga "cherukoo" (Roxb.), in Tamil "karoomboo" (Drur.); and its product *sugar* in Sanscrit "sarkura," in Tamil "sakkara" (Royle), in Bengalee "sharkara" or "bhura" or "chini," in Hindustanee "shakar" or "bura" or "chini" or "khand" (D'roz.): sugar is mentioned in the Institutes of Menu, and the Sama Veda (transl.); "honey made by the hands of confectioners" was known to Herodotus iv.; a kind of reed "yielding honey without the aid of bees" was seen by Nearchus in Hindustan (Strab. xv. i. 20), is mentioned also by Theophrastus fr. 190; "sakharōn" is described by Dioscorides as a kind of concreted honey obtained from reeds in India and Arabia Felix (the living plant already in Yemen), is mentioned also by Pliny, and Galen: *S. officinarum* was observed by Roxburgh, Graham, and myself, under cultivation in Hindustan, and "the 'bhooroo' reed of which the native pens are made" is according to Graham "common in the Concans:" *S. officinarum* was observed by Forskal seemingly wild among the mountains of Yemen, and called "muddarjend;" was ascertained by myself at Zanzibar to be cultivated by Negro tribes as far inland as the Monomoizi country; was observed by Baumgarten i. 16, Forskal, and Delile, under cultivation in Egypt; and by Harib in the "Tenth" century, in Spain (A. Dec.). By European colonists, was carried "in 1420" from Sicily to Madeira, thence "in 1503" to the Canaries (Buch), and somewhat later to the Mauritius Islands (A. Dec.); by Columbus, was carried to America (F. Columb. 53), where it continues abundantly cultivated within as well as near the Tropics.

474 B. C. = "12th year of Hesira" or Xerxes; the latest date in his reign found on the Egyptian monuments — (C. Mull. fr. Man. p. 596).

"The same year" (Diodor., and Clint.), the Tuscans defeated in *naval combat* by Hiero Greek king of Syracuse.

The wheat-fly, *Cecidomyia destructor*, figured on coins of Metapontum in Southern Italy — (Lee's edit. Keller p. 351). From Europe, the wheat-fly was unintentionally carried by colonists to Northeast America; where in our Middle States, it continues to commit great ravages.

"470, not earlier" (Niebuhr, and Sm. b. d.), Coriolanus banished from Rome finding refuge among the Volscians. — Some ten years later, arriving before Rome at the head of a Volscian army, he was persuaded by his mother and family to withdraw. The account however is regarded as legendary rather than historical.

In this year (= 452 + "18 years reign" of the Mahavamsi iv), Nagadaseka succeeded by Susanaga, now Hindu king. Sahalin is in this place in the Avadana asoka (Burnouf i. 358).

"In or about this year" (C. Mull. geogr. min. i. p. xxii, see Plin. ii. 67), sailing from Carthage of "sixty" ships, containing "thirty thousand" persons, under Hanno, to found and re-establish colonies on the West coast of Africa. "Two days" South of the entrance to the Mediterranean, the new city of "Thumiatiērōn" was built. Passing the "sōlōēnta" promontory (Cape Cantin), additional colonists were left in the maritime cities of "Karikōn-tēihōs, Guttēn, Akran, Mēlittan," and "Aram-vun." At the river "Lixōn" having procured interpreters, Hanno proceeded South along the "Desert;" and entered a gulf containing a small island which he occupied and named "Kērnē" (Herne at the mouth of the Rio do ouro). — Herodotus iv. 195 had heard of gold procured by the Carthaginians at the island of "Kuraunin," and of their trading with African tribes without seeing them; "Kērnē" is mentioned by Ephorus, Lycophron, Eratosthenes, Polybius, Cornelius, Diodorus, Strabo, Plinius, C. Ptolemaeus, Nonnus; and at the end of a little over nineteen centuries, gold was procured from the natives and the spot named "Rio do ouro" by the Portuguese navigator A. Gonzalez.

From "Kērnē," Hanno proceeded South to a "great river full of *hippopotami* and *crocodiles*" (Senegal); and after re-visiting "Kērnē," continued his voyage; the natives everywhere fleeing and shouting unintelligibly to the Lixite interpreters. He next reached large and wooded mountains (Cape Verd), producing trees whose wood was scented and variegated. After "two days" sailing, crossing a wide opening (mouth of the Gambia), the country became level; and fires were seen at night. "Five days" later, he entered a gulf, known to the interpreters as "Espērou kēras;" and containing a large island, and within the island a sea-water lake, and within the lake another island (Harang, one of the Bissagos Islands). Woods only were in sight; but at night, there were fires in different directions (kindled by the negroes mainly to keep off wild beasts), and sounds were heard of pipes and drums, mingled with outcries. Continuing beyond, the country was found to be on fire (tall reedy grass becoming dry in autumn and fired by the negroes); and at the end of "four days," a very lofty mountain came into view, called "Thēōn ōhēma" (Mount Sagres, about fifty miles from Sierra Leone). After the next "three days," Hanno entered a gulf called "Nōtōu kēras" (Sherbro Sound); want of provisions precluding the farther prosecution of the voyage.

On an island in this gulf, hairy or furry "wild men" called by the interpreters ΓΟΡΙΑΑΑΞ were captured, but continuing to resist, were killed and their skins preserved: "toorallas," the Mandingo

name of the *chimpanzee* or small African orang. *Troglodytes niger*, — is referred here by Hugius (C. Mull. geogr. min. i. p. 13). The skins brought back to Carthage, were kept in the "temple of Juno" until the capture and destruction of the city (Plin. vi. 36).

The name "gōrillas" may therefore afford evidence of the *Mandingo language* being already in existence.

"469 B. C." (Clint.), at Athens, Pericles first taking part in public affairs.

"468 B. C. = 1st year of Tching-ting-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

About this time, "548-432 B. C." (Scylacean periopl., Theophrast., Hygin., Plin., C. Mull. geogr. min. i. p. 69 and Sm. b. d.), the constellation Hoedi or kids, defined among the stars by Cleostratus of Tenedos.

One hundred and fifteenth generation. May 1st, 467, mostly beyond youth: the Greek poets, Bacchylides, Panyasis, and Epilycus; the comic poets, Ecphantides, Peisander; the tragic poets, Aristarchus, Ion of Chios, Achæus, Neophron, Cleomachus, and Aristæas; the philosophers, Diagoras of Melos, Archelaus, Melissus, and Hermotinus; the historians, Pherecydes of Athens, Damastes of Sigeum, and Xenomedes of Chios.

Ranunculus flammula of Europe and Northern Asia. Called in Britain *spearwort* (Ainsw.), in Sweden sometimes "æltegræs" (Linn.), and the ΣΑΡΙΣΣΑ herb growing according to Archelaus along a river of Aetolia, its root like a spear, good for short-sightedness — (Stob. 98), or according to Aristotle mirab. 171 along the river Lycorna, resembling a "lōghē" lance-head and good for short-sightedness, may be compared: fragments of *R. flammula* occur in debris of the ancient lake-villages of Switzerland; the plant is termed "*r. longifolius palustris minor*" by C. Bauhin pin. 180, and Tournefort inst. 292; was observed by Linnæus in the wooded country as far as Lapland; by Curtis vi. pl. 37, in Britain; by Brotero, in Portugal; by Sibthorp, and Chaubard, in the Peloponnesus; and is known to grow throughout Siberia (A. Dec.). Its leaves according to Lindley are "vesicant," and the distilled water is "said by Withering to be an emetic."

"465 B. C." (Clint.), Xerxes succeeded by Artabanus, fifth Persian emperor. Who reigned "seven months" (according to Manetho); his name has not been found on the Egyptian monuments.

"The same year" (Euseb., and Clint. ii. p. 43), fall of a *meteoric stone* at Aegospotamos on the Hellespont. Recorded by Diogenes of Apollonia: and the opinion maintained by Anaxagoras and others, That the stone "came from the sun" — (Plin. ii. 58, D. Laert., and Theodoret. therap. 4. iv. p. 797).

That *all animals respire*, including fishes and mollusks, maintained by Diogenes, and Anaxagoras; both of whom attempted to explain the respiration of fishes by a portion of air in the mouth (Aristot. respir. 2). — Modern discoveries have shown, the necessity of the water being aerated.

"464 B. C." (Astronom. can., and Clint. ii. p. 380), Artabanus succeeded by Artaxerxes, sixth Persian emperor. The hieroglyphic ovals of Artahesses occur on rocks on the Kossor road; at this time therefore, a route of commercial intercourse with the Red Sea — (Glid. analect.).

"The same year" (Thucyd., and Clint.), revolt of the Helots against the Spartans; and beginning of the Third Messenian war. — The war continued "ten" years.

"460 B. C." (Thucyd., and Clint.), revolt against the Persians of the Egyptians led by Inarus; and aid extended to the insurgents by the Athenians. — The war continued "six" years.

A Greek inscription of this date (= "Ol. 80. 1," Franz) containing the following form of the letter *μ*.

458 B. C. = "7th year of Artaxerxes" (Ezr. vii. 6 to 9), a body of Israelites under Ezra, permitted by the Persian emperor to leave Babylon for Jerusalem.

Myrica sapida of the Himalayan mountains. A tree long celebrated by Sanscrit writers, and its exported bark called in Hindustanee "kaephul" (Drur.), in Arabic "dar-shisan" (Royle); in which we recognize the "dar-shisan" identified through Avicenna, and Serapion, with the ΑΣΓΑΛΑΘΟΣ enumerated among spices and perfumes in the Apocryphal book of Sirach xxiv. 15, — referred here conjecturally by Royle (Kitt. bibl. cycl.): "aspalathōs" according to Manetho formed one of the ingredients of the "kuphi" incense (Plut. is. and osir. 80); seems mentioned by Theophrastus ix. 7. 3 to od. 33 only as a perfume; a tree "aspalathum" growing in the East, is mentioned by Pliny xii. 52 to xxiv. 68; the "dar-shisan," by Maserjawia, Ebn Wahshaneh, Edrisi, Ebn Baitar; and two kinds are distinguished by Persian medical writers (Ulfaz-i-Udwieh 157 to 884 transl. Gladw.). Bark of *M. sapida* was found by Royle exported in quantities from Nepal into the lower country, and esteemed a "valuable stimulant medicine." (See *Spartium villosum*, and *Genista horrida*).

"The same year" (Sm. b. d.), L. Minucius Esquilinus Augurinus and C. Nautius Rutilus consuls, the Roman army hemmed in by the Aequians and Sabines said to have been liberated by the dictator Cincinnatus.

"457 B. C." (Thucyd., and Clint.), the "Long walls," extending from the harbour to the city of Athens, commenced. — In the following year, they were completed.

About this time (. . .), a *geological observation* by Xanthus of Lydia. Who, finding *salt-lakes* in Armenia, Mattiena, and Phrygia, and "stones having the form of shells," concluded that the whole territory "had once been sea."

"456 B. C." (Jahn biblic. archaeol.), Anaxagoras, a disciple of Hermotinus, visiting Athens. Contrary to the opinion then prevalent, that matter has always existed, Anaxagoras maintained, That matter and the universe had been created by a god: or (according to Plato phæd. 104), "That it is intelligence that sets in order and is the cause of all things." He also thought that the moon is inhabited, and contains hills and valleys (D. Laert. ii. 8), and were its revolving force to cease, would fall to the Earth like a stone from a sling (Humb. cosm. ii.).

"In this year" (Sm. b. d.), the revolted Egyptians under Inarus defeated by the Persian general Megabyzus. — Herodotus iii. 12 in visiting Egypt, found the battle-field covered with bones and skulls of the slain.

As early probably as this date (Herodot. ii. 32), Etearchus king of the Oasis of Ammon visited by Nasamonians, who stated that some of their young men had crossed the Great Desert, and were carried by dwarfish people whose language they did not understand (Hottentot Race) to a city on the banks of a great river, containing *crocodiles* and flowing from West to East; supposed by Etearchus to be the Nile; — Herodotus ii. 29 further speaks of a great navigable lake "40 + 12" days sail with the current beyond Meroe.

Soyimida sp. of Eastern Equatorial Africa. A large Meliaceous tree called "m'bawa" (Grant); and probably furnishing some of the canoes on the Lake and rivers: — observed by Grant in "3° N." on the Nile, and immense canoes made by the Wahiyow from its trunk.

Nov. gen. near Copaifera of Eastern Equatorial Africa. A tree fifty feet high called "miombo" (Grant); and possibly furnishing some of the canoes in question: — observed by Grant from "5° 30' to 2° 30' S., alt. 4148 feet," its bark made into boats roofing grain-bins and cloth, and its wood into rafters.

Sterculia tomentosa of Equatorial Africa. A tree called "m'loolooma" (Grant); and probably in some instances furnishing the required cordage: — observed by Guillemain and Perrotett in Senegambia; by Grant, in 3° N. on the Nile, the seeds eaten in dearths, and cordage made from the bark of young trees.

Hibiscus (Abelmoschus) heterotrichus of Eastern Equatorial Africa. Probably in some instances furnishing the required cordage: — received from Africa by E. Meyer; observed by Grant "among vegetation 2° N." on the Nile, and cordage made from its bark; by Bojer, on Zanzibar and the mainland opposite, and on the Comoro Islands. By Bojer, carried to the Mauritius Islands.

Chrysophyllum sp. of Eastern Equatorial Africa. A tree, probably in some instances furnishing the required cordage: — observed by Grant frequent at "3° 15' N." on the Nile, growing like a huge bush on the face of rocky hills, and ropes made from its inner bark.

Ficus sp. of Eastern Equatorial Africa. A tree called "m'chæræ" (Grant); and possibly in some instances furnishing the required cordage: — observed by Grant from "6° S. to 3° 15' N." on the Nile, its bark used for bark-cloth and ropes, and birdlime gathered from its trunk.

Sansevieria sp. of Eastern Equatorial Africa. Possibly furnishing a portion of the required cordage: — observed by Grant in Uganda on the Upper Nile, its long leaves yielding beautiful white ropery.

Asphodelus fistulosus of the more Southern Mediterranean countries. Called in Egypt "burak" (Forsk.); and the "anthërikôn" interwoven with "shöinōus" by the Nasamonians to make portable huts — (Herodot. iv. 190), may be compared ("anthërikôn" according to Dioscorides and Pliny being the stem of "asphōthēlōs"): the "barwak" is mentioned by Ebn Baitar: A. fistulosus was observed by Forskal as far as Cairo growing in the Desert; by Sibthorp, and Bory, on the Greek islands and the Peloponnesus. Westward, is termed "a. foliis fistulosis" by Tournefort inst. 344; and is known to grow in Southern France and Spain (Moris. iv. pl. i, Cav. iii pl. 202, and Pers.).

"455 B. C." (Thucyd., and Clint.), Ithomë the acropolis of Messene surrendered to the Spartans; terminating the Third Messenian war.

"The same year" (Thucyd., and Clint.), in Egypt, capitulation of the Athenian army, deserted by their insurgent allies; and possession of the country, "the marshes under Amyrtæus" excepted, recovered by the Persians.

"The same year" (Aristot., and Clint.), *logic* invented by Zeno of Elea; and *rhetoric*, by Empedocles. That fire can be kindled by rays of the sun passing through a glass goblet filled with water, also mentioned by Empedocles — (Clem. strom. vi. 17).

The ΚΛΕΨΥΔΡΑ or *water-clock* mentioned by Empedocles (Aristot. respir.), — Aristophanes acharn. 693, Eubulus, and Aristotle poet. 7. (See Scipio Nasica).

"454 B. C." (Blair, and Sm. b. d.), mission of the Romans to Athens, to procure the laws of Solon.

452 B. C. (= 443 + his "10th year," in the Mahavamsi iv), Susanaga succeeded by his son Calasoka, now Hindu king. He is called Tulakutchi in the Avadana asoka (Burn. i. 358).

"451 B. C." (Sm. b. d.), at Rome, Appius Claudius Crassinus and T. Genucius Augurinus consuls; and in conformity with a plan adopted on the return of the mission to Greece, decemviri appointed, including the two consuls, and the Laws of the ten tables promulgated.

"450 B. C." (Sm. b. d.), at Rome, decemviri continued, and two additional tables appended, making the Laws of the Twelve tables.

In this year (431 + "about 65 years" of Pamphila = 496, Sm. b. d.), Hellenicus the historian about 46 years old.

Acacia seyal of Nubia. A thorny tree called in Egypt "seyal" (Del.); and the ΑΚΑΝΘΑΙ: ΑΕΥΚΑΙ worn there in garlands according to Hellenicus, as well as the ΜΕΛΑΝΑΙ kind — (Athen. xv. 24), may be compared: the "akantha lëukē" is described by Theophrastus iv. 2. 8 as a tree covered with thorns, but its wood is weak and not durable, while on the other hand the "mēlaina" kind (A. Nilotica) is used for ship-building, and the flowers are coronary: the "sijal" is enumerated by Forskal p. lvi as affording charcoal of the best quality; and A. seyal was observed by Granger, Bruce, and Delile, in the Desert between the Nile and the Red Sea from Syene and Thebes to the Valley of the Wandering towards Suez, the thorns white. The "m'salla," to all appearance the same species, was found by Grant along the Nile from 9° N. to 18°, forming forests much broken by elephants feeding on it. The "akanthēs thipsathōs" according to Theophrastus iv. 7. 1 the only tree growing along the Red Sea beyond Coptum, or the "spina sitiens" of Pliny xiii. 50, may also be compared.

"449 B. C." (Sm. b. d. . . .), at Rome, the decemviri illegally continuing in power until the death of Virginia by the hand of her father; when they were deposed and the old form of government restored, Valerius and Horatius being appointed consuls. The power of the plebeians was then increased by the Valeria Horatia laws.

The same year = "16th year of Artaxerxes;" the latest date in his reign on the Egyptian monuments (C. Mull. fragm. Maneth.). The war against the Persians renewed in this year, the Athenians sending assistance to Amyrtaeus. And before its close, death of Cimon commander of the Athenian fleet on the coast of Cyprus (Sm. b. d.).

The ΜΕΛΕΑΓΡΙΔΕΣ of Sophocles — (Plin. xxxvii. 11) is admitted to be *Guinea fowl*, Numida meleagris. Imported (according to the Scylacean Periplus 112, and Mnaseas) only from Pōntiōn or Crathin, on the African coast outside of the entrance to the Mediterranean; but of course, derived originally from the country South of the Sahara. The "mēlēagris" is mentioned also by Aristotle, Clytus Milesius, Menodotus, Pliny, and Athenaeus. Those carried in the festival of Ptolemy Philadelphus at Alexandria (Callixen.) were possibly derived through a new route of supply; for in the time of Browne, Guinea fowl were brought into Egypt by the Darfour caravans.

The ΗΛΕΚΤΡΟΝ associated with "mēlēagritēs," but attributed to India by Sophocles — (Plin. xxxvii. 11), is of course *gum copal*: brought together with the birds from the country South of the Sahara. By Mnaseas, the associated "electrum" is attributed with the birds to the above-named spot in West Africa; and the same source of supply is given by Asarubas (Plin. l. c.). The "succinum indicum containing lizards" seen by Archelaus (Plin. l. c.), is clearly gum copal; carried from the Eastern coast of Equatorial Africa. This gum while flowing often envelopes leaves and insects, which continue visible in its hardened state; and in one instance, a young lizard thus enveloped was shown me.

Psoralea bituminosa of the Mediterranean countries. A leguminous plant called in Greece "agriō triphulli" (Fraas); and the poisonous ΤΡΙΦΥΛΛΟΝ of Sophocles, — prescribed as medicinal by Euryphon 2 morb. 25 to 38, Nicander, Simus, exhaling according to Dioscorides the odour of bitumen, is referred here by writers: P. bituminosa was observed by Sibthorp, Chaubard, and Fraas, frequent in stony places from the Peloponnesus throughout the Greek islands. Westward, the "triphullōn" or "asphaltion" or "knikiōn" or "mēnuanthēs" or "ōxuphullōn" is identified in Syn. Diosc. with the "triphōliōm akōūtōm ōthōratōm" of the Romans; the "acutum trifolium" is identified by Columella vi. 17. 2 with the "asphaltion" of the Greeks; by Scribonius Largus, with the "ōxutriphullōn;" and the "trifolium" called by the Greeks "minyantes" or "asphaltion" is distinguished as coronary by Pliny xxi. 30 to 88: P. bituminosa is described by Matthioli p. 608, and Dodoens p. 566 (Spreng.); is termed "trifolium bitumen redolens" by Tournefort inst. 404; is known to grow in Italy and other parts of Southern Europe (Pers., and Lenz).

Onopordum Arabicum of the Mediterranean countries. A thistle called by the Arabs of Barbary "suchaha" (Matthioli), in Greece "agkathi" (Sibth.); and the ΓΡΑΙΑΣ: ΑΚΑΝΘΗΣ: ΠΑΡΡΟΞ of Sophocles — (Plut. disp. epicur. 19) may be compared; also the "akantha aravikē" growing

according to Dioscorides in rough uneven places, astringent and resembling in character "lëukē akanthē," and in the added Synonyms identified with the "akanthin:" O. Arabicum was observed by Sibthorp frequent in Greece. Westward, the "akantha aravikē" is further identified in Syn. Diosc. with the "spina" of the Romans; but the account by Pliny xxiv. 65 of the "spinæ arabicæ" seems taken from Dioscorides: O. Arabicum is termed "carduus tomentosus acanthi folio altissimus lusitanicus" by Tournefort inst. 441; and is known to grow in Portugal and Southern France (Pers., and Spreng.; see O. Illyricum and Silybum marianum).

Narcissus serotinus of the Mediterranean countries. Possibly the ΚΑΛΛΙΒΟΤΡΥΞ: ΝΑΡΚΙΣΣΟΣ of Sophocles oedip. 682 to 713: — the late-blooming "narkissōs" of Theophrastus vi. 6 is referred here by Fraas; and N. serotinus was observed by him, and Chaubard, frequent in mountainous situations in Greece. Westward, the "sera comans narcissus" of Virgil geor. iv. 122 is referred here by writers; N. serotinus is termed "n. autumnalis minor" by Clusius hist. pl. 252; and is known to grow in Algeria, Morocco, and in various parts of Southern Europe (Desf. i. p. 283, Schousb. i. p. 141, and Pers.).

"448 B. C." (Sm. b. d.), Sacred war between the Delphians and Phocians for the possession of the Oracle and temple: the Lacedaemonians assisting the Delphians, and the Athenians the Phocians.

"In or about this year" (Sm. b. d.), at Athens, a prize for comedy gained by the Archilochi of Cratinus.

Acer creticum of Crete and Greece. A species of *maple* called in Greece "sphēnthamni" (Fraas) or "sphēntani" (E. Soph.); in which we recognize the ΣΦΕΝΔΑΜΝΙΝΑΙ of Cratinus, — Aristophanes acharn. 181, Plutarch, and Athenaeus, that of the plains distinguished as "glēinōs" according to Theophrastus iii. 11: A. Creticum is described by Plukenet phyt. pl. 251; is termed "a. orientalis hederæ folio" by Tournefort cor. 43; was observed by Sibthorp on the mountains of Crete; by Chaubard in the Peloponnesus, and regarded by him as the special maple of Greece; was observed however by Hogg as far West as Sicily. "A. obtusifolium" mentioned also by Tournefort cor. 43, and observed by Sibthorp on the mountains of Crete, is regarded by Chaubard and Fraas as not distinct.

Melilotus Cretica of the East Mediterranean countries. Called in Greece with other species "triphulli" (Fraas): the ΜΕΛΙΛΩΤΟΣ of Cratinus, — and Aristotle, mentioned as coronary by Alexis, and Nicander ther. 897, as remarkable for permanence of odour by Theophrastus caus. vi. 14, the best kind according to Dioscorides growing in Attica and Cyzicum and around Carthage saffron-coloured and fragrant, is referred here by Fraas: M. Cretica is termed "m. cretica fructu maximo" by Tournefort inst. 407; and was observed by Sibthorp, Chaubard, and Fraas, in the Peloponnesus, conspicuous in the spring from the beauty of its fragrant yellow flowers. Westward, is described by Bauhin prodr. pl. 142; and was observed by Desfontaines ii. p. 193 in Barbary.

Ruta graveolens of the Mediterranean countries. Called in Britain *herb of grace* or *rue* (Prior), in France "rue" (Nugent), in Germany "raute," in Italy "ruta" (Lenz), in Greece "pēganōs," or by the Turks "jaban sedef" (Sibth.); in which we recognize the ΡΗΓΑΝΟΝ of Cratinus, — Aristophanes, Philoxenus of Cythera, Aristophon, Aristotle, Theophrastus, Nicander, Athenaeus ii. 62 to xiv. 50, and "pēganōn kēpētōn" of Dioscorides: R. graveolens was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout the Greek islands to Constantinople, frequent both wild and cultivated; and according to Persoon, and Clot-Bey and Figari, has been long known in the gardens of Egypt. Westward, the "pēganōn kēpētōn" is identified in Syn. Diosc. with the "rōuta ōrtēnsis" of the Romans; the "ruta" is enumerated by Pliny xix. 45 as long cultivated in Italy, on record under the consulship of Cornelius Cethego and Quintius Flamininus; is mentioned also by Ovid, Petronius, and Martial: R. graveolens is described by Dodoens pl. 119, and Lobel pl. 52; is termed "r. sylvestris major" and "r. hortensis latifolia" by Tournefort inst. 257; was observed by Forskal wild near Marseilles; is known to grow also in Barbary, Italy, and other parts of Southern Europe (Shakesp., Pers., and Lenz), is besides cultivated as far as Britain. Eastward from the Mediterranean, is called "saturee" in the environs of Bombay, where it was observed by Graham "in gardens" but "by no means common;" has however been long cultivated in Hindustan (Ainsl. mat. ind.): was observed by Thunberg in Japan, and called "mats kase so." By European colonists, was carried before 1669 (Josselyn) to Northeast America, where it continues in gardens. The plant according to Lindley was "once in repute as an emmenagogue, antispasmodic and anthelmintic," and "is still used in the form of 'rue tea' in domestic medicine."

Ruta Chalepensis of the East Mediterranean countries. Closely resembling the preceding, but distinguished by its fringed petals, and called in Greece "apēganōs" (Forsk., and Sibth.) or by the Turks "sendef," in Egypt "sādeb," in Yemen "schedab" (Forsk.), in Egyptian "vatshōutsh" — (transl. Luke, and ms. Borg.), being probably the "pēganōn" cultivated in Palestine of Luke xi. 42: R. Chalepensis was observed by Forskal, and Delile, in the gardens of Egypt, where according to

Delile it has been long known; and by Forskal, under cultivation in Yemen. Farther North, by Forskal in gardens at Constantinople; by Chaubard, in the Peloponnesus; and by Sibthorp, seemingly wild on Zacynthus and other Greek islands. As transported Westward, is distinguished by Tournefort inst. 257, Linnæus mant. 69, and Persoon.

Anthriscus cerefolium of Europe? Called in Britain *chervil*, in Anglo-Saxon "cærfille," in France "cerfeuil" (Prior, and Lindl.), in Germany "kerbel," in Italy "cerfoglio" (Lenz), in Egypt "maqḍunis frandji" parsley of Europeans (Forsk.); in which we recognize the "chaerephyllum" identified by Columella xi. 3 with the ἈΝΘΡΙΣΚΟΥ of Cratinus, — or "ἔνθρυσκῶν" of Pherecrates (Athen.), enumerated among potherbs by Theophrastus vii. 7. 1: the "anthriscum" aphrodisiac and restorative, closely resembling "scandix" but the leaves less slender and less fragrant, is enumerated by Pliny xxi. 52 to xxii. 38 among the esculent plants of Egypt: *A. cerefolium* was observed there in gardens by Forskal, and Delile; and by Forskal, in the environs of Constantinople. Westward, the "caerefolium" is sown according to Pliny xix. 54 at the autumnal equinox, is mentioned also by Palladius iii. 24. 9 to x. 13. 3: *A. cerefolium* is described by C. Bauhin p. 152 (Spreng.); continues under cultivation in Italy and middle Europe, springing up besides in cultivated and fallow ground as far as Britain (Pers., A. Dec., and Lenz); is according to Lindley "a common potherb with edible roots" (See *Scandix Australis*, and *S. pecten*).

Cachrys libanotis of the West Mediterranean countries. The ΚΑΓΧΡΥΞ of Cratinus — (schol. Aristoph. nub. 447), called "livanōtis" from the frankincense odour of its root, and this root as appears from Dioscorides collected and dried, may be compared: the "kaghruōs" root prescribed in Nat. mul. 29, and 2 Morb. mul. 71, is identified with the "livanōtis" by Galen: the "livanōtis karpimōs" of Dioscorides having a large white root, fennel-like leaves spreading on the ground and odorous, and umbels of rounded white seed, is referred here by Matthioli, and Sprengel: the account by Pliny xxiv. 59 of the "rosmarinum" bearing a resinous seed called "cachrys," seems in part taken from Dioscorides: *C. libanotis* is described by Matthioli p. 375, Dodoens p. 308, and Morison ix. pl. 1; and is known to grow in Sicily and Barbary (Pers., and Spreng.).

Cachrys Cretica of the East Mediterranean countries. Possibly the "kaghrus" of Cratinus: — the "karpimōs livanōtis" of Theophrastus ix 10 growing in arid stony places and having leaves like "σέλινο ἐλκίο" but much larger, oblong rough white seeds, which with the leaves and root are employed medicinally, is referred here by Sprengel; also the "kaghruōēssa" and "kaghruphōrōs" of Nicander ther. 40 and 850: *C. Cretica* is termed "c. cretica angelicæ folio asphodeli radice" by Tournefort cor. 23; is known to grow on Crete (Pers., and Fraas), and was observed by Sibthorp on Cyprus.

Thymus serpyllum of Europe and Northern Asia. Called in Britain *pell-a-mountain* (Prior), in France "serpolet" (Fée), in Germany "quendel," in Italy "sermollino selvatico" or "serpillo" (Lenz), in Yemen "saatar" (Forsk.); in which we recognize the "sērpullōum" of the Romans identified in Syn. Diosc. with the Egyptian "mērōuōpuōs," and the ΕΡΥΛΛΟΞ of Cratinus, — Aristophanes pac. 168, Eubulus, Antiphanes, Anaxandrides, Clearchus, Theophrastus vi. 1, Theocritus, Callimachus, Nicander, Dioscorides, and Athenæus xv. 32: *T. serpyllum* was observed by Sibthorp, and Fraas, frequent on mountains from the Bithynian Olympus to the Peloponnesus and Crete; is known to grow also on the Taurian, Himalayan, and Altaian mountains, and as far as Daouria (Bunge, Ledeb., Bieb., Royle, and Benth.); was observed by Forskal on the mountains of Yemen; and by Schimper, in Abyssinia. Westward, the "serpyllum" is mentioned by Cato 73, Varro, Catullus, Virgil, Columella, and is described by Pliny xx. 90 as growing chiefly in stony places: *T. serpyllum* is known to grow in Italy and Barbary and throughout middle and Northern Europe as far as Lapland, Iceland, and Greenland (Hook., and Wats.). By European colonists, was carried to Madeira (A. Dec.); to Northeast America prior to 1669 (Joss.), where it has become naturalized in exposed situations; and to other distant countries where I have found it readily acquiring foothold.

Thymus glabratus, regarded as distinct by Hoffmannsegg and Link, and called in Greece "hamōthrōmpi" (Fraas): — the kind of "ἐρpullōs agriōs" having according to Theophrastus vi. 7 a sharp "thumvrōthē" odour, is referred here by Fraas: *T. glabratus* was observed by him, and Chaubard, on the mountains of Greece and the Greek islands; and Westward, is known to grow in France (Chaub.).

Phlomis fruticosa of the Mediterranean countries. A shrubby sage-like plant called in Greece "phlōmō" or "sphaka" or "gatharōsphaka" (Sibth.); in which we recognize the ξΦΑΚΟΝ of Cratinus, — Phrynichus, Eupolis, Alexis, Aristophon, and Athenæus: the "phlōmōs agria" of Dioscorides iv. 102 having rings around the twigs as in "prasion" and the flower yellow, is referred here by writers: *P. fruticosa* was observed by Sibthorp, Chaubard, and Fraas, throughout Greece and the Greek islands, one of the most frequent shrubby plants in the vicinity of the sea; by Delile, on the Mediterranean border of Egypt. Westward, is described by Matthioli p. 800, and Dodoens p. 146;

is termed "ph. fruticosa salviæ folio latiore et rotundioræ" by Tournefort inst. 177; and is known to grow in Italy, Sicily, and Spain (Pers., and Lenz; see *Salvia officinalis*).

Euphorbia characias of the Mediterranean countries. A kind of *spurge* called in Italy "caracia" or "titimalo caracia" (Lenz), in Greece "phlômôs" or "galazitha" or "tithumalô" (Sibth.); in which we recognize the ΤΙΘΥΜΑΛΛΟΝ of Cratinus, — Phrynichus, the Hippocratic writings, described as red-stemmed by Micion, and Cratevas, and the "tithumalôs arrên" of Theophrastus ix. 11. 8 identified by Dioscorides with "t. karakias" growing in rough mountainous situations, and red-stemmed with olive-like leaves: *E. characias* was observed by Sibthorp, Chaubard, and Fraas, frequent in Greece in rough stony places to the height of "two thousand" feet. Westward, the "tithymallus" is mentioned by Columella; and "tithymalus characias" by Pliny xxvi. 39: *E. characias* is termed "t. characias rubens peregrinus" by Tournefort inst. 85; was observed by Forskal on mountains near Marseilles; and is known to grow in Italy, Sicily, Spain, and as far as middle Europe (Lam. fl. fr., Pers., and A. Dec.).

Muscari comosum of the Mediterranean countries. Called in Germany "schopf-hyacinthe" (Fraas), in Greece "vôurvôs" or "vôrvôs" or "vôlvô" (Sibth.); in which we recognize the ΒΟΛΒΩ of Cratinus, — Eupolis, Callias, Archestratus, Xenarchus, Theophrastus vii. 13, Heraclides Tarentinus, Athenaeus ii. 64, and "vôlvôs êthôthimôs" known to every one according to Dioscorides: of "bulborum" some are eaten crude, as in the Taurian Chersonesus, and the names of six kinds distinguished in Greece are further enumerated by Pliny xix. 30: *M. comosum* was observed by Sibthorp, Chaubard, and Fraas, from Cyprus and the Peloponnesus to the Bithynian Olympus, flowering at the opening of Spring and the root eaten; by Delile, on the Mediterranean border of Egypt. Westward, next after the "bulborum" of the Taurian Chersonesus those of Numidia in the days of Pliny were most esteemed, the third place being assigned to those of Southern Italy: *M. comosum* is enumerated by Anguillara p. 119 as eaten in Crete, Corcyra, and Italy: is termed "m. arvense latifolium purpurascens" by Tournefort inst. 347; was observed by Forskal near Marseilles; and is known to grow in waste ground as far as middle Europe (Jacq. austr. pl. 126, and Pers.).

Ophrys ferrum-equinum of the Mediterranean countries. The ΚΟΞΜΟΞΑΝΔΑΛΛΟΝ of Cratinus, — worn in garlands by the Spartans according to Clearchus, growing according to Pausanias ii. 35 in the Peloponnesus, its flower large agreeing in colour with the "uakinthôs" and in like manner marked with letters, is referred here by Sprengel: *O. ferrum-equinum* is described by Desfontaines (ann. mus. x. pl. 15).

Lilium Chalcedonicum of the mountains of the East Mediterranean and Tauro-Caspian countries. Called in Greece "krinôs" (Fraas); in which we recognize the "krinôn agriôn" or krinanthēmôn" or "pôrhuranthês" identified in Syn. Diosc. with the Egyptian "iôkrôi," and ΗΜΕΡΟΚΑΛΛΕΙ of Cratinus, — and Athenaeus xv, having according to Dioscorides a large bulb-like root, stem and leaves "krinô"-like, and on each branch three or four pale flowers resembling those of "krinô" beginning to open: the red "krinôn" is mentioned by Theophrastus vi. 6: "lils rouges" were observed by Belon at Constantinople: *L. Chalcedonicum* is termed "l. Byzantium miniatum" by Tournefort inst. 371; was observed by Sibthorp, and Fraas, in mountain-ravines from Zante to Parnassus; is known to grow also in Persia (Pers.). Westward, the "rubens lilium" called by the Greeks "crinôn" is mentioned by Pliny xxi. 11: the "êmêrôkallis" or "êmêrôkatallaktôs" or "vôlvôs ô aimatikôs" or "antikantharôn" is identified in Syn. Diosc. with the "avilavôn" of the Numidians, and "vôulvôm" or "êliôm agrêstêm" or "êliôm marinôm" of the Romans, but is separately mentioned by Pliny xxi. 90: *L. Chalcedonicum* is known to grow wild in Carniola, and in a few localities in Italy (Pers., and Lenz).

Lilium bulbiferum of the mountains of Southern Europe. Included perhaps in the "êmêrôkallei" of Cratinus, — and Dioscorides, referred here by Matthioli p. 631: the "krinôn" producing drops and multiplied by planting them, is mentioned by Theophrastus ii. 2: *L. bulbiferum* was observed by Fraas on mount Parnassus; and farther East, by Thunberg in Japan (Steud.). Westward, is known to grow in Austria, Italy, and other parts of Southern Europe (Jacq. austr. pl. 226, Pers., and Lenz).

Asphodelus luteus of the Mediterranean countries. The ΑΝΘΕΡΙΚΟΞ of Cratinus, — Phrynichus, Theophrastus vi. 2. 9 to vii. 13. 4, or the "anthêrix" by boys according to Theocritus i. 52 woven into a trap to catch grasshoppers, is referred here by Stackhouse; "anthêrikôn" according to Dioscorides ii. 199, and Pliny xxii. 32, being the stem of the "asphôthêlôs": *A. luteus* is described by C. Bauhin pin. 28; is termed "a. luteus et flore et radice" by Tournefort inst. 343; was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus to Parnassus; by Hogg, frequent in the wooded region of Etna; and is known to grow as far as Switzerland (Hall. 1206, and Pers.).

"447 B. C." (Sm. b. d.), at Rome, quaestors, hitherto appointed by the consuls, for the first time elected by the people; M. Geganus Macerinus and C. Julius Julius being consuls.

Probably in "the second half of the fifth century B. C." (Lubke and Lutrow), building of the temple to Neptune at Pæstum in Italy. — The temple there to Ceres, is referred "at the earliest" to "the second century B. C."

"446-5 B. C." (Plut. malign. 26, and Euseb. p. 169), Herodotus reading his historical work at the Panathenæa at Athens.

The Arabs are mentioned by Herodotus iii. 8 as worshipping Dionysus (the god of Sinai) under the name of ΟΥΡΟΤΑΑ (Allabou-Taala "God supreme"), and Uranie under the name of ΑΛΙΛΑΤ (Al-alihat "subordinate divinities, Pococke, and Percev. i. 74).

The ΚΕΑΤΟΙ or Celts inhabiting Western Europe, are mentioned by Herodotus ii. 33, — Ephippus, Ephorus, Alexis, Polybius, Strabo, Arrian, and others.

The "ΚΡΟΒΥΖΟΙ on the Ister" mentioned by Herodotus iv. 49 — are regarded by Talvi as probably the Krivitski; a Slavonian tribe now within the limits of Russia: the "Krōvuzōi" and other Slavi are mentioned by Strabo vii. 6. 5, Pomponius Mela, Pliny, Tacitus, and Claudius Ptolemy iii. 10. The Slavonians are distinctly described and named by Jornandes, Procopius, Menander, and the abbot John of Biclar; and towards the close of the Eleventh century, are found "in possession, partly as masters and partly as servants, of the whole vast extent of territory which they now occupy;" being very nearly half of Europe.

The ΜΑΡΑΓΔΟΞ of Herodotus ii. 44. — or "smaragthōs" of Plato phæd. 110, and Cosmas Indicopleustes xi. p. 339, is admitted to be the *emerald*; derived of course from the emerald mines of Upper Egypt.

The *sturgeon* of the large rivers of Southern Russia is mentioned by Herodotus iv. 53, together with the drying or salting of its flesh. — Isinglass or *fish-glue* "ihthuōcōlla," probably obtained from the sturgeon, is described by Dioscorides, Pliny xxxii. 24, and Aelian.

Nymphæa lotus of Tropical Eastern Asia. A white *water-lily* called in Egypt "naufar" (Forsk.) or "bachenyn el-khanzyr" (Del.): during the inundation of the Nile, according to Herodotus ii. 92, a ΚΡΙΝΟΝ called by the Egyptians ΛΩΤΟΞ makes its appearance in immense quantities and the root and seeds are collected and eaten; nothing is said about the colour of the flowers, — but the white-flowered "lōtōs" of Egypt having a rounded edible root as large as a quince is mentioned by Theophrastus iv. 9 to 11, and Dioscorides: the "bisnin el-hanziri" is distinguished by Ebn Baitar; and its root, though extremely similar, is according to Delile pl. 60 considered inferior to that of the blue-flowered kind (see *N. cœrulea*): *N. lotus* was also observed by Alpinus, and Forskal, in Lower Egypt, but to the end of my journey I met with no traces of a living *Nymphæa*, being as was alleged in the wrong season. *N. lotus* was observed by Beauvois pl. 78 in Equatorial Africa as far as the Atlantic; was carried also to a lake in Hungary before the days of Waldstein and Kitaibel pl. 15. The leaves are described by Sprengel as downy underneath, agreeing therefore with the "*N. pubescens*" called "koe" or "kummul" according to Graham in the environs of Bombay, and "very common throughout the Concans during the rains;" observed there by myself, by Rheede xi. pl. 26 in Malabar, by Roxburgh ii. p. 577, and Wight 57, in other parts of Hindustan; by Mason, in Burmah and called "kya-phyoo;" known to grow also on Java and the Moluccas (Rumph. vi. p. 172, and A. Dec.).

Aschynomene aspera of Eastern Equatorial Africa. Perennial, floating, and called in Malabar "attakudasa," in Tamil "attoonette," in Bengalee "phool-sola," in Hindustanee "shola" or "tola" (Drur.); and the ΦΛΟΙΝΗΝ or ΦΛΟΥΝ of India, harvested according to Herodotus iii. 98 from the river, beaten and woven like basket-work into the form of a corselet, and worn by the fishermen, — may be compared: *Ae. aspera* was received by Breynius cent. pl. 52 from India (Pers.); is termed "hedysarum lagenarium" by Roxburgh iii. 365, was observed by him abundant in the marshes in Bengal, and the borders of jheels and lakes between Calcutta and Hurdwar; by Wight, and Drury, "in tanks and lakes" in the peninsula, the pith "much used for the manufacture of hats, bottle-cases, and similar articles, it being a bad conductor of heat," is also made up into "fishing-floats," and is gathered "in April and May." Westward, the "solah" of India was observed by Grant in Equatorial Africa, in marshes generally and called "m'pæcee," seven feet high, affording "floats for nets."

Hibiscus (Abelmoschus) esculentus of Equatorial Africa. The *okro* or *gombo* is called in Burmah "yung-ma-dæ" (Mason), in Bengalee "dhenroos," in Tamil "venday," in Malabar "vendah," in Telinga "benda," in Hindustanee "bhindi" or "ramturi" (Drur.), in the environs of Bombay "bendy" or "ram toorai" (Graham), in Nubia "djyoundou" (Del.), in Congo and Angola "quillobo" (Piso), in Yemen and Egypt "bamia" (Forsk.), in Greece "vamiés" (Bory); and the plant growing according to Herodotus iii. 100 spontaneously in India, its capsule with the "keghrōs"-like seeds cooked and eaten, — may be compared: *A. esculentus* was observed by Loureiro in Anam; by Mason "exotic" in Burmah; by Moon, on Ceylon; by Roxburgh, Wight, Gibson, Graham, and Drury, throughout Hindustan, "a most useful esculent, and much cultivated," used also medicinally as emol-

lient and demulcent; but according to Piddington, has no Sanscrit name. Westward, the "bamiat" is mentioned by Abu'l Abbas Nebati, Abd-allatif, and Ebn Baitar: *A. esculentus* was observed by Forskal under cultivation in Yemen; by myself, the fruit in market at Mocha; by Schweinfurth iii. to vi, wild on the Upper Nile as well as cultivated by the Bongo; is known to be cultivated in Western Equatorial Africa (fl. Nigr.); was observed by Alpinus, Forskal, and Delile, under cultivation in Egypt; by Forskal, and Bory, cultivated also in Asia Minor and Greece; and was already known to Matthioli pl., and Lobel pl. Through European colonists, was carried from Africa to Brazil before 1658 (Piso ii. 31); reached Surinam before 1686 (Commelyn, and A. Dec.), the West Indies before the days of Sloane, and continues under frequent cultivation in our Southern States.

The ΟΡΓΙΕΜΠΑΙΟΙ living peaceably at the base of high mountains, appealed to in disputes among the neighbouring tribes, wearing the Scythian dress but having a peculiar language, flat-nosed with a large chin and said to be bald from birth both men and women, clearly belong to the *Mongolian Race*.

Cerasus padus of middle Europe and the adjoining portion of Asia. Called in Britain *bird cherry* (Prior), in France "merisier" (A. Dec.), and Erman on the Ural found an edible preparation made of the fruit by the Baschkirs and called "atschui;" in which we recognize the ΑΞΧΥ made by the Orgiempæi of fruit of a tree called ΓΟΝΤΙΚΟΝ, according to Herodotus iv. 23. — Westward, *C. padus* occurs in remnants of the fruit among debris of the early lake-villages of Switzerland (Troyon); and is known to grow wild in middle Europe (Mill., Engl. bot. pl. 1383, and Lam. fl. fr.). Abounds according to Lindley "in the oil of bitter almonds, and consequently is a dangerous poison." (See *Larix Europæa*).

Acacia Stephaniana of the shores of the Caspian. The "ashu" — is however referred here by Breyn, and Sprengel gesch. 88: *A. Stephaniana* is described by Buxbaum, and is known to grow about the Caspian.

Pistacia lentiscus of the wooded portion of the Mediterranean countries. The *mastich* tree is called in France "lentisque" (Fée), in Italy "lentiscio" or "lentischio" (Lenz), in Greece "shinōs" (Sibth.); in which we recognize the ΞΙΝΟΞ of Herodotus iv. 177, — mentioned as a tree by Theophrastus ix. 4. 7, and Dioscorides: gum mastich "mastihē" is mentioned as its product by Theophrastus ix. 1. 2, procured according to Dioscorides of the best quality on Chios; as to the present day, and in especial repute among the Arabs (Tourn. trav., Niebuhr p. 144, and Spreng.): *P. lentiscus* was observed by Sibthorp, Chaubard, and Fraas, abounding in dry stony soil from the Peloponnesus throughout the Greek islands; is known to grow also in Palestine (Pers.); and may have been once cultivated in Egypt, for Egyptian "mastihē" is mentioned by Galen, and Paulus of Aegina; was seen by Forskal in gardens at Constantinople. Westward, the "lentiscus" is mentioned by Cato vii, Ovid, Columella, Palladius; and by Cicero, and Pliny xviii. 61, as cultivated in Italy: *P. lentiscus* is termed "l. vulgaris" by Tournefort inst. 580; is known to grow in Istria and Italy (Lenz), abounding on Sicily, and was observed by Fée frequent in Spain. The "sweet fragrant stimulant resin called mastich," as appears from Lindley, continues to be employed "to strengthen and preserve the teeth," much as in the days of Lucian lexiph. p. 191. (See *Atractylis gummifera*).

Rubia tinctorum of the Mediterranean countries. Called in Britain *madder*, in Old English "madyr," from confusion with the coccus insect (Prior), in France "garance" (A. Dec.), in Italy "robbia" (Lenz), in Greece "rizari" (Sibth.) or by the Turks "alisari" (Fraas), in Yemen "fua" (Forsk.), in Egypt "fouah" (Del.), in Egyptian "sōphōvi" (Syn. Diosc.); in which we recognize the "rubiam" identified through Pliny with the ΕΡΕΥΘΕΔΑΝΩ used for dyeing a cloak worn by Libyan women in the days of Herodotus iv. 189, — and in the days of Dioscorides cultivated in Caria: the "ēruthrōthanōn" prescribed in Vict. acut., Steril. p. 20, 1 Mul. morb., and by Nicander, may also be compared, two kinds being enumerated as medicinal by Dioscorides: cloth dyed with madder has been found around Egyptian mummies; and "phōua ēruthrōn" is mentioned by Philon Judæus r. div. her. 491: *R. tinctorum* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout the Greek islands to Constantinople, and under cultivation in and around Attica; by Delile, and Clot-Bey, under cultivation in Egypt; by Forskal, under cultivation on the mountains of Yemen; but the living plant seems unknown in Hindustan, where according to Graham "madder is imported at Bombay from the Red Sea." Westward from Greece, the "ēruthrōthanōn" is enumerated by Dioscorides as occurring at Ravenna in Italy, and in the added Synonyms is identified with the "lappa minōr" of the Tuscans, and "rōuvia passiva" of the Romans; the "rubia" abundantly cultivated in Italy, is mentioned by Pliny xix. 17 to xxiv. 56; the "warentia," in the capitularia of Charlemagne; and the "vermiculum," in "an Anglo-Saxon manuscript of the thirteenth century" (Mayer and Wright 139, and Prior): *R. tinctorum* is termed "r. tinctorum sativa" by Tournefort inst. 114; was observed by Forskal near Marseilles; is known to grow wild in Southern France as well as in Italy (Pers., Bert. fl. ii. 146, and Lenz): and its cultivation re-

introduced by Althen in the middle of the Eighteenth century, continues successful in France and Germany, and as far as Holland (Gasparin agric. iv. 253, and A. Dec.). The plant according to Lindley is said "to be tonic, diuretic and emmenagogue."

Eleusine coracana of Tropical Africa. A grass called in Tamil "kayvaru" or "kelwaragoo," in Telinga "tamida" or "sodec" or "ponassa," in Bengalee "murooa," in Hindustanee "nachen" or by the Mohammedans "raggee" (Drur.), in Malwa "mand," in the environs of Bombay sometimes "nagla" (Graham), on Zanzibar "weembi" (heard by myself), in Interior Africa "oolezee" (Grant); and the grain $\xi\Gamma\text{EPMAT}$ used according to Herodotus iii. 97 both by the Ethiopians and Calanian Indians, — may be compared: *E. coracana* was observed by myself on Zanzibar, specimens shown as cultivated about the mouths of the Jub under the Equator; by Grant, everywhere on his route, cultivated and yielding flour and coarse beer; was observed by Vesling in 1638 in Egypt, and by C. vallini in 1689 on Malta, but from these two countries has disappeared. Eastward, was observed by Rheede xii. pl. 78 in Malabar; by Graham, "extensively cultivated by the hill people on the slopes of the great range of Ghauts, and forms their principal article of diet;" by Roxburgh, in other parts of Hindustan, but never seen "in a wild state;" and according to Drury, "is the staple grain of the Mysore country" and "perhaps the most productive of Indian cereals." Farther East, was observed by McClelland in Pegu (Mason v. 478); and by Kaempfer, and Thunberg, under cultivation in Japan.

445 B. C. = "20th year of Artaxerxes" (Neh. ii. 1 to vi. 15), Nehemiah "cupbearer" to Artaxerxes, permitted to visit Jerusalem as "governor;" and under his direction, the city-wall rebuilt in "fifty and two days."

"The same year" (Sm. b. d.), at Rome, the Canuleian law; permitting marriage between patricians and plebeians; which had been taken away by the Twelve tables.

"In this year" (Sm. b. d.), the five years' truce having expired, Attica invaded by the Lacedaemonians; and a new truce concluded, to last thirty years.

The $\Pi\text{ONTIA}\xi\text{: XE}\Lambda\text{QN}\text{H}$ of Crates (Athen. iii. p. 117) is clearly a turtle or *sea tortoise* — possibly *Chelonia coriacea* known to sometimes enter the Mediterranean.

Brassica campestris of Europe and Northern Asia. Called in Britain *turnip* from the Latin "terrae napus" (Prior), in France "navet" (Nugent), in Germany "rübe," in Italy "turnepi" or "rapa domestica" or "rapa tonda" (Lenz), in Greece "révës" (Fraas), in Egypt "lift" (Del.); in which we recognize the "rapa" of the Romans identified through Syn. Diosc. with the $\Gamma\text{O}\Gamma\Gamma\text{Y}\text{A}\text{I}\xi\text{N}$ of Crates, — Callias, Aristophanes, Euphron, Polemon, Diocles, having a fleshy root according to Theophrastus i. 6. 6, mentioned also by Dioscorides, Athenaeus ix., Aretaeus, and further identified in Syn. Diosc. with the "goggulë ëmërös" or "goggulitha" or "gölgösiön." *B. campestris* was observed by Fraas under cultivation in Greece; by Delile, and Clot-Bey, under cultivation in Egypt; is known to be also cultivated in Syria; and according to Ledebour i. 217 grows wild throughout Siberia. Westward, the "rapum" is mentioned by Cato, Columella, Palladius, and directions for its cultivation are given by Pliny xviii. 35: *B. campestris* continues abundantly cultivated from Italy and Portugal throughout middle and Northern Europe (Pers., and Lenz), and in Sweden and Russia is found to all appearance indigenous (Fries, and A. Dec.). Southward and Eastward from Egypt, was observed by myself a dry-rooted weed on Zanzibar; is called in Hindustanee "shalgam," in Bengalee "salgram" (D'roz.); was observed by Mason "exotic" in Burmah and called "mung-la-oo-waing;" by Kaempfer, and Thunberg, under cultivation on Japan and called "kabu" or "kabuna" or "busei," or usually "aona;" and through native tribes may have been distributed to the islands of the Pacific, where I found it a dry-rooted weed on the Feejeean, Tongan, and Tahitian groups, and New Zealand. Clearly by European colonists, was carried to Northeast America, where it continues abundantly cultivated; to Peru, and Australia, observed by myself under cultivation in both countries. In Northern climates, the plant is often cultivated solely for the oil from its seeds (A. Dec., and others; see *B. napus*).

"444 B. C." (Blair, and Sm. b. d.), at Rome, Military tribunes having consular power elected from patricians and plebeians, but through a defect in the auspices compelled to resign; and L. Papirius Mugillanus and L. Sempronius Atratinus appointed consuls.

"The same year" (Cint.), at Athens, Pericles, one of the governors during twenty-five years, now entrusted with the sole direction of affairs. — This continued for the remainder of his life, "fifteen years."

Parietaria officinalis of Europe and the Mediterranean countries. Called in Britain *pellitory* or *paritory of the wall* (Prior), in France "pariétaire" (Nugent), in Germany "glaskraut," in Italy "parietaria" (Lenz), in Egypt "hasjijet errihh" wind herb (Forsk.) becoming "anemoklëiti" in Greece, where it is also called "përthikaki," or by the Turks "ya pu can" (Sibth.); in which we recognize the "perdicium" said to have healed Pericles after his fall from the temple he was building, — from which time the herb began to be called "parthenium" (Plin. xxii. 20): the "parthëniön" is mentioned by Theophrastus vii. 7. 2 as cooked and eaten; is identified in Syn. Diosc. with the

"ēlxinē" growing according to Dioscorides on walls and fortifications; and the "perdicium" is further enumerated by Pliny xxi. 62 as eaten by other nations besides the Egyptians: *P. officinalis* was observed by Forskal, Sibthorp, and Chaubard, frequent on rocks and walls from the Peloponnesus throughout the Greek islands to Smyrna; by Hasselquist, in Palestine; and by Forskal, and Delile, in Egypt. Westward, the "pérthikiōn" or "parthēniōn" of the Greeks is identified by Celsus ii. 33 with the "herba muralis;" by Pliny, with the "asteriscum" or "herba urceolaris;" and the "herba urceolaris" is mentioned by Scribonius Largus 39 to 158, Marcellus i. 12 to 36, and *P. Vegetius* i. 34: *P. officinalis* is termed "*p. officinarum et Dioscoridis*" by Tournefort inst. 509; was observed by Forskal near Marseilles; and is known to grow from Italy as far as Denmark (fl. Dan. p. 521, Pers., and Lenz).

"443 B. C." (Clint.), a colony accompanied by Herodotus, and Lysias, sent by the Athenians to Thurium in Italy.

"The same year" (Blair, and Sm. b. d.), at Rome, M. Geganius Macerinus and T. Quinctius Capitolinus Barbatus consuls; the censorship instituted, and L. Papirius Mugillanus and L. Sempronius Atratinus, consuls during the preceding year, appointed censors.

"In this year (= 100 yrs in Budhu-verouse," Mahav., and Mason 39), at Vasali "twenty miles North" from Patna on the Ganges, in the "10th year of Calasoka," meeting of the Second great Buddhist council. Calasoka made inquiry "touching the law called Istewirrewade, and Wineya, and committed them to writing."

Of the Buddhist cave-temples, some are possibly as early as this date. The painted walls of the series at Adjunta disclose an advanced state of society; respecting which, particulars have already been given in my work on the Races of Man.

Figures of the *Indian cobra* or hooded snake, *Naja*, occur in the cave-temples at Adjunta, — and in Braminical cave-temples, as witnessed by myself. The worship continues in Hindustan according to the oral account of a native, for protection against sunstroke and the febrile influence of the sun.

Figures of the *buffalo*, *Bos? bubalus*, occur in the cave-temples at Adjunta, — and in other cave-temples, Buddhist and Braminical, as witnessed by myself: the buffalo is enumerated in the Institutes of Menu among the wild beasts that inhabit the woods (transl. Deslongch.); and in another passage, as sometimes employed instead of the bullock for drawing carts (Mason v. p. 174); is mentioned in the Sama Veda (transl. Stev.); under the name of "*Indian taurēlēphas*," by the pseudo-Callisthenes; as a domestic animal in Hindustan, by Cosmas Indicopleustes xi. p. 334; was seen in Eastern Asia by Marco Polo 118; by myself, from Hindustan throughout the Malayan Archipelago to Luzon, but always in the domesticated state. Westward, is mentioned under the year "388 A. D." by the Armenian chronologer Samuel Aniensis; under its Arabic name "*djamus*," by Ebn Masawia, Temimi, Abd-allatif, Ebn Baitar, and Allatafet; and was observed by myself in Egypt.

Nymphaea stellata of Tropical Hindustan and Burmah. Distinctly figured in the cave-temples at Adjunta, — and in Braminical cave-temples, as witnessed by myself: the *blue water-lily* is mentioned by Kalidasa kum. i. 47 and raghuv. vi. 65: *N. stellata* was observed in Hindustan by Rheede xi. pl. 27, Wight, and Graham; and farther East, is enumerated by Mason as indigenous in Burmah and called "*kya-nyo*." Westward, dried flowers to all appearance of this species were observed by myself in a drug-shop at Mocha: and the living plant has been carried to the Mauritius Islands, where it has become so completely naturalized as to be regarded by Bojer as indigenous.

Musa paradisiaca of the Siamese countries. The *banana* is figured on the walls of the cave-temples at Adjunta, — as observed by myself; has Sanscrit names (Pidd., and A. Dec.); is called in Bengalee "*kala*" or "*kadali*," in Hindustanee "*kela*" or "*kadli*" (D'roz.); and was seen under cultivation in Hindustan by Rheede i. pl. 12 to 14, Roxburgh cor. iii. pl. 275, and Graham. Eastward, is enumerated by Mason v. p. 449 as "indigenous" in Burmah, "but the wild fruit is too full of seeds to be eatable;" var. "*seminifera agrestis*" a wild seed-bearing kind, also a cultivated seed-bearing kind, were seen by Loureiro p. 791 in Anam; and *M. paradisiaca* was found by Finlayson trav. p. 86 wild on the islet of Pulo Ubi at the Southern extreme of Cambodia; the only seed-bearing kind ever met with by myself, was cultivated by the natives of the Samoan Islands: seedless varieties I found especially numerous on the Philippines; and one or more, aboriginally introduced throughout the Tropical islands of the Pacific, the Feejeean, Tongan, Samoan, Taheitian, and Hawaiian Groups. Westward from Hindustan, was observed by myself introduced from an early period on Zanzibar; is mentioned by Mohammed in the Koran (Kasimirsk. vers.), and was seen in Yemen by Forskal; is described under the name of "*mauz*" by Asmai, Ebn Masawia, Abu Hanifa, Avicenna, Serapion, Abd-allatif, and Ebn Baitar; and was seen at Alexandria in 1520 by a Portuguese pilot, who also met with it on St. Thomas Island in the Gulf of Guinea. From Egypt also, the plant was carried mostly or altogether by Europeans to Malta, the Canaries, Madeira, the Azores, even here (I was informed by Nuttall) in certain situations ripening fruit: from the Canaries, was carried in 1516 by

P. Thomas de Berlangas to the West Indies (Ovied. p. 112, and A. Dec.), and rapidly extending among colonists and natives, was soon cultivated throughout Tropical America.

442 B. C. = "a year after the" Second Buddhist council (Mason iii. 39), founding of the city of Prome in Burmah by king Dwattabong.*

"441 B. C." (Blair), the *testudo* and other engines of war, invented by Artemones.

"In this year" (Sm. b. d.), at Athens, the first prize for tragedy gained for the first time by Euripides.

Paliurus aculeatus of the Mediterranean countries. Called in Italy "marruca" or "marruca nera" or "paliuro" (Lenz), in Greece "paliōuri" (Sibth.); in which we recognize the ΠΑΛΙΟΥΡΟΣ of Euripides, — Agathocles, Diphilus Siphnius, Theophrastus, Theocritus, Strabo, and Athenaeus xiv. 62, described by Dioscorides as a well-known thorny shrub: *P. aculeatus* was observed by Forskal, Sibthorp, Chaubard, and Fraas, one of the most frequent shrubs from the Peloponnesus to the Dardanelles; is known to grow also around Caucasus (Pall. fl. Ross. ii. pl. 64); and was observed by Hasselquist near Jaffa in Palestine. Westward, the "*paliurus*" is mentioned by Virgil, and

* *Bombax (Salmalia) insigne* of Burmah. A red-flowered *silk-cotton tree* resembling the first species, from early times furnishing down for stuffing mattresses and pillows: — observed by Wallich, and Mason v. 487 to 520.

Grewia? *sp.* of Burmah. A tree called "phet-won" (Mason), its wood red-coloured and from early times used for spear-handles, ploughs, and sawn for building: — observed by Berdmore (Mason v. 537).

Dipterocarpus grandiflorus of Burmah. A tree called "en" (Mason), and from early times its timber valued and gum used for torches: — observed by Wallich, and Mason v. 493 to 528.

Muraya may-kay of Burmah. An Aurantiaceous tree called "may-kay" (Mason), and its strong tough wood box-like in grain, known from early times: — observed by Wallich, and Mason v. 534, indigenous in Tavoy.

Sophora robusta of Burmah. A Leguminous tree called "theet-wa-gyee" (Mason), its timber known from early times: — observed by McClelland in Pegu (Mason v. 532).

Syzygium and *Acmena sp.* of Burmah. Woody Myrtaceous plants, more than a dozen species classed under the general name "tha-byæ" (Mason), all affording a small timber used from early times: — observed by Mason v. 533.

Careya sphaerica of Burmah. A Gustavioid tree — observed there by Falconer. Regarded by Mason v. 534 to 746 as perhaps the "ban-bwæ" that "furnishes a useful timber for house building."

Lagerstroemia glomerata of Burmah. A tall straight Lythraceous tree called "theet-phyu" (Mason), its compact close-grained wood known from early times: — observed by Mason v. 538.

Lagerstroemia kha-moung-phyu of Burmah. Its name signifying *white jarool*, and its timber used from early times, — though considered inferior to the red kind: observed by Mason v. 538 in Tavoy.

Nauclea? sp. of Burmah. A Cinchonaceous tree called "theet-pa-young" *wax-wood* (Mason), its wood having the colour of bees-wax, and though not durable, straight-grained and from early times used for house-posts: — observed by Berdmore (Mason v. 538).

Millingtonia (Meliosma) simplicifolia of Burmah. A Bignoniaceous tree, its timber from early times valued from its weight and strength: — observed by McClelland, and Mason v. 535, common at Toungoo: known also to Roxburgh.

Vitex arborea of Tropical Hindustan and Burmah. A small Verbenaceous tree called by the Burmese "htouk-sha" (Mason), and from early times used to make wooden bells: — observed by Mason v. 526 "very common at Maulmain." Westward, is known to grow as far as Hindustan (Drur.), its wood according to Roxburgh becoming when old chocolate-coloured, very hard and durable.

Laurus nitida of Burmah. A tree from early times furnishing the solitary post, to which Termites or white ants will confine themselves in Tavoy houses, in preference to all other kinds of timber: — observed by Mason v. 542.

Laurus kyai-zai of Burmah. A tree, its hard wood from early times used in carpentry: — observed by Mason v. 542 in Tavoy.

Laurus (Sassafras) hman-then of Burmah. A tree even in odour resembling the sassafras, and from early times its wood used in carpentry: — observed by Mason v. 542.

Myristica amygdalina and *M. Sphaerocarpa* of Burmah. Two species of *wild nutmeg* — observed there by Wallich. In Southern Burmah, Mason v. 543 met with one or two *Myristica* trees, their fruit having "none of the aroma of a nutmeg," but the timber "large" and "used by the natives in house carpentry."

Columella, as growing in Italy, and the "zuram" seeds of the Numidians are identified by Pliny xvi. 41 and xxiv. 71: *P. aculeatus* is termed "paliurus" by Tournefort inst. 616, "p. spina Christi" by Miller; was observed by Forskal near Marseilles; and is known to grow also in Italy and other parts of Southern Europe (Pers., and Lenz).

Satureia thymbra of the Mediterranean countries. Called in Greece "thumvrō" or "thrimvē" (Sibth.) in which we recognize the ΘΥΜΒΡΑ of Euripides rhes. 508, — Eupolis, Demochares, Theophrastus, Nicander, Athenaeus, eaten according to Aristophanes nub. 421 and acharn. 254, sometimes cultivated according to Dioscorides, and the "thrumvē" of the Geoponica x. 42: *S. thymbra* was observed by Honorius Bellus on Crete (Clus. 304); by Sibthorp, abounding on the Greek islands and in Southern Greece, the dried herb bruised and scattered over dishes as seasoning (Walp. p. 244). Westward, the "thymbra" is termed "graviter spirans" by Virgil geor. v. 30, is mentioned also by Columella, and Pliny xix. 50: *S. thymbra* is described by Barrelier pl. 898; is termed "thymbra legitima" by Tournefort inst. 197; and is known to grow in Italy, Sardinia, and Tripoli (Pers., Spreng., and Lenz). "Thymus tragoriganum" observed by Alpinus exot. pl. 78 on Crete, by Sibthorp on Cyprus and in Boeotia, is regarded by Bory as not distinct.

Poa pratensis of Europe and Northern Asia. A grass called in Sweden "slater-groe" (Linn.). The ΠΟΙΑ of Euripides cycl. 333, — or "pua" of Eubulus (Athen.), or "pōa" among later Greeks a term usually employed in a general sense for herb, but the "pōa" properly so called of Theophrastus i. 6. 6 to vii. 8. 3 and caus. iii. 20. 9 is referred here by C. Bauhin pin. 1, under the name of "poa Theophrasti" (Linn.): *P. pratensis* is described also by Ray syn. 409, is termed "gramen pratense paniculatum majus latiore folio" by Tournefort inst. 521, and is known to grow from Lapland throughout middle Europe (Curt. lond. ii. pl. 5, Pers., Wats., and A. Dec.), also about Caucasus and in Siberia (Georgi, and Kunth); was observed by Linnæus in Sweden; by Sibthorp, and Chaubard, abundant in the meads of the Peloponnesus. Westward, by Hooker on Iceland; by Herzberg, at "57° 20'" near Okak in Labrador (Meyer, and Schlecht. in linn. 1835); grows according to Hooker fl. am. ii. 246 throughout Canada, and according to A. Gray is "indigenous" on the White mountains: farther South along the Atlantic, seeds having been imported with those of other grasses for cultivation, has become abundantly naturalized in our Middle States; was observed by Chapman in our Southern States "mostly around dwellings, introduced;" by Short, in Kentucky; and by Nuttall, on the Arkansas.

Poa trivialis of Europe and Northern Asia. Resembling and probably included with the preceding by the Greeks: — distinguished by the Swedes under the name of "betes-groe" (Linn.); termed "gramen pratense paniculatum medium" by C. Bauhin pin. ii., theat. 30, and Tournefort inst. 521, "poa scabra" by Ehrhart; described also by Ray syn. 409, and known to grow from Lapland and Russia to the Mediterranean (Curt. lond. ii. pl. 6, Pers., and Wats.), also in the Tauro-Caucasian countries (Bieb.) and throughout Siberia to Japan (Georgi, and Kunth); was observed by Linnæus in Sweden; by Sibthorp, and Chaubard, in the meads of the Peloponnesus. Westward, by Hooker on Iceland; by Herzberg, at 57° in Labrador (Meyer, Schlecht., and A. Dec.); by myself, in the environs of Salem, brought apparently among imported grass seed; by A. Gray, in "moist meadows" in central New York, "less common and less valuable than the" preceding species, and regarded by him as "naturalized" only.

Boletus luridus of Europe. The "thanasimōs mukēs" on which Euripides wrote an epigram — according to Eparchides (Athen. ii. 56), or the poisonous kind mentioned by Ehippus, Nicander, Dioscorides, and in the Geoponica xiv. 24, may be compared: *B. luridus* is known to grow in Italy and middle Europe, and is called in Germany "hexenpilz" (Schaeff., Spreng., and Lenz).

The ΜΑΓΝΗΤΙΣ: ΛΙΘΟΣ of Euripides oen. — (Hesych.), prescribed as purgative in Int. affect. 21, and by Rufus Ephesius (Cribas. vii. 26), and described by Theophrastus lap. 41 as a white stone hard enough to be worked, is referred by Daremberg to *carbonate of magnesia*.

"440 B. C. = 1st year of Kao-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

"The same year" (Diodor. xiii. 18. 2, and C. Mull. geogr. min. i. p. xxi), war again carried into Sicily by the Carthaginians, now under Hannibal and Himilco son of Hanno. Agrigentum, Gela, and other cities, captured and plundered, and the spoils removed to Carthage.

"The same year" (Sm. b. d.), at Rome famine, and a praefectus annonae first appointed. Sp. Maelius, a wealthy plebeian, employing his fortune in purchasing corn in Etruria, selling at a low price to the poor and distributing gratuitously.

"In this year" (Sm. b. d.), Samos revolting against the Athenians, and defended by the philosopher Melissus; — but in the ninth month subdued by Pericles and his associate generals, including the poet Sophocles.

"439 B. C." (Sm. b. d.), T. Quinctius Capitolinus Barbatus and Agrippa Menenius Lanatus consuls, the pretended conspiracy of Sp. Maelius. L. Quinctius Cincinnatus for the second time appointed dictator, and Sp. Maelius attempting to avoid arrest, illegally slain by the magister equitum.

"438 B. C." (Sm. b. d.), at Rome, military tribunes with consular power holding the place of consuls; revolt of the citizens of Fidena (about "five miles" from Rome), who after murdering the Roman ambassadors ally themselves with the neighbouring Etruscan city of Veii.

"In this year" (Anon. de com., Mein., and Sm. b. d.) at Athens now dominant in the affairs of Greece, the prize for comedy gained for the first time by Pherecrates.

Eryum tetraspermum of Europe and Northern Asia. Called in Britain with some similar weeds *tare* (Prior): the ΑΦΑΚΗΝ of Pherecrates, — eaten by sheep according to Aristotle viii. 10, and Phanas of Eresus, enumerated among Leguminous plants by Theophrastus viii. 1. 4 to 11. 1, growing according to Dioscorides in cultivated ground, slender-leaved and taller than "phakōu" lentil, with larger pods and three or four smaller black seeds, mentioned also by Athenaeus ix. 71, and Paulus Aegineta, may be compared: *E. tetraspermum* was observed by Sibthorp, and Chaubard, in fallow ground from the Peloponnesus to Caria in Asia Minor. Westward, the account of the "aphaca" by Pliny xxvii. 21 seems taken from Dioscorides: *E. tetraspermum* is termed "vicia segetum singularibus siliquis glabris" by Tournefort inst. 397; is known to occur as a weed throughout middle Europe (Curt. lond. i. pl. 55, and Pers.). Eastward from Greece, was observed by Thunberg in Japan, along roadsides everywhere and called "no iendo." By European colonists, was carried to Northeast America, where it continues in waste ground in our Atlantic States.

Satureja capitata of the East Mediterranean countries. Called in Greece "thumari" or "thumio" (Sibth.), in Egyptian "stēphanē" (Syn. Diosc.); in which we recognize the ΘΥΜΩ of Pherecrates, — Choerilus of Samos, Eupolis, Aristophanes, Antiphanes, Crates the cynic, Theophrastus, Ariston, Nicander, Athenaeus ii. 60, not growing according to Hegesander so far North as the Hellespont, and according to Dioscorides small and shrubby with heads of purple flowers: *S. capitata* was observed by Sibthorp, Chaubard, and Fraas, one of the most frequent plants in sunny situations from the Peloponnesus throughout the Greek islands; is known to grow also in Palestine (Pers.), and was observed by Delile on the Mediterranean border of Egypt. Westward, the "thumōs" or "ēpithumis" or "thursiōn" is identified in Syn. Diosc. with the "mōzōula" of the Dacians, and "thōumōum" of the Romans; the "thymum" is mentioned by Virgil, Celsus, Columella, and from being celebrated for the honey from its flowers was brought from Attica and sown in Italy, the stony plains of Narbon in Southern France being already filled with it in the days of Pliny xxi. 31: *S. capitata* is described by Matthioli comm. p. 531; is termed "t. capitatus qui Dioscoridis" by Tournefort inst. 196; and has become abundant along the Mediterranean as far as Portugal (Brot., and Spreng.).

Urtica pilulifera of the Mediterranean countries. Called in Britain *Roman nettle* (Prior), and by a name corresponding to "Roman" or "Italian nettle" in Germany in the days of Gerarde (A. Dec.), in Greece "tziknitha" (Sibth.), in Egypt "kures" (Forsk.) or "zorbeh" or "fisah klab" (Del.); in which we recognize the "knithē" identified in Syn. Diosc. with the Egyptian "sēlēpsiōn," and ΑΚΑΛΗΦΑΙΞ of Pherecrates, — Eupolis, Aristophanes, 3 *Morb.* 18, cooked and eaten according to Diocles, and Theophrastus vii. 7. 2, and according to Dioscorides having fruit like "linōspērmō:" the "knithē" is also mentioned by Euryphon 2 *morb.* 44 to 68, and Hippocrates vi. p. 688: Pliny xxii. 15 speaks of oil made from the "urtica" in Egypt, and seed imported from Alexandria; and the "korrais" is mentioned by Ebn Baitar: *U. pilulifera* was found by Forskal, Sibthorp, and Fraas, one of the most frequent plants about dwellings from the Peloponnesus throughout the Greek islands to the Dardanelles; by Forskal, and Delile, as far as Cairo. Westward, the "akaluphé" is identified in Syn. Diosc. with the "thun" of the Dacians, and "ōurtika" of the Romans: the "urtica" is mentioned by Catullus xlv. 15; by Horace, and Apicius, as edible; by Ovid am. i. 417 as "mordax;" by Pliny xxi. 55 as "acetabulis in flore purpuream lanuginem fundentibus:" *U. pilulifera* is termed "u. urens pilulas ferens prima Dioscoridis semine lini" by Tournefort inst. 535; was observed by Forskal on Malta; and is known to grow in Italy and other parts of Southern Europe (Pers., and Lenz). Farther North, is supposed to have been introduced by the Romans into Britain, occurring near Romney naturalized from time immemorial (Park. th. 441), is termed "a strange herbe" by Lyte, is considered foreign by Gerarde p. 571, and according to Watson in other localities has appeared and disappeared (Bromf., A. Dec., and Prior).

"437 B. C." (Sm. b. d.), at Rome, M. Geganius Macerinus and L. Sergius (Fidenas) consuls, and M. Aemilius Mamercinus dictator; the citizens of Veii defeated, and Fidena reconquered.

"436 B. C." (Harpocr., and Clint.), at Athens, building of the propylaea on the acropolis.

"435 B. C." (Sm. b. d.), war between the Corcyreans and Corinthians, and the Corinthians defeated in naval combat.

Artemisia arborescens of the East Mediterranean seashore. A large species of *wormwood* called in Egypt "sjæbe" white hair (Forsk.) or "cheybeh" (Del.); and the "artemisia" named after Artemis-Ilithyia, — or according to others after Artemisia wife of Mausolus (Plin. xxv. 30), prescribed in Nat. mul. 29, Superfæt. 19, 1 *Morb. mul.* 31, growing according to Dioscorides mostly by the sea-

side, a branchy shrub resembling "apsinthiō" but with larger and more shining leaves, is referred here by Sibthorp and others: the "shaibah" of gardens is mentioned by Costa, El Gafeki, and Ebn Baitar: *A. arborescens* was observed by Forskal, and Delile, in the gardens of Egypt: and by Sibthorp, and Chaubard, in beautiful silvery bushes frequent along the seashore of the Peloponnesus and the Greek islands. Westward, the "artemisias" is prescribed by Scribonius Largus 106, and according to Pliny xxv. 81 to xxvi. 89 is both used medicinally and worn as a charm: *A. arborescens* is described by Dodoens stirp. 21, and Lobel pl. 753; is termed "*absinthium arborescens*" by Tournefort inst. 457; and is known to grow as far as Italy and Barbary (Pers., and Spreng.). Is enumerated by Lindley among the species that "have been used medicinally." (See *A. vulgaris*).

One hundred and sixteenth generation. Sept. 1st, 434, mostly beyond youth: the prophet Malachi: the Greek poets, Antimachus of Claros, and Choerilus of Samos; the comic poets, Myrtillus, Lysimachus, Phrynichus, Lycis, Leucon, Lysippus, Aristomenes, Teleclides, Cantharus, Callias, Nicomachus?, Metagenes, Philonides, and Archippus; the tragic poets, Theognis, Nicomachus, Philocles, Agathon, Antiphon, Carcinus, Nothippus, Acestor, Pythangelus, Xenocles, Sthenelus, Morsimus, Melanthius, Morychus, and Iophon; the philosopher, Prodicus of Ceos; the mimographer Sophron; the historians, Antiochus of Syracuse, Stesimbrotus of Thasos, Herodicus, Cratippus, and Herodorus of Heraclea; the orators, Gorgias, and Andocides; the sophist Protagoras; the sculptor, Phidias; the painters, Parrhasius of Ephesus, Panaenus, Polygnotus, Mycon, Pauson, Dionysius of Colophon, Aglaophon, Cephissodorus, Phrylus, and Evenor (Bryan).

433 B. C. = "32d year of Artaxerxes" (Neh. v. 14 to xiii. 6), permission granted by Artaxerxes to Nehemiah governor of Jerusalem, to again visit that city.

"The same year" (Sm. b. d.), at Rome, military tribunes having consular power holding the place of consuls, and M. Aemilius Mamercinus for the second time dictator; the Aemilian law, limiting the duration of the censorship to eighteen months.

"In this year" (Sm. b. d.), arrival at Athens of embassies from the Corinthians and Corcyreans soliciting assistance: and a defensive alliance formed with the Corcyreans.

Brassica eruca of the Mediterranean countries. Called in Britain *rocket*, in France "*roquette*" (Prior), in Germany "*rauke*," in Italy "*ruchetta*" or "*ruca*" or "*eruca*" (Lenz), in Greece "*aromatōs*" or "*ēuzōmatōn*" (Sibth.) or "*rōka*" (Fraas), in Egypt "*djærdjir*" (Forsk.), in Egyptian "*ēthrēkikēn*" (Syn. Diosc.); in which we recognize the ΕΥΖΩΜΟΝ of Hippolochus, — the Hippocratic writings, Diocles Carystius, Theophrastus, Dioscorides, Athenaeus iv. p. 130, and Galen fac. alim. ii. p. 639: *B. eruca* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout Greece and the Greek islands, frequent in vineyards and cultivated ground and eaten as greens; by Alpinus, Forskal, and Delile, in the gardens of Egypt. Westward, the "*ēuzōmōn*" is identified in Syn. Diosc. with the "*asōurik*" of the Numidians, and "*ērōukam*" of the Romans; the "*eruca*" is mentioned by Ovid, Columella, and Pliny xx. 49: *B. eruca* is termed "*sinapis alterum genus*" by Fuchsius 539, "*e. latifolia alba*" by Tournefort inst. 227; was observed by Lenz in Italy; and is known to occur in waste ground as far as Switzerland and Austria (Bulliard pl. 313, and Pers.), but in Britain perhaps only under cultivation for it is sometimes termed "*garden rocket*." The seeds according to Lindley "may be substituted for mustard, but are less pungent." (See *Sinapis erucoides*).

"432, in the Spring" (Sm. b. d.), the Corinthians defeated by the Corcyreans aided by the Athenians. Revolt of Potidaea from Athens, and in the autumn, a general congress of Peloponnesians to decide upon war against that city.

"In this year" (Ptol. math. synt. iii. 2, and Blair), the earliest Greek astronomical Observation on record: the summer solstice observed at Athens under the archonship of Apeudes by Meton and Euctemon, on "the twenty-first of the Egyptian month Phamenoth, in the morning, being the 27th of June." Eighteen days later, with "the new moon of the 15th of July," the lunar cycle of nineteen years instituted; called from one of the observers, the *Metonic Cycle*.

"Not before this year" (Lubke and Lutrow), the temple to Jupiter at Olympia in Greece completed by Libon of Elis.

"In this year" (Sm. b. d.), Pericles attacked by the comic poet Hermippus, on the occasion of Aspasias and in connexion with the impending Peloponnesian war.

Chondrilla juncea of Europe and the adjoining portion of Asia. A lettuce-like herb called in Germany "*knorpelsalat*," in Italy "*lattajola*" or "*lattugaccio*" (Lenz), in Greece "*agriō mastihia*" (Forsk.) or "*kōlla*" (Sibth.) or "*hōnthrōs*" (Fraas); and the ΙΤΑΛΙΑΣ: ΧΟΝΔΡΟΝ mentioned by Hermippus — (Athen. xiv.), may be compared: "*hōnthrōn*" is mentioned also by Aristophanes vesp. 749: the "*hōnthrulla*," by Theophrastus vii. 11. 4 as not fit for food and its root containing copious acrid juice; by Dorotheus, as good for cooking and for the stomach (Plin. xxii. 45); by Dioscorides, as sometimes called "*sērithōs agrias*," resembling "*kihōriō*" in stem leaves and flowers but smaller in all its parts, and among its branches exuding a "*mastihē*"-like gum in grains large as

"kuamiaia;" is further enumerated by Pliny xxi. 52 among the esculent plants of Egypt: *C. juncea* was observed by Forskal, Sibthorp, and Fraas, frequent in vineyards from the Peloponnesus throughout the Greek islands to Constantinople, and on Lemnos its gum collected. Westward, is termed "*ch. juncea viscosa arvensis quæ prima Dioscoridis*" by Tournefort inst. 475; was observed by Lenz frequent in Italy; and is known to grow as far as middle Europe (Jacq. austr. pl. 427, and Pers.).

Chondrilla ramosissima of the East Mediterranean countries. Also called in Greece "*hōnthrōs*" (Fraas), and included perhaps in the "*hōnthrōs*"—or "*hōnthrulla*" in question: the "*ētērōn kōnthrillēs*" having according to Dioscorides eroded leaves oblong and spreading on the ground, the root slender and full of juice, the stem juicy also and suitable for cooking, is referred here by Fraas: *C. ramosissima* was observed by Sibthorp, Chaubard, and Fraas, frequent in Attica and Boeotia.

"431 B. C." (Thucyd. ii. 2, and Clint.), commencement of the "Peloponnesian war," against the Athenians.—The war continued nearly "twenty-seven" years.

"August 3d" (Thucyd. ii. 28, and Clint.), an *eclipse*.

"430 B. C." (Thucyd. ii. 47, and Clint.), pestilence at Athens.

"In this year" (Liv., and Sm. b. d.), to avert pestilence, a temple to Apollo first built at Rome. It was dedicated by the consul C. Julius (Mento).

"429, autumn" (Clint.), death of Pericles: after governing Athens "forty" years, the last "fifteen" without colleagues.

Amaranthus blitum of Tropical Arabia. Called in Germany "*gemüsamaranth*" (Fraas), in France "*amarante blette*" (Fée), in Italy "*biedone*" or "*blito*" (Lenz), in Greece "*vlitōn*" (Sibth.) or "*vlita*" (Fraas), in Egypt "*fisa klab*," in Yemen "*schedach*" (Forsk.), in Egyptian "*riplam*" or "*ēhlōtōripan*" (Syn. Diosc.); in which we recognize the nickname "*vlitomammas*" applied to the sons of Pericles—(Muell. note to Festus), also the "*vlitōn*" or "*vlētōn*" mentioned by Aristophanes nub. 1001, Theopompus, Antiphanes, Menander, Athenæus ii. 73, and prescribed by Hippocrates. *A. blitum* was observed by Sibthorp, Chaubard, and Fraas, frequent in waste and cultivated ground from the Peloponnesus throughout the Greek islands; by Forskal, and Delile, as far as Cairo: and by Forskal, wild in Yemen. Westward, the "*vlētōn*" is identified in Syn. Diosc. with the "*vlēs*" of the Dacians, and "*vlitōm*" cf the Romans; the "*blitum*" is mentioned by Plautus, and Palladius iv. 9. 17, by Pliny xx. 93 as "*stomacho inutile*" unwholesome food but used medicinally: *A. blitum* is described by Lel. el. pl. 250; is termed "*blitum sylvestre spicatum*" by Tournefort inst. 507; was observed by Lenz in Italy: and is known to occur as a weed as far as middle Europe (Pers., and A. Dec.). Eastward from Arabia, is known to occur in Hindustan (Moquin), and the "*A. viridis*" observed there by Roxburgh iii. 60, by Graham "a common weed in gardens and cultivated grounds" in the environs of Bombay, no native name being given, is regarded as probably identical. By European colonists, was carried to Northeast America, observed in Virginia (Pers.), and by Nuttall in the outskirts of Philadelphia ("*A. græcizans*" of Willd.); to Cuba, Buenos Ayres, Chili, and Peru (C. Gay, and Moq.); and to Austral Africa (Drège).

Euxolus oleraceus of Hindustan. An allied plant distinguished in Yemen as "*schedach hindi*" (Forsk.); and possibly included in the "*vlitōn*" in question:—the "*vlitōn*" is enumerated among potherbs by Polemon diæt. ii. Theophrastus, and according to Dioscorides is a wholesome esculent of no medicinal use: the "*blitum*" is enumerated by Alpinus among the esculent plants of Egypt; and an "*amaranthus*" called "*vlitōn*," with leaves not retuse, was found by Forskal cooked and eaten at Smyrna: *E. oleraceus* is termed "*blitum album majus*" by Tournefort inst. 507; was observed by Sibthorp in cultivated ground around Constantinople; by Forskal, under cultivation in Yemen. Eastward, has no Sanscrit name (Roxb., and Pidd.), but in the environs of Bombay is called "*tamdoolja*" or "*maat tambree*," and "several varieties are commonly cultivated and used as spinage" (Graham); was observed by Roxburgh in other parts of Hindustan; by Mason, "*exotic*" in Burmah, cultivated and called "*hen-ka-nway*," or by residents *Nepaul spinige*: the "*amaranthus mangostanus*" of Blanco, cooked and eaten on the Philippines and called in Tagalo "*halon*," may also be compared. By European colonists, *E. oleraceus* was carried to the Mauritius Islands, where it is cultivated and called "*brède de Malabar grande espèce*," and has become naturalized (Boj.); to Tropical America, where it is also cultivated (A. Dec.).

"429-8 B. C. (= fourth year of 87th Olymp., Sync., and Sm. b. d.), at Athens, Eupolis first exhibiting comedy.

Cistus villosus of the Mediterranean countries. A species of *rock-rose* called in Greece "*kōunōukliā*" (Fraas) or "*kistari*" (Sibth.); in which we recognize the "*kistharōn*" or "*kissarōn*" identified through Syn. Diosc. with the *ΚΙΣΘΟΝ* of Eupolis—(Plut. symp. iv. 1), Mnesimachus, and 1 Morb. mul. 614, usually written "*kistōs*" by Dioscorides, Galen, Athenæus ix. p. 403, Hesychius, Aetius, and Paulus Aegineta: the "*kistōs arrēn*" is distinguished by Theophrastus vi. 2 as having purplish flowers: *C. villosus* was observed by Sibthorp, and Fraas, abounding from the

Peloponnesus throughout Greece and the Greek islands; and farther South, the "kisth" is mentioned by Avicenna p. 245 (Spreng.). Westward, the male kind of the "cisthon" of the Greeks is described by Pliny xxiv. 48 as having the flower "rosaceus;" *C. villosus* is described by Matthioli valgr. i. p. 159; is termed "c. mas major folio rotundiore" by Tournefort inst. 259; and is known to grow in Italy, Spain, and Barbary (Desf., and Pers.).

Cistus salvifolius of the Mediterranean countries. Called in Greece "asprōkōnōuklia" or "agria alēsphakia" (Fraas) or "agriō phaskōmēlia" or "kistari" (Sibth.) and included perhaps in the "kisthōn" of Eupolis, — and others: the "kistōs thēlus" is mentioned by Theophrastus, and is distinguished by Dioscorides as having white flowers: *C. salvifolius* was observed by Forskal, Sibthorp, and Fraas, from the Peloponnesus throughout the Greek islands to Constantinople. Westward, the "cisthon" of the Greeks is described by Pliny as a shrub larger than "thymo" with leaves of "ocimi," the female kind having the flower white: *C. salvifolius* is termed "c. fœmina folio salviæ elatior et rectis virgis" by Tournefort inst. 259; was observed by Forskal near Marseilles; and is known to grow also in Carniolia, Italy, Sicily, and as far as Switzerland (Pers., and Spreng.).

Pisum sativum of the Crimea and neighbouring countries. Called in Britain *pea* or by old writers *pease* (Prior), in France "pois" (A. Dec.), in Italy "pisello" (Franz), in Greece "pizēlia" (Fraas) or "aukōs" (Sibth.); in which we recognize the ΠΙΣΟΥ of Eupolis, — Aristophanes, Antiphanes, Phanias of Eresus, Theophrastus viii. 3, Athenæus, and Clemens Alexandrinus strom. i. 7, (the *pea-bug*, *Bruchus pisi*, distinctly mentioned by Theophrastus caus. iii. 27): *P. sativum* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Cyprus, seldom cultivated but occurring as a weed in cultivated ground; by Bieberstein ii. p. 151, wild on hills in the Crimea (A. Dec.); and was seen by Alpinus in Egypt. Westward, the "pisum" according to Pliny xviii. 31 was sown in Greece in November, but in Italy and farther North in the Spring; is mentioned also by Virgil geor. i. 74, and Columella: *P. sativum* is described by C. Bauhin, and Rivinus; is termed "p. hortense majus flore fructuque albo" by Tournefort inst. 394; and is known to be cultivated from Italy throughout middle Europe. (Pers., and Lenz). Eastward from Greece, has a Sanscrit name (Pidd.), is called in Bengalee "matar," in Hindustanee "matar" or "dana" (D'roz.); was observed by Graham "cultivated in gardens during the cold season" in the environs of Bombay; by Roxburgh, and Wight, in other parts of Hindustan; by Mason, "exotic" in Burmah; by Thunberg, under cultivation in Japan and called "wan," or usually "nora name." By European colonists, was carried to Northeast America, where it continues abundantly cultivated.

Ononis Cherleri of the Mediterranean countries. The ΑΙΓΙΠΥΡΟΣ of Eupolis, — employed when plentiful for the caprification of figs, mentioned also by Theocritus iv, and identified by Cratevas with the "anōnis" (Anguill.), may be compared: the "aigipurōs" is described by Demetrius as red-flowered (schol. Aristoph. ran. 310, and Schneid.), by schol. Theocr. as a spiny plant "akanthōthēs" with the leaf "platu" as in lentil "glaukizōusa," good for inflamed ulcers: *O. Cherleri* was observed by Sibthorp on Cyprus; by Delile, on the Mediterranean border of Egypt near Alexandria. Westward, is termed "a. arvensis hirsuta pusilla viscosa multis siliquis cernuis" by Cupani pl. 17, as observed by him in Sicily; "a. pusilla villosa et viscosa purpurascens flore" by Tournefort inst. 408; was observed by Desfontaines ii. 148 in Barbary; and is known to grow also in Italy, Spain, and Southern France (Bauh. hist. ii. pl. 394, and Pers.).

Ononis antiquorum of Europe and the adjoining portion of Asia. Called in Britain from its strong matted roots *rest-harrow*, in France "arrête-bœuf" (Prior), in Germany "heuhechel," in Italy "bulimacola" or "anonide" (Lenz), in Greece "palamōnitha" or "anonēitha" (Sibth.); and possibly the "aigipurōs" in question: — the "anōnis" is identified through Syn. Diosc. with the "ōnōnis" of Theophrastus vi. 1. 3 to 5. 3 having leaves separate from the thorns, hated by agriculturists, and on account of its roots difficult to extirpate, mentioned also by Nicander, and according to Dioscorides pickled and eaten before the thorns are developed: *O. antiquorum* was observed by Sibthorp, Chaubard, and Fraas, frequent in cultivated ground from the Peloponnesus throughout Greece and the Greek islands. Westward, the "anonin" or "ononida" is according to Pliny xxi. 58 to xxvii. 12 "aratro inimica," but his further account seems chiefly taken from the Greeks: *O. antiquorum* is described by Dodoens p. 743, and Lobel ii. pl. 28 (Spreng.); is termed "a. legitima antiquorum" by Tournefort cor. 28; was observed by Lenz in Italy, and is known to grow in other parts of Southern Europe (Pers.). "*O. spinosa*," termed "a. spinosa flore purpureo" by Tournefort inst. 408, observed by Sibthorp from Zacynthus to Constantinople, and known to occur throughout middle Europe as far as Denmark (fl. Dan. pl. 783, and Pers.), is regarded as probably not distinct.

Artemisia dracunculus of Tartary. Called in Britain *tarragon* (Prior), in France "estragon" (Pers.), among the Arabs "tharkhun;" and the ΤΑΡΙΧΟΣ: ΦΡΥΓΙΟΝ: Η: ΓΑΔΕΙΡΙΚΟΝ of Eupolis, — or "tarihōs phrugion" of Antiphanes, the Hippocratic writings, and Athenæus, may be compared: the "tharkhun" is mentioned by Ebn Masawia, Abu Hanifa, Rhazes, Avicenna, Symeon Sethus,

and Ebn Baitar; and *A. dracunculus* was observed in Egypt by Hasselquist. Westward, the "dragon-tea" is enumerated in the Capitularia of Charlemagne; *A. dracunculus* is termed "*d. hortensis*" by Blackwell pl. 116; is known to be cultivated in Southern Europe, and the "leaves and young shoots" employed "as a pickle, or for giving a pleasant flavour to vinegar" (Pers., and Lindl.). Eastward from Greece, was observed by Gmelin ii. pl. 59 and 60 wild in Siberia. By European colonists, was carried to Northeast America, observed by myself under cultivation in our Middle States.

Verbascum sinuatum of the Mediterranean and Tauro-Caspian countries. A species of *mullein* called in Italy "guaraguasco" (Lenz), in Greece "glōssa" (Fraas) or "phlōmōs" (Sibth.); in which we recognize the ΦΛΟΜΟΝ of Eupolis, — Aristotle, Macrobius, Plutarch symp. iv. 1, and "phlōmōs mēlaina" of Theophrastus ix. 12. 3, and Dioscorides: *V. sinuatum* was observed by Forskal, Sibthorp, Chaubard, and Fraas, the most abundant species from the Peloponnesus throughout Greece and the Greek islands, and to the present day employed for killing and capturing freshwater fishes as described by Aristotle anim. viii. 20 (Walp. p. 276, and Spreng.); is known to grow also in the Crimea and as far as the Caspian (Ledeb.); in Syria and on mount Sinai (A. Dec.); was observed by Delile in Egypt, and is enumerated by Clot-Bey and Figari as long known there. Westward, the "phlōmōn" is identified in Syn. Diosc. with the "vērvasklōum" or "phēminalē" of the Romans; the "*verbascum nigrum femina*" is distinguished by Pliny xxv. 73; *V. sinuatum* is termed "*v. nigrum folio papaveris corniculati*" by Tournefort inst. 147; was observed by Hogg on Sicily, by Lenz in Italy, by Forskal near Marseilles; and is known to grow in Spain, Algeria, and on the Canary Islands (Pers., and A. Dec.).

Verbascum undulatum of the East Mediterranean countries. Called in Greece "glōssa" (Fraas) or "phlōmōs" (Sibth.), and perhaps included in the "phlōmōn" of Eupolis: — the "glōssan" is mentioned in 2 Morb. mul. 75; the "phlōmōn thēlu" is distinguished by Theophrastus, and Cratevas (schol. Nicand.); and the "phlōmōs lēukē thēlēia" having according to Dioscorides "kramvē"-like but more hairy and white or yellowish flowers, is referred here by Sibthorp, and Fraas: *V. undulatum* is termed "*v. græcum fruticosum folio sinuato candidissimo*" by Tournefort cor. 8 and trav. i. pl. 128; was observed by Sibthorp, Link, and Fraas, frequent in Southern Greece, and often becoming woody.

Verbascum thapsus of Europe and Northern Asia. Called in Britain *hig-taper* or *mullein*, in old French "malen," in mediæval Latin "malandrium" (Prior), in Germany "königskerze," in Italy "barbarastio" or "tasso barbasco" or "verbascio" (Lenz), in Greece "phlōmōs" (Sibth.), and possibly included in the "phlōmōn" of Eupolis: — the "phlōmōn arrēn" is distinguished by Theophrastus, Nicander ther. 856, and Cratevas (schol. Nicand.); and "phlōmōs lēukē arrēn" having according to Dioscorides oblong and narrower white leaves, is referred here by Sibthorp, and Fraas: *V. thapsus* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus throughout the Greek islands to Constantinople. Westward, the "phlomon" of the Greeks is identified by Pliny xxv. 73 with the "verbascum" of the Romans; *V. thapsus* is described by Brunfels p. 197, Fuchsius, and Dalechamp (Spreng.); is termed "*v. mas latifolium luteum*" by Tournefort inst. 146; and is known to grow from Italy throughout middle and Northern Europe almost as far as Lapland (Pers., and Fries). Eastward from Greece, is known to grow throughout the Caucasian, Himalayan, and Altaian mountains as far as Daouria (Ledeb., and A. Dec.). By European colonists, was carried to the Azores (Wats.); to Northeast America (Walt.), where I have found it one of the first foreign plants to acquire foothold in clearings. The seeds according to Lindley "are said to be used by poachers to poison fish."

"427 B. C. (= fifth year of the Peloponnesian war," Sm. b. d.), assistance sent by the Athenians to the Leontines in Sicily. The comic poet Plato first exhibiting — (Cyril, and Sm.).

Cymbopogon schoenanthus of the Moluccas. The *lemon grass* is called in Yemen "m'hah," its imported root in Egypt "edcher" (Forsk.); and the ΣΧΟΙΝΟΥΞ of the comic poet Plato — (Etym. magn.), "ēuōsmōu" according to the Hippocratic writings (Spreng.), Theophrastus ix. 7, and Dioscorides i. 16, called "shōinou alēxanthrinēs" by Damogeron (geopon. vii. 13), "shōinōu anthōs" by Galen ant. i. p. 70, and "shōinanthōs" by Actius, and Actuarius, is referred here by writers: the fragrant "schoenium" is mentioned also by Plautus, and Columella; the "gramen arabum" by Propertius xxix. 17; "*juncum odoratum*" by Pliny; "*squinanthum*" by Palladius, Rutilius, and Plinius Valerianus; and the "idschir" by Ebn Baitar: the living plant in the days of Pliny xii. 48 had been found growing in Italy; was known to Theophrastus as growing in Syria; to Dioscorides as growing in Lybia and Arabia, the best brought from Nabathea, and the Arabian kind sometimes termed Babylonian. The root of *C. schoenanthus* or "*juncus odoratus*" is enumerated by Alpinus as imported from Arabia into Egypt; comes "from Limbo in Arabia Petraea," according to Hasselquist; and "edcher" or "schoenanthus" root from Arabia, was seen in Egypt by Forskal mat. med.: the plant itself was received by Garcias from Arabia; and was observed by Forskal p. 173 seemingly wild among the mountains of Yemen. Eastward, is called in Hindustanee "akya-ghas," in Bengalee

"agya-ghans," in Telinga "nimma-gaddi" or "chippa-gaddi," in Tamil "vashanap-pullu" or "karpura-pullu" (Drur.); was observed by Rheede xii. pl. 72 in Malabar; by Graham, "cultivated in gardens" in the environs of Bombay; by Roxburgh, Wallich, and Drury, in other parts of Hindustan, covering "large tracts of waste land in Bengal, and its oil regularly exported from Ceylon; by Mason v. p. 501, "exotic" in Burmah and called "sa-ba-len," cultivated "by the natives," and "a decoction made from the leaves" used medicinally; by Bontius, cultivated and seemingly wild on Java; by Blanco, on the Philippines, and called in Tagalo "salai" or "tanglad" or "paja de meca," in Bisaya "baliyoco;" is described also by Rumphius amboin. v. pl. 72; was observed by myself on the Feejeean Islands, planted around native dwellings and occurring besides in wild situations. Transported to Europe, continues under cultivation for its fragrance (Morison iii. pl. 8, Vent., and Pers.); and by European colonists, was carried to Northeast America, observed by myself in gardens in our Northern and Middle States.

"426 B. C." (Blair), pestilence again breaking out in Athens, permission given to the men to marry "two" wives. Socrates among others taking advantage of the privilege.

"425 B. C. = 1st year of Wei-lie-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"The same year" (Clint. ii. p. 380), Artaxerxes succeeded by Xerxes II.; and after "two months," by Sogdianus, who reigned "seven months." The names of these two Persian emperors, though given by Manetho, have not been found on the Egyptian monuments.

"The same year" (Thucyd. iii. 116, and Clint.), in Sicily, eruption of mount Etna. And in Italy (Sm. b. d.), war between Rome and the neighbouring Etruscan city of Veii suspended by a truce for "twenty years."

Thapsia Garganica of the Mediterranean countries. An Umbelliferous plant called in Greece "pōlukarpōs" (Sibth.) or "ōglēgōra" or "thapsia" (Fraas); in which we recognize the "thapsia" supposed to have been discovered on the island of Thapso, and named accordingly — (Diosc.), prescribed together with its root in Nat. mul. 29, 3 Morb. 17, Superfoet. 19 to 20, Int. affect. 19, and 7 Popular. 39, having according to Theophrastus ix. 9 "marathō"-like leaves and a "narthēkōthē" stem, according to Dioscorides yellow-flowered "anēthō"-like umbels, the acrid root with its juice purgative: *T. Garganica* was observed by Sibthorp, D'Urville, and Fraas, frequent from the Peloponnesus throughout the Greek islands. Westward, the "thapsia" called also "pagkranōn" or "skammōniōn" is identified in Syn. Diosc. with the "vōithēn" of the Numidians, and "phērōulagō" or "phērōula silvēstris" of the Romans; the "thapsia" is mentioned by Celsus v. 18; was used by Nero, and the mode of collecting the juice is described by Pliny xiii. 4, the most virulent growing in Africa: *T. Garganica* is described by Magnol pl. 286; is termed "th. sive turbitis garganicum semine latissimo" by Tournefort inst. 322; and is known to grow at the Southern extreme of Italy and in Barbary (Pers.).

"424 B. C." (Astronom. can., and Clint. ii. p. 381), Sogdianus succeeded by Darius II. Nothus, ninth Persian emperor. Though reigning "nineteen" years (Astronom. can., Maneth., and Diodor.), his name has not been found on the Egyptian monuments.

In this year (= 452 — "28 years reign" in the Mahavamsa iv.), the Hindu king Calasoka succeeded by his ten sons, including Baddesenah and Pantchewekeya. Mahamandala holding this place in the Avadana asoca (Burn. i. 359) may prove king Mandelica who harboured the heretical Budhists (see Mahavans. iv. p. 43).

"In this year" (Sm. b. d.), the Athenians defeated by the Thebans at Delium: in the retreat, Xenophon having fallen from his horse was carried on the shoulders of Socrates (Strab., and D. Laert.). The historian Thucydides, not arriving with his fleet in time to save Amphipolis from the Spartans, incurred the penalty of banishment. The first prize for comedy awarded to the Equites of Aristophanes, his first exhibition under his own name; the second prize, to the Satyri of Cratinus; Aristomenes also exhibiting comedy.

Pyrus (. . .) *aria* of middle Europe and mountains farther South. Called in Germany "mehlbeerbaum," in Italy "lazzeroło montano" or "lazzeroło di montagna" (Lenz), in Greece "trōkkia" (Sibth.); and the ΑΜΑΜΗΛΙΔΕΣ of Aristomenes, — Aeschylides, and Athenaeus xiv. 63, described as not pears, sweet and devoid of a kernel, may be compared: *P. aria* was observed by Sibthorp append., and Fraas on the mountains of Greece from Pelion to Athos. Westward, the "upomelis" is described by Palladius xiii. 4 as resembling a sorb, its sweetness mingled with "sapore acuto" a tart flavour: berries of *P. aria* occur in debris of the early lake-villages of Switzerland (Heer); the tree is termed "c. folio subrotundo serrato" by Tournefort inst. 633; was observed by Lenz on the mountains of Italy; is known to grow also on Etna and the Pyrenees (A. Dec.), and throughout middle Europe as far as Denmark (fl. Dan. pl. 302, Crantz austr. i. pl. 2, and Pers.).

"423 B. C. (= 8th year" of the Peloponnesian war, Thucyd. iv. 116 to 133, and Clint.), the temple to Juno near Mycenae burned. A new temple — was erected on the site by Eupolemus, and a statue of Juno made by Polycleitus (Paus. ii. 17), a work of art much celebrated.

Aster amellus of the Mediterranean countries. A species of *aster* called in Italy "amello" or "astro" or "astere attico" (Lenz), in Greece "valtökratēs" (Fraas); in which we recognize the "astēriona" growing along the river of that name and offered in this temple to Juno, its leaves woven in garlands — (Paus.), identified through Syn. Diosc. with the "astēriskōs" or "astēr attikōs;" the "astēriskōs" is mentioned by Theophrastus iv. 13; the "astēr" by Nicander fr. ii. 66 to 67 as coronary and placed on temples or images of gods, by Cratevas as employed medicinally (add. Diosc.); and the "astēr attikōs" by Dioscorides as having oblong hairy leaves and a star-like purple and yellow flower split around as in "anthēmithōs," the fresh plant applied in inflammation of the groin: *A. amellus* was observed by Sibthorp, and Fraas, in wet ground sometimes saline in Attica and Southern Greece. Westward, the "astēr attikōs" or "uōphthalmōn" or "vōuvōniōn" is identified in Syn. Diosc. with the "rathivitha" of the Dacians, and "iggunalis" of the Romans; the account of the "aster" or "bubonion" by Pliny xxvii. 19 seems chiefly taken from the Greeks; but the "amellus" of Virgil geor. iv. 271 has a golden flower surrounded with purple rays, is mentioned also by Columella ix. 4. 4: *A. amellus* is described by Matthioli p. 817 (Spreng.); is termed "a. atticus cæruleus vulgaris" by Tournefort inst. 481; was observed by Lenz throughout Italy; and is known to grow as far as Austria and middle Europe (Jacq. austr. pl. 435, and Pers.).

"In this year" (Meineke, and Sm. b. d.) at Athens, the First prize for comedy gained by Cratinus, and the Second by Ameipsias, over the *Nubes* of Aristophanes containing an attack on Socrates.

Lithospermum tinctorium of the Mediterranean countries. Resembling the *alkanet* and called in Egypt "sadjaret el arneb" hare's herb (Forsk.): the ΕΓΚΟΥΞΑ of Ameipsias — or "enchusam" by some called "anchusam" but distinguished by Pliny xxii. 25 and identified with the "rhexiam" or "arcebio" or "onochelim" or "onochiles," may be compared: the "ōnōkihlē" is enumerated by Theophrastus vii. 10. 3 among plants continuing a long time in flower from the flowers opening successively; the "ōnōhēitlōs" is mentioned by Nicander ther. 838; the "ōnōhēilēs" or "alkivia-thiōn" is identified in Syn. Diosc. with the "aghōusa ētēra" of Dioscorides having smaller leaves similar in roughness, reddish-purple flowers, and long red roots swelling in harvest-time with blood-coloured juice; and the "adsan el arnab" is mentioned by Elgafaki, and Ebn Baitar: *L. tinctorium* was observed by Chaubard, and Fraas, in Attica and the Peloponnesus; by Delile, near Alexandria; and by Forskal p. 63 in the Desert not far from Cairo, its root red and staining the skin, stem branching from the base but erect, flower "obscure-violacea." Westward, the account by Pliny of the "enchusam" seems in part taken from Dioscorides, but he states that the bruised leaves exhale the odour of "cucumberis," and gives additional medical uses: *L. tinctorium* was observed by Forskal near Marseilles, is known to grow in other parts of Southern France (Dec. fl. fr.); is distinctly described by Vahl, and Lamarck ill. p. 398; and according to Bory is often confounded with *Anchusa tinctoria*, furnishing in like manner "orchanette" (see *Anchusa tinctoria*).

"422 B. C. (= tenth year of the Peloponnesian war," Sm. b. d.), hostilities continuing in Thrace between the Lacedaemonians and Athenians; the Athenian citizens now computed at "twenty thousand." The second prize for comedy awarded to the *Vespae* of Aristophanes; who, according to some writers, tendered in vain a second edition of his *Nubes*.

The ΦΑΞΙΑΝΟΣ bird of Aristophanes, is admitted to be the *phœasant*, Phasianus Colchicus. — The "phasianōs" is also mentioned by Epænetus, Mnesimachus, Aristotle anim. v. 31, and Agatharchides; and according to Callixenus (Athen. ix. 37), these birds were carried in the festival of Ptolemy Philadelphus at Alexandria.

The ΚΟΡΙΞ of Aristophanes nub. 630 is admitted to be the bed bug, *Cimex lectularius*. — The "cimex" is mentioned by Catullus, Horace, Pliny, and Martial; and the "lectuli bestias," by Tertullian adv. Marcio. i. 14. *C. lectularius* continues to be well known in Egypt and throughout Europe; and by European colonists, has been carried across the Atlantic to America and other countries.

Onobrychis crista-galli of the Mediterranean countries. Called on Cyprus "trivōli" (Sibth.); and possibly the ΤΡΙΒΟΛΟΣ of Aristophanes lys. 576: — both kinds of "trivōlōs" according to Theophrastus vi. 5. 3 have spines on the pericarp, and the seed of the autumnal kind is rounded and contained in a pod: *O. crista-galli* was observed by Sibthorp from the Peloponnesus and Cyprus to Constantinople; and by Delile, near Alexandria on the Mediterranean border of Egypt. Westward, is termed "o. seu caput gallinaceum minus fructu maximo insigniter echinato" by Tournefort inst. 390; and is known to grow in various parts of Southern Europe (Pers.).

Anagyris foetida of the Mediterranean countries. Called in Greece "azōgēra" or "anthravanō" or "anaguri" (Sibth.); in which we recognize the ΑΝΑΓΥΡΟΝ of Aristophanes lys. 735, — Aeschines, Demosthenes, a proverb preserved by Zenobius ii. 22, described by Dioscorides as an arborescent strong-scented shrub having "agnō"-like twigs with fruit in long horns, reniform, and in the added Synonyms identified with the "agnakōpōn" or "akōpōn:" *A. foetida* was observed by Fors-

kal, Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands to Smyrna; and by Forskal, in gardens at Constantinople. Westward, the account by Pliny xxvii. 13 of the "anagyros" or "acopon" seems taken from Dioscorides: *A. foetida* is described by Tournefort inst. 647; was observed by Gussone i. 477 on Sicily; and is known to grow wild in Italy and other parts of Southern Europe (Pers., Spreng., and Lenz). The seeds according to Lindley "said to be poisonous."

Verbascum Linnense of the East Mediterranean countries. A species of *mullein* called in Greece "manōla" or "phitilēa" (Fraas); and the ΘΡΥΑΛΛΙΞ lamp-wick of Aristophanes nub. 60,—"thruallis" plant of Theophrastus vii. 11. 2, and Nicander, identified by Dioscorides with the "phlōmis luhnitis" having three or four or more hairy leaves and furnishing lamp-wicks, is referred here by Fraas: *V. Linnense* is described by him as observed near Limni in Euboea.

Salvia officinalis of the Mediterranean countries. Called in English gardens *sage*, in France "sauge" (Prior), in Germany "salbey" (Fraas), in Italy "salvia" (Lenz); in which we recognize the "salviam" called in Greek "elēlisphacon" by herbalists of the time of Pliny xxii. 71, the "elēlisphacos" of the Greeks being sometimes called "sphacos;" the garden ΣΦΑΚΟΣ of Aristophanes them. 486,—and Theophrastus vi. 1. 4 to 2. 5, seems therefore to correspond: *S. officinalis* was observed by Sibthorp in rugged places in Greece, bearing edible galls like *S. pomifera*, but according to Fraas is very rare; by Delile, near Rosetta on the Mediterranean border of Egypt; and according to Clot-Bey has besides been recently introduced. Westward, the "salvium" potion is mentioned by Columella; the "salviam" is described by Pliny as resembling "mentae" hoary and fragrant; is mentioned also by Macer Floridus: *S. officinalis* is termed "s. major" by Tournefort inst. 180; is known to grow wild in Italy and other parts of Southern Europe (Etling *salv.* 1, Pers., and Lenz), is besides cultivated there and throughout middle Europe. By European colonists, was carried to Northeast America, where it continues under cultivation; to Hindustan, observed by Graham "in gardens" at Bombay but no native name is given; to Burmah, observed by Mason "exotic" but no native name is given. The leaves according to Lindley are much employed in cookery, and tea made of them "has the reputation of being a stomachic." (See *S. pomifera*, and *Phlomis fruticosa*).

Chenopodium olidum of Europe and the adjoining portion of Asia. A fetid species of *goosefoot* called in Germany "stoltz heinrich" (Trag.), in France "vulvaire" (Nugent); and the ΨΕΥΔΑΤΡΑ ΦΑΞΥΝ of Aristophanes eq. 630—is referred here by Hase: *C. olidum* was observed by Sibthorp, and Chaubard, in waste and cultivated ground from the Peloponnesus to Constantinople. Westward, the term "blitea meretrix" used by Plautus *truc.* is supposed by Tragus to refer to this plant: *C. olidum* is described by Cornelius Petrus (Spreng.), Dodoens 616, and Bauhin; is termed "atriplex canina" by Tragus ii. 57, "ch. foetidum" by Tournefort inst. 506, "ch. vulvaria" by Linnæus; and is known to occur along roadsides and in cultivated ground throughout middle Europe as far as Denmark (*fl. Dan.* pl. 1152, *Engl. bot. pl.* 1034, *Woodv. pl.* 145, and Pers.). The plant was found by Chevallier exhaling pure ammonia during its whole existence, and according to Lindley "is still employed as an antispasmodic and emmenagogue, and is constantly to be found" in London herb-shops.

Juniperus nana of Europe and the adjoining portion of Asia. The ΚΕΔΡΙΞ berry of Aristophanes them. 493,—or "kēthris" shrub described by Theophrastus i. 9. 4 to 12. 1 and *caus.* vi. 14. 4 as small and never becoming a tree, its fruit fragrant and though acrid grateful to the palate, (translated "cedrula" by Gaza), is referred here by Sprengel: a tree in Arcadia resembling the "cedro" and called in Phrygia "frutex," is mentioned by Pliny xiii. 11: *J. nana* is described by Pallas *ross.* ii. pl. 54; is known to grow in Sweden (Wahl.), Siberia, and on the Saltzburg and Styrian Alps (Pers.), but has not been observed by modern travellers within the limits of Greece.

Juniperus rufescens of the Mediterranean countries. A little-known species called in Greece "kēthrōs" (Lenz); and possibly the "kēthris" in question:—*J. rufescens* is described as "very like" *J. macrocarpa*; is known to grow in Bithynia (Lenz), Thrace and Macedonia (Daub.), and was observed by Link in Portugal.

Imperata cylindrica of Tropical Asia. A reedy grass called in Greece "thēmatia" or "thēmātōhōrtōn" (Fraas), in Egypt "halfē" (Del.), and the ΦΛΕΩΞ of Aristophanes *ran.* 244,—Aristotle, Theophrastus *iv.* 10 to 11. 12, Pollux, mentioned by Dioscorides i. 114 as a kind of "kalamōn," is referred here by Fraas: *I. cylindrica* is termed "gramen tomentosum creticum spicatum spica purpurea" by Tournefort *cor.* 39, "lagurus cylindricus" by Linnæus, "saccharum cylindricum" by Lamarck, its spike according to Persoon "nivea lanata;" was observed by Sibthorp, Chaubard, and Fraas, abounding in moist places in the Peloponnesus and Attica; by Forskal p. 23, and Delile, from Alexandria and Rosetta to Cairo; is known to occur also in Barbary, Italy, Southern France, and Spain (Cyrill. *rar.* ii. 2. pl. 11, and *Cav.* iii. pl. 2). Eastward from Syria, was observed by Law "common in Guzerat" (Graham); by Roxburgh, and Royle, in other parts of Hindustan; by Mason *v. p.* 524, indigenous in Burmah and called "thek-kay-nyen," one of the two grasses employed in the

Interior to thatch native dwellings; by Blanco, extending itself over the Philippines and called in Tagalo and Bisaya "cogon," in Camarines "cogon cogon," in Pampango "ilib" or "balili;" is described also by Rumphius amboin vi. pl. 7; was observed by myself throughout the Malayan archipelago, white-spiked and springing up spontaneously, and in clearings from the Feejeean as far as the Samoan Islands.

"421 B. C." (Sm. b. d.), at Rome, N. Fabius Vibulanus and T. Quinctius Capitolinus Barbatus consuls, the number of quaestors increased from two to four.

"420 B. C." (Sm. b. d.), at Rome, military tribunes having consular power holding the place of consuls. Farther South, the Greek city of Cumae (on the bay of Naples) captured by the Campanians, people of the country around.

"418 B. C." (Sm. b. d.), the Athenians defeated in battle at Mantinea, Argos now joining in alliance with Sparta. Perdiccas II. having also joined in alliance, hostilities were renewed between him and the Athenians.

Campanula versicolor of the East Mediterranean countries. A species of *bell-flower* called in Greece "haritzia" (Sibth.); in which we recognize the ΧΑΡΙΤΙΩΝ growing along the Eurotas in the spring, and suspended by women on the neck to increase the affection of the men, according to Cleanthes mont. i. — Sosthenes of Cnidus, and Hermogenes (Plut. flux. 17. 4): the "hariēn" of Mul. morb. 109, may also be compared: *C. versicolor* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Thessalonica: and from transported specimens, is described by Andrews repos. pl. 396.

"417 B. C. = 9th year of Wei-lie-wang" (Chinese chron. table), beginning of the Thirty-eighth cycle. At this time, the men of the principality of Thsin wearing their swords on the side attached to a girdle; a custom borrowed by the Thsin family from the Tartars: walls were also built as a barrier against the Thsin, by the princes of Wei and Tchou on their own frontiers (Pauth. 186).

"416 B. C." (Sm. b. d.), unjust expedition against the Melians: who were barbarously punished by the Athenians through a decree proposed by Alcibiades.

Hardly later than this date (Soran., and Sm. b. d.), the physician Euryphon summoned to the court of Perdiccas II. in Macedonia. Euryphon was aware of the difference between *arteries* and veins, and considered the former as also containing blood — (Aurel. morb. chron. ii. 10). He is mentioned by the comic poet Plato (Gal. comm. in Hippocr. vii. 44).

Sisymbrium irio of Europe and the adjoining portion of Asia. Called in Britain *rock gentle* or *rock-gallant* (Ainsw.), or *London rocket* from springing up abundantly among the ruins left by the great fire of 1667 (Ray 297, and Prior); and the ΕΡΥΣΙΜΟΝ: ΑΕΙΑ of 2 Morb. 52, written by Euryphon — (as appears from an extract in Galen), may be compared: the "ērusimōn" is described by Theophrastus viii. 1. 4 to 7. 3 and caus. ii. 12 1 as fatty, having very small seeds, and sown together with "sēsamōn;" and the "erysimum" of Asia and Greece according to Pliny xviii. 22 differs from the "irionem" only in being "pinguius" and is medicinal rather than esculent: *S. irio* was observed by Sibthorp in the Peloponnesus; by Delile, growing about Cairo; and by Forskal p. 118, among the mountains of Yemen (Steud.). Westward, the "erysimum" is prescribed by Celsus: *S. irio* is termed "*erysimum latifolium majus glabrum*" by Tournefort inst. 228; was observed by Lenz in Italy; is known to occur along walls and in cultivated ground throughout middle Europe (Jacq. austr. pl. 322, Lam. fl. fr., and Pers.), in Britain appearing in profusion after the removal of soil near Berwick in 1847 (A. Dec.), occurring also in other localities, but regarded by Watson as not indigenous. "*S. altissimum caule non hispido*" observed by Forskal near Marseilles, edible and called "*roquettes sauvages*," may also be compared (See *S. polyceratum*).

Hypericum crispum of the Mediterranean countries. Called in Greece "agōuthōura" or "skōuthritza" or "upērikōn" (Sibth.); in which we recognize the ΥΠΕΡΙΚΟΝ of Euryphon 2 morb. 52 and 62. — of 1 Morb. mul. 610, Niger, growing according to Dioscorides præf. and iii. 161 in rugged places and cultivated ground: *H. crispum* was observed by Sibthorp, Chaubard, and Fraas, frequent in waste and cultivated ground throughout Greece and the Greek islands. Westward, the "hypericon" is identified in Syn. Diosc. and by Pliny xxvi. 53 and 93 with the "chamaeptyin" or "corion:" *H. crispum* is described by Boccone mus. ii. pl. 12; is termed "*h. crispum triquetrum cuspidato folio*" by Tournefort inst. 255; and is known to grow in Southern Italy, Sicily, and Barbary (Desf., Pers., and Lenz).

Saponaria officinalis of Europe and the adjoining portion of Asia. Called in Britain *soapwort* or *fuller's herb* (Prior), in France "saponaire" (Nugent), in Germany "seifenkraut," in Italy "saponaria" and its root used as soap (Lenz), in Greece "sapōunōhōrtōn" or "kalōstrōuthi" (Fraas), by the prophets "halirutōn," in Egyptian "ōinō" (Syn. Diosc.); in which we recognize the ΣΤΡΟΥΘΙΟΝ of Euryphon — (Soran. Ephes. mul.), growing on the shore of Andros and its root and fruit prescribed in Nat. mul. 29. Superfet. 19, and 1 Morb. mul. 104, employed according to Dioscorides medicinally as well as for washing wool, mentioned also by Lucian alexand. 12, and

Galen: the "strouthōs" with which linen is whitened, mentioned by Theophrastus ix. 12. 5, is read "struthiō" by Dioscorides (but translated "speciem passerum praeberentibus" by Pliny xx. 79): *S. officinalis* is figured in the Vienna manuscript Diosc. (Harl. and Cockayne); was observed on Andros by Fraas; and by him, Forskal, Sibthorp, and Chaubard, frequent in moist places along hedges from the Peloponnesus to Asia Minor; "struthium" root from Greece was found by Forskal mat. med. employed medicinally in Egypt; and the living *S. officinalis* according to Clot-Bey has recently been introduced. Westward, the "strouthiōn" or "strouthiōkamēlōs" or "katharsis" or "hamairutōn" is identified in Syn. Diosc. with the "suris" of the Numidians, and "erva laria" or "rathix anaria" of the Romans; by Pliny xix. 18 and xxiv. 58 with the "radicula" used for washing wool, growing "sativa" everywhere, and having a large root but no seeds (the many-petalled form?); the "radix lanaria" is mentioned by Columella xi. 2. 53; the "struthio" is prescribed by Celsus 18 to 22, and in the time of Macer Floridus 26 was commonly called "ostruthium": *S. officinalis* is regarded as introduced into Britain after the departure of the Romans and before the discovery of America (A. Dec.); is described by Brunswyck, Ruel, Fuchs, Lobel, and Gerarde p. 360; is termed "lychnis sylvestris quæ saponaria vulgo" by Tournefort inst. 336; was observed by Lenz in Italy, and is known to occur along roadsides as far as Denmark (fl. Dan. pl. 543, Pers., and Fries); is besides sometimes regularly cultivated (A. Dec.). By European colonists, was carried to Northeast America, where it continues chiefly near dwellings in our Northern, Middle, and according to Chapman our Southern States. (See Imperatoria ostruthium).

Silene inflata of Europe and the adjoining portion of Asia. Called in Britain *bladder campion* or *ben* or *white ben* or from froth of an insect infesting it *spatling poppy* (Prior), in Germany "klatschnelke" (Fraas), in Greece "phōuskōuthia" or "kōukaki" or "strouthōula" (Sibth.); and possibly the "strouthiōn" in question: — the "struthion" of Pliny xix. 18, wild in stony places in Asia and Syria, the best in quality beyond the Euphrates, its stem slender and eaten and leaves like those of the olive, may also be compared: the "mēkōn ēraklēia" whose root according to Theophrastus ix. 12. 5 is employed medicinally, and leaves resemble "strouthōs" with which linen is whitened, is identified through Syn. Diosc. with the "mēkōn aphrōthēs," referred here by Lobel and others: *S. inflata* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout Greece, the leaves cooked and eaten. Westward, is described by Gesner f. 273, and Dodoens p. 172; is termed "lychnis sylvestris quæ behen album vulgo" by Tournefort inst. 335; was observed by Tenore near Naples, by Forskal near Marseilles; and is known to occur along roadsides and in fallow ground from the Pyrenees as far as Denmark (fl. Dan. pl. 914, Pers., and A. Dec.). By European colonists, was carried to Northeast America, where it has become naturalized, occurring along roadsides and near dwellings from Quebec (Mx.) to Salem and Philadelphia, and observed by myself in wild situations not far from the last-named city. *S. fabaria*, termed "lychnis maritima saxatilis anacampserotis folio" by Tournefort cor. 24 and "cucubalus foliis crassis" by Forskal, observed by him on the rocks of Tenedos, by Sibthorp on mount Athos and the Bithynian Olympus, the seashore of Caria and maritime rocks of Samos, by Boccone mus. pl. 92 on the seashore of Sicily (Pers.), is regarded by Bory as perhaps not distinct.

Potentilla reptans of Europe and the adjoining portion of Asia. Called in Britain *five-leaf* or *five-finger-grass* or *cinquefoil*, by Askham "quynckefolye," in Sweden "finger-ört" (Prior), in France "quinte-feuille" (Nugent), in Germany creeping "gänsefuss" (Fraas), in Italy "cinquefolio" (Lenz), in Greece "pēntathaktula" or "pēntaphullō" (Sibth.), by the prophets "ptērōn ivēōs" or "ivēōs ōnux" or "ērmōthaktulōn," in Egyptian "ōrphētēvēōkē" or "ēnōtrōn" (Syn. Diosc.); in which we recognize the ΠΕΝΤΑΦΥΛΛΟΥ whose root is prescribed by Euryphon 2 morb. 38, — enumerated by Democritus among signs of subterranean water (geopon. ii. 6), identified by Theophrastus ix. 13. 5 with the "pēntapētōus" having slender stems resting on the ground and all its leaves in fives, growing according to Dioscorides in wet places and along streams, its leaves serrate; clearly also the "pēntapētēlōn" of Nicander ther. 839: *P. reptans* was observed by Sibthorp, Chaubard, and Fraas, frequent in the situations described by Dioscorides from the Peloponnesus throughout Greece; and dried "pentaphyllum" root was found by Alpinus, and Forskal mat. med., employed medicinally in Egypt. Westward, the "pēntaphullōn" or "pēntapētēs" or "pēntathaktulōn" is identified in Syn. Diosc. with the "prōpēthōula" of the Dacians, "pēmpēthōula" of the Gauls, and "kigkēphōliōum" of the Romans, by Pliny xxv. 62 with the "quinquefolium;" and "quinquefolii radix" is prescribed by Celsus vi. 9: *P. reptans* is described by Fuchs 624, Matthioli, and Lobel pl. 960; is termed "q. majus repens" by Tournefort inst. 297; was observed by Munby in Algeria (A. Dec.), by Lenz in Italy; and is known to grow throughout middle Europe as far as Sweden (fl. Dan. pl. 1164, and Pers.).

Rhus coriaria of the wooded portion of the East Mediterranean countries. Called in commerce *sumach*, in France "sumac" (Nugent), in Germany "sumach" (Grieb), in Italy "sommaco" or "ru" (Lenz), in Greece "vursia" or "vursōklatha" (Fraas) or by the Turks "sumack" (Sibth.),

in Egypt the imported berries "semmaq" (Del.), in Egyptian "rōuthin" (Kirch.); in which we recognize the ΠΟΥΞ prescribed by Euryphon 2 morb. 28, — mentioned also by Antiphanes, Alexis, by Theophrastus iii. 18. 5 as having conjugate elm-like leaflets, by Dioscorides, Galen voc. hippoc., the "rōus suriakōs" in Geopon. xvi. 8, and "sōumakin" by Nicolaus Myrepsicus i. 155: R. coriaria was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Constantinople and Smyrna; by Pococke, and rabbi Schwarz, in Palestine; and the imported berries, used in cookery as well as in medicine, were seen in Egypt by Abd-allatif, Forskal mat. med. p. 150, and Delile. Westward, the "rhus" and "rhus syriacum" are mentioned by Celsus, Columella xii. 41, Pliny, and Macer Floridus: R. coriaria is termed "r. folio ulmi" by Tournefort inst. 611; was observed by Lenz frequent on the Apennines; and is known to grow as far as Southern France (Ludw. pl. 122, Pers., and Spreng.).

Chlora perfoliata of Europe and the adjoining portion of Asia. A gentianaceous plant called in Old English *earth-gall* or *more centory* (Askham, and Prior); and the ΚΕΝΤΑΥΡΙΟΝ or ΚΕΝΤΑΥΡΙΗΞ: ΚΑΡΡΟΝ prescribed by Euryphon 2 morb. 52 to 57 — may be compared: the "kēntauriōn" is described by Theophrastus iii. 3. 6 to iv. 5. 1. and caus. iii. 1. 3 as barren in the Elean plain but bearing fruit on the neighbouring mountains, growing also in Northern climates, but not in wet ground; the "pēlēthroniōn" according to Nicander ther. 440 to 505 is yellow-flowered; and the "kēntauriōn xanthiōn" is prescribed by Alexander Trallianus viii. 12. 11. C. perfoliata was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus throughout the Greek islands. Westward, the "centaurea major" of Macer Floridus 53 is referred here by Lynacre, who further speaks of its "leves lyke to the lesse centory, but more whyter, and yelow flowers, and flowreth not but in the top;" and "eorth geallan" or "cummelle seo mare" occurs in the Anglo-Saxon translation of Apuleius herb. 35: C. perfoliata is described by Morison; is termed "centaurium luteum perfoliatum" by Tournefort inst. 123; was observed by Desfontaines in Barbary; and is known to grow throughout middle Europe as far as Britain (Hall., Engl. bot. pl. 60, and Pers.). Its qualities according to Smith are similar to those of Gentiana and Erythræa but weaker (Lindl.).

Salvia pomifera of the East Mediterranean countries. A species of wild *sage* bearing edible galls and called in Greece "phaskōs" or "phaskōmēlia" (Sibth.) or "alisphakia" (Fraas), in Egyptian "apōusi" (Syn. Diosc.); and the ΕΛΕΙΞΦΑΚΟΝ prescribed by Euryphon 2 morb. 52, — allied to but having rougher leaves than the "sphakōs" according to Theophrastus vi. 1. 4 to 2. 5, growing according to Dioscorides in rugged places, a tallish branchy shrub with whitish leaves, strongly fragrant, may be compared: S. pomifera is termed "s. cretica frutescens pomifera foliis longioribus incanis et crispis" by Tournefort trav. i. pl. 30; was observed by Sibthorp, Chaubard, and Fraas, frequent in rugged sunny places from Crete and the Peloponnesus throughout Greece and the Greek islands, and tea made of the leaves; is known to grow also in Syria (Pers.). Westward, the "ēlēlisphekōn" or "ēlaphōvōskōn" or "kiōsmin" or "phagnōn" or "vēhiōn" is identified in Syn. Diosc. with the "kōsalōn" or "salvia" of the Romans; and the "altera bechion" resembling "verbascum" (transl. "phlōmis"?) and by some called "salvia" is enumerated by Pliny xxvi. 17 as medicinal. "S. triloba," termed "s. baccifera" by Tournefort inst. 180 and "s. cretica pomifera Clusii flore albo" cor. 10, is regarded by Fraas as not distinct.

Amaracus dictamnus of Crete. Called in English drug-shops *dittany of Crete* (Lindl.), in Italian gardens "dittamo cretico" or "dittamo di candia" (Lenz), on Crete "stōmatōhōrtōn" (Sibth.); in which we recognize the ΔΙΚΤΑΜΝΟΞ of Euryphon — (Soran. Eph. mul. 22), the Hippocratic writings, Aristotle an. ix. 16, peculiar to Crete and rare there according to Theophrastus ix. 16. 1, mentioned also by Antigonus of Carystus, Andromachus, Damocrates, and known to Virgil. aen. xii. 412, Dioscorides, and Pliny xxv. 53, as growing only on Crete: A. dictamnus is described by Dodoens pl. 281 (Spreng.); is termed "o. creticum latifolium tomentosum seu dictamnus creticus" by Tournefort inst. 199; and was observed by Sibthorp only on the rocks of Crete. Imported "dictamnus cretensis" was found by Alpinus, and Forskal mat. med., employed medicinally in Egypt: farther North, according to Lindley, was "once in much repute among the Greeks and Romans but not now used."

Iris Florentina of the Mediterranean countries. The imported root is called in Britain *orris-root* (Lindl.), in Germany "veilchenwurz" (Fraas), and perforated pill-like fragments in Egypt "hab el kei" (Forsk. mat. med.); in which we recognize the ΙΡΙΞ: ΙΛΛΥΡΙΚΗ of Euryphon — (Soran. Eph. mul. 22), 2 Mul. morb. 673, Dromo, the only spice according to Theophrastus iv. 5. 2 and ix. 7. 3 that Europe produces, growing of the best quality in Illyria and about the Adriatic: "irinōn murōn" is mentioned by Cephisodorus; the fragrant-rooted "iris" is mentioned also by Didymus, Dioscorides, Athenaeus, is prescribed by Galen, and Paulus Aegineta, and the cultivation of "iris illurikē" is mentioned in Geopon. xi. 21: I. Florentina was observed by Sibthorp, and Chaubard, from the Peloponnesus to Rhodes. Westward, the "iris" or "iris illurikē" is identified in Syn. Diosc. with the "rathix marika" or "ōpērritōs" or "kōnsēkatrix" of the Romans; and the "iris" and

"unguentum irinum" are mentioned by Columella, and Pliny: I. Florentina is described by Lobel pl. 59; is termed "i. alba florentina" by Tournefort inst. 358; was observed by Desfontaines in Barbary, by Savi in Italy (Steud.), and is known to grow in other parts of Southern Europe (Pers.). The root according to Lindley is "subacrid, aromatic, rather bitter," is "employed in the manufacture of tooth-powder," and "to keep up the discharge from issues."

"415 B. C." (Thucyd. vi. 30, Clair, and Clint.), the statues of Mercury mysteriously mutilated or thrown down at Athens, just as the Athenian fleet sailed for Sicily.

The metal *mercury* or *quicksilver* may have been at this time introduced into Greece: — "kinnavar" (an Indian word according to Pliny) is mentioned by Ctesias, and Anaxandrides, and notwithstanding its alleged discovery by Callias ("90 yrs before Praxibulus = 405, Theophr. lap. 8.) is admitted to be Chinese *vermilion*: "tiggavari" is mentioned by Diocles the comic poet, and Eustathius; "argurōn hutōn to move images," by Eubulus, Philippus, Aristotle psych. i. 3, and Themistius; and "uthrargurōs" (a translation of its Chinese name "shwui yin" water-silver), by Plautus, Vitruvius, Dioscorides, Pliny, and Galen. Quicksilver is mentioned also by Arab medical writers; but in the days of Forskal mat. med., "durur ahmar" or "cinnab. nativum" was imported into Egypt from Greece. (See "kinnamōmōn," and "minium").

"414 B. C." (Clint. ii. p. 87, = 538 — "124 years" of the Egyptian Chronicle), independence recovered by the Egyptians; their leader Amurtēōs or Amurtaiōs becoming the head of the Twenty-eighth or Saite dynasty. The hieroglyphic ovals of king Amunrut occur on contemporaneous monuments (Leps. k. pl. 49).

As early probably as this date, the "kōnēiōn" poison, composed in part of the juice of "mēkōnōs" and inducing death without pain, invented or made known to the Greeks by Thrasyas of Mantinea. — His pupil Alexias lived shortly before the time of Theophrastus ix. 16.8. The "kōnēiōn" poison was employed to put Socrates to death; is mentioned also by Androcydes, Nicander, and Anaxilaus.

Oenanthe prolifera of the East Mediterranean countries. A species of *hemlock-dropwort*: the "kōnēiōn" employed by Thrasyas was that of Susa and cool places, — was obtained strongest from the root, and the plant is further alluded to by Theophrastus ix. 8. 3 to 15. 8 and 16. 8; is described by Dioscorides as having a great stem and terminal umbels of whitish flowers with "apōphusēis" (sprouts or bracts); is identified in the added Synonyms with the "vavathu" of Osthanes, and Egyptian "apēmphin": *O. prolifera* is termed "æ. prolifera apula" by Tournefort inst. 313; was observed by Sibthorp in the marshes of Lycia in Asia Minor; and is known to grow as far as Sicily and the Southern extreme of Italy (Pers.).

Oenanthe pimpinelloides of the Mediterranean countries. Called in Italy "filipendula aquatica" (Lenz), in Greece "sgarantzi" (Sibth.); and the species of *Oenanthe* being according to Fée all dangerous poisons, perhaps included in the "kōnēiōn" in question, — produced in the days of Dioscorides in Cilicia, Chios, Crete, and Attica: *O. pimpinelloides* was observed by Sibthorp, and Chaubard, from Lycia and the Peloponnesus to Constantinople. Westward, is termed "æ. apii folio" by Tournefort inst. 312; is known to grow in Carniola, Italy, and Southern France (Hacq. carn. pl. 3, Jacq. austr. pl. 394, Pers., and Lenz). Its "fleshy tubercles" according to Lindley "have occasionally been eaten."

Oenanthe peucedanifolia of Europe and the adjoining portion of Asia. Also having claims to be included in the "kōnēiōn" in question, — though the roots "have occasionally been eaten" (Pers., and Lindl.): observed by Sibthorp in marshes in the Peloponnesus; by Gmelin, in Siberia (Steud.); and Westward, known to grow in Austria and France (Pollich palat. i. pl. 3, Thuil., and Steud.).

Oenanthe incrassata, observed by Chaubard in the Peloponnesus, and *O. virgata* by Guérin among maritime rocks there, are other species that have been found in Greece.

"The same year" (Sm. b. d.), at Rome, military tribunes having consular power holding the place of consuls; war with the Aequians, and Bola a city of Latium captured by the Romans.

"In this or the following year" (Sm. b. d.), Perdiccas II. succeeded by Archel us, now twelfth king of Macedonia.

"413, August 27th, Monday" (Thucyd., Blair, and Clint.), *eclipse of the moon*, "about thirteen digits," beginning at Syracuse "8 h. 27 m. 27 s. P.M.;" and causing the loss in Sicily of the terrified Athenian army under Nicias.

Some days later at Athens (Aristot., Athen., and Clint.), exhibition of *parody* by its inventor the comic poet Hegemon: news arriving of the disaster in Sicily, the Athenians kept their seats.

"412 B. C." (Thucyd. viii. 12 to 17, and Clint.), Alcibiades sent by the Spartans into Asia, and the first treaty between them and the Persians.

"411 B. C." (Thucyd. viii. 12 to 17, and Clint.), constitution of the "Four hundred," devised by Antiphon, and adopted at Athens. After ruling "four months," the "Four hundred" resigned; and before the close of the year, Antiphon was put to death. The historical writings of his pupil Thucydides, close with the "autumn of this year."

"410 B. C." (Sm. b. d.), at Rome, M. Aemilius Mamercinus and C. Valerius Potitus Volusus consuls, an *agrarian law* proposed by M. Maenius tribune of the people.

"409 B. C." (Sm. b. d.), at Rome, Cn. Cornelius Cossus and L. Furius Medullinus consuls; plebeians for the first time quaestors, three of the four.

"In the same year" (Blair), the Carthaginians after entering Sicily and destroying Selinus and Himera, repulsed by the Syracusan general Hermocrates.

"408 B. C." (Clint. ii. p. 87 = 414 — "6 years" of both Maneth. tables, erased in this place in the Egyptian Chronicle), Amurtēōs succeeded by Nēphēritēs, head of the Twenty-ninth or Mendesian dynasty. Nēphēritēs is historically mentioned by Diodorus xiv. 79: and the hieroglyphic ovals of king Naifaurut occur at Medinet-Abu, and on a sphynx now in Paris (Glid. analect., and Leps. k. pl. 50).

"In this year" (Sm. b. d.), at Athens, exhibition of the tragedy of Orestes by Euripides. The pronunciation of the 269th line by the actor Hegelochus, was ridiculed by the comic poets Plato, Aristophanes, Sannyrion, and Strattis.

The ΤΡΩΓΕΞ of Strattis — is referred by Photius to the "thēria ēn ōspriōis" or *pea-bug*, *Bruchus pisi*; an insect mentioned also by Theophrastus: and brought by European colonists to Northeast America, where it has multiplied and caused much damage.

Doronicum pardalianches of mountains in Europe and the adjoining portion of Asia. A composite plant called in Germany "gamswurzel" (Fraas), in Greece "skorpithi" (Sibth.); in which we recognize the "skōrpion" identified by Theophrastus with the "thēluphōnōn," and through Syn. Diosc. iv. 78 with the ΚΑΜΜΟΡΩ of Strattis, — and "akōnitōn" of Dioscorides: the "thēluphōnōn" is described by Theophrastus ix. 18. 2 as growing in shaded situations, and geniculate in the manner of "agrōstis": the "akōnitōn" according to Dioscorides has roughish "sikuō"-like leaves, is mixed in soothing applications for the eyes, and in the added Synonyms is further identified with the "parthaliaghēs": the "darunaj" is mentioned by Ebn Baitar as growing on the mountains near Bairut; *D. pardalianches* was observed by Sibthorp, Chaubard, and Fraas, frequent in moist shaded situations on mountains from the Peloponnesus to Asia Minor; and "*doronicum*" root was found by Forskal mat. med. employed medicinally in Egypt. Westward, the account of the "thelyphonon" called "scorpion," or "aconiton" called "*pardalianches*" by Pliny xxv. 75 to xxvii. 2, seems chiefly taken from the Greek: *D. pardalianches* is described by Dodoens pl. 437, and Gerarde 621; is termed "*d. maximum foliis caulem amplexantibus*" by Tournefort inst. 488; is known to grow wild on the mountains of Italy and middle Europe (Jacq. austr. pl. 350, and Pers.), but in Holland, Britain, and Denmark, seems only naturalized (Wats., Fries, and A. Dec.). Is enumerated by Lindley as "reported to be a poisonous plant." (See *Marsdenia erecta*.)

Delphinium peregrinum of the Mediterranean countries. A species of *larkspur* called in Greece "linarithra" (Sibth.): the plant in question — is perhaps the "kamarōs" or "paralusis," identified in Syn. Diosc. iii. 77 with the "thēlphinion," growing according to Dioscorides in rugged sunny places, its leaves divided, flower like that of "lēukōiō" (*Viola canina*) and purplish, pods containing millet-like seeds employed against scorpion stings, and referred here by Sibthorp, and Fraas: *D. peregrinum* was observed by them in the situations described by Dioscorides frequent throughout Greece and the Greek islands; by Delile, on the Mediterranean border of Egypt; is known to grow also in Palestine (Pers.). Westward, the "thēlphinion" or "thēlphinas" or "uakinthōs" is identified in Syn. Diosc. with the "vōukinōs minōr" of the Romans. *D. peregrinum* is described by Morison xii. 4; is termed "*d. latifolium parvo flore*" by Tournefort inst. 426; and is known to grow from Malta and Sicily as far as France (Allion. pl. 25, and Pers.).

Salvia sclarea of the East Mediterranean countries. Called in Britain *clary* or *seebright*, translated by apothecaries "Godes-eie" or "oculus Christi" (Prior): the ΩΚΙΜΩΝ leaves of Strattis, — "ōkimōn" or "ōkumōn" of Eubulus, Polemon diæt. ii. 25, Philistion, Plistonius, Diodotus, and Athenaeus ii. p. 68, a cultivated potherb according to Theophrastus vii. 1. 2 to caus. v. 7. 2 flowering from below upward and having a long woody root, woody stem, and degenerating into ērpullōs, may be compared: the "ocimum" is regarded by Chrysippus as unfit for food and not clarifying the eyes (Plin. xx. 48); weakens the sight according to Dioscorides if eaten copiously but the juice clarifies the eyes, eaten also in Libya; is mentioned by Galen; is identified by Serapion with the "baderudsch" (Spreng.), and the "badsarudsch" is mentioned by Ebn Baitar: *S. sclarea* was observed by Sibthorp in cultivated ground in Bithynia; is known to occur also in Syria (Pers.). Westward, the "ocimum" is mentioned as cultivated in Italy by Cato, Varro, Sabinus Tiro, Persius, Columella, Pliny, Palladius, its flowers according to Gargilius Martial purple or rose-coloured or sometimes white: the "sclarea" is mentioned in the capitularia of Charlemagne, and by Walafridus Strabus p. 225 (Spreng.): *S. sclarea* is described by Lobel pl. 556; is termed "sclarea" by Tournefort inst. 179; is known to occur in Italy (Pers.); is cultivated throughout middle Europe, and eye-salves made of it are mentioned by Gerarde p. 627, and Prior. (For "*silvestri ocimo*" or "*agriōs vasilikōs*" or *wild clary* see *S. verbenaca*.)

"407 B. C." (Sm. b. d.), at Rome, military tribunes holding the place of consuls. Expiration of the "twenty years" truce with Veii (the reckoning therefore in old Roman years of ten months).

About this time (Clint.), improvements in *music* by the Greek poet Timotheus.

"In this year" (Xenoph., and Clint.), Cyrus the younger sent to the coast of Asia Minor, to command on the sea and co-operate with the Spartans.

Ranunculus Asiaticus of the East Mediterranean countries and middle Asia. The *garden ranunculus* is called in Japan "tagaras" or "dobusesi" or "kimpoge" (Thunb.), in Persian "kabikej" (Avicenn., and Ebn Bait.), in Egypt "zaphyl" (Clot-Bey), on Cyprus "agriō sēlinōn" (Sibth.), in which we recognise the "sēlinōn agriōn" identified through Syn. Diosc. with the BATPA XION prescribed in Nat. mul. 29, — and 1 Morb. mul. 108, described by Dioscorides as a cubit high, growing along rills, its leaves coriander-like, and flowers yellow or sometimes "pōrphurōn": "R. Asiaticus is termed "r. grumosa radice flore phœniceo minimo simplici" by Tournefort inst. 287; was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Asia Minor and Cyprus, its flowers yellow or sometimes scarlet; by Thunberg, frequent along ditches in Japan; by Clot-Bey, in the gardens of Egypt. Westward, the "batrachium" is described by Scribonius Largus 174 as ulcerating, and is identified by Pliny xxv. 109 with the "ranunculum" of the Romans, his account being chiefly taken from Dioscorides: R. Asiaticus is well known as a garden-flower throughout Europe. And by European colonists was carried to Northeast America, where it continues under cultivation.

Delphinium staphisagria of the Mediterranean countries. A species of *larkspur* called in Greece "agria staphitha" (Sibth.), in Egyptian "ivēsaōithē" (Syn. Diosc.); in which we recognize the ἑταφίς: ἀγρία of Nat. mul. 584, — Nicander ther. 943, having upright stems according to Dioscorides, incised leaves like those of "ampēlōu agrias," green follicles containing blackish trigonal acrid seeds that excite vomiting, the bruised plant applied against "phthēriasēis": "D. staphisagria was observed by Sibthorp, Bory, and Fraas, frequent about villages from Crete to the Peloponnesus and Euboea. Westward, the "staphis agria" or "astaphis" or "phthēriōn" or "phthēriōktōnōn" or "apanthrōpōn" is identified in Syn. Diosc. with the "ērva pēthikōularia" of the Romans; the "herba pedicularis" is mentioned by Columella vi. 30. 8, the "pedicularia" or "staphis agria" by Scribonius Largus 166, and the "astaphis agria" or "staphis" by Pliny xxiii. 13: D. staphisagria is described by Lobel adv. 306, and Dalechamp p. 1609; is termed "d. platani folia staphisagria dictum" by Tournefort inst. 428; was observed by Tenore in Italy (Steud.); and is known to occur in "waste places" in other parts of Southern Europe, and as far as the Canary Islands (Pers., and Lindl.). By European colonists, was carried to the Mauritius Islands, observed under cultivation there by Bojer. The seeds according to Lindley "are emetic drastic and inflammatory, never used internally," but chiefly for "destroying pediculi in the head."

Iberis semperflorens of the Mediterranean and Tauro-Caspian countries. Called in Egyptian "sōuitēmpsōn" (Syn. Diosc.) in Italy "thlaspi" (Targ.), in which we recognize the Θάλασπι of Nat. mul. 29, — growing according to Dioscorides on walls and along pathways, a little herb with whitish flowers, fruit flattened from the summit and containing small discoidal "ēntēthlasmēnōn" seed; also mentioned by Galen, and Paulus of Aegina: a species of *Iberis* was observed by Forskal on Imros; *I. semperflorens* is described by Linnæus, and is known to grow in Persia (Pers.). Westward, the "thlaspi" or "thlaspihiōn" or "muōptērōn" is identified in Syn. Diosc. with the "kapsēllam" or "skanthōulakiōum" or "pēthēm gallinakēōum" of the Romans; but the account by Pliny xxvii. 113 of the "thlaspi" seems taken from Dioscorides: *I. semperflorens* is known to occur on Sicily (Pers.).

Iberis sempervirens of the Mediterranean countries. Also called in Italy "thlaspi" (Targ.), and possibly the "thlaspi" in question, — especially as two Cappadocian kinds are mentioned by Galen (Spreng.): *I. sempervirens* is described by Rivinus tetr. pl. 224; is termed "thlaspi montanum sempervirens" by Tournefort inst. 213, "i. garrexiana var." by Allioni, "i. saxatilis var." by Lamarck fl. fr. (Steud.); is known to grow in Southern France, Italy, and Crete (Pers.); was observed on the mountains of Crete by Sibthorp.

Sempervivum arboreum of the Mediterranean countries. A woody-stemmed *houseleek* called on Corcyra "anastasian," on Chios "amarantōn" (Anguill.), by the prophets "parōnuhia" or "hrusitis," in Egyptian "pamphanēs" (Syn. Diosc.): the ΚΡΙΝΑΝΘΕΜΟΝ growing on houses and prescribed in Nat. mul. 29 — may be compared; also the "aizoon" in whose juice all seeds according to Democritus should be soaked (Plin. xviii. 45), growing according to Theophrastus vii. 15. 2 on the ground as well as on walls and places on roofs where sandy soil collects, and having smooth fleshy leaves always green: the "aēizōōn tō mēga" of Dioscorides having stems a cubit or more high, growing in mountainous situations and planted in vases upon roofs, is referred here by writers: *S. arboreum* was observed by Sibthorp on walls and among rubbish on Cyprus. Westward, the "aēizōōntō mēga" or "aēithalēs" or "zōōphthalmōn" or "aiōniōn" or "stērgēthrōn" is

identified in Syn. Diosc. with the "kēriōkōusia" or "sōuthēmmōur" or "iōvis kaulis" of the Romans; is called "stergethron" according to Pliny xxv. 102 because "amatoriis conveniat," and "hypogeson" from growing "in subgrundiis fere" almost in the eaves, is further identified with the "sedum magnum" or "oculum" or "digitellum" of the Italians: *S. arboreum* is described by Anguillara 276 (Spreng.); is termed "sedum majus arborescens" by Tournefort inst. 262; and is known to grow in Barbary and Portugal (Pers.).

Cachrys lœvigata of the West Mediterranean countries. A fennel-like plant called in France smooth-fruited "amarinte" (Fée), by the prophets "thumarnōliōn," in Egyptian "sampsōs" (Syn. Diosc.); not observed by modern travellers in Greece, but the ΙΠΡΟΜΑΡΑΘΡΟΝ prescribed in Nat. mul. 572, — 1 Morb. mul. 73, Steril. 13, Miction, Nicander, Petrichus, ferulaceous and having a furrowed stem according to Theophrastus vi. 1. 4, identified by Dioscorides with "marathrōn agrion" having a fragrant root and "kahrui"-like seed, and according to Galen fac. simpl. vii. p. 68 taller than the "marathrōn," is referred here by Anguillara, and Honorius Bellus (Spreng.). Westward, the "ippōmarathrōn" or "marathis" is identified in Syn. Diosc. with the "sistramēōr" of the Gauls, and "mēōum" or "phainikōulōum ērratikōum" or "ph. ēkōuinōum" of the Romans; is mentioned by Strabo xvii. p. 645 as growing in Mauritania; by Pliny xx. 96 as a "silvestre" kind of "foeniculum" by some called "myrsineum," growing in warm stony places: *C. lœvigata* is described by Anguillara p. 124, and Morison umb. 63. pl. 3; was observed by Allioni in Southern France, by Desfontaines i. p. 250 in Algeria; is known to grow also in Italy and Spain (Pers.).

Peucedanum officinale of Europe and the adjoining portion of Asia. Called in Britain *sulphurwort* or *hog's fennel* (Prior), in Germany "haarstrang," in Italy "finocchio porcino" or "peucedano" (Lenz), by the prophets "agathōs thaimōn" or "pinasgēlōum" (Syn. Diosc.); in which we recognize the ΠΕΥΚΕΔΑΝΟΝ of Nat. mul. 29, — Superfoet. 19, 2 Morb. mul. 81, Theophrastus ix. 14. 1 to 20. 2, Nicander ther. 76, having according to Dioscorides a fennel-like stem, flowers yellow, and root full of juice: *P. officinale* was observed by Sibthorp, and Chaubard, in the Peloponnesus; and is known to grow in Siberia (Gmel. i. pl. 41). Westward, the "pēukēthanōs" is identified in Syn. Diosc. with the "satriam" of the Romans: the "peucedanum" and its medicinal uses are mentioned by Pliny: *P. officinale* is described by Gerarde p. 1053, and Bauhin hist. iii. p. 376; is termed "p. germanicum" by Tournefort inst. 318; was observed by Lenz in Italy, by Forskal near Marseilles; and is known to grow throughout middle Europe as far as Britain (Engl. bot. pl. 1767, Steud., and Lindl.). The inspissated "juice of the root" according to Lindley "is reputed antispasmodic and diuretic."

Crithmum maritimum of the sea-cliffs along the Mediterranean and Atlantic as far as Britain. Called in Britain *sampfire*, in old English "sampire" or "sampler," in France "Saint Pierre," in Italy "herba di San Pietro" or "sampetra" from the fisherman saint (Prior) or "finocchio marino" (Lenz), in Greece "almura" (Fraas) or "krētamiōn" (Sibth.); in which we recognize the ΚΡΗΘΜΟΝ of Nat. mul. 20, — Morb. mul., and the "krithmōn" or "kritamōn" growing according to Dioscorides in rocky maritime situations, white-flowered, and eaten either crude or cooked: *C. maritimum* was observed by Forskal, Sibthorp, Chaubard, and Fraas, along the seashore from the Peloponnesus to Constantinople. Westward, the "crethmo" commended by Hippocrates is enumerated as esculent by Pliny xxvi. 50 and 90: *C. maritimum* is described by Pandulf. Colenuccius, and Brunfels i. p. 187 (Spreng.); is termed "c. sive foeniculum maritimum minus" by Tournefort inst. 317; was observed by Forskal on Malta and near Marseilles, by Lenz in Italy; and is known to grow along the Atlantic seashore as far as Britain (Shakspeare, and Pers.).

Echinophora spinosa of the Mediterranean seashore. A prickly Umbelliferous plant: the ΤΡΙΒΟΛΟΝ: ΠΑΡΑΘΑΛΑΣΣΙΟΝ prescribed in Nat. mul. p. 552, — and 1 Morb. mul. 106, is referred here by Dalechamp 1367 (Spreng.): *E. spinosa* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Smyrna. Westward, is termed "e. maritima spinosa" by Tournefort inst. 656; has been found in some instances beyond the Straits along the Atlantic seashore (Cav. ii. pl. 127, and Pers.), but is not known to be employed medicinally.

Anthemis rosea of the East Mediterranean countries. A purple-flowered *may-weed* or "may-denwede" called on Cyprus "papōuni" (from the Arabic name of camomile "babunaj"); in which we recognize the "anthēmis pōrphuranthēs" identified through Dioscorides with the ΗΠΑΝΘΕΜΟΝ prescribed in Nat. mul. 570: — the account of the "eranthemum" by Pliny xxii. 26 seems taken from Dioscorides, but the "chamaemelum purpureum" is mentioned by Nicolaus Myrepsus i. 44 p. 42 (Spreng.): *A. rosea* is described by Sibthorp, and was observed by him frequent on the dry hills of Cyprus.

Anthemis chia of the East Mediterranean countries. Also called on Cyprus "papōuni" (Sibth.), but in Attica "armēgka" (Fraas); in which we recognize the ΑΝΘΕΜΟΝ: ΧΑΩΡΟΝ that may be substituted according to Nat. mul. 570: — the "anthēmōn" is described by Theophrastus vii. 14. 2 as flowering from above downwards, the flowers white around with the centre "hlōrōn"

greenish-yellow; the "anthēmis" is celebrated by Asclepiades (Plin.); the "anthēmis lēukanthēmōn" is one of the three kinds enumerated by Dioscorides, collected in the Spring; and the account of the "leucanthemum" or "leucanthemida" by Pliny xxii. 26 seems taken from the Greek: A. Chia is termed "chamæmelum chium vernum folio crassiore flore magno" by Tournefort cor. 37; was observed by Sibthorp, and Fraas, frequent from Attica throughout the Greek islands to Cyprus, flowering at the opening of Spring; by Gussone, frequent also at the Southern extreme of Italy (A. Dec.).

Anthemis discoidea of the East Mediterranean countries. Possibly included in the "anthēmōn hlōrōn" of Nat. mul. 570: — the "anthēmōn aphullanthēs" is enumerated by Theophrastus vii. 8. 3 as having radical leaves; and the third or "hrusanthēmōn" kind with flowers entirely yellow according to Dioscorides is like the preceding more powerfully diuretic than the purple-flowered kind: A. discoidea having the lower leaves pinnate was observed by Forskal 356 in the environs of Constantinople (Steud.), and by Sibthorp on mount Parnassus; is termed "chamaemelum discoideum" by Allioni 681, and is known to grow as far as Italy (Pers.). "A. monantha" or "coarctata," developing short yellow rays, known to grow in Tauria (Pers., and Bieb.), and observed by Sibthorp near Smyrna, is regarded by him as probably not distinct.

Matricaria suaveolens of the Mediterranean countries. A fragrant kind of *may-weed*; and the "hamaimēlōn," named according to Syn. Diosc. iii. 144 from its apple or quince-like odour, and identified by Galen with the EYANΘEMON of Nat. mul. — and 1 Morb. mul. 106: M. suaveolens was observed by Bory in the Peloponnesus. Westward, the "hamaimēlōn" or "mēlanthēmōn" is further identified in Syn. Diosc. with the "astertiphē" apple herb of the Numidians, and "maliōum" of the Romans: M. suaveolens is described by Linnæus; is known to grow in Western Europe (Pers.), its calyx-scales pointed, and flowers according to Smith half as large as in M. chamomilla, but is regarded by Chaubard, as perhaps not distinct.

Matricaria chamomilla of Europe and the adjoining portion of Asia. A fetid kind of *may-weed* called in Britain *maghet* (Prior), in Germany "chamille," in Italy "camamilla" or "camomilla" (Lenz), in Greece "hamōmēlēa" (Fraas) or "hamōmēla" (Sibth.); and possibly the "ēuanthēmōn" in question, — clearly the "hamaimēlōn" identified through Syn. Diosc. with the "parthēniōn mikrōphullōn" of Ulc. 10, or the Hippocratic "parthēniōn" identified by Galen with the "amarakōn" or "anthēmis:" the "parthēniōn" is described by Dioscorides as having a rankish odour and bitter taste, slender coriander-like leaves, flowers white with the centre yellow, and a decoction employed against inflammations of the matrix: M. chamomilla was observed by Forskal, Sibthorp, and Fraas, abounding from the Peloponnesus to the Dardanelles; by Hasselquist, in Palestine; and by Delile, near Rosetta on the Mediterranean border of Egypt. Westward, the "parthēniōn" or "amarakōn" or "anthēmis" or "lēukanthēmōn" or "hrusōkalis" or "mēlavathrōn" or "anthōs pēthiōn" is further identified in Syn. Diosc. with the "thamakh" of the Numidians, "kautan" of the Tuscans, and "millēphōliōum" or "sōlis ōkōulōum" of the Romans; and the "parthenium" or "amnacum" or "leucanthes" is described by Pliny xxi. 104 as growing in garden hedges: M. chamomilla is described by Lobel obs. 455; is termed "chamæmelum vulgare leucanthemum Dioscoridis" by Tournefort inst. 494; was observed by Lenz frequent in Italy; and is known to occur along roadsides and in waste and cultivated ground as far as Denmark (fl. Dan., Lam. fl. fr., and Pers.). By European colonists, was carried to Southeast Australia, where it has become naturalized, spreading far inland (Corder, and A. Dec.). "M. suaveolens" of Pallas is enumerated by Steudel as not distinct. (See *Pyrethrum parthenium*).

Carthamus Creticus of the East Mediterranean countries. A thistle-like plant; and the KNI KON prescribed in Nat. mul. 29, — 3 Morb. 31, Popular. vii. 39, drink from by Hippocrates vict. acut. 30, and enumerated as esculent and laxative by Polemon diæt. ii. 27, may be compared: the "knēkōs" is mentioned by Anaxandrides (Athen.); by Theophrastus i. 13. 3 to vi. 4. 5 and caus. v. 18. 4 as thorny-leaved and single-stemmed, its seeds stony and having pappus "pōgōnōspērmata," and is termed "ēmērōs;" the "knikōs" by Dioscorides as two cubits high with a flower "krōkō ōmōiōn" which is eaten, and the juice of the seeds laxative and mixed in cakes: C. Creticus is termed "atractylis flore citrino" by Vaillant; and was received by Linnæus sp. pl. (not syst. nat.) from Crete (J. E. Smith in Sibth. fl. gr. ii. 161).

Thymus incanus of the East Mediterranean countries. A hoary species of *thyme* called in Greece "asprōvalsamō" (Fraas); and the EAENION prescribed in Nat. mul. 572, — coronary according to Theophrastus vi. 1. 1 to 7. 4, fragrant in all its parts, shrubby and small-leaved with a superficial multifid root, mentioned also by Nicander fr. named from Helen according to Pliny xxi. 33 and growing of the best quality on Helena Island (near the shore of Attica), is referred here by Fraas: T. incanus is termed "calamintha orientalis annua ocymi folio flore minimo" by Tournefort cor. 12; and was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus and Attica throughout the Greek islands. (See *Lithospermum callosum*.)

Ulva lactuca of the seacoast along the Mediterranean and adjoining portion of the Atlantic. A marine *laver* called in Germany "meersalat" (Lenz); and the ΒΡΥΟΝ: ΘΑΛΑΣΣΕΙΟΝ prescribed in Nat. mul. 570, — growing on stones and shells according to Theophrastus iv. 6. 2 to 6, grassy green, broad and not unlike lettuce, described by Dioscorides as thin and stemless and employed as an astringent medicinally, is referred here by writers: *U. lactuca* is termed "f. creticus lactucæ-folius" by Tournefort (Bory); was observed by Sibthorp, and Bory, in harbours and sea-water pools from the Peloponnesus to the Bosphorus; and by Delile, at Alexandria. Westward, the "vruōn thalassion" or "vallaris" or "iranē" is identified in Syn. Diosc. with the "gnómousillon" of the Romans; the "bryon marinum" according to Pliny xxvii. 33 is clearly an herb, the leaves arising "ab ima radice," and he mentions additional medical uses: *U. lactuca* is described by Dillenius 42 pl. 8; and is known to grow around Italy (Lenz), and along the Atlantic as far as Britain, employed there against scrofula, and from its bitter and salt taste sometimes mixed in salads (Engl. bot. pl. 1551, and Spreng.).

"406 B. C." (Sm. b. d.), at Rome, military tribunes holding the place of consuls. Anxur or Taracina, a city of Latium, captured from the Volscians by the Romans and war declared against Veii. For the first time, pay decreed by the senate to Roman soldiers.

"December" (Plut., and Clint.), death of Euripides. At Syracuse on the "same day," the government seized by Dionysius: who besides opposing the Carthaginian invaders of Sicily, wrote poetry; and during "thirty-eight" years reign, obtained several "second and third prizes of tragedy at Athens."

"In this year" (Sm. b. d.), Callias archon at Athens. He appears to be the Callias who "90 years before the archon Praxibulus" (= 315 + 90) discovered "minium" (Theophr.); a mineral pigment at this time found in Spain — (Plin. xxxiii. 37): the addition to the Second book of the Iliad 637 in which "miltōparcōs" red-prowed ships are spoken of, possibly not older than this date. The face of the image of Jupiter at Rome was covered with "minium" as early at least as the triumph of Camillus, and to the time of Pliny xxxiii. 40 the pigment continued to be brought exclusively from Spain (from the mine afterwards worked for *quicksilver*).

"In the reign of Darius II." (Julian ep. 37 p. 413, and Clint.), Democritus visiting Persia and Egypt.

Helianthemum vulgare of Europe and the adjoining portion of Asia. Called in old British herbals *sunflower* (Prior); in which we recognize the "heliocallidem" or "helianthes" growing according to Democritus in Pontus and on the maritime mountains of Cilicia, myrtle-leaved, and mixed in ointment by the Magians and Persian kings — (Plin. xxiv. 102): *H. vulgare* was observed by Forskal, Sibthorp, and Chaubard, from the Peloponnesus to the Bithynian Olympus. Westward, is described by Matthioli comm. 546 (Spreng.); is termed "h. vulgare flore luteo" by Tournefort inst. 248. "h. chamæcistus" by Miller; was observed by Scopoli in Carniola; and is known to grow throughout middle Europe as far as Denmark (Crantz, fl. Dan. pl. 101, and Pers.).

Caucalis maritima of the Mediterranean seashore. A carrot-like plant called in Greece "cafcalithra" or "kaukalitha" (Belon, and Hon. Bell.), in Egyptian "sēsēlis" (Syn. Diosc.); in which we recognize the "kaukalis" identified in Syn. Diosc. with the ΒΡΙΟΝ of Democritus: — the "kaukalis" is enumerated among potherbs by Theophrastus vii. 7. 1, and Chrysippus, is described by Dioscorides as a span or more high, leaves "sēlinō"-like, the upper ones more divided and hairy, white fragrant umbels, the plant eaten either crude or cooked and diuretic; is enumerated by Pliny xxi. 52 among the esculent plants of Egypt; and is termed a "lahanōn almurōn" by the scholiast of Nicander (Spreng.): *C. maritimus* was observed by Belon, and Honorius Bellus (append. Clus. 301), eaten in salads in Greece; by Sibthorp, growing on the sandy shore of Cimolus Island; and by Delile, near Alexandria. Westward, the "kaukalis" or "kaukōn" or "thaukōn agriōn" or "muitis" is further identified in Syn. Diosc. with the "pēthēm gallinakēōum" or "pēthēm pōulli" of the Romans; they who eat "cappon" herb (by some read "caucon") "bilem per urinam reddunt" according to Pliny xxvi. 19: *C. maritima* is termed "c. pumila maritima" by Tournefort inst. 323; was observed by Gerard gall. pl. 10 on the Mediterranean shore of France; is known to grow also as far as Barbary and Spain (Gouan, Cav. ii. pl. 10, and Pers.). An allied species is called *hen's foot* in Britain (Prior).

Ranunculus Orientalis of the East Mediterranean countries. The ΒΑΤΡΑΧΙΟΝ called ΧΡΥΣΑΝΘΕΜΟΝ golden-flowered, only two palms high and having leaves like ΞΕΛΙΝΟΝ and larger, enumerated among signs of subterranean water by Democritus — (geopon. ii. 6), may be compared: *R. Orientalis* was received from the East by Linnæus (Pers.); and was observed by Chaubard on the Greek islands.

Convolvulus Sibthorpi of the East Mediterranean countries. A species of *bindweed* with leaves "cordato-hastatis pilosis basi angulatis" (Sibth.); and the ΜΑΛΑΚΟΚΙΣΣΟΝ twining around reeds and whatever it gets hold of, enumerated among signs of subterranean water by Democritus —

(geopon. ii. 6), may be compared: *C. Sibthorpi* is termed "*c. græcus sagittæ foliis flore albo*" by Tournefort cor. 1; was observed by Sibthorp, and Chaubard, from the Peloponnesus throughout the Greek islands to Samos, but only in hedges, vineyards, and cultivated ground; is identified by Bory with the "*C. hirsutus*" of Bieberstein, occurring probably as far as Caucasus.

Calystegia sepium of Temperate climates. Called in Britain *hedge-bells* or *larger bindweed* (Prior), in France "*liseron des haies*" (Fée), in Germany "*zaunwinde*," in Italy "*campanelle*" or "*vilucchio maggiore*" or "*smilace liscia*" (Lenz), in Greece "*pēriplōkathi*" (Sibth.), and possibly the "*malakōkissōs*" in question;—clearly the "*smilax lēia*" of Dioscorides having "kissō"-like leaves but "*malakōtēra*" as well as smoother and thinner, its circular white flowers distributed throughout the plant which twines around trees and is formed into arbores: *C. sepium* was observed by Forskal, Sibthorp, and Fraas, in hedges from Attica to Smyrna; is known to grow from Kasan in Russia to Caucasus, the Altaian mountains and Daouria (Ledeb.). Westward, the "*convolvulum*" is described by Pliny xxi. 11 as an herb growing in bushy places and bearing a lily-like flower, scentless and devoid of saffron, as though nature was learning to make lilies: *C. sepium* is described by Fuchsius 719 (Spreng.); is termed "*c. major albus*" by Tournefort inst. 82; was observed by Munby in Algeria, by Lenz in Italy; and is known to grow as far as Sweden (fl. Dan. pl. 458, Pers., and Fries). Farther West, is known to grow on the Azores Islands (Wats.), on Newfoundland and along the St. Lawrence (herb. Dec., and Lindl.), to the Saskatchewan (Hook.); was in New England before 1669, as appears from Josselyn rar. p. 58 "*briony of Peru we call it though its grown hear, or rather scammony*;" was observed by myself in New England, as well as within reach of the Pacific tide in San Francisco Bay. In the Southern Hemisphere, is known to grow in Peru (fl. Per. ii. p. 10); was observed by Poeppig in Chili; by J. D. Hooker on the Chonos archipelago; by R. Brown, in Australia and Tasmania; by myself, indigenous in Australia and New Zealand. Clearly by European colonists, was carried to the Mauritius Islands, where it was observed by Bojer under cultivation only; and to Java (Burmman, see A. Dec.). The root according to Lindley is "*purgative like scammony but much less active*"

Salvia aethiopsis of the Mediterranean countries. The "*aethiopida*" growing according to Democritus at Meroe and hence called "*meroida*,"—believed by the Magians to open by contact everything closed (Plin. xxiv. 102 and xxvi. 9), growing according to Dioscorides in Messenia and on Ida and having shaggy "*phlōmō*"-like leaves around the base of its quadrangular stem, is referred here by Matthioli and others: *S. aethiopsis* was observed by Sibthorp around Athens and by the roadside near Smyrna. Westward, is brought according to Pliny xxvii. 1 to 3 of fine quality from Aethiopia: *S. aethiopsis* is termed "*sclarea vulgaris lanuginosa amplissimo folio*" by Tournefort inst. 179; is known to grow on the African side of the Mediterranean and as far as France and Austria, the lip of the corolla cohering and forming a sack (Jacq. austr. pl. 211, and Pers.).

Schoenus mucronatus of the Mediterranean seashore. A Cyperoid plant called in Egypt "*sææd*" (Forsk.); and the $\Sigma\text{ΧΟΙΝΟΥ}\Sigma$ by some called $\text{ΟΛΟ}\Sigma\text{ΧΟΙΝΟΥ}\Sigma$ enumerated among signs of subterranean water by Democritus—(Geopon. ii. 6), mentioned also by Aeschines, and Aristippus (D. Laert.), may be compared: the "*ōlōshōinōs*" of Dioscorides iv. 52 has radical leaves and terminal inflorescence: but *S. mucronatus* appears to be a maritime species, was observed by Sibthorp, and Chaubard, in the sand of the seashore from the Peloponnesus to Crete; by Alpinus, Forskal p. 15, and Delile, along the Mediterranean shore of Egypt; and is termed "*cyperus aegyptiacus*" by Gloxin pl. 3 (Pers.). Westward, is described by Morison iii. pl. 9: is termed "*scirpus maritimus capite glomerato*" by Tournefort inst. 528; and is known to grow along the seashore of the West Mediterranean countries as far as Morocco (Schousb. ii. 28).

Equisetum arvense of Northern climates. Called in Britain *horsetail* (Ainsw.), in Germany "*schaftalm*," in Italy "*coda di cavallo*" or "*coda equina*" (Lenz); in which we recognize the $\text{ΙΡΠΟΥΡΙ}\Sigma$ enumerated among signs of subterranean water by Democritus, and described as resembling a horse's tail, its stem more slender at the root than above, hollow and divided into joints from which arise hair-like leaves—(geopon. ii. 6): *E. arvense* was observed by Forskal, and Sibthorp, in moist open situations from the Peloponnesus to Constantinople. Westward, the "*hippuris*" of the Greeks is identified by Pliny xviii. 67 and xxvi. 83 with the "*equisetum in pratis vituperata*:" *E. arvense* is termed "*e. a. longioribus setis*" by Tournefort inst. 533; was observed by Lenz frequent in Italy; and is known to grow throughout middle and Northern Europe (Curt. lond. iv. pl. 64). Farther West, is known to grow on Madeira (herb. A. N. S.); was observed by Drummond in Lat. 54° at Cumberland House; by myself, along the Atlantic as far South as Lat. 42°, and by Barton to 40° near Philadelphia.

Equisetum ephedrioides of the Mediterranean countries. Possibly the "*ippōuris*" of Democritus;—at least, agreeing better with the Egyptian "*phērp̄ra*" identified in Syn. Diosc. iv. 44 with the "*krōnōu trōphē*" of the prophets: *E. ephedrioides* was observed by Bory pl. 37 in the Peloponnesus; by Bové in the Sinai Desert; and Westward, is known to grow in Algeria and Spain as far as the Garonne (Bory).

"405 B. C." (Astronom. can., and Clint. ii. p. 381), Darius II. succeeded by Artaxerxes II. Mnemon, tenth Persian emperor.

"In the autumn" (Xenoph., Blair, and Clint.), Nineteenth change in naval dominion. The Athenians defeated by Lysander in *naval combat* at Aegospotamos; and the "Empire" over the Eastern waters of the Mediterranean transferred to the Spartans.

"The same year" (Lubke and Lutrow), in Sicily, Agrigentum devastated by the Carthaginians; the temple there to Jupiter being unfinished. — Remains of the "almost destroyed" temple continue extant.

By Clidemus (Aristot. meteor. ii. 9), *lightning* regarded as having no real existence; as an effect only, like striking the sea with a rod.

"404, in the spring" (Xenoph., Blair, and Clint.), Athens captured by the Spartans under Lysander; the Peloponnesian war thus ending in *Spartan ascendancy*. Athens now placed under the "Thirty;" who ruled "eight months."

"On the nones of June" (. . . Cic. rep. i. 16, and Sm. b. d.), *eclipse of the sun*. Recorded in the Annales Maximi.

"403 B. C." (. . . Clint.), archonship of Euclides. "a marked epoch in the civil history of Athens." After the deposition of the "Thirty," Thrasybulus and his party carrying on war against the succeeding government of the "Ten."

402 B. C. (= 424 — "22 years" in the Mahavamsa v.), the sons of Calasoka succeeded by Uggasenah-Nandeya, now Hindu king, — afterwards by Panducah-Nandeya, Panducagaty-Nandeya, Bupala-Nandeya, Rattepaale-Nandeya, Govisanah-Nandeya, and Dasesittica Nandeya.

In this year (= 408 — "6 years" of both Maneth. tables), in Egypt. Néphérités succeeded by Ahôris, second king of the Twenty-ninth dynasty. Ahôris is historically mentioned by Theopompus, and Diodorus. The hieroglyphic ovals of king Hakor occur at Shayl, and on stone fragments at Karnak (Glid. analect.); also on repaired portions of the temples at Medinet-abu and El Kab, in the quarries at Tura, and on a sphinx (now in Paris).

"In this year" (Lysias, Suid., Eudox., and Sm. b. d.) at Athens, a prize for comedy gained by Cephisodorus.

"401 B. C. = 1st year of Ngan-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

The same year = "2d year of Hakor," inscribed at Tura; the latest date in his reign found on the monuments. "Thirteen" years are however assigned to him in both the Maneth. tables.

Moringa aptera of Nubia and Tropical Arabia. The oil called in commerce *oil-of-ben*, in Egypt "habbet el-ghaly" (Del.) or "hobba gali" (Forsk. mat. med.), being remarkable for not turning rancid (Pers., and Spreng.), may have been the kind used in compounding precious ointment called in Egyptian "sôjén" (transl. Sept.): the ἈΓΓΑΝ Egyptian ointment of Epilycus, — and Eubulus (Athen. xvii. 13), may be compared: the "valanôs" is described by Theophrastus iv. 2 to 6 as a contorted tree peculiar to Egypt, its leaves myrtle-like, fruit like that of "kappariôs" and used by "myrêsôî" ointment-makers; grows according to Dioscorides in Ethiopia, Egypt, Arabia, and at Petra on the border of Judea; and the "myrobalanus" is mentioned by Cato 114. Pliny, and Galen comp. med. ix. p. 239: *M. aptera* is described by Lamarck enc. i. 733 (Pers.); was observed by myself, a low contorted tree in mountain-ravines at Aden; by Lepsius eg. and sin. p. 227, the "ban" tree having "roundish furrowed pods" in a small valley in Upper Nubia, but regarded by him as perhaps "introduced by the Schaiqieh Arabs." The seeds of this species according to Decaisne, and Lindley, yield the oil-of-ben "much used by perfumers as the basis of various scents, and by watch-makers, because it does not readily freeze."

Moringa pterygosperma of Tropical Hindustan. Called in Tamil "mooringhy," in Telinga "mooraga," in Bengalee "shajina," in Hindustanee "sujna" (Drur.); and confounded with the preceding as early perhaps as this date: — the "balanus myrepsica" seen by Belon 126, and Hasselquist, at mount Sinai, may be compared (a pod from that locality obtained by Gliddon was sharply trigonal, but I did not examine the seeds); also the two foreign trees seen by Forskal p. 67 in the city of Beit el fakih, unknown to the inhabitants but by some one called "seseban." Eastward from Arabia, was observed by Rheede vi. pl. 11 in Malabar: by myself, from Bombay to the end of my journey only around villages; by Graham, "common about villages all over the country, oil is obtained from the seeds;" by Drury, "in gardens in the peninsula," and the oil used medicinally; by Roxburgh, in other portions of Hindustan; is known to occur also on Ceylon (Pers.). Farther East, was observed by Mason v. p. 468 "exotic" in Burmah and called "da-tha-lwon," cultivated "by the Burmese for its pods which are eaten in curries," but by residents chiefly valued for its root hardly to be distinguished from *horse-radish*; is known to occur also on Java (Drur); was observed by Loureiro in Anam (Steud.); by Blanco, on the Philippines and called in Tagalo "maluñgai" or "camaluñgai" or "caluñgai," in Bisaya and Pampango "maluñgai" or "caluñgai" or "malungit" or "dool," universally known to the natives and regarded by them as never struck by lightning, the

leaves and fruit cooked and eaten. By European colonists, was carried to the West Indies, where the oil is eaten on salads, and on "Jamaica the wood is employed for dyeing a blue colour" (Drur.).

"The same year" (D. Laert., Blair, and Clint.), expedition of the younger Cyrus with Greek auxiliaries, against his brother Artaxerxes II. The route led through "Lycaonia," the table-land or inland basin of Asia Minor, now first mentioned in history (Xen. anab. i. 2. 19, iii. 2. 23, and cyp. vi. 2. 20). — The country is described by Strabo xii. 6; and the *Lycaonian language* is mentioned in Acts xiv. 12.

One hundred and seventeenth generation. Jan. 1st, 400, mostly beyond youth: the Greek poets, Philoxenus of Cythera, Telestes, and Polyidus; the comic poets, Diocles, Sannyrion, Philyllius, Hipparchus, Polyzelus, Xenophon, Arcesilaus, Autocrates, Eunicus, Apolophanes, Nicophon, Nicochares, and Theopompus; the tragic poets, Cleophon, Astydamos, Diogenes, Euripides the younger, Astydamos the younger, Sophocles the younger, Dicaeogenes, and Chaeremon; the mimographer Xenarchus; the philosophers, Aeschines, and Metrodorus of Chio; the historians, Anaximander the younger, and Philistus; the orators Archinus, Cephalus, Thrasybulus of Colyttus, and Melanopus; the painters, Zeuxis, Apollodorus, and Eupompus; the sculptor Polycletus of Argos.

The ΕΑΕΙΟΞ of Xenophon cyn. v. 17, — and Aristotle, enumerated as inferior food by Mnestheus (Oribas. ii. 68), identified by Hesychius with the "skiōrōs," is referred by writers to the *squirrel*, *Sciurus Europæus*.

Corylus colurna of the countries on the Black Sea. The imported nuts called in Britain *cob-nut*, in Germany "zellernuss" (Grieb), and the living shrub in the environs of Constantinople "phōuntōukia" (Fraas); the ΚΑΡΥΑ without seam of Xenophon anab. v. 4, — "karua pōntika" of Ctesias, Athenæus, Galen f.c. alim. ii. p. 609, and of Dioscorides in part, may therefore be compared: the "ēraklēōtikē karua" bearing "prōmakrōn karpōn" of Theophrastus iii. 15. 2 and causs. ii. 12. 6 is referred here by Fraas: Pliny xv. 24 speaks of the "abellinas" as distinct from the "avellanis" and brought into Greece from Pontus, therefore called "ponticae nuces:" *C. colurna* is termed "avellana byzantina" by Clusius hist. i. pl. 11, "c. byzantina" by Tournefort inst. 582 and Seba i. pl. 27; and was observed in the environs of Constantinople by Sibthorp (see *C. avellana*).

Azalea Pontica of the Caucasian countries. After the defeat and death of Cyrus the younger, the "Ten thousand" Greeks retreating towards Trebizond found the honey of the country poisonous, and from the effects some became delirious and some died (Xenoph. anab. iv. 8): — the existence in this quarter of poisonous honey, is mentioned also by Aristotle mirab. 17, Diodorus, Dioscorides, and Aelian; soldiers under Pompey in crossing the mountains near Trebizond, were defeated through partaking of this honey (Strab. xii. p. 88); and the poisonous quality is attributed by Pliny xxi. 45 to flowers of "rhododendri" abounding through the woods. In modern times, this poisonous honey has been traced to the flowers of *A. Pontica* by Tournefort acad. paris. 1704, and Klapproth trav. i. p. 455, and according to Pallas flor. i. pl. 69 the effects are like those of *Lolium temulentum*, and the natives are well aware of the deleterious properties. *A. Pontica* is known to grow in other parts of Asia Minor, in Georgia, and in woods of oak and beech on the subalpine portion of Caucasus (Lindl.).

Rhododendron Ponticum of Taurus and Caucasus. An allied ornamental shrub, growing chiefly on mountains, — and its flowers supposed by Tournefort to equally poison honey; but this is denied by Guldenstædt, and according to Pallas i. pl. 29 the shrub is unknown in the country of poisonous honey and makes its first appearance in the districts of Ocrida and Salordkipaniso on the Southern subalpine limestone ridge of Caucasus: *R. Ponticum* is known to grow also on the neighbouring mountains of Western Persia (Lindl.); was observed by Labillardiere in Syria, by Grisebach on the Bithynian Olympus at the elevation of only "eight hundred" feet, but according to Tchihatcheff is rarely met with in Asia Minor. Westward, was known to *R. Constantinus*; and according to Persoon, Webb trav. 29, and A. Decandolle, reappears on the extreme Southern mountains of Portugal and Spain. Is besides planted for ornament, and by European colonists was carried to Northeast America, where it continues in greenhouses.

"Before the close of the year" (Clint.), arrival home by the way of Asia Minor of the retreating "Ten thousand" Greeks.

"In this year" (Chinese writers, Amyot, and Pauth. p. 200), *gunpowder*, and "ho-toung" or fire-tubes in use among the Chinese.

The Feejeean Tongan and Samoan Groups colonized as early possibly as this date. The Tongans and Samoans "refer the origin of their race to a large island, situated to the Northwest, called by the former Bulotu, by the latter Pulotu and Purotu," and by the Feejeeans "Mburotu:" regarded by Hale ethnogr. Expl. Exp. 195 as perhaps Bouro in the Malayan archipelago (see *Tau-maco*).

Calophyllum inophyllum of wooded Tropical shores from Madagascar to the Taheitian Islands. A seaside tree called in Hindustanee "sultan-champa," in Tamil "pinnay," in Telinga "ponna" (Drur.), in the environs of Bombay "poona" (Graham), in Burmah "phung-nyet" (Mason), in Tagalo "tamauiian" or "dincalin" or "dancalan," in Camarines "dancalan," in Bisaya "dancalan" or "bitoag," in Pampango and Ylocano "bitoag" (Blanco), on Taheiti "tomanu" (Bertero); and known to the first colonists of the Feejeean and Polynesian islands: * — observed by myself on the Feejeean, Tongan, Samoan, and Taheitian Islands as far as Metia; by Rich on the Tarawan coral-islands; by Blanco, on the Philippines, its resin highly esteemed and called "balsamo de Maria," and oil from its nut occasionally used for illuminating; is described also by Rumphius ii. pl. 71; is termed "balsamaria" by Loureiro, as seen by him in Anam; was observed by Horsfield on Java, regarded as diuretic; by Mason v. 411 to 751 "exotic" in Burmah, planted near Buddhist monasteries; by Rheede iv. pl. 38, in Malabar; by Graham, common in "sandy soil near the sea" as far as Bombay; by Roxburgh, Wight, and Drury, as far as Travancore and Ceylon, its oil employed medicinally by the natives and for burning in lamps. Farther West, was observed in 1661 by Flacourt 130 on Madagascar (Spreng.); and according to Lamarck enc., grows also on the Isle of Bourbon. From transported specimens, is described by Plukenet alm. pl. 147. (See C. calaba).

Canavalia obtusifolia of Tropical shores. A kind of sword-bean called in Tagalo "pataning dagat" from growing on the seashore (Blanco); and doubtless known to the first colonists of the Feejeean and Polynesian islands: — observed by myself on the Hawaiian, Samoan, Tongan, and Feejeean Islands, and on the Mangsi coral-islets near Borneo; by Blanco, frequent on the Philippines, but not put to any use by the natives; was received by Decaisne from Timor (A. Dec.); was observed by Mason v. 468, "growing in great profusion" along "the sea shore" of Burmah; by Roxburgh, Wight, and Drury, from the mouth of the Godavery "common on the sea-shore;" by Rheede viii. pl. 43, in Malabar; by Graham, in "the Concans" to and beyond Bombay; and by Bojer 108, on the Mauritius Islands. Farther West, is known to grow along the Atlantic in Equatorial Africa (fl. Nigr. 307) and the West Indies (Pers., and A. Dec.). Transported to Europe, is described by Plukenet pl. 51.

* *Brugueira gymnorhiza* of muddy Tropical shores from Hindustan to the Samoan Islands. A mangrove or salt-water arborescent shrub, known of course to the first colonists of the Feejeean Islands: — observed there by myself, abounding in muddy places within tide-water, in times of scarcity its fruit eaten by the natives, observed also as far as the Samoan Islands; by Rumphius iii. pl. 68, and Blume, in the Malayan archipelago, its fruit leaves and bark eaten by the natives (Pers.); by Mason v. 515 to 541, the most abundant mangrove in Burmah, affording "hard and durable timber" and bark abounding in "tannic acid;" by Rheede vi. pl. 31 and 32, in Malabar; by Roxburgh, and Wight, in other parts of Hindustan; and by Graham, as far as Bombay.

Mussaenda frondosa of Tropical Eastern Asia and the neighbouring islands as far as the Samoan. A large shrub called in the environs of Bombay "sarwud" or "lanchout" or "bhootcase" (Graham), in Malabar "belilla" (Rheede, and Drur. p. 500), in the environs of Canton "kaulimang" (Osbeck), in Ylocano "balailamoc," in Tagalo "tingatinga" (Blanco), and clearly known to the first colonists of the Feejeean Islands: — observed there by myself, frequent and to all appearance indigenous, as also on the shores of the Samoan Islands. Westward, is described by Rumphius iv. pl. 51; was observed by Blanco on the Philippines, by myself, a single stock growing by the roadside in Interior Luzon; by Osbeck, "near the shore" in the environs of Canton, by James Read also near Canton and specimens shown me; by Burmann pl. 46, on Ceylon; by Rheede ii. pl. 18, in Malabar; by Roxburgh, and Wight, in other parts of Hindustan; by Graham 86 to 95, as far as Bombay, "in gardens" and "common on the Ghauts," used by the natives "as a charm to drive away dæmons" and its "strange looking white calycine leaves" eaten, seen by myself only in the Botanic garden.

Justicia (Hypoestis) purpurea of Tropical China. Called in the environs of Canton "happy-key-lee" (Osb.), and carried to the Feejeean Islands possibly by the first colonists: — observed by myself naturalized there and also cultivated for ornament by the natives, on the Samoan Islands only around native dwellings. Westward, is described by Rumphius vi. pl. 22; is attributed to China by Persoon; and was observed by Osbeck near Canton, planted on the graves of Europeans. Transported to Europe, is described by Vahl symb. ii. 13 (Pers.), and continues in greenhouses (Brackenridge).

Codiaeum variegatum of Tropical Eastern Asia. A shrub with laurel-like variegated leaves called in Malabar "tsjera-maram" (Rheede), in Tagalo "saguilala," in Bisaya "calipayang" (Blanco); carried to the Feejeean Islands, and possibly by the first colonists: — observed there by myself, planted for ornament by the natives, one variety having long narrow leaves incised at intervals to the midrib; the usual broad-leaved variety planted also on Tongatabu and the Samoan Islands. West-

"399 B. C." (Sm. b. d.), pestilence in Rome, military tribunes holding the place of consuls; and a "lectisternium" funeral banquet to the gods, for the first time instituted.

"The same year" (Clint.), at Athens, Socrates accused by the tragic poet Meletus and unjustly put to death.

"398 B. C." (Sm. b. d.), from Rome, military tribunes holding the place of consuls, an embassy sent to consult the oracle at Delphi.

As early probably as this date (Plat. phaed., and D. Laert.), Philolaus maintaining after the Pythagoreans, That the Earth is not stationary, but moves around a central fire.

"396 B. C." (Sm. b. d.), military tribunes holding the place of consuls, Veii captured by the Romans under the dictator M. Furius Camillus. — Three years afterwards, the conquered territory was distributed among the plebeians.

"The same year" (Blair, and Clint.), expedition of the Proclid king of Sparta, Agesilaus II., into Asia against the Persians.

About this time (epist. socrat. 9), the Socratic philosopher Aristippus writing from Syracuse to Antisthenes.

Lupinus albus of the Mediterranean countries. A field lupine called in France "lupin" or "pois lupin" (Nugent), in Italy "lupino" (Lenz), and the large and white ΘΕΡΜΩΝ sent from Sicily by Aristippus — may be compared: *L. albus* was observed by Chaubard in the Peloponnesus, by Grisebach in Thrace, by Durville near Constantinople, and is known to grow as far as Caucasus (Ledeb.); is known to be cultivated in Egypt (Moench, Del. mem. cult. p. 13, and Dec. prodr. i. 407), was observed by Grant in descending the Nile under cultivation in "Lat. 15°." Westward, the cultivated "lupinus" is mentioned by Cato 34 to 54, Varro, Virgil, Columella, Pliny xviii. 36, Palladius, and the "lōupinōum" of the Romans in Syn. Diosc. ii. 132: *L. albus* is termed "*L. sativus*" by Gateau; was observed by Lenz under cultivation in Italy, by Link i. 207 in Portugal and the seeds eaten (Pers.); is besides known to grow to all appearance wild in Italy and Sicily (Bertol., Guss., and A. Dec.).

"395 B. C." (Clint.), after an absence of "three or four" years in Italy, Cyrene, and especially Egypt, where he received instruction from Sechnuphis, Plato returning to Athens.

The superstition of the *evil eye*, ΒΑΞΚΑΝΙΑ already in Greece in the days of Plato phaed.

ward, "the willow-leaved variety" is described by Rumphius iv. pl. 26 (Graham); *C. variegatum* was observed by myself on the Philippines, planted by the natives according to Blanco for ornament; by Thunberg, as far as Japan; is termed "*phyllaurea codiaëum*" by Loureiro xi. 705; was observed by Mason 421 to 762 "exotic" in Burmah, cultivated for ornament; by Roxburgh, in Hindustan; by Rheede vi. pl. 61, in Malabar; by Graham, as far as Bombay, "very common" in "gardens and flower pots." By European colonists, was carried to the Mauritius Islands, observed by Bojer in gardens. Transported to Europe, continues in greenhouses (bot. mag. pl. 3051, and bot. cab. pl. 870).

Dioscorea aculeata of Tropical Eastern Asia. The *Goa potato* or *birch-rind yam* is called in Malabar "kata-kelengu" (Rheede), on the Feejeean Islands according to one account "kawai" (C. P.); carried there, and perhaps by the first colonists: — observed by myself, cultivated rather abundantly, roots also at Tongatabu, possibly imported, and roots again in the market on Sulu; the plant according to Rumphius v. pl. 126 and p. 358 is chiefly spontaneous in Western China (A. Dec.); was observed by Roxburgh in Hindustan; by Rheede vii. pl. 37, in Malabar; and according to Drury, the roots "are dug up in the forests in the cold season, and sold in the bazaars;" are known at Bombay only as "imported from Goa" (Graham, and myself). By European colonists, was carried to the Mauritius Islands, observed by Bojer cultivated around dwellings. (See *D. pentaphylla*).

Crinum Asiaticum of Tropical Eastern Asia. Called in Cingalese "tolabo," in Bengalee "burakanoor" or "sookh-dursun" (Lindl.), in Telinga "vesha mungaloo-pakoo," in Tamil "veshi moon-ghée" (Drur.): carried to the Feejeean Islands possibly by the first colonists: — observed by myself under cultivation there and on Tongatabu, seemingly indigenous along the seashore of the Samoan Islands, but found by Brackenridge under cultivation also by the Samoans. Westward, was observed by Blanco on the Philippines in Mandaloyon, though unknown to the natives; by myself, under cultivation in the Malayan archipelago; is termed by Rumphius "*radix toxicaria*;" and in Java, is considered a good emetic, efficient in curing wounds made by poisoned arrows (Rumphia i. 55, and Drur.); was observed by Hermann hort. lugd. 683 on Ceylon; by Rheede xi. pl. 38, in Malabar; by Graham, in "both Concans," to and beyond Bombay; by Ainslie, and Roxburgh, in other parts of Hindustan, "on the banks of rivers and in marshy places," the juice of its leaves given "in Upper India" in ear-ache (Drur.). Transported to Europe, is described by Miller pl. 110.

100,—and Aristotle prob'l. 20. 34: spitting thrice upon persons in danger of being bewitched is mentioned by Theocritus vi. 39, and to the present day, according to E. A. Sophocles gloss., is practised by the Greeks

The ΜΑΓΝΗΤΙΣ: ΑΙΘΟΞ magnetic ore of iron or the natural *magnet*, mentioned by Plato ion. 533,—Eubulus (Athen. iii.), and others.

Astragalus poterium of the Mediterranean countries. The ΝΕΥΡΑ string of vegetable fibre in Plato polit. 279 seems to imply knowledge of the "neuratha" of the Ionians;—identified in Syn. Diosc. with the "pōtērion" of Dioscorides, a large spiny bush covered with woolly down and having long soft thong-like branches "tragakanthē"-like, small roundish leaves, "neurōthēis" roots two or three cubits long yielding when cut a gummy exudation, and referred here by writers: the "pōtērion" is further identified in Syn. Diosc. with the "phrunion" or "akithōtōn:" A. poterium was observed by Tournefort trav. i. p. 61 in Greece, its down collected for kindling. Westward, the account by Pliny xxv. 76 and xxvii. 97 of the "poterion" or "phrynion," an antidote to "ranis venena rubetis maxime," seems chiefly taken from Dioscorides; A. poterium is described by Matthioli comm. p. 498, and Clusius hist. i. p. 108 (Spreng.); and is known to grow in Spain and Portugal (Morison ii. pl. 13, Lam., and Pers.).

In this year (= "Ol. 96. 2, Diophantus being Athenian archon," Paus. viii. 45. 4), at Tegea in Arcadia, the temple to Minerva in the Doric style of architecture destroyed by fire. The temple was rebuilt by Scopas, after the Corinthian order invented by Callimachus.

Acanthus mollis of the West Mediterranean countries. The "acanthus" said to have suggested to Callimachus the idea of the Corinthian column—(Vitruv. iv. 1. 10), is referred here by writers: a cup with the "ugrōs akanthōs" sculptured around is mentioned by Theocritus i. 55: the "akantha" (read "acanthos" by Pliny) growing according to Dioscorides in gardens and stony and moist places, its leaves smooth and incised like those of "ēuzōmōu," and flower white, is identified in the added Synonyms with the "ērpakantha" or "mēlamphullōn" or "paithērōta;" the "paithērōs" was found by Pausanias ii. 10. 5 growing only within the enclosure of the temple to Venus at Sicyon, the leaves having the shape of those of the oak and burned with the offerings: A. mollis has not been observed in Greece by modern travellers; and according to Clot-Bey and Figari has only recently been introduced into Egypt. Westward, the "acanthus" is termed "moli" as well as "flexi" by Virgil ecl. iii. 45 and geor. iv. 122; "tortus" by Columella x. 243; the "laeve" kind according to Pliny xxii. 34 is by some called "paederota" or melamphyllum; the "acanthus" is mentioned also by the younger Pliny ep. v. 6: A. mollis is termed "a. sativus vel mollis" by Tournefort inst. 176, "a. niger" by Miller: was observed by Sibthorp on Sicily; is known to grow also in Italy, the neighbouring portion of France, and in Spain (Pers., and Colm. recuerr. p. 18). Farther North, is cultivated for ornament: and introduced at some remote period, has become naturalized on the Scilly Islets and in the neighbouring portion of Cornwall (Wats., and A. Dec.). The leaves according to Lindley are "emollient" and "used for poultices."

Acanthus spinosus of the East Mediterranean countries. Called in Greece "mōutrina" or "tzōulathitza" (Sibth.); and possibly the "acanthus" seen by Callimachus:—the "akanthōu" enumerated by Theophrastus vi. 1. 3 as prickly-leaved, and the "akanthōs althēis" of Nicander ther. 645, are referred here by the scholiast; the "agria akantha" of Dioscorides iii. 17 may also belong here: A. spinosus was observed by Sibthorp, Chaubard, and Fraas, frequent from Crete and the Peloponnesus throughout the Greek islands. Westward, the "agria akantha" is identified in Syn. Diosc. with the "spina agrēstis" of the Romans, but the account by Pliny xxii. 34 of the "aculeatum et crispum" kind of "acanthos" seems taken from Dioscorides: A. spinosus is termed "a. aculeatus" by Tournefort inst. 176; was observed by Hogg on Sicily; is known to grow also in Italy (Sabb. hort. iii. pl. 14, and Pers.).

"394 B. C." (Blair, and Clint.), *naval combat* at Cnidus; the Spartans defeated by the Athenians and their allies, the forces of Pharnabazus and of Evagoras of Cyprus, all under the command of Conon. By a Twentieth change, the "Empire" over the Eastern waters of the Mediterranean now leaving the Spartans. A few days later,

"August 14th," *eclipse of the sun*. And after a few days, the Athenian army and allies defeated at Coronea by the Spartans under Agesilaus II.

"The same year" (Ges. mon. Phœn. p. 10), date of a Cilico-Phœnician coin bearing the earliest *Phœnician inscription* known:—even after including *Punic inscriptions*. The *Hebrew inscriptions* on the Maccabee coins present many of the same forms of letters.

"392 B. C." (Diod. xiv. go to 96, and Sm. b. d.), in Sicily, Mago with a Carthaginian army compelled by Dionysius by cutting off supplies to conclude a treaty of peace.

"In this year" (Jap. centen. comm. 45), accession of Koan, sixth dairo of Japan.—He "reigned during not less than one hundred and two years" (must therefore have been proclaimed in infancy).

"391 B. C." (Sm. b. d.), military tribunes holding the place of consuls, Camillus banished from Rome. Etruria invaded by the Gauls, who besiege the city of Clusium.

"390 B. C." (Polyb., Diodor., and Grenfel), Rome captured by the Gauls under Brennus; who remained some months, and on leaving, compelled the citizens to pay a ransom. Camillus was then recalled from exile and appointed dictator. — This capture of Rome is mentioned by Aristotle (Plut. Camill. 22.)

"389 B. C." (Sm. b. d.), military tribunes holding the place of consuls, alliance with Rome renounced by the surrounding people of Latium. Victories over them gained by the dictator Camillus.

The same year (= 402 — "13 years" of both Maneth. tables), in Egypt, Ahōris succeeded by Psammōuthis, third king of the Twenty-ninth dynasty. "One" year only is assigned to the reign of Psammōuthis in the Maneth. tables. His name has not as yet been found on the monuments.

388 B. C. (= 389 — "1 year" of both Maneth. tables), Psammōuthis succeeded by Nēphrītēs II., fourth king of the Twenty-ninth dynasty. Whose name has not as yet been found on the monuments.

At the end of "four months" (both Maneth. tables), he was succeeded by Nēktanēvēs, head of the Thirtieth or Sebennyte dynasty. The hieroglyphic ovals of king Nehtharheb were observed by Gliddon at Assouan; occur also in the Oasis El-Kargeh, at Karnak and on the neighbouring temple of Khons, and on moveable articles (now in the museums of Europe. Glid. analect.).

"The same year" (Suid., and Sm. b. d.), at Athens, the comedy entitled Pasiphae exhibited by Alcaeus.

"387 B. C." (Xenoph., Blair, and Clint.), treaty of peace of the Spartan general Antalcidas; by which the Greek cities in Asia Minor were rendered tributary to the Persians. Evagoras king of Cyprus was excepted from the provisions of the treaty.

Hardly later than this date, oration of Isocrates *pac. 32* containing the following words on the possession of naval power by Sparta: "The *Empire of the sea* has displayed its effects there in even a shorter period than at Athens: it has shaken and nearly overthrown the institutions which had stood the assault of seven centuries: it has taught individuals injustice, idleness, and the love of money; and has inspired the public with disdain for their allies, with ambition of conquest, and contempt of oaths and treaties" (*pac. 32*).

Apollodorus of Cumae, the earliest grammarian, a follower "assectator" of Democritus — (Plin. vii. 37 and xxiv. 102, and Clem. Alex. *strom. i. p. 309*).

Mimosa etta of the mountains of Tropical Arabia. A tree called there "schadjaret etta" (Forsk.); and the "herbam aescynomenen" of Apollodorus, contracting its leaves on the approach of the hand — (Plin. xxiv. 102), may be compared: a spiny shrub at Memphis with feather-like leaves that fall together on being touched, and after a while revive, is mentioned by Theophrastus iv. 2. 11, and the account is repeated by Pliny xiii. 19: *M. etta* was observed by Forskal p. xcv frequent on the mountains around Abu arisch, lowering its branches to a person coming underneath as though saluting, and therefore venerated and held sacred. Eastward, appears to have been carried to Hindustan, for a tree three cubits high bearing no fruit and called "modesty" from shrinking when approached, was seen there in the province of "Pudifetania" by Nicolo Conti; and a yellow-flowered sensitive plant was seen in Malabar by Garcias.

Sedum telephium of Europe and the adjoining portion of Asia. Called in Britain *livelong* or *liblong* or *midsummer men*, by old herbalists "fat hen" (Prior), in France "grassette" (Nugent), in Germany "fette-henne," in Italy "fava grassa" (Lenz); in which we recognize the "anacampseroten" when touched according to Apollodorus "redirent amores vel cum odio depositi" — (Plin. xxiv. 102), and mentioned by Plutarch *fac. orb. lun. 25* as growing and sprouting long after removal from the ground; also the "tēlēphilōn" leaf of Theocritus iii. 29, and Pollux ix. 8, regarded by lovers as a good omen if it makes a loud crack, a belief alluded to by Horace *satyr. iii. 2. 271*: *S. telephium* was observed by Sibthorp in the environs of Constantinople. Westward, is termed "anacampseros sive faba crassa" by Tournefort *inst. 264*; was observed by Lenz not rare in Italy; and is known to grow in stony bushy places throughout middle Europe as far as Denmark (*fl. Dan. pl. 686*, Pers., and Lindl.). By European colonists, was carried to Northeast America, where it is sometimes called *Aaron's rod* and seems naturalized in rocky situations, though as yet chiefly confined to roadsides and the vicinity of dwellings. The plant is sold in the Italian drug-shops (Lenz), and according to Lindley is "refrigerant and slightly astringent."

"385 B. C." (Diodor., and Clint.), great *naval combat* between the Persians and Evagoras of Cyprus.

"The same year" (Diodor. xv. 13, Strab. vi. p. 241, Plin. iii. 18, and C. Mull. *geogr. min. i. p. 24*), the city of Ancona in Italy founded by Dionysius of Syracuse; now establishing colonies on the shores, and claiming the sovereignty of the Adriatic.

"384 B. C." (Sm. b. d.), at Rome, military tribunes holding the place of consuls, M. Manlius

Capitolinus having left the patricians and endeavouring to incite insurrection, accused of treason, condemned, and put to death.

"The same year" (Diodor. ii. 32, and Clint.), return of Ctesias from the court of Artaxerxes II.

Ctesias brought accounts of a bird in India "that could talk like a man, and even speak Greek if it had learned the language:" clearly the *parrot*, *Psittacus*; further described, as in part "of the colour of kinnabar" (Chinese vermilion). To this time therefore, the parrot remained unknown in Greece. — The "*vittakōus*" of Eubulus (Athen.) is admitted to be this bird; "*sittakōus* having the human voice," were seen in India by Nearchus; the "*psittacus eoīs imitatrix ales ab indīs*," is mentioned by Ovid; the "*humanæ solers imitator psittace linguæ*," by Statius; and in the days of Arrian ind. 15, parrots were familiarly known in the Mediterranean countries.

Calamus fasciculatus of the valleys of the Himalaya from Cuttack to Bengal. Affording *rattun canes*, and called in Bengalee "*buro-bet*," in Tamil "*paramboo*" (Drur.); the ΚΑΛΑΜΟΣ; ΑΡΡΗΝ growing according to Ctesias along the Indus, strong and having no ΕΝΤΕΡΙΩΝΗΝ, — described by Theophrastus iv. 11. 13 as "*stērēōs*" solid, may be compared: the "*nadeya*" or "*vidula*" or "*sita*" of Susrutās chik. 1, is referred here by Hessler: *C. fasciculatus* is described by Roxburgh iii. 779; and according to Royle, and Drury, the stems are exported from the valleys of the Himalaya into the plains, are about as thick as the forefinger and are used as walking-sticks. (See *C. rotang*.)

Terminalia catappa of Tropical Eastern Asia. The *Indian almond* is a lofty tree called in Tamil "*nattoo vadamcottay*," in Telinga "*vadam*," in Bengalee "*badam*" (Drur.), in the environs of Bombay "*buddum*" (Graham); and the ΚΑΡΥΙΝΩ oil used according to Ctesias 11 by the Indians, — may be compared: the sacred "*ingudi*" fruit yielding according to Kalidasa sacont. healing oil that makes the hair shine (transl. W. Jones), mentioned also by Susrutās chik. 1 and 18 to kalp. 6, is referred here by Hessler: *T. catappa* was observed by Rheede iv. pl. 3 in Malabar; by Graham, "common in gardens and about houses, Bombay," clearly planted as observed by myself; by Roxburgh, Wight, and Drury, under cultivation in other parts of Hindustan, the oil expressed from the seeds edible and pleasant-tasted, very like almond-oil both in taste and smell. Farther West, was observed by myself planted at Muscat and on Zanzibar; by Clot-Bey 138, in the gardens of Egypt. Eastward from Hindustan, is enumerated by Mason as indigenous in Burmah; was observed by Blanco on the Philippines, in former times used for dyeing, and to the present day planted and called in Tagalo "*talísai*," in (Bisaya) "*talísai*" or "*dalasa*" or "*banilac*" or "*nato*" or "*hitam*," in Pampango "*calísai*," in Ylocano "*lugo*" or "*pandan*;" by myself, planted by the natives in the Malayan archipelago and as far as the Feejeean and Tongan islands, conspicuous in the distance from its projecting tapering summit of sparse horizontal branches. By European colonists, was carried to the West Indies (Descourt. pl. .). *T. Moluccana*, called in Sanscrit "*kala-drooma*," observed by Roxburgh ii. 433 in the mountainous countries Northeast of Bengal, and substituted in Hindustan for *T. belerica* (Lindl.), is given as a distinct species.

Cycas circinalis of Tropical Eastern Asia and the Malayan archipelago. The *sago-plant* is called in Telinga "*wara-gudu*," in Malabar "*todda-pana*" (Drur.); and the Indian ΦΟΙΝΙΚΕΣ of Ctesias bearing dates three times larger than the Babylonian, — may be compared: *C. circinalis* was observed by Graham "in gardens Bombay, introduced from the Eastern Islands," by Lush, "the common tree from Tellicherry to the foot of the Ghauts;" by Rheede iii. pl. 13 to 21, in Malabar, its vitality such that on being planted again after one or two years removal it will revive and grow: is very abundant according to Drury in the forests of Malabar and Cochin, and a kind of *sago* prepared from the nuts is much used by the poorer classes and forest tribes. Farther West, was observed by myself by the seaside on Zanzibar, natives on the spot asserting that it abounds and is a common esculent on the Comoro Islands. Eastward from Hindustan, was observed by Mason 424 to 506 indigenous in Burmah and called "*mu-daing*," frequent on the mountains in various districts and producing "a gum like gum tragacanth;" by Loureiro ii. 632, in Anam; by Blanco, on the Philippines, growing spontaneously on the mountains as well as planted by the natives, called in Tagalo "*patubo*" or "*pitogo*" or "*bitogo*," and its fruit sometimes eaten; by Rumphius i. pl. 22 to 23, abounding on the Moluccas and the fruit eaten (Lindl.); by myself, seemingly wild in the Malayan archipelago, in wild situations on the mountains of Ovolau, one of the Feejee Islands, but carried by the natives to Tongatabu and cultivated there. By European colonists, was carried to Northeast America, where it has become frequent in greenhouses. (Compare also *Diospyros kaki*.)

Rosa Damascena of Central Asia. Called in English gardens *Damask rose* (Drur.). in French "*rosier des quatre saisons*" (Pers.); and the ΚΑΡΡΙΩΝ, in Greek ΜΥΡΟΡΟΔΑ, described by Ctesias as a tree exuding drops of oil collected and kept in ΑΛΑΒΑΣΤΡΟΥΣ its fragrance so powerful that it can be perceived at the distance of five stadia, — may be compared: the account by Mark xiv. 3, and John xii. 3, of the costly "*narthōs*" filling the house with its odour, is eminently descriptive of *attar of rose*: *R. Damascena* according to Royle him. 203 is the most esteemed and is culti-

vated in Northern Hindustan for rose-water and attar of rose, but the latter is extensively distilled only at Ghazipore within the limits of Persia; was observed by Graham "commonly cultivated in Indian gardens" around Bombay; and the var. with variegated flowers, by Loureiro in Anam (Steud.). Westward from Persia, the "bifera rosaria Paesti" of Virgil geor. iv. 119, mentioned also by Propertius iv. 5. 59, Ovid met. xv. 708, Martial iv. 41. 10, and Ausonius xiv. 11, are referred here by Sprengel: R. Damascena is described by Symphorius Campegius, and Miller; is termed "r. bifera alba et rosea" by Duhamel (Steud.); and has become well known in the gardens of Europe. (See R. centifolia.)

Vateria Malabarica of Southern Hindustan. The *piney varnish* or *Indian copal tree* is called in Canarese "dupa" (Buch.), in Telinga "dupada mara," in Tamil "koondrikum" or "velli koondrikum," in Malabar "peini-marum" (Drur.); and the $\Sigma\Gamma\text{TAXO}\text{PA}$ tree on the mountains, yielding according to Ctesias an exudation that falling into the river Uparhos hardens into amber $\text{H}\Lambda\text{EKTPO}\text{N}$, — may be compared: V. Malabarica is termed "chloroxylon dupada" by Buchanan, as observed by him in Mysore; is wrongly termed "v. indica" by Roxburgh; and according to Drury "forms beautiful avenues in Malabar and Canara" and "was a favourite with the ancient rajas," yields "an excellent varnish resembling copal," but "the best specimens of the gum are employed as ornaments under the name of amber 'kebroba' to which it bears exterior resemblance."

Vateria Roxburghiana of Burmah. Called there "let-touk" (Mason); and the locality in question — is referred by Mason iii. 39 to the *amber mines* of North Burmah: V. Roxburghiana is described by Wight; and according to Mason v. 486 to 515 yields a varnish similar to that of the preceding species.

Ruellia indigofera of the Eastern Himalayas. Called in Assam "room," in Burmah "mai-gyee" (Mason); and the purple flower $\text{AN}\Theta\text{O}\Sigma$: $\Gamma\text{O}\Phi\text{YPOYN}$ growing according to Ctesias at the sources of the Uparhos and brought down in quantities on rafts, the $\Gamma\text{OP}\Phi\text{YPAN}$ purple dye it affords being brighter than the Greek, — is referred here by Mason: R. indigofera is described by Griffith; was observed by Mason "exotic" in Burmah, cultivated extensively for its blue dye not inferior to indigo, the plant probably derived from Assam.

Diospyros kaki of Japan. *Chinese dates* are called by the Burmese "tay-thee" (Mason); and the fruit attributed to the "siptahōra" tree by Ctesias, and brought down $\Xi\text{HPAINONTE}\Sigma$ like raisins in baskets on the same rafts, — is referred here by Mason: who further states, that the dried fruit continues to be brought in great quantities overland to Ava, the living tree has also been introduced and is sometimes cultivated, but "bears fruit very sparingly." Farther East, was observed Kaempfer pl. 806, and Thunberg, frequent in Japan, cultivated as well as seemingly wild. By European colonists, was carried to the environs of Bombay, observed by Graham in a garden, "a large erect-growing very handsome tree," its fruit "yellow and about the size of a small orange."

The insects living on the amber-bearing trees, and when bruised yielding $\Phi\text{OINIKI}\Delta\text{A}\Sigma$ red or purple dye, — are referred by Mason iii. 39 to v. 357 to *lac*, *Coccus lacca*: to the present day very abundant in the Shan States of Burmah, and exported in large quantities from the mouths of the Irawaddy; met with also by Bontius on Java. Farther West, lac as imported into Hindustan is mentioned in the Institutes of Menu (transl. Deslongch.): and as known among the Arabs, by Ishak ebn Amran, Rhazes, Mesue can. univ., Avicenna, Ebn Elhazar, and Ebn Baitar.

The inhabitants of the mountain-district in question according to Ctesias are called by the Indians "Kalustriōi" meaning in Greek "Kunōkēphalōi," and their language resembles the barking of dogs; they live by hunting, clothing themselves in the skins of wild beasts and drying the meat in the sun, but also keep sheep, goats, and donkeys, have neither bedsteads nor houses but dwell in caves, are black in complexion, equitable in their dealings like the other Indians, and both men and women all have tails, larger and more hairy than that of dogs. — This belief in tailed men continues in the Malayan archipelago, our native pilot in the Sooloo Sea pointing to Borneo said the "people are very bad, but those on the mountains worse and have tails."

Glycyrrhiza glabra of Tartary. The *liquorice* plant is called in Germany "sussholz," in Italy "liquirizia" or "regolizia" or "glicirrizza" (Lenz), in Greece "régōlitzā" or "glukōrizā" (Sibth.), in Egypt "orksus" (Forsk.); in which we recognize the PIZAN : $\Gamma\text{AYKEIAN}$ eaten according to Ctesias by the pastoral people beyond the sources of the river to prevent milk from coagulating in the stomach; — known to Theophrastus ix. 13. 2 only as a "skuthikē" root, growing about the Maeotis and alleviating thirst if held in the mouth, enabling the Scythians to continue eleven or twelve days on horseback: "radix dulcis" is prescribed by Celsus v. 20 to 23; "glycyrrhizae succi est autem radix dulcis" according to Scribonius Largus 75 to 86; and the "thōulkis rathix" of the Romans is identified in Syn. Diosc. with the "pōntikē" or "skuthiōn" or "athipsōn": the living plant is mentioned by Rhazes, and Avicenna: G. glabra was observed by Forskal in the gardens of Egypt, according to Clot-Bey long known there; by Sibthorp, Bory, and Fraas, frequent and seemingly wild from Crete to the Peloponnesus, its pods sometimes scabrous; is termed "g. siliquosa vel

germanica" by Tournefort inst. 389, "liquiritia officinalis" by Moench 152 (Pers.); was observed by Lenz under cultivation in Italy, as well as seemingly wild. The decoction according to Lindley "is a common remedy for coughs and hectic or phthisical cases."

Potamogeton gramineum of Europe and the adjoining portion of Asia. A grass-leaved *water spike*; and the ΚΕΓΧΡΙΤΙΞ growing according to Ctesias flum. in the river Alpheus, resembling ΜΕΛΙΚΗΡΩ, and given in potion against insanity — (Plut. flum. xix. 2). may be compared: *P. gramineum* was observed by Sibthorp in the rills of Arcadia. Westward, is known to grow throughout middle Europe (Pers.); and was observed by Ray pl. 4. f. 3 as far as Britain.

"382 B. C." (Isocr., and Clint., see also Diodor.), Amyntas II., successor of Pausanias, reigning in Macedonia.

As early perhaps as this date (prose Avadan. Asok., and Burnouf introd. 358), Mahamandala succeeded by his son Prasenadjit as Hindu king.

"376 B. C." = tenth and last year of the Cyprian war, between Evagoras and the Persians (Isocr., and Clint.). Nectanebus at the time reigning in Egypt (Theopomp. fr. 111).

The earliest *Zodiacal projection* known, is on a sarcophagus of the time of king Nectanebus (Birch).

"The same year" (Sm. b. d.), at Rome, military tribunes holding the place of consuls, "rogationes Liciniae" to increase the political power and improve the condition of the plebeians, proposed by C. Licinius and L. Sextius tribunes of the people.

"The same year" (101st Ol. of Suid., see Clint.), comedy exhibited by Eubulus: regarded by grammarians as the beginning of the "Middle Comedy."

"375 B. C. = 1st year of Lie-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

"The same year" (Sm. b. d.), C. Licinius and L. Sextius re-elected tribunes; who, the patricians not permitting the "rogationes" to become a law, prevented the election of any patrician magistrates. — This continued four years.

The ΞΜΙΚΡΟΝ: ΤΡΥΠΑΝΟΝ small *trepan* (for sawing a circular piece out of the skull) used by Hippocrates vuln. cap.: *lithotomy*, cutting for the stone, is mentioned in the treatise oec., — and according to Aretaeus chron. ii. 4, men sometimes die on the day of the latter operation, which however is indispensable (Cockayne).

Piper longum of Tropical Hindustan. Called in commerce *long pepper*, in Sanscrit "krishna" or "chupula" or "pippulee," in Bengalee "pippul," in Telinga "pippul-chitoo" (Lindl.); in which we recognize the ΠΕΠΕΡΙ about which Ctesias is silent and all writers prior to Eubulus, — and Antiphanes, so far as known to Athenaeus ii. 73: the "pēpēri" is mentioned in Vict. acut. 53 (regarded as a genuine writing of Hippocrates) also in 3 Morb. 25, and according to 7 Morb. mul. 84 is so called by the Persians; the "pēpēri prēmēkēs" is distinguished by Theophrastus ix. 20. 1, Dioscorides, and Galen fac. simpl. iii p. 97: the "piper longum," by Pliny xii. 14; and the fruit of "dar folfel" is compared by Avicenna p. 159 to aments of the willow (Spreng.): from transported specimens, *P. longum* is described by Valerius Cordus iv. 25, and Plukenet alm. pl. 104. Eastward from Persia, the "pēpēri" is described by Cosmas Indicopleustes iii. p. 178 to xi. 336 as a woody vine clinging to trees in "Malē" (Malabar): *P. longum* was observed in Malabar by Rheede vii. pl. 14; by Nimmo, in the Southern Concan (Graham); is known to grow "wild among bushes on the banks of water-courses, up towards the Circar mountains" (Lindl.); is besides much cultivated, and according to Roxburgh dried slices of the root and thickest part of the stem are much used medicinally under the name of "pippula moola;" was observed by Mason v. 494 "exotic" in Burmah and called "peik-khyen," its dried berries sold "in the bazars." The effects according to Lindley "are analogous to those of black pepper."

Anthyllis Cretica of Crete. Called there "arhōntixulōn" (Bell.); and the ΕΒΕΝΟΞ prescribed in Vict. acut. 407, — its rasped wood useful against ophthalmia according to Theophrastus ix. 20. 4, and Dioscorides, is referred here by some writers: the "acanthina xula" mentioned by Dioscorides as sometimes sold for ebony, may also be compared: *A. Cretica* is termed "barba jovis lagopoides cretica frutescens incana flore spicato purpureo amplo" by Tournefort inst. 651, "ebenus cretica" by Linnæus; was observed on the mountains of Crete by Honorius Bellus (Clus. hist. 309), Alpinus exot. ii. 32 p. 278, and Sibthorp.

Euphorbia pepylis of the seashore along the Mediterranean and adjoining portion of the Atlantic. Called in Greece "hamōgalatzithaki" (Fraas); and the ΠΕΠΑΙΩ of Hippocrates vict. acut. 11 — is identified in Syn. Diosc. with the "pēplis" of Dioscorides, growing on the seashore and full of white juice, referred here by writers: the "pēplis" is mentioned also by Rufus Ephesius, and Galen, and is further identified in Syn. Diosc. with the "anthrahnen agrian:" *E. pepylis* was observed by Sibthorp, Chaubard, and Fraas, frequent in maritime sand around Greece and the Greek islands; and by Delile on the Mediterranean shore of Egypt. Westward, numerous medicinal properties are attributed by Pliny xx. 81 to the "porcilaca" or "peplin:" *E. pepylis* is described by Lobel pl. 363, and Camerarius

epit. 970; is termed "*tithymalus maritimus folio obtuso aurito*" by Tournefort inst. 87; was observed by Forskal near Marseilles; and is known to grow on the seashore from Italy as far even as the Southwestern extreme of Britain (Engl. bot. pl. 2002, Lindl., and Lenz).

Ammi majus of the Mediterranean countries. Called in Italy "ammi" or "comino nostrale" (Lenz), in Greece "aspērōkēphalōs" (Forsk., and Sibth.), in Egypt "chælle" (Forsk.); in which we recognize the "ammi" identified by Pliny xx. 58 with the KYMINON: ΠΑΡΑΒΑΣΙΛΕΙ of Hippocrates humor. 4.—or "kuminōn vasilikōn" distinguished according to Syn. Diosc. iii 63 by some writers from the "aithiōpikōn kuminōn": *A. majus* was observed by Forskal, Sibthorp, and Fraas, frequent in cultivated ground in Greece and on the Greek islands; by Hasselquist in Palestine; and by Forskal p. 54, and Delile, around Alexandria and Rosetta. Westward, is described by Tournefort inst. 304, and Blackwell pl. 447; and is known to grow as a weed in cultivated ground in Italy and other parts of Southern Europe (Pers., and Lenz).

Ptychotis ajowan of Hindustan. Called in Sanscrit "yuvanika" or "Bruhmadurbha," in Bengalee and Hindustanee "jouan" or "ajouan" or "ajwan" (Lindl.), in Tamil "womum" (Drur.); and the KYMINON: ΑΙΘΙΟΠΙΚΟΝ of 3 Morb., — Int. affect. p. 492. and 1 Mul. morb. 603, identified through Syn. Diosc. with the "ammi" whose seeds only are described by Dioscorides, is referred here by Sprengel: "ammii" seeds are enumerated among the ingredients of the theriac of Antiochus Magnus (Plin. xx. 100), the "ammi" is mentioned also by Galen, and Paulus Aegineta, Avicenna (F. Adams); and "ammi seeds from India" are enumerated by Forskal mat. med. as imported into Egypt. Eastward, *P. ajowan* was observed by Roxburgh, Wight, Lush, and Drury, under cultivation throughout Hindustan, and according to Graham "the seeds have an aromatic smell and warm pungent taste," are "sold in the bazars, and used by the natives for culinary and medicinal purposes." Farther East, *P. ajowan* is enumerated by Mason as "exotic" in Burmah, and no native name is given. The seeds according to Sprengel continue to be imported into Europe; and the plant is regarded by Roxburgh, and Lindley, as "one of the most useful and grateful of the umbelliferous tribe."

Ptychotis Coptica of Crete and Egypt. Possibly included in the "kuminōn aithiōpikōn" of the Hippocratic writings: — the "ammiōm alexanthrinōm" of the Romans, mentioned in Syn. Diosc. iii. 63, may be compared: "ammi seeds produced in Egypt" are enumerated by Forskal mat. med.; *P. Copticum* received from him is described by Linnæus mant. 56, and Jacquin hort. ii. pl. 196 (Pers. and Spreng.); and according to Lindley, grows also on Crete.

Tordylium officinale of Europe and the adjoining portion of Asia. Called in Greece "kaukalithra" (Fraas) or "kaukalitha" (Sibth.); and the medicinal $\xi \epsilon \xi \epsilon \alpha \lambda$ prescribed in Vict. acut. 12, — Fistul. 884, and by Paulus Aegineta, is referred here by Fraas: the "seselios" was found by Alpinus employed medicinally in Egypt; and *T. officinale* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands to Asia Minor. Westward, *T. officinale* is termed "*t. narbonense minus*" by Tournefort inst. 320; was observed by Lenz frequent in Southern Italy; is known to grow also in Sicily and Southern France, occurring according to Persoon even in England. (See *Caucalis maritima*).

Rubia lucida of the East Mediterranean countries. Called in Greece "rizari" (Sibth.) or "agriōn rizari" (Fraas); and possibly the ΕΡΥΘΡΟΔΑΝΟΝ prescribed in Vict. acut., — Steril. p. 20, 1 Mul. morb., and by Nicander: the "ērēuthēthanōn" growing according to Theophrastus ix. 13. 6 in shady places, is referred here by Sprengel, and Fraas; and the "ērēuthrōthanōn agria" is given by Dioscorides as a second medicinal kind: *R. lucida* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Cyprus. Westward, is termed "*r. quadrifolia asperima lucida peregrina*" by Tournefort inst. 114; and according to Persoon, grows as far as Majorca. (See *R. tinctorum*.)

Aristolochia pallida of the East Mediterranean countries. Called in Greece "pikrōunia" (Fraas), in Italy with other species "stallagio" or "stallogio" or "aristolochia" (Lenz); in which we recognize the ΑΡΙΣΤΟΛΟΧΙΑ of 3 Morb. 23, — Int. affect. 25, 2 Morb. mul. 79, Nicander, and Paulus Aegineta: the "aristōlōhia strōggulē" described by Dioscorides as having an orbicular "gōggulithi"-like root and white flowers with their red portion rank-scented, is referred here by writers: *A. pallida* was observed by Sibthorp, and Fraas, frequent in shaded mountainous situations in Greece. Westward, is termed "*a. rotunda altera*" by Clusius hist. ii. 70, "*a. rotunda flore ex albo purpurascens*" by Tournefort inst. 162; and is known to grow in Croatia and Italy (Pers., Kitaib. hung. pl. 240, Spreng., and Lenz).

Aristolochia rotunda of the Mediterranean countries. Called in Italy by the same names with the preceding species (Lenz), and possibly included in the "aristōlōhia" of the Hippocratic writings: — the "aristōlōhia" described by Theophrastus ix. 20. 4 as black in colour and agreeably-scented, may be compared: *A. rotunda* was observed by Sibthorp, and Chaubard, in the Peloponnesus. Farther South, "*aristolochia root*" was observed by Forskal mat. med. in the drug-shops of Egypt;

and according to Lindley, *A. rotunda* with the preceding and other species "are supposed to be the plants with which the Egyptian jugglers stupify the snakes they play with." Westward, the round-rooted "*aristolochia*" is described by Pliny xxv. 54 as having leaves intermediate between "*malvam*" and "*ederam*," blacker and softer: *A. rotunda* is described by Matthioli, and Camerarius epit. 419; is termed "*a. rotunda flore ex purpura nigro*" by Tournefort inst. 162; was observed by Forskal near Marseilles; is known to grow also in Italy and other parts of Southern Europe (Pers., and Lenz).

Aristolochia parvifolia of the East Mediterranean countries. Called in Greece "*pikrōrriza*" (Fraas), and possibly included in the "*aristōlōhia*" of the Hippocratic writings:—the "*makra aristōlōhia*" or "*thaktulitis*" having according to Dioscorides a purple flower eventually becoming much like a pear "*apiō*," root as thick as the finger and a span or more long, is referred here by Sibthorp, and Fraas: *A. parvifolia* is termed "*a. chia longa folio minori subrotundo flore tenuissimo*" by Tournefort cor. 8; and was observed by Wheler trav. pl. 414, Sibthorp, and Fraas, frequent in Greece.

Arum dracunculus of the Mediterranean countries. Called in Greece "*phithōhōrtōn*" or "*thrakontia*," in which we recognize the "*thrakōntiōu*" described by Theophrastus vii. 12. 2 as having an inedible medicinal root, and from its spotted stem called "*arōn*:" the ΑΡΟΥ: ΜΕΓΑΛΟΥ is mentioned in 3 Morb. 493;—the "*thrakōntia mēgalē*," by Dioscorides as growing in the shade of hedges, its stem spotted with purple and "*lapathō*"-like leaves implicated together: *A. dracunculus* was observed by Sibthorp, Chaubard, and Fraas, frequent in the above-described situations in Greece. Westward, the "*thrakōntia mēgalē*" or "*arōn*" or "*isarōn*" or "*iarōn*" or "*viarōn*" is identified in Syn. Diosc. with the "*lōurōumam*" or "*maurariam*" or "*sigiggialiōs*" of the Romans; and the "*maiōrēm*" kind of "*dracunculus*" is mentioned by Pliny xxiv. 93: *A. dracunculus* is described by Brunfels, Fuchsius, Tragus, and Dodoens; is termed "*dracunculus polyphyllus*" by Tournefort inst. 160; and is known to grow in Carniolia and throughout Southern Europe (Pers., and Spreng.).

Hypericum coris of the Mediterranean countries. Called in Greece "*valsaminō*" or "*phōuthōura*" or "*gōuthōura*" (Sibth.) or "*arkōuthōura*" (Fraas); and the ΚΟΡΗ of Hippocrates—identified with the "*upērikōn*" by Galen, or the "*kōris*" according to Dioscorides by some called "*upērikōn*," an odorous shrub a span high with "*ērēikēs*"-like leaves, is referred here by writers: *H. coris* was observed (on Crete) by Honorius Bellus (Pona m. bald. pl. 40); by Sibthorp, Chaubard, and Fraas, abounding on the dry hills from the Peloponnesus throughout Greece and the Greek islands. Westward, the account by Pliny xxvi. 54 of the "*hypericon*" by some called "*corin*," seems chiefly taken from Dioscorides: *H. coris* is described by Matthioli pl. 669, and Morison ii. 5. pl. 6; is termed "*h. saxatile tenuissimo et glauco folio*" by Tournefort inst. 255; and is known to grow in Italy and Southern France (Lam. fl. fr., Pers., Spreng., and Lenz).

Alcea acaulis of the East Mediterranean countries. A low almost stemless species of *hollihock*; and the "*althaeae*" of Hippocrates, the juice of its root prescribed against thirst from loss of blood—(Plin. xx. 84), may be compared: the "*althaian*," a medicinal plant having soft stems, leaves like those of "*malahē*" but larger and more hairy, flowers yellow, and root said to render water gelatinous, is according to Theophrastus ix. 16. 5 to 18. 1 called "*malahēn agrian*" in Arcadia; and the "*malahē agria*" is prescribed in Mul. morb. p. 715, and by Nicander ther. 89 and alex. 486: *A. acaulis* is termed "*malva rosea folio subrotundo chalepensis acaulos flore pallide luteo*" by Tournefort inst. 95; is described also by Cavanilles ii. pl. 27 (Pers.); and was observed by Sibthorp in Greece, but the locality not recorded (J. E. Smith).

Viola canina of Europe and Northern Asia. Called in Britain *dog violet* (Prior), in Greece "*viōlēta*" (Sibth.), and the ΑΕΥΚΟΙΟΥ: ΚΑΡΡΟΝ prescribed by Hippocrates—and identified by Dioscorides (of Alexandria?), and Galen, with seeds of "*iōu lēukōu*," may be compared: the "*lēukōiōu rizēs*" is prescribed in 2 Morb. mul. 73; the "*lēukōiōn*" or "*lēukō iō*" or "*iōnias tes lēukēs*" is described by Theophrastus iii. 18. 13 to vi. 8. 5 as the earliest flower of spring, the plant lasting three years, the flower itself entirely resembling that of the "*mēlan iōn*;" the "*lēukōiōn*" is mentioned also by Dercyllus (Plut. fluv. 8. 4), Nicander, Hicesius, and a white-flowered kind by Dioscorides: *V. canina* was observed by Sibthorp, and Chaubard, from the Peloponnesus and Cyprus to the Bithynian Olympus; is known to grow also in Iberia and Persia (Bieb.). Westward, the "*pallens viola*" is mentioned by Virgil ecl. ii. 47; the "*viola alba*," by Pliny xxi. 38 to 76 as flowering at the opening of spring and employed medicinally, its flower "*suppurata aperit, ipsa discutit*:" *V. canina* is termed "*v. martia inodora sylvestris*" by Tournefort inst. 419; is known to grow from the Canaries throughout middle and Northern Europe to Lapland, Iceland, and "*Lat. 61°*" in Greenland (Hook., Dec., and Wats.), var. "*lactea*" having whitish-blue flowers (Smith fl. brit. i. p. 247). Eastward from Persia, is known to grow as far as Northeastern Asia and Japan (Bieb., Dec., and Wats.). The plant according to Lindley is considered a "*depurative*, and recommended for the removal of cutaneous affections, root emetic."

Glycyrrhiza echinata of the East Mediterranean seashore and as far as Tartary. Called in Greece "glukōriza" (Sibth.), in which we recognize the "glukurizēs" identified by Galen with the ΓΛΥΚΥΡΜΗΞ: BOTANHΞ of Hippocrates, — the Cretan kind the best (antid. i. 12): "glycyrrhizae radici" is prescribed by Asclepiades; and the "glukuphutōn" is mentioned in Syn. Diosc. iii. 5: *G. echinata* is termed "g. capite echinato" by Tournefort inst. 389; was observed by Sibthorp frequent in the sand of the seashore from Samos and Smyrna to Crete; is known to grow as far as the Southern extreme of Italy, and Eastward to the Tartarian Desert (Pers.). Compared with *G. glabra*, its root according to Lindley has "similar properties but in a less degree."

Glycyrrhiza glandulifera of the plains of Eastern Europe. Possibly the "glukumēs vōtanēs" in question, — at least agreeing better with the "glukurizē" of Dioscorides, growing mostly in Cappadocia and Pontus, and having hyacinthine flowers, glutinous leaves, and rough glomerate fruit: *G. glandulifera* is described by Pallas (Steud.); was observed by Waldstein and Kitaibel i. pl. 21 in Hungary (Pers.); by Fraas in Greece; is known to grow throughout middle Asia (Spreng.), but is not enumerated among medicinal plants.

Bryonia dioica of Europe and the adjoining portion of Asia. Called in Britain *white wild-vine* or *white bryony* (Prior), in Greece "agriōkōlōkuthia" or "agriōklēma" (Sibth.); in which we recognize the "lēukē vruōnia" identified by Galen with the ΕΧΕΤΡΩΞΙΞ of Hippocrates: — *B. dioica* was observed by Sibthorp, and Chaubard, not rare in hedges in the Peloponnesus and surrounding islands. Westward, the "albam bryoniam" is mentioned by Pliny xxiii. 16: *B. dioica* is termed "b. aspera sive alba baccis rubris" by Tournefort inst. 102; was observed by Lenz in Italy; is known to grow also in Barbary and throughout middle Europe as far as Britain (Jacq. austr. pl. 199, Engl. bot. pl. 439, and Pers.). Outside of the profession according to Lindley, the root continues in medicinal use, though producing "violent vomiting and purging, tormina, profuse watery evacuations, and fainting," is besides sold in London market "to remove the bruise of a blackened eye."

Bryonia Cretica of the East Mediterranean countries. Called in Greece by the same names with the preceding (Sibth.): the ΨΙΛΟΘΡΟΝ or ΑΜΓΕΛΟΞ: ΑΓΡΙΑ of Fistul. 6 — is identified through Syn. Diosc. with the "ampēlōs lēukē" of Dioscorides, climbing among bushes, its berries red, cooked "asparagōi" young shoots purgative and diuretic, leaves berries and root applied to "hēirōnēiōn" and other bad ulcers, and referred here by Sibthorp, and Fraas: the "ampēlōs lēukē" or "psilōthrōn" is further identified in Syn. Diosc. with the "ōphīostaphulōn" or "hēlithōniōn" or "mēlōthrōn" or "arhēzōstin" or "kēthrōstin" or "vruōnian": *B. Cretica* is described by Linnæus; was observed by Sibthorp, D'Urville, and Fraas, frequent in hedges in the Peloponnesus and surrounding islands. Westward, the account by Pliny xxiii. 16 of the "vitis alba" called by the Greeks "ampeloleucen" or "psilothrum" or "ophiostaphylon" or "melothron" or "archezostin" or "cedros-tin" or "madon" seems chiefly taken from Dioscorides. (See *B. alba* and *Tamus Cretica*.)

Galium saccharatum of Europe and the adjoining portion of Asia. The ΨΙΛΙΞΤΙΟΝ or ΦΙΛΕΤΑΙΡΟΞ of Hippocrates — is identified by Galen with the "aparinē;" described by Theophrastus vii. 14. 2 to viii. 8. 4 as growing among lentils and adhering to garments, its flower on a rough head withdrawing within itself in ripening seed; mentioned also by Nicander ther. 850 to 923; by Dioscorides, as employed to strain hairs from milk and having a hard rounded somewhat concave seed, and in the added Synonyms identified with the "ōmphalōkarpōn" or "ampēlōkarpōn" or "philanthrōpōn" or "ixōn": *G. saccharatum* was observed by Sibthorp frequent in the cultivated ground of Greece; is known to occur also in Siberia (Gmel.). Westward, is termed "aparine semine coriandri saccharati" by Tournefort inst. 114, "valantia aparine" by Linnæus; was observed by Allioni in cultivated ground in Southern France, by Vaillant pl. 4 near Paris (Pers.), and within the present century has made its appearance in Britain (Engl. bot. pl. 2173, and A. Dec.).

Galium aparine of Northern Climates. Called in Britain *ca'chweed* or *cleavers* or *clivers* or *goose-share* or *goose-grass*, in Anglo-Saxon "clife," in Holland "kleef-kruid" (Pryor), in Germany "klebkraut," in Italy "attacamani" or "appicamani" (Lenz), in Greece "kōllēzitha" (Sibth.); and possibly included in the "philitiōn" or "philētairōs" of Hippocrates: — *G. aparine* was observed by Sibthorp, Chaubard, and Fraas, frequent along walls hedges and in cultivated ground from the Peloponnesus to Constantinople; is known to grow also along the Taurian mountains (Bieb.), on the Yenisei (Gmel.), and throughout Northern Asia (Ledeb.). Westward from Greece, remnants have been found in debris of the early lake-villages of Switzerland; the "aparinē" or "philanthropon" or "omphacocarpon" was known to Pliny xxvii. 15 as growing both in cultivated ground and meads "pratisve;" the small "clifan" is mentioned in the Anglo-Saxon leechbook, and "gosys gres" by Galfridus pr. pm.; *G. aparine* is described also by Turner, and W. Coles (Prior); is termed "aparine vulgaris" by Tournefort inst. 114; was observed by Lenz in Italy, by Forskal near Marseilles, by Desfontaines in gardens in Algeria, by Brotero in waste places in Portugal; and is known to occur throughout middle and Northern Europe as far as Lapland (fl. Dan. 495, Pers., and Wats.), also on Madeira (Lemann) and the Azores (Wats.). Farther West, was already in New England

when visited by Josselyn; is known to grow from Canada along the Atlantic as far at least as 39°; was observed by Short in Kentucky, by Pitcher in Arkansas; is known to grow also as far as Vancouver (Hook.), Sitka (Bongard), and Unalaska (Ledeb.). In the Southern Hemisphere, was observed by J. D. Hooker at the Southern extreme of both Africa and America; by C. Gay, in Chili (A. Dec.); has doubtless in some instances been transported by European colonists, but its wide diffusion seems in part due to adherence to the plumage of water-fowl.

Cynara acaulis of the Mediterranean countries. A stemless kind of *artichoke* called in Greece "agriōkinara" (Sibth.); and the ἱεῖον of Hippocrates, — identified by Galen with the "lēukōs hamailēōn," may be compared: the leaves of the "hamailēōn" according to Theophrastus vi. 4. 3 to ix. 12. 1 are not spiny, those the "lēukōs" kind being "skōlūmō"-like but larger and its head of flowers like a great thistle close to the ground, the root used medicinally; the "hamailēōn lēukōs" is alluded to by Nicander ther. 661; is described by Dioscorides as stemless with a "kinara"-like head of purplish flowers: *C. acaulis* is termed "c. orientalis moschata acaulos foliis jacobææ tenuius incisissimis calycis sursum spectantibus" by Tournefort cor. 31, "cestrinus carthamoides" by Cassini, and "serratura acaulis" by Decandolle (Steud.); was observed by Sibthorp on Cyprus. Westward, the account of the "chameleon candidus" by Pliny xxi. 56 to xxii. 21 seems taken from the Greek; but *C. acaulis* was observed by Desfontaines pl. 223 in Barbary (Til. pis. pl. 20, and Pers.).

Attractylis gummifera of the Mediterranean countries. A stemless thistle called in Greece "kēphalia" (Fraas), in Egyptian "ēphēr" or "ēphthōsēphīn" (Syn. Diosc.): probably the ἱεῖον of Hippocrates, — for the "hamailēōn lēukōs" of Syn. Diosc. iii. 8 is identified with the "ixian," in some situations yielding about the roots "ixōn" used by the women for mastich: the "ixia" of Crete yielding a gum is mentioned by Theophrastus vi. 4. 9 to ix. 1. 3, and the "ixinē" is separately described as giving out leaves from its root around a central head, like a concealed "mēlōn," which exudes a pleasant-tasted gum, the "akanthikē mastihē:" *A. gummifera* was observed by Honorius Bellus, Alpinus, Sibthorp, Sieber cret., Chaubard, and Fraas, frequent from Crete and the Peloponnesus throughout the Greek islands. Westward, the "ixian" or "hrusiskēptrōn" is identified in Syn. Diosc. with the "karthōus ōuarinōus" of the Romans; the account of the "helixine" by Pliny xxi. 56 and xxii. 21 seems taken from Theophrastus, and that of the "ixian," partly from Syn. Diosc.: *A. gummifera* was observed in Italy by Anguillara p. 137, its gum well flavoured, and the flower-head preserved with honey and sugar especially around Urbino; is described also by F. Columna ecph. i. 12; is termed "cnicus carlinæ folio acaulos gummifer aculeatus flore purpureo" by Tournefort cor. 33; was observed by Oliver it. gall. in Southern France, by Cavanilles in Spain, by Brotero in Portugal, and by Desfontaines in Barbary (Pers., and Spreng.).

Chrysanthemum coronarium of Eastern Asia. Called in Greece "tztzimvōla" or "mantalina" (Sibth.) and the young stems eaten (Fraas), in Egypt "gahvan" (Forsk. emend.); in which we recognize the βοανθήμεον of Hippocrates, — mentioned as coronary by Nicander fr. ii. 59, and identified by Galen with the "vōuphthalmōn" or "hrusanthēmōn;" the "hrusanthēmōn" of Dioscorides growing in the outskirts of towns, its stems edible, leaves multifid, brilliant yellow flowers improving the complexion in jaundice, and according to the added Synonyms is sometimes called "vōuphthalmōn:" *C. coronarium* was observed by Sibthorp, Chaubard, and Fraas, frequent along roadsides and about villages on the Peloponnesus and neighbouring islands; by Hasselquist, in Palestine; and by Forskal, and Delile, at Alexandria in Egypt. Westward, the "hrusanthēmōn" or "halkas" or "halkitin" or "halkanthēmōn" is further identified in Syn. Diosc. with the "hōurzēta" of the Numidians "garōulēōum" of the Tuscans, and "kaltham" of the Romans; the "buphthalmos" with edible stems is mentioned by Pliny xxv. 42 to xxvi. 55, and the "chrysanthemum" by him, and Martial: *C. coronarium* is termed "c. foliis matricariæ" by Tournefort inst. 491; and is known to occur in Switzerland and Sicily (Pers.). Eastward from Syria, was observed by Kaempfer in Japan, on the mountains beyond Nagasaki and elsewhere and called "singikf" or "sungiku." (See *C. segetum*).

Anthemis Valentina of the Mediterranean countries. Called in Greece "matalina" (Forsk.), by the prophets "aimōrra" or "gōnōs Ermōu" or "gōnōs aphthitōs" or "Mnēsithēōs" or "kappakōrania" (Syn. Diosc.) possibly the "vōanthēmōn" of Hippocrates, — but the "vōuphthalmōn" is separately mentioned as coronary by Nicander fr. ii. 59; is described by Dioscorides as growing in the open country as well as around towns, its leaves "marathrō"-like, flowers yellow and larger than in "anthēmithōs," improving temporarily the complexion in jaundice; by Galen fac. simpl. vi. p. 852, as having flowers of the same shade of colour as "anthēmithōs;" prescribed also by Paulus Aegineta, and referred here by Clusius, and Sprengel: the "bihar" of Avicenna, or "bahar" of Ebn Baitar, is also referred here by Sprengel, as well as Sontheimer: *A. Valentina* was observed by Forskal near Constantinople, and by Chaubard, along the seashore of the Peloponnesus. Westward, the "vōuphthalmōn" or "kahlan" or "valsamēnē" is further identified in Syn. Diosc. with the "narat" of the Numidians; and the "buphthalmos" or "cachlam" is mentioned by Pliny xxv. 42:

A. Valentina is termed "buphthalmum Narbonense" by Clusius hist. i. pl. 773; is described also by C. Bauhin pin. 134; and is known to grow along roadsides and in fallow ground in Barbary and Spain (Pers.).

Euphorbia paralias of the Mediterranean seashore. Called in Greece "ēmērōs phlōmōs" (Fraas) or "galatzitha pēlagitha" (Sibth.); in which we recognize the "lactuca marina" of Celsus, and the "tithumalōu" called "kramviōn paralīōn" identified by Galen with the ΓΑΡΑΛΙΟΝ of Hippocrates: — the "paraliōs" kind of "tithumallōn" is distinguished by Theophrastus ix. 11. 7, and Dioscorides; is identified in Syn. Diosc. with the "mēkōna" or "tithumalitha;" and the "tithumalitha" is mentioned by Micion, and Cratevas (schol. Nicand. ther. 617): *E. paralias* was observed by Sibthorp, Chaubard, and Fraas, in the sand of the seashore around Crete, the Greek islands, and the Peloponnesus; and by Delile, near Alexandria in Egypt. Westward, of the juice of "tithumallos" called "lactuca marina" according to Celsus ii. 12 to v. 7 a drop purges; and the "tithymalon" or "mecona" or "paralion" is mentioned by Pliny xx. 80: *E. paralias* is termed "tithymalus maritimus" by Tournefort inst. 87, and Lamarck fl. fr.; and is known to grow on the seashore of Italy as far as the adjoining portion of France (Pers., and Lenz).

Orchis papilionacea of the Mediterranean countries. Called in Greece "salēpi" or "sarkinōvōtani" (Sibth.); and the ΔΙΔΥΜΗ of Hippocrates, — identified by Galen with the "ōrhis," may be compared: the "ōrhis" is described by Theophrastus ix. 18. 3 as having a twin root, the two bulbs producing opposite effects, the leaves "skillōthēs" but smoother and smaller: by Dioscorides as growing in stony and sandy situations, its leaves spreading on the ground, stem a span high, flowers purplish, and the double root cooked and eaten: *O. papilionacea* was observed by Sibthorp, Chaubard, and Fraas, abounding in the situations described by Dioscorides from the Peloponnesus throughout Greece. Westward, the account of the "orchin" by Pliny xxvii. 42 seems taken from Dioscorides: *O. papilionacea* is termed "o. orientalis et lusitanica flore maximo papilionem referente" by Tournefort cor. 30, "o. montana humilis flore majore" by Buxbaum iii. pl. 3; was observed by Tenore in Italy (Bory); is known to grow also in Carniolia, Barbary, and Spain (Pers.). Eastward from Greece, the nutritious substance called *salep* or *saloop* was according to Lindley originally obtained from "Turkey or Persia," and Lieut. Hutton found tubercles of an *Orchis* collected on the Himalayas under the name of "salep misri" (see *O. undulatifolia*, and *Eulophia salep*).

The inhabitants of Phasis at the foot of Caucasus, described in the Hippocratic treatise aer. aq. et loc. as walking only in the city and the market-place for strangers: thence transporting themselves in canoes made of trunks of trees through the numerous canals to dwellings of wood and reeds surrounded by water; the whole country being marshy (Troyon p. 209).

"374 B. C." (Diodor., and Clint.), death of Evagoras king of Cyprus. He was succeeded by his son Nicocles.

The same year = "15th of Nectanebus," on the sarcophagus of a person who died in this year — (Birch).

"The same year (= Ol. 101, 3" of Diodor., and Blair), an army under Pharnabazus, accompanied by twenty thousand Greeks, sent by Artaxerxes II. against Nectanebus of Egypt.

Citrus Medica of Hindustan and Burmah. Geographical proximity indicates, that the *sweet lemon* would be the first of its tribe in reaching the Mediterranean countries; and the "hrusa mēla" whose seeds were sent by the great king (Artaxerxes II.) to Athens — (according to Eriphus), recently according to Antiphanes, or the "mēlōn mēdikōn" and "pērsikōn" of Theophrastus having thorns and bearing at all seasons fruit which is not eaten, oblong in shape according to Dioscorides and placed among clothing to keep out moths, or the "kitriōn" of Phantias of Eresus, Juba, and Athenaeus iii. 26, may be compared: the description by Abu Hanifa of the "atrodj tree" corresponds; and *C. Medica* has been observed by myself only at Muscat on the Persian Gulf, the fruit placed among clothing as described by Dioscorides. Farther East, "lemons sweet as sugar" were seen by Jordanus mirab. p. in Hindustan (soc. Hakl); a plant "having the characteristics of the citron" and called "bijoorie," was observed by Royle "apparently wild" along "the foot of the Himalayas" (Graham); and *C. Medica* was found by Mason v. p. 453 "apparently indigenous" in the jungles of Burmah, but also cultivated and called "shouk-ta-khwa."

"373 B. C." (Sm. b. d.), unsuccessful attempt by the Spartans to recover the island of Corcyra.

Vicia lutea of Europe, Egypt, and the adjoining portion of Asia. Called in Egypt "bachra" (Forsk.); and possibly the ΩΧΡΟΞ of Antiphanes, — Anaxandrides, Alexis, Polemon, Aristotle anim. ix. 40, Phantias, and Athenaeus, described by Theophrastus iv. 2 and viii. 3 as yellowish internally with the leaves more oblong, by Berosus as growing along the Euphrates: *V. lutea* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Constantinople and Caria; by Forskal, and Delile, in Egypt (but the latter found the name "el-bakhrāh" applied to *V. sativa*). Westward, is described by Morison ii. pl. 21; is termed "*v. sylvestris lutea siliqua hirsuta*" by Tournefort inst. 398; and is known to grow in Italy, Spain, and middle Europe as far as Britain (Engl. bot. pl. 481, and Pers.).

"371, July" (Pausan., Blair, and Clint.), the Spartans invading Boeotia defeated at Leuctra by the Thebans under Epaminondas. Spartan ascendancy thus brought to a close; and "a few months later," the city of Megalopolis founded in Arcadia.

Greek inscriptions of about this date (Franz.), presenting the following forms of letters, Ζ, Π.

Dolichos lubia of Abyssinia? A bean called in Egypt "*lubia bæledi*" (Forsk.); in which we recognize the "lōvōs" identified by Galen, and Aretaeus, with the ΔΟΛΙΧΩΝ of Anaxandrides, — Polemon diæt. ii. 13, Theophrastus viii. 3, growing at Tempe in Thessaly according to Pliny xvi. 92, and identified by Galen with the "phasēōlōn" of Diocles, and Dioscorides ii. 130; also the "lōvia" pods called "asparagōs" of the "smilax kēpaia" of Dioscorides ii. 175, a twining plant having bicoloured kidney-shaped seeds: the seeds of *D. lubia* continue well known in Greece (E. A. Soph.) though perhaps imported, and may be included under the term "phasōlia" applied according to Fraas to allied species: *D. lubia* continues abundantly cultivated in Egypt, the black spot on its seeds mentioned by Ebn Djoldjol, Delile, and Clot-Bey; and according to Delile occurs also in Persia and Hindustan. A species regarded by Forskal p. 133 as probably identical was observed by him under cultivation in Yemen and called "didjre."

"370 B. C." (= 388 — "18 years" of the Afr.-Maneth. table, see below), Nēctanēvēs succeeded by Tēōs, second king of the Thirtieth dynasty. "Two" years are assigned to the reign of Tēōs in both the Maneth. tables. His name occurs in the quarries at Mokattam — (Birch).

"The same year" (Sm. b. d.), at Rome, on account of the war with Velitæ, the election of consular tribunes permitted by C. Licinius and L. Sextius the regularly elected tribunes.

369 B. C. (= 408 — "39 years" of the Egyptian Chronicle, the Euseb.-Maneth. table giving 332 + "6 + 4 + 6 + 20 years" = 368 = 370 — "2 years" of both Maneth. tables), Tēōs succeeded by Nēctanēvōs II., third king of the Thirtieth dynasty. Who reigned "eighteen" years (Egypt. Chron., and Afr.-Maneth. table), and proved the last native Egyptian king. The hieroglyphic ovals of king Nehtnebf occur at Beghe, on a temple built by him on Philæ, on stone fragments at Karnak and the neighbouring temple of Khons, and on "a little figure (brought from Pompeii." Glid. analect., and Leps. k. pl. 50).

At the First cataract, the earliest building on Philæ (according to Lepsius eg. and sin. 119 to 122) is by Nectanebus: the island is not mentioned by Herodotus, — and appears to have been first regarded as sacred under the Ptolemies. The hieroglyphic inscription on the obelisks there, is said by Lepsius to have nothing to do with the Greek inscription.

Piper sylvestre of Madagascar and the Mauritius Islands. Called in Madagascar "*lale vitsit*;" and possibly the African pepper mentioned by the comic poet Ophelion — (Athen. ii. p. 66, and Daremb.): *P. sylvestre* was observed by Flacourt i. 36 25 abounding in the forest throughout Madagascar and Bourbon Island, eaten by wild pigeons, and its stem and leaves having the savour of pepper; by Bojer, indigenous in moist places in the forest on Mauritius, and called by the colonists "*poivrier sauvage*." From transported specimens, is described by Lamarck ill. pl. 23 (Pers.). Vartheta found "a grove of cubebs" near Mozambique (edit. Badg.): *Bourbon cubebs* is mentioned by "most writers on *Materia medica*," the berries according to Th. Martius "not larger than grains of millet," but the species producing them remains unascertained (Lindl.).

"368 B. C. = 1st year of Hien-wang, of the Tcheou" or Fifth dynasty — (Chinese chron. table).

"The same year" (. . . Sm. b. d.), C. Licinius and L. Sextius still holding by re-election the power of tribunes, Camillus for the fourth time appointed by the senate dictator: he resigned and P. Manlius Capitolinus was appointed in his place.

"In or about this year" (Apollod., D. Laert., Blair, and Clint.), Eudoxus visiting king Mausolus of Caria; and recommended by Agesilaus II. to Nectanebus, proceeded to Egypt. — He received instruction in Egypt from Chonuphis (. . . Leps. eg. and sin. p. 386): and brought back into Greece the Celestial Sphere and the science of *Astronomy*. Eudoxus is regarded as the discoverer of the principle of *curved lines*.

One hundred and eighteenth generation. May 1st, 367, mostly beyond youth: the Chinese philosopher Meng-tseu; the Greek poet Erinna the younger; the comic poets, Araros, Calliades, Nicostratus, Philippus, Anaxilas, Callicrates, Heracleides, Amphis, Cratinus the younger, Eriphus, Epicrates, Aristophon, Sotades, Augeas, Heniochus, Epigenes. Timotheus, Sophilus, Antidotus, Nausicrates, Xenarchus, Dromo, Diodorus of Sinope, and Simylus: the tragic poets, Aphareus, and Theodectes; the philosopher Diogenes the cynic; the historians, Cephisodorus, Hermeias of Methymne, and Simonides; the orators, Isaëus, Aeschines, Aristophon of Colyttus, Cydias, Hegesippus, Callistratus, Leodamas, Aristophon of Azenia, and Androtion; the painters, Pamphilus, Euxenidas, Euphranor (Bryan).

"In this year" (Sm. b. d.), at Syracuse, death of Dionysius after a reign of "38 years." He was succeeded by his son Dionysius II., now king of Sicily.

"The same year" (Blair, and Sm. b. d.), at Rome, the dictator P. Manlius elected consular

tribune, and the "rogationes Liciniae" passed into a law: one of the consuls to be a plebeian, and the praetorship instituted, to be confined to the patricians. War against the Gauls, and after a victory by Camillus dictator for the fifth time, a temple dedicated to Concordia, the two orders of citizens being reconciled.

"366 B. C." (Sm. b. d.), at Rome, L. Sextius now the first plebeian consul, associated with L. Aemilius Mamercinus; Sp. Furius Camillus son of the dictator, becoming the first praetor.

"365 B. C." (Sm. b. d.), at Rome, L. Genucius Aventinensis and Q. Servilius Ahala consuls; *pestilence*, and the death of the dictator Camillus.

"364 B. C." (Sm. b. d.), at Rome, C. Licinius now plebeian consul, associated with C. Sulpicius Peticus; the *pestilence* continuing, and "ludi scenici" dramatic exhibitions first established.

"In this year" (Sm. b. d.), second campaign in the war between Arcadia and Elis, and battle at Olympia at the time of the Games.

Isatis Orientalis of the East Mediterranean countries. A wild species of *wood*, included perhaps in the $\text{I}\xi\text{AT}\text{I}\xi$ leaves externally applied of Affect. 37:—the "isatis agria," resembling according to Dioscorides the "isatis" of dyers and possessing the same medicinal properties, is referred here by Sibthorp: I. *Orientalis* was observed by him on the maritime rocks of Greece and Asia Minor; and was received by Linnæus from Aleppo (Ait., and Steud.). Westward, the "isatis agria" or "ëgnë mikra" is identified in Syn. Diosc. with the "routam minörë" of the Romans; bruised leaves of "in sylvis nascens isatin" were applied to wounds in the days of Pliny xx. 25: I. *Orientalis* is termed "i. sylvestris minor lusitanica" by Tournefort cor. 211, is attributed by Linnæus also to Portugal and Spain (Pers., and Steud.), but the change of name by Willdenow seems to imply some mistake. (See I. *tinctoria*.)

Euphorbia spinosa of the Mediterranean seashore. A *spurge* called in Greece "aphana" or "kōukōulaphana" (Fraas); and the $\text{I}\Pi\Pi\text{O}\Phi\text{E}\Omega$ whose juice is prescribed in Int. affect. 23 and 24—is identified by Galen with the "knaphōn" or "stuvōn" or "ippōphaës:" the "ippōphēōs" is enumerated by Theophrastus vi. 5. 1 to ix. 15. 6 among plants having thorns separate from the leaves, and the "tithumallōs" yielding "ippōphaës" is mentioned as growing in Arcadia: the "ippōphaës" of Dioscorides, growing in maritime and sandy situations and yielding a juice, a dense bush with crowded leaves resembling those of the olive, dry whitish spines and flowers like corymbs of the ivy, is referred here by Honorius Bellus (Clus. ii. 308), and Sprengel: E. *spinosa* was observed by Alpinus exot. 302, Sibthorp, Chaubard, and Fraas, frequent in dense inextricable tufts on seaside bluffs from Crete to the Peloponnesus and Greek islands. Westward, the "ippōphaës" or "ippōphuēs" or "ippōphanēs" or "ippiōn" or "ëhiniōn" or "pëlëkinōs" is identified in Syn. Diosc. with the "lappagō" or "lappōlamëra" of the Romans; and the "hippophæa spinis geniculatum" is mentioned by Pliny xxi. 54: E. *spinosa* is described by Hermann lugd. pl. 601; is termed "tithymalus maritimus spinosus" by Tournefort inst. 87: was observed by Bivona in Sicily, by Forskal near Marseilles; and is known to grow on the seashore of Carniolia and Italy, the old branches in drying becoming spinescent (Pers., Spreng., and Lenz).

Cuscuta epithymum of Europe and the adjoining portion of Asia. A species of *dodder* called in Italy "cuscuta" or "epitimbra" or "epitimo" (Fraas), in Greece "tēs alōpōu tō mētaxi" fox-silk (Fraas); in which we recognize the $\text{E}\Pi\text{I}\Theta\text{Y}\text{M}\text{O}\text{N}$ prescribed in Int. affect. 10,—2 Morb. mul. 9, and by Paulus Aegineta; abounding according to Dioscorides especially in Cappadocia and Pamphylia: C. *epithymum* was observed by Sibthorp, and Fraas, upon Thymbra and allied plants from the Peloponnesus and Greek islands to the Bithynian Olympus; and "aftimūn" from Syria was found by Forskal employed medicinally in Egypt. Westward, the "ëpithumōn" or "kēthōis" is identified in Syn. Diosc. with the "ëmvölōukrōum" of the Romans; the "epithymum" growing without root and by some called "hippopheon" is mentioned by Pliny xxvi. 35: C. *epithymum* is termed "c. minor" by Tournefort inst. 652; was observed by Lenz frequent in Italy; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 427, Engl. bot. pl. 53, and Pers.).

Physalis alkekengi of Barbary? Called in English gardens *winter cherry* (Prior), in France "coqueret" (Nugent), in Germany "schlutte," in Italy "alcachengi" or "palloncini" or "solatro alicacabo" (Lenz), in Greece "kërasōulia" (Sibth.), in which we recognize the "kakavōum" of the Numidians identified in Syn. Diosc. with the "struhnōn alikakavōn" yielding a juice, possibly the εTPYXNOY juice prescribed in Int. affect. 30:—the "struhnōn alikakavōn" of Dioscorides bears bladder-like follicles containing a sort of reddish grape, worn in garlands, and the juice of the plant is dried like that of the edible kind and possesses the same properties: the "alikakavōn" is mentioned also by Florentinus (geopon. xiii. 8); and as known in Egypt, by Pliny xxi. 105; the "alkekengi" is mentioned by Avicenna, and Mesue simpl.: P. *alkekengi* was observed by Forskal, and Sibthorp, in shady situations from Parnassus to Constantinople and the Bithynian Olympus; its fruit was found by Forskal mat. med. employed medicinally in Egypt; and the living plant according to Clot-Bey and Figari has been recently introduced. Westward, the "struhnōn alikakavōn" or

"phusalitha" or "kalliatha" is further identified in Syn. Diosc. with the "kukōlitha" of the Dacians, and "vissikalīs" of the Romans; and the "halicacabum" or "callion" or "vesicarium," having a large berry within a large follicle, is further described by Pliny as ripening in November: *P. alkekengi* is described by Christophorus de Honestis, and Matthioli; is termed "*alkekengi officinarum*" by Tournefort inst. 151; was observed by Lenz frequent in Italy, and is known to occur on dikes as far as Germany (Scop., Moench, and Pers.). Eastward from the Mediterranean, is attributed by Persoon to Japan. The plant according to Lindley "is diuretic and employed in veterinary practice."

Solanum miniatum of Tropical Africa or Asia. Called in France "morelle" (Nugent), in Italy "solatro" or "solano" (Lenz), in Greece "skilōstaphilō," in Egypt "enab eddib" wolf grape, in Yemen "mesälleha" (Forsk.), in Egyptian "pélēmōn" (Kirch.) or "allélō" (Syn. Diosc.); in which we recognize the "solanum" identified by Celsus with the "strychnon" of the Greeks (Plin. xxvii. 108); and from the above remark of Dioscorides iv. 72, probably the kind affording the "struhnōu" juice of Int. affect. 30: — the "struhnōs" is enumerated as edible by Polemon diaet. ii. 12; the "struhnōs êthōthimōs," as if "êmērōn" and having berried fruit, is mentioned by Theophrastus vii. 15. 4, and according to Dioscorides the berries become either black or yellowish; "truhna" are mentioned by Theocritus x. 37; the "strychnum" is enumerated by Pliny xxi. 52 among the esculent plants of Egypt; and the "inab el-dubb" is mentioned by Ebn Baitar: *S. miniatum* was observed by Forskal, and Delile, springing up spontaneously from Cairo to Alexandria, the berries eaten crude; by Forskal, Sibthorp, Chaubard, and Fraas, frequent in waste places from the Peloponnesus to Constantinople. Westward, the "struhnōs kêpaiōs" or "êmērōn" is identified in Syn. Diosc. with the "astrēsmōunim" of the Numidians, "skōuvōulōum" of the Gauls, and "strōumōum" or "kōukouvalōum" of the Romans; by Pliny xxvii. 44, with the "strumum" or "cuculi": the "maurellam" is mentioned by Macer Floridus 60, and the "morella" or "solatrum" or "uva vulpis" in *Ortus Sanitatis* pl. 455: *S. miniatum* is termed "*s. officinarum acinis nigricantibus et acinis luteis*" by Tournefort inst. 148; was observed by Lenz in Italy, by Forskal near Marseilles; and is known to occur in waste places as far as middle Europe (Dill. elth. pl. 274. f. 353. Pers., and Bory). Southward from Egypt, was observed by Forskal p. 46 among the mountains of Yemen, the bruised leaves applied in the "bulæ" ulcerous disease; by Grant, along the Nile from Lat. 28° to the Equator, and beyond to 4° 18' South, the "leaves made into spinage." Eastward, was observed by Rheede x. pl. 73 in Malabar: by Graham, "in gardens pretty common" around Bombay and called "ghattee," or on the Deccan "camunee;" by Roxburgh, and Royle, in other parts of Hindustan, and called "anab-al-salib" (the "inab-el-thalab" of Ebn Baitar); by Mason, in Burmah; by Loureiro i. p. 133, in Anam, the leaves applied externally to cure cancers; by Kaempfer, and Thunberg, around Nagasaki in Japan and called "tenka" or "tenkja," or usually "nassubi;" by Blanco, on the Philippines and called in Tagalo "cunti" or "onti" or "gamagamatisan," in Camarines "cuti" or "lubi-lubi," in Bisaya "lubilubi" or "lagpacum" or "bolagtog." Farther East, was observed by myself aboriginally introduced on the Feejeean Islands, and clearly by Polynesians carried to New Zealand, to the Samoan, Tahitian, and Hawaiian Islands, everywhere naturalized, occurring in wild situations, the berries edible and the plant two feet or more high: may therefore be the species seen by J. D. Hooker on the Galapagos Islands, and the "yerva mora o solatrum like that of Spain" found by Oviedo already in the West Indies. Probably by European colonists, was carried to the Mauritius Islands, where it occurs in clearings (Boj., and A. Dec.), but according to Graham is besides cultivated as a potherb and called "brede." (See *S. nigrum*, and *S. Aethiopicum*).

Arum maculatum of Europe and the adjoining portion of Asia. Called in Britain *wake robin* or *cuckoo-pintle*, in a manuscript of the Fourteenth century "*kokok-pyntel*" (Prior), in Greece "thrakōntia" (Sibth.) or "arōn mikra thrakōuntia" (Fraas); in which we recognize the "thrakōntias mikras" of Cratevas (Anguill.), and Dioscorides: the ΔPAKONTION prescribed in Int. affect. 1, — and termed "prēu" mild in Steril. 17, may be compared: *A. maculatum* was observed by Sibthorp, and Fraas, frequent from the Peloponnesus throughout the Greek islands; by Anguillara, its root cooked and eaten in Albania, and in Slavonia made into a kind of bread (Spreng.). Westward, is described by Bauhin (Pers.); is termed "*a. vulgare*" by Tournefort inst. 158; was observed by Lenz in Italy; is known to grow in Barbary (Lindl.) and throughout middle Europe as far as Denmark (fl. Dan. pl. 505, Lam. fl. fr. and Curt. lond. ii. pl. 63). The crude tubers according to Lindley "are stimulant, diaphoretic and expectorant," and a nutritious substance manufactured from them on the island of Portland is called *Portland sago*.

Arum italicum of the Mediterranean countries. A larger species called in Italy "*lengua de bo*" or "*aro*" (Lenz); and possibly the "thrakōntiōn" of Int. affect. — and Steril.: the "thrakōntia êtēra" is described by Dioscorides as two cubits high with great ivy-like leaves spotted with white, its root eaten either crude or cooked: *A. italicum* was observed by Fraas, not rare in the Peloponnesus. Westward, the cooked root of the "thrakōntia êtēra" is further mentioned by Dioscorides

as mixed with honey by the Balearic islanders and made into cakes: *A. Italicum* is described by Dodoens p. 329 (Spreng.); was observed by Lenz, not rare in Italy; is known to grow also in Spain, Portugal, Southern France, and as far as Germany (Pers.). By European colonists, was carried to Northeast America, where it has become a frequent greenhouse plant.

Trifolium arvense of Europe and the adjoining portion of Asia. Called in Britain *hare's foot*, in Germany "hasenfuss," in France "pied de lievre" (Prior), in Italy "pie di lepore" or "lagopo" (Lenz), in Greece "lagōnōura" (Fraas); and the ΛΑΓΩΠΥΡΟΞ according to Ulc. p. 319 in the dried state resembling bran, its small leaf like that of the olive and longer or more elongate, — identified by Galen voc. with the "lagōnatē vōtanē," is referred here by writers: *T. arvense* was observed by Sibthorp, Chaubard, and Fraas, frequent from Crete and the Peloponnesus to Constantinople and Cyprus; is known to occur also along the Taurian mountains (Bieb.). Westward, is described by Valerius Cordus, Fuchsius pl. 479, and Lobel hist. 383; is termed "t. arvense humile spicatum sive lagopus" by Tournefort inst. 405; was observed by Lenz frequent in Italy; is known to grow also in Barbary and throughout middle and Northern Europe as far as Sweden and Iceland (fl. Dan. pl. 724, Hook., and Wats.) By European colonists, was carried before 1547 to the West Indies ("trifolium leporinum" of Oviedo hist. gen. xi. 2), and extending thence, or independently introduced, has become naturalized in our Southern (Chapm.) and throughout our Atlantic States, occurring not only in old fields and roadways but in wild sunny situations.

Potentilla hirta of the mountains of middle and Southern Europe. The black ΠΕΝΤΑΦΥΛΛΟΝ prescribed in Ulc. 880 — is referred here by Fraas: *P. hirta* was observed by Sibthorp, Gittard, and Fraas, on and about the mountains of Southern Greece. Westward, is termed "q. montanum erectum hirsutum luteum" by Magnol monsp. 216; and is known to grow also on the Carpathians and Pyrenees (Allion., and Pers.).

Mesembryanthemum nodiflorum of the Mediterranean shores, and beyond as far as Madeira. Called in Egypt "ghasul" or "schæchacha" (Forsk.); and the ΕΠΙΠΕΤΡΟΝ prescribed in Ulc. 875, — growing according to Aristotle part. an. iv. 5 on Parnassus and continuing alive suspended on a peg, regarded as altogether flowerless by Theophrastus vii. 8. 4, mentioned also by Galen method. iv. 5, may be compared: *M. nodiflorum* was observed by Sibthorp, and Chaubard, frequent along the seashore of Greece; by Labillardiere, on the seashore of Syria; and by Alpinus pl. 127, Forskal, and Delile, frequent in the Egyptian Desert. Westward, is described by Linnæus; was observed by Forskal on Malta; and is known to grow around the Adriatic to "Lat. 43°," along the West coast of Italy to Genoa, also to Marseilles, Corsica, Sardinia, Spain, Barbary, and beyond the Straits to Portugal, the Canary Islands, and Madeira (A. Dec.; see *M. Copticum*).

Carthamus corymbosus of the East Mediterranean countries. Called in Greece "ōmvrela" (Fraas) or "hamailēōn" (Sibth.), in Egyptian "sōvēl" (Syn. Diosc.); in which we recognize the ΧΑΜΑΙΛΕΩΝ: ΜΕΛΛΞ of Ulc. 879, — Theophrastus ix. 12, Nicander, Cratevas, growing according to Dioscorides on dry plains and seaside hills and having spinescent hyacinth-coloured flowers, leaves varying according to locality, deep green, hoary, bluish, or red: *C. corymbosus* was observed by Forskal, Sibthorp, Chaubard, and Fraas, from the Peloponnesus and Greek islands to the Dardanelles, frequent in the situations described by Dioscorides. Westward, the "hamailēōn mēlas" or "pagkarpōn" or "ōulōphōnōn" or "ixian" or "kunōmahōn" or "ōkimōēithēs" or "knithiōn kōkkōn" or "kunōxulōn" is identified in the Syn. Diosc. with the "karthōus nigra" or "ōuērnilagō" of the Romans: the account by Pliny xxii. 21 and xxvii. 118 of the "chameleon niger" or "ulophonon" or "cynozolon" seems in part taken from Dioscorides: *C. corymbosus* was observed by Anguillara, and A. Maranta, in Slavonia and Southern Italy (Spreng.): is described also by Matthioli comm. p. 491, and is termed "c. aculeatus carlinæ folio flore multiplici veluti umbellato" by Tournefort cor. 33.

Cynoglossum officinale of Europe and Northern Asia. Called in Britain *hound's-tongue* (Prior), in Italy "lingua canina" or "cinoglossa" (Lenz), in Greece "gōurgōugiannēs" or "shēlōglōssōn" (Sibth.); and the ΞΕΛΙΑΞ prescribed in Ulc. 879 — may be compared: *C. officinale* was observed by Sibthorp frequent in Greece and on the Greek islands; by Hasselquist, in Palestine; root of "cynoglossum" or "lissan-el-kelb" was found by Forskal mat. med. employed medicinally in Egypt; and the living *C. officinale* according to Clot-Bey has recently been introduced. Westward, the "lingua canina" is mentioned by Celsus v. 27; and a kind of "cynoglossos" bearing "lappas minutas," its root taken in potion against (the poison of) frogs and serpents, is distinguished by Pliny xxv. 41: *C. officinale* is described by Miraldus, and W. Coles simpl. 27 (Prior); is termed "c. majus vulgare" by Tournefort inst. 139; was observed by Lenz frequent in Italy; and is known to occur in waste ground throughout middle Europe as far as Denmark (fl. Dan. pl. 1147, and Pers.). By European colonists, was carried to Northeast America, where it continues along roadsides and in waste ground from the Saskatchewan (Hook.) to Montreal and North Carolina (Darl., Chapm., and myself). The plant according to Lindley "was once officinal, being used as an antispasmodic," but

"is so fetid that it has long since ceased to be exhibited;" its odour is compared by Smith to that of mice (Pers.; see *Lithospermum purpureo-coeruleum*).

Cynoglossum Apenninum of the East Mediterranean countries. Also called in Greece "gourgougiannēs" or "shēlōglōssōn" (Sibth.); and possibly included in the "shēlias" in question: — the "alia similis cynoglossos quae fert lappas minutas" of Pliny xxv. 41, may also be compared: *C. Apenninum* was observed by Sibthorp from the Peloponnesus to Cyprus. Westward, is described by Columna ecphr. pl. 170; is termed "c. montanum maximum" by Tournefort inst. 139; and is known to grow in Italy, on the Apennines (Pers.).

Cynoglossum pictum of the Mediterranean countries. Called in Greece "görgōiannēs" (Fraas); and possibly included in the "shēlias" in question: — *C. pictum* is termed "c. creticum latifolium" by Tournefort inst. 140; was observed by Chaubard, and Fraas, frequent in Attica and the Peloponnesus. Westward, is described by Scopoli (Steud.); is known to grow in Barbary and various parts of Southern Europe, and even on Madeira (Pers.).

Ruscus aculeatus of Europe and the adjoining portion of Asia. Called in Britain *butcher's broom* from being used to protect meat against mice and bats, or *knee-holly* or *knee-holm*, in Anglo-Saxon "cneow-holen" (Prior), in France "fragon piquant" (Fée), in Germany "mausedorn," in Italy "pugnitopo" or "spruneggio" or "ruschio" (Lenz), in Greece "smurnakantha" or "kōrallo-hōrtōn" or "lagomēlēa" (Fraas), by the prophets "gōnōs ēraklēōus" (Syn. Diosc.); in which we recognize the "rōuskōum" identified through Syn. Diosc. with the ΜΥΠΠΗ ΑΓΡΙΗ prescribed in Ulc. 880, — or "mursinē agria" of Dioscorides, its sharp-pointed leaves bearing at the middle globular fruit, the root used for adulterating "phōu:" the "kēntrōmurrinē" is described by Theophrastus iii. 17. 4 as having fruit upon its leaves. *R. aculeatus* was observed by Sibthorp, and Fraas, frequent in rugged mountainous situations in Attica and other parts of Greece: was known to Serapion f. 166, by whom its berries were called "khababath," and hence improperly by mediæval writers "cubebæ" (Leonice., and Spreng.). Westward, the "mursinē agria" or "hamaimurte" or "ōxumursinē" is identified in Syn. Diosc. with the "rōuskōum" of the Romans; the "oxymyrsinen" by Castor with the "ruscum" of which "scopae" are made (Plin. xxiii. 83); "ruscea" are mentioned by Cato orig. i. 7; the "ruscum" by Varro, Virgil, Verrius; and "oxymyrsinae" or "scopa regia" by Scribonius Largus 153: *R. aculeatus* is described by Anguillara 291, Lonicer 204, and Parkinson; is termed "r. myrtifolius aculeatus" by Tournefort inst. 79; was observed by Lenz in Italy; and is known to grow throughout middle Europe as far as Britain (Engl. bot. pl. 560, and Pers.).

Marrubium alyssum of the Southern division of the Mediterranean countries. A species of *horehound* called in Egypt "frasium" (Forsk.); in which we recognize the Greek "prasīōn" transferred to allied species: — the "alussōn" of Antonius rhizotom., and Galen antidot. ii. p. 449, is referred here by writers, and the "kamēlōpōthion" of Syn. Diosc. iii. 109 may also be compared: *M. alyssum* seems unknown in Greece, but was observed by Forskal p. 213, and Delile, near Alexandria on the Mediterranean border of Egypt. Westward, is described by Dodoens 88, and Clusius hist. ii. 35, and is known to grow in Spain (Pers., and Spreng.).

Marrubium catariaefolium of the East Mediterranean countries. The ΠΡΑΣΙΟΝ prescribed in Ulc. 878 — is perhaps the medicinal kind described by Theophrastus vi. 2. 5 as having green and more deeply incised leaves, termed "prasioio hlōanthēōs" by Nicander ther. 550, and referred here by Sprengel: *M. catariaefolium*, received from the East "Oriente" is described by Desrousseaux enc. meth. iii. 771, its leaves "ovatis subviridibus profunde crenatis" (Pers.), and according to Sprengel is frequent in Asia Minor.

Marrubium vulgare of Europe and the adjoining portion of Asia. Called in Britain *horehound*, in Anglo-Saxon "hara-hune" (Prior), in France "marrube" (Nugent), in Germany "andorn," in Italy, "marrobio" (Lenz), in Greece "skulōhōrtōn" (Fraas), by the prophets "aima taurou" or "aphēthrōs" or "gōnōs ōrōu," in Egyptian "astērōpē" (Syn. Diosc.); in which we recognize the marrōviōum identified in Syn. Diosc. with the "prasīōn:" — growing according to Dioscorides around dwellings and in waste places, its leaves rounded and wrinkled: the "prasīōn ētērōn" is distinguished by Theophrastus vi. 2. 5 as having rounder dry or shrivelled leaves not so deeply incised: *M. vulgare* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout Greece and the Greek islands; is known to occur also about Taurus and Caucasus (Ledeb.); was received by Bentham from Yemen, and may therefore be the unnamed species observed on mountains there by Forskal; was found by Alpinus employed medicinally in Egypt. Westward, the "prasīōn" or "phullōpharēs" or "philōpharēs" or "tripēthilōn" is further identified in Syn. Diosc. with the "atiērvēzia" of the Numidians, and "lavēōnia" or "marrōviōum" of the Romans; the "prasion" or "philochares" or "philopaeda" or "linostrophon," by Pliny with the "marrubium;" the "marrubium candidum" is mentioned by Castor (Plin. xx. 89); and "marrubium," by Macer Floridus 42: *M. vulgare* is described in *Ortus Sanitatis* 256 (Prior); is termed "m. album vulgare"

by Tournefort inst. 192; was observed by Lenz in Italy, by Forskal near Marseilles; and is known to occur in waste places from Algeria and the Canary Islands to Sweden, and to Kasan in Russia (Pers., Fries, and A. Dec.). Eastward from Caucasus, is known to occur in Persia and as far as Cashmere, but continues unknown in Eastern Asia (Ledeb.). By European colonists, was carried to Northeast America, where it continues in gardens and waste ground in our Atlantic States; also to Mexico, California, Southern Brazil, Buenos Ayres, and Chili (Benth., A. Saint-Hil., and herb. Dec.). Its extract according to Smith, and Lindley, "is a popular remedy for coughs and asthmatic complaints."

Marrubium pseudodictamnus of the East Mediterranean countries. Called in Greece "maurō-markōs" (Fraas) or "mavrōmargō" or "asprōpikrōpanthi" (Sibth.); and the ΨΕΥΔΟΔΙΚΤΑΜΝΟΝ of the Hippocratic writings, — described by Theophrastus ix. 16. 2 as resembling in leaves "thiktamnōn" and used medicinally for the same purposes but less efficacious, by Dioscorides as growing in many countries, and by Pliny xxv. 53 to xxvi. 31 as sometimes called "chondris," is referred here by writers: *M. pseudodictamnus* is described by Dodoens (Spreng.); is termed "pseudodictamnus verticillatus inodorus" by Tournefort inst. 188; and was observed by Sibthorp, and Fraas, frequent from the Peloponnesus and Crete throughout the Greek islands.

Origanum Tournefortii of the Greek islands. The ΔΙΚΤΑΜΝΟΞ: ΚΡΗΤΙΚΟΞ of the Hippocratic writings — may be compared; also the "ētērōn thiktamnōn" of Theophrastus ix. 16. 3, bearing the same name with the preceding and peculiar to the same island, but differing in medicinal properties and in aspect, the leaves like those of "sisumvriō:" the "ētērōn ēithōs thiktamnōu" from Crete is described by Dioscorides as having flowers like "ōrganō agriō" soft and black, the odour of its leaves exquisite, between that of "sisumvriōu" and "ēlēlispakōu:" *O. Tournefortii* is termed "o. dictamni cretici facie folio crasso nunc villosa nunc glabro" by Tournefort cor. 13 and trav. i. pl. 91 as observed by him on Amorgos (Pers.); and was found by Sibthorp on the same island, on rocks near the monastery.

Teucrium scordium of Europe and the adjoining portion of Asia. Called in Britain *water germander* (Ainsw., and Prior), in Italy "scordio" (Lenz), in Greece "skōrthēō" or "skōrthōhōrtōn" (Sibth.), by the prophets "aïma pōthōtōs," in Egyptian "aphō" (Syn. Diosc.); in which we recognize the ΣΚΟΡΔΙΟΝ of the Hippocratic writings, — and Galen: the "scordion" or "scordotin" growing according to Mithridates in the fertile humid plains of Pontus, bitter to the taste, a cubit high and branching, stem quadrangular and leaves "lanuginosis," is attributed to him by Lenæus (Plin. xxv. 27): the "skōrthiōn" is described by Dioscorides as growing in marshes and best in quality in Pontus and Crete, bitter and astringent to the taste with a slight odour of garlic, stems quadrangular, leaves like those of "hamaithrui" but larger and less incised; is identified in the added Synonyms with the "mithrithaniōs:" the "shkordium" is mentioned also by Ebn Baitar: *T. scordium* was observed by Forskal, Sibthorp, and Fraas, in watery places from the Peloponnesus to the Dardanelles; by Schimper, in Abyssinia (A. Dec. g. b. 1015); and according to Clot-Bey has recently been introduced into Egypt; imported "scordium" is enumerated among the ingredients of the Egyptian theriac, and was observed by Forskal mat. med. employed medicinally. Westward, the "skōrthiōn" or "skōrviōn" or "plēuritīs" or "thusōsmōn" is further identified in Syn. Diosc. with the "phrixagō palōustris" of the Romans; and the medicinal use of "scordium" is enumerated by Pliny xxvi. 48 to 85: *T. scordium* is termed "chamædrys palustris canescens seu scordium officinarum" by Tournefort inst. 205; was observed by Lenz in Italy; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 593, Lam. fl. fr., and Pers.). "*T. scordioides*," termed "c. cretica palustris canescens scordioides betonicæ folio" by Tournefort cor. 14, and observed by Sibthorp, and Bory, on Crete and the Peloponnesus, is regarded as not distinct (Steud.).

Corylus avellana of Europe and the adjoining portion of Asia. Called in Britain *filbert* or *hazel*, in Anglo-Saxon "hæsl" or "hæsel" from "hæs" behest (Prior), in France "noisette" or "aveline" (Nugent), in Germany "hasel," in Italy "nocciolo" or "avellano" (Lenz), in Greece "lēphtōkaria" (Sibth.) or "phōuntōkia" (Forsk.), in Egypt "bondok" (. .), in Egyptian "pantōki" (Kirch.): the ΘΑΞΙΑΙ: ΚΑΡΥΑΙ of the Hippocratic writings — are referred here by Sprengel: the "ēraklē-ōtikē karua" is described by Theophrastus iii. 15. 1 as hardy, wild on the mountains as well as cultivated, its leaves like those of the alder but wider; and "pōntika" are identified by Dioscorides i. 179 with "lēptōkarua:" *C. avellana* was observed by Forskal, and Sibthorp, on the mountains of Greece and around Constantinople; and imported nuts were seen by Abd-allatif, and Baumgarten i. 14, in Egypt. Westward, cultivation of the "nux avellana" is mentioned by Cato, Virgil, Columella, and Pliny, the name derived by Servius from the town of Avellano in Campania; the "corylus" is mentioned by Virgil, Columella vii. 9. 6, by Pliny xvi. 30 as growing both on plains and mountains, and "coryleta" hazel-thickets by Ovid: *C. avellana* occurs in remnants in forests buried under the sea along the coast of France and England; in peat-bogs on the Shetland Islands, where the living shrub is no longer known (Edmonst., Austen, and Beud.); also in debris of the earliest lake-villages

of Switzerland (Heer); is termed "*c. sylvestris*" by Tournefort inst. 582; was observed by Munby in one locality in Algeria, perhaps not indigenous; by Lenz, wild in Italy; is known to grow wild on the mountains of Sicily Sardinia and Corsica (Guss., Moris, and Salis) and throughout middle and Northern Europe as far as Lat. 65° 30' (A. Dec.). Eastward from the Black Sea, is known to grow in Northern Asia (Pers.); and was observed by Kaempfer, and Thunberg, in Japan. Filberts are largely imported into Northeast America, but I have not heard of attempts at cultivation. (See C. columna.)

Lepraria flava of Northern Climates. The ΨΩΡΑΝ ΕΛΑΙΗΞ and ΔΑΦΝΗΞ of the Hippocratic writings,—and Theophrastus iv. 16, is referred to this genus by Billerbeck: the "*limus arborum*" by the Greeks called "*lichena*," is described by Pliny xxiii. 69 as growing on plum trees wild and cultivated, and used medicinally: *L. flava* was observed by Sibthorp on old trees in Greece. Westward, is termed "*b. pulverulenta flava lignis adnascens*" by Dillenius iii. pl. 1; and is known to grow throughout middle Europe (Engl. bot. pl. 1350).

The ΤΕΤΡΑΓΩΝΟΥ of the Hippocratic writings—is identified by Galen voc. Hippocr. 578 with "*stimmi*" or *antimony*: "*stibium*" is mentioned by Celsus; and "*stimmi*," by Dioscorides, and Pliny.

"363 B. C." (Diod., and Clint. iii. p. 421), Mithridates succeeded by Ariobarzanes II. as king of Pontus in Asia Minor.

Origanum Heracleoticum of the Mediterranean countries. Called in Greece "*rigani*" (Fraas); and the "*kōnilēn*" discovered by Conilus—is identified through Syn. Diosc. with the "*ōrganōs ēraklēōtikē*" of Dioscorides, strewn to drive away reptiles as well as taken against their bites, having an umbel not rotate but as if separated, and referred here by writers: the "*lēukē ōrganōu*" is mentioned by Theophrastus vi. 2. 3; and the "*ēraklēōn ōrganōn*" by Nicander ther. 627: *O. Heracleoticum* was observed by Sibthorp, Chaubard, and Fraas, in dry mountainous situations from the Peloponnesus throughout Greece; and by Forskal within the city of Constantinople. Westward, the "*origanum heracleoticum*" of the Greeks is identified by Pliny xx. 62 with the "*cunila gallinacea*;" known to Plautus trinum. 4 as growing in Pontus; mentioned also by Cato 127, Serenus 909; and termed "*gallicam*" by Apuleius 122 (Spreng.). *O. Heracleoticum* is described by Matthioli comm. 519, and Lobel pl. 492; is termed "*o. sylvestre album*" by Tournefort inst. 199; was observed by Lenz in Italy; and is known to grow in other parts of Southern Europe (Pers.; see *O. Creticum*).

"362 B. C." (Sm. b. d.), at Rome, Q. Servilius Ahala and L. Genucius consuls, half of the military tribunes for the first time elected by the people.

"June" (Plut., and Clint.), defeat of the Spartans at Mantinea by the Thebans under Epaminondas; who however was mortally wounded.

After the battle at Mantinea and before the close of the year ("Ol. 104. 3" of Diodor. xv. 92, and Blair), by Agesilaus III. Proclid king of Sparta, an army sent into Egypt to assist Tachos against the Persians.

361 B. C. = "45th year of Artaxerxes II.," in a Greek inscription (2691 of Boeckh ii. p. 468).

"In this year" (Polyb., Diodor., and Clint.), peace among the States of Greece.

"The same year" (Sm. b. d.), at Rome, C. Sulpicius Peticus and C. Licinius consuls; invasion of the Gauls; and a Gaul advancing and challenging the Roman army killed in single combat by T. Manlius, who from the captured chain received the name of Torquatus.

"360 B. C." (Sm. b. d.), at Rome, C. Poetelius Libo Visolus and M. Fabius Ambustus consuls; the Gauls and Tiburtines defeated by the dictator Q. Servilius Ahala.

"359 B. C." (Diodor., and Clint.), Perdiccas king of Macedonia slain in battle against the Illyrians, and succeeded by his brother Philip. Who defeated the Athenians at Methonē; made peace with them; and before the close of the year, defeated the Illyrians under Bardylis.

"The same year" (Astronom. can., and Clint. ii. p. 382), Artaxerxes II. succeeded by Artaxerxes III. Ochus, eleventh Persian emperor.

Tamarix dioica of Hindustan. A very graceful shrub called "*surroo*" or "*lal jhau*" (Roxb.), in Sanscrit "*jhavaca*" or "*pichula*," and along the Ganges pointed out to W. Jones as the "*gaz*" of the Persians, used by them for arrows in ancient times, the celebrated shaft of Isfendiya being made of it—(asiat. res. iv. 268): the Indian "*murikēs*" is described by Theophrastus v. 4. 8 as differing in having strong wood: *T. dioica* was observed by Graham "common in the beds of the Concan and Deccan rivers;" by Roxburgh, and Wight, in other parts of Hindustan as far as Bengal.

"358 B. C." (Sm. b. d.), C. Fabius Ambustus and C. Plautius Proculus consuls, fighting around Rome against the Tarquinians, Gauls, and Hernicians, and the alliance with Latium renewed.

"357 B. C. = 12th year of Hien-wang" (Chinese chron. table), beginning of the Thirty-ninth cycle.

"The same year" (Sm. b. d.), at Rome, C. Marcius Rutilus and Cn. Manlius Capitolinus Imperiosus consuls, C. Licinius fined for violating his own law, having acquired too much public land.

"Aug. 9th" (Plut., and Clint.), *eclipse*: Dion immediately afterwards sailing from Zacynthus for Sicily:

"356 B. C." (Sm. b. d.), at Rome, M. Fabius Ambustus and M. Popilius Laenas consuls; the Etruscans defeated by C. Marcius Rutilus the first plebeian dictator.

"In this year," defeat and death of the historian Philistus, and expulsion of Dionysius II., Dion establishing himself as king at Syracuse. — He reigned less than four years.

Euphorbia falcata of the Mediterranean countries. The ΠΕΠΛΟΣ prescribed by (Leophanes) Superfœt. 19, — and Paulus Aegineta, spreading on the ground according to Dioscorides in gardens and vineyards, and identified in the added Synonyms with the "sukên" or "mekôna aphrôthê," is referred here by Sibthorp: *E. falcata* was observed by Sibthorp, and D'Urville (Bory), in vineyards and cultivated ground in Greece and on the Greek islands. Westward, the account by Pliny xxvii. 93 of the "pêplis" or "sycen" or "meconion" or "mecona aphrode" seems taken from Dioscorides: *E. falcata* is described by Barrelier pl. 751; is termed "tithymalus annuus supinus folio rotundiore acuminato" by Tournefort inst. 87; was observed by Boccone xxiv. pl. 13 in Sicily, and is known to occur in cultivated ground in Southern and as far as middle Europe (Jacq. austr. pl. 121, Pers., and Lindl.).

Euphorbia peplus of Europe and Northern Asia. An allied species called in Italy "rogna" or "fico d' inferno" (Lenz), in Greece "galazitha" (Sibth.), in Egypt "mælæke," in Yemen "sabia" or "subbejd" (Forsk.); and possibly the "sukên" of Syn. Diosc. and "pêplôs" in question: — *E. peplus* was observed by Sibthorp, and Chaubard, in vineyards and cultivated ground from the Peloponnesus throughout Greece and the Greek islands; by Forskal, and Delile, in Egypt; and by Forskal among the mountains of Yemen. Westward, is described by Bauhin hist. iii. 670, and Morison x. pl. 2; is termed "t. rotundis foliis non crenatis" by Tournefort inst. 87; was observed by Lenz in Italy; and is a "weed in cultivated ground" throughout middle Europe as far as Britain (Engl. bot. pl. 959, Pers., and Lindl.). Eastward from Greece, was observed by Thunberg in various parts of Japan, but no native name is given. By European colonists, was carried to Northeast America, where it continues in "waste places in the Eastern States, rather rare" (A. Gray). Its medicinal properties according to Lindley are "the same as in *E. falcata*."

"355 B. C." (Sm. b. d.), at Rome, C. Sulpicius Peticus and M. Valerius Poplicola consuls, both of them patricians in violation of the Licinian law.

"354 B. C." (Sm. b. d.), at Rome, M. Fabius Ambustus and T. Quinctius Pennus Capitolinus Crispinus consuls, again in violation of the Licinian law both of them patricians. League with the Samnites.

Sargassum natans of the North Atlantic and the Mediterranean. The ΦΥΚΟΣ of the Scylacean Periplus — is referred here by Sprengel: *S. natans* is termed "f. folliculaceus serrato folio" by Tournefort inst. 568; was observed by Sibthorp, and Bory, floating at sea from Cadiz throughout the Mediterranean to the Greek archipelago and the Propontis; and is known to occur in frequent tufts throughout the Gulf Stream to the terminal accumulation called the "Sargasso Sea," and is sometimes driven Northward as far as the coast of Britain (Engl. bot. pl. 1967).

Laminaria bulbosa of the Mediterranean. A species of *sea-belt* (Prior) or *kelp*: and the ΦΥΚΟΣ of Scylax p. 126 — is further identified by Sprengel with the "zöstêra;" described by Theophrastus iv. 6. 2 as "platuphullôn tainiôëithês" and having an onion-like root, referred here by writers: *L. bulbosa* is described by Turner, and Lamouroux, and was observed by Fraas on the coast of Attica. *L. Blosevillii*, four to eight feet long, and according to Bory formerly discovered by Bloesville among the Greek islands, may also be compared.

"353 B. C." (Sm. b. d.), at Rome, C. Sulpicius Peticus and M. Valerius Poplicola again consuls. War against the Tarquinians and Caere; and a truce made with Caere for a hundred years.

"In this year" (Diodor., and Clint.), death of Mausolus king of Caria. — His memory was consecrated by his widow Artemisia by a tomb much celebrated for its magnificence; and the origin of our English word "mausoleum."

"352 B. C." (Sm. b. d.), at Rome, P. Valerius Poplicola and C. Marcius Rutilus consuls, "quinqueviri mensarii" appointed for a general liquidation of debts.

"351 B. C." (Sm. b. d.), at Rome, C. Sulpicius Peticus and T. Quinctius Pennus Capitolinus Crispinus consuls, the first plebeian censor C. Marcius Rutilus; war against Tarquinii, and a truce for forty years granted.

"In this year" (Blair), Sidon besieged by a Persian army, and burned by its inhabitants; involving in the flames their own destruction.

The same year (= 369 — "18 years"), end of the Egyptian Chronicle.

Sison amomum of Europe and the adjoining portion of Asia. Called in Italian drug-shops "amomo germanico" (Targ.); and the $\Sigma\text{E}\text{I}\Sigma\Omega\text{N}$ of Axionicus — (Poll. onomast. x. 122), a small seed according to Dioscorides resembling that of "sēlinō" but hot to the taste, growing in Syria and employed there as a condiment, is referred here by writers: *S. amomum* was observed by Sibthorp from the Bithynian Olympus to the environs of Smyrna. Westward, the "sison" is mentioned by Pliny xxvii. 15, and Apuleius Barbarus 94 (Fraas): the "amomon" herb by Pliny xxvi. 19; and from mediæval times "semen amomi" have been sold in the drug-shops of Europe (Spreng., and Lindl.): *S. amomum* is described by Dalechamp 708; is termed "*sium aromaticum, sison officinarum*" by Tournefort inst. 308; and is known to occur in "chalky fields" in Carniolia, France, and Britain (Scop., Pers., Engl. bot. pl. 954, and Lindl.). The seeds according to Lindley are "pungent and aromatic" but have a nauseous smell when fresh.

"350 B. C." (Diodor., and Clint. ii. p. 383), Egypt re-conquered by the Persians with the aid of Greek mercenaries. The name of the reigning emperor, Artaxerxes III. Ochus, has not been found on the Egyptian monuments (Glid., and Leps. k.).

Aucklandia costus of Cashmere. An imported root called in commerce *costus*, in Arabic "kust" (Royle), in Egyptian "ris" — (Edw.): in which we recognize the "kōstōs" enumerated among imported fragrant roots by Theophrastus ix. 73 and odor. 28 to 34; used by the Romans in supplicating the gods (Plin. xxii. 56), mentioned also by Horace, Ovid, Celsus, Lucan ix. 917; and according to the Erythræan Periplus brought from the Indus: three kinds are mentioned by Dioscorides; and two kinds "from the island of Patale at the mouth of the Indus" by Pliny xii. 25: the "kust" is mentioned by Rhazes, Avicenna, Abd-allatif, Ebn Baitar, and Persian medical writers; and the root in question was traced by Falconer to *A. costus*, observed by him growing in the valley of Cashmere. Eastward, was found by Garcias brought to Malacca for export to China; and according to Royle (in Kitt. bibl. cycl.), is an ingredient in the incense burned in Chinese temples and houses.

"In this year" (Liv., App., and Sm. b. d.), the Gauls defeated by the consul M. Popilius Laenas; and a triumph celebrated, the first obtained by a plebeian. A second temple to Apollo built in Rome.

"In this year" (Böthling, Roth, Lassen, and Buns. iv. 7. 3.), Panina the grammarian, founder of *Sanscrit literature* — the oldest Sanscrit prose occurring in the Bramana or books of ritual, and the Upanishad or philosophical treatises. (Panina may have lived to the time of Alexander's invasion).

As early probably as this date (Theophrast., and Cic. acad. quaest. ii. 39), Hicetas of Syracuse maintaining That the heavens are stationary, and that the Earth turns on itself or rotates.

The Niobe group of statues — (referred by writers to the Fourth century B. C., Lubke and Lutrow) impressed me more deeply than any work of art I ever met with. For a different reason, I was interested in the Scythian slave preparing to skin Marsyas; as being in the days of the sculptor a truthful representation of the people on the North of Greece.

"348 B. C." (Sm. b. d.), at Rome, M. Valerius Corvus and M. Popilius Laenas consuls, renewal of the treaty with Carthage.

The same year (= 339 + "2 + 3 + 4 years" of the Afr.-Maneth. table = 332 + "6 + 4 + 6 years" of the Euseb.-Maneth. table), a date thus found in both the Maneth. tables, and possibly marking some event (see B. C. 339).

The Greek physician Mnesitheus may have been at this time writing. — He is quoted by the comic poet Alexis.

The tree MYA Σ enumerated among articles of food by Mnesitheus — (Oribas. ii. 68) is referred by writers to the dormouse, *Myoxus glis*: the "μυόχως" is mentioned by Oppianus cyn., Epiphanius haer. 64, and as eaten in Italy by Galen al. fac. iii. 2: the "glis" is mentioned by Plautus, Lupinus or Hirpinus, Petronius, Pliny, Martial, and Apicius; was the subject of a Roman sumptuary law in "B. C. 115;" and the "glirarium" park for keeping dormice, is described by Varro iii. 15. The dormouse continues to be eaten in Italy, and is even reared for that purpose in Carniolia, Carinthia, and Styria (Gesn., Matthiol., Valvasor, and Daremb.).

"347 B. C." (Clint. ii. p. 156), Syracuse recovered by Dionysius II.

"In this year" (= Ol. 108. 1, Cic., Senec., D. Laert., and Sm. b. d.), at Athens, death of Plato. He was succeeded by his pupil Speusippus as head of the Academic school of philosophy.

Brassica napus of Europe and the adjoining portion of Asia. Called in Britain *coltza* or *rape* or *navew* (Prior), in France "colza," in Italy "rapaccione" or "navone selvatico" or "napo silvestre" (Lenz), in Egypt "selgam" (Del.); in which we recognize the "napus" identified through Pliny with the BOYNIA Σ of Speusippus. — Diphilus Siphnius, Artemidorus, Nicander fr., Columella, Dioscorides, and Athenæus ii. 71 B. *napus* was observed by Fraas in hilly situations in Greece, where it is or has been cultivated; is known to occur seemingly wild in Armenia, Russia, and "perhaps Siberia" (Billerb. p. 170, Ledeb., and A. Dec.); the "seljam" was seen in Egypt by Abd-allatif; and *B. napus*, by Delile, and Clot-Bey, cultivated in Upper Egypt for the oil from its

seeds. . Westward, "coles rapicii" and "semen rapicium" are mentioned by Cato; the "napus" by Columella xii. 56. and Pliny xx. 11: B. napus is described by Miller; is cultivated in middle Europe for the oil from its seeds, and is known to grow wild in maritime situations as far as Gothland and the neighbouring portion of Sweden (Pers., and Fries p. 29).

"345 B. C." (Sm. b. d.), the comic poet Alexis mentioned by Aeschines in his oration against Timarchus. — Alexis satirized Demosthenes in "343," alluded to the decree through Sophocles of Sunium against the philosophers in "316," exhibited plays in "306," and was alive in "288" (Sm.).

Tordylium maximum of Europe and the adjoining portion of Asia. Called in Britain *hartwort* (Prior); in which we recognize the $\Xi\epsilon\Xi\epsilon\alpha\iota$ of Alexis,—resorted to before delivery by the female stag according to Aristotle an. ix. 5: T. maximum was observed by Sibthorp, and Chaubard, from the Peloponnesus to Constantinople. Westward, the "seselis" is mentioned by Cicero, and as sought by the female stag by Pliny viii. 50: T. maximum is described by Parkinson th. 908, and Tournefort inst. 320; is known to occur in waste places and along hedges throughout middle Europe as far as the three Southern counties of Britain (Ray, Jacq. austr. pl. 142, Pers., Wats., and A. Dec.).

Nardostachys jatamansi of the Himalayan mountains. A Valerianaceous herb called there "jatamansē" or "balchur" (W. Jones), and *spikenard* in Hindustanee "jatamasi" or "chhar" or "sambuluttib" or "nard" (D'roz.); in which we recognize the "nardus indica spica" found by Forskal mat. med. imported from Hindustan into Egypt, the "nardi spica" of an ointment used by the Parthian kings (Plin. xiii. 2), and perhaps the $\text{NAP}\Delta\text{ON}:\text{BABY}\Lambda\text{ONIAKON}$ of Alexis — (Poll. onom., named from the route of importation): "narthōs" having a spike is mentioned by Nicander ther. 604; "narthōu inthikēs" called "gaggitis" from the river along the mountains on which it grows, by Dioscorides; "nardum indicum," by Pliny; "narthōu stabuōs" by Galen fac. s mpl. viii. 84, and Paulus Aegineta; and "sunbul hindē" by Avicenna, and Persian medical writers: "espi" of "Bangala" was seen in Hindustan by Marco Polo 126; the spikenard of commerce was traced by W. Jones to the long hairy root of *N. jatamansi*, and living specimens were brought from the Himalayan mountains to Royle (Kitt. bibl. cycl.). Imported spikenard according to Lindley "has been highly esteemed not only as a perfume, but as a stimulant medicine." (See *Rosa centifolia*).

Patrinia scabiosaefolia of the Himalayan mountains. An allied plant, possibly the "narthōn vavulōniakōn" in question: — beyond Babylon and before reaching Hindustan, Alexander met with the "narthōs" growing wild (Onesicrit., and Strab. xv. 1. 22): the "narthōu suriakē" growing according to Dioscorides on the same mountains with the first kind, but on the slope facing Syria, yellow and very fragrant but with a "kupēirizēin" odour, enumerated by Pliny xii. 26 as highly esteemed by the Romans, is referred here conjecturally by Sprengel: *P. scabiosaefolia* is described by Fischer; and was ascertained by Sprengel to grow "in Imao et Emodis montibus."

344 B. C. (= 322 + "22 years reign" in the Mahavamsa v.), Dasesittica-Nandeya succeeded by Danepala-Nandeya now Hindu king. — He is called Nanda in the Avadana-asoka (Burn. i. 359, see also Puranas, and Wilford as. res. ix. 87).

343 B. C. (= 347 — "4 years," Clint.), Dionysius II. finally expelled from Syracuse by Timoleon.

"The same year" (Blair, and Sm. b. d.), M. Valerius Corvus and A. Cornelius Cossus Arvina consuls, the Romans now gaining more than local importance: Eastward beyond the limits of Latium, the Campanians claiming their protection, and war commenced in that direction against the Samnites. — The war continued at intervals fifty-three years.

Elettaria cardamomum of the Siamese countries. The imported seeds are called in commerce *cardamoms* (Johnson); in which we recognize the "karthamōmōn" mixed in the Egyptian "kuphi" incense — (Maneth. in Plut. is. and osir. 80), prescribed by Diocles (Orib. excerpt. 52, and Daremb.), and in 1 Morb. mul. 52, imported partly from Media and partly from India in the days of Theophrastus ix. 7, mentioned also by Dioscorides, Celsus, and Pliny. Farther South, "hal" or "kakulah" are mentioned by Gafeki, Avicenna, and Ebn Baitar: cardamoms were observed by Abd-allatif, and Delile in Egypt; by myself, imported there through Mecca and the Thebaid, and everywhere in use in Southern Arabia. Eastward, are called in Persian "hil," in Hindustanee "kakulah," in Sanscrit "buhoola" or "ela nishkooti," in Bengalee "elachi," in Telinga "sana-yallacci" (D'roz., and Lindl.), in Tamil "aila-cheddie" (Drur.): the living plant was observed by Rheede xi. pl. 4 and 5, Roxburgh, and Lush, under cultivation in Hindustan (Graham), and springing up spontaneously on clearing the forest in Wynaad and other hilly districts (Drury). Farther East, cardamoms are enumerated by Edrisi as brought to Aden from "China" (meaning Siam); *E. cardamomum* is described by Sonnerat ii. pl. 136: was observed by Bontius on Java; and according to Mason v. p. 496, abounds in the "forests of Tavoy and Mergui," the seeds collected in former times by the Karens for tribute, and is called "bala."

This word "bala" seems the origin of the Sanscrit, Persian, and Arabic names, and may therefore be regarded as an early specimen of the *Burman language*.*

"340 B. C." (Sm. b. d.), total defeat of the Latins at mount Vesuvius by the consul T. Manlius Torquatus, partly through the self devotion of his colleague P. Decius Mus. A son of T. Manlius Torquatus, having contrary to orders engaged and slain an enemy in single combat, was put to death by his father; and the supremacy of Rome over Latium was now established.

The same year = "20th year of Artaxerxes III. Ochus," mentioned in both the Maneth. tables.

"In or about this year" (Lubke and Lutrow), at Priene in Asia Minor, building under the architect Pytheos of the temple to Minerva.

Various animals of "Ethiopia" or Abyssinia described by Dinon, as ΟΡΝΙΘΑΣ: ΤΟΥΣ: ΜΟΝΟΚΕΡΩΣ — (Aelian xvii. 10), the Abyssinian *hornbill*, Buceros.

The ΥΣ: ΤΕΤΡΑΚΕΡΩΣ — the Abyssinian boar, *Phacochoeres leliani*: mentioned also by Agatharchides (Ael. v. 27); the "hóirélaphōn" seen and eaten in Abyssinia by Cosmas Indicopleustes xi. p. 336, according to his accompanying figure, is clearly the same animal:

And ΠΡΟΒΑΤΑ devoid of wool, ΤΡΙΧΑΣ: ΔΕ: ΚΑΜΗΛΩΝ: ΕΧΟΝΤΑ — the Somali or hairy variety of the *sheep* (already mentioned).

"339 B. C." (Diodor., and Clint.), the Carthaginian army defeated in Sicily at the river Crimisus by Timoleon king of Syracuse.

"In this year" (. . Sm. b. d.), at Athens, Speusippus succeeded by Xenocrates as head of the Academic school of Philosophy.

"The same year" (Syncell.), end of the Maneth. tables. Clearly the initial point of reckoning, — notwithstanding that Arses is mentioned, and the death of Darius. (If however as Syncellus further states, the point of reckoning is from the conquest of Egypt by Alexander, see B. C. 348).

"338 B. C." (Clint. ii. p. 382, = 340 — "2 years" of the Afr.-Maneth. table, see Astronom. can.), Artaxerxes III. succeeded by Arses, twelfth Persian emperor. He reigned only "two" years (according to the Astronomical canon); and his name has not been found on the Egyptian monuments.

"The same year" (Dionys., Diodor., and Clint.), the Athenian and Theban armies defeated at Chaeronea by Philip, and the last obstacle to his ascendancy over the States of Greece now removed. On the battle-field, a colossal statue of a lion was erected: — mentioned by Pausanias ix. 40. 10; but at the present day in fragments, and the only sepulchral monument of "the better days of Hellas, with the exception perhaps of the tumulus of Marathon, the identity of which is beyond dispute" (Mure in Sm. geogr. dict.).

Acacia fistula of the Upper Nile. A tree called by the Arabs "soffar" flute, by the natives of Soudan "whistling tree" (Schweinf.); and the ΚΙΘΑΡΑ plant of Clitonymus, growing on mount Pangaeus from the blood of Orpheus, and emitting the sound of a harp during the Dionysia — (Plut. flum. 3. 4). notwithstanding the different locality may be compared: *A. fistula* was observed by Schweinfurth iii. in Lat. 10° on the Upper Nile, conspicuous in the *Acacia* groves throughout an area a hundred miles square, yielding gum, and the holes left by the departure of a gall-insect rendered musical by the wind like "a thousand flutes give out their hollow dirge."

"337 B. C." (Sm. b. d.), at Rome, C. Sulpicius Longus and P. Aelius Paetus consuls, the first plebeian praetor (?). Publius Philo.

"336 B. C." (Eratosth., Arrian, and Clint.), Philip slain; and the accession of his son Alexander as king of Macedonia.

* *Croton thet-yen-nee* of Burmah. Its roots from early times employed by the natives as a cathartic: — observed by Mason v. 492 abounding "in some parts especially on the Maulmain hills."

"*Croton thet-yen-ka-dau*" of Burmah. A shrub three or four feet high, having similar properties with the preceding — according to the natives: observed by Mason v. 492 frequent "in the neighborhood of Rangoon," and found occasionally in Tenasserim.

Alstonia? let-htuk of Burmah. An Apocynous tree, its bark employed from early times to cure rheumatism, and its very white smooth wood to make yokes, — also chopped and boiled with jaggery by the natives to mix in segars: observed by Mason v. 538.

Wrightia sp. of Burmah. A small Apocynous shrub, from early times employed as a vermifuge: — observed by Mason v. 415 "abundant in the Toungoo forests."

Cynomorium sp. of Burmah. A fungus-like flowering plant, valuable as a styptic: — observed by Wallich in Tenasserim, "parasitical on the roots of trees" (Mason v. 505).

Colocasia odora of the Siamese countries. The *fragrant arum* called "peing-ma-haw-ya" (Mason) cultivated from early times, — according to the Burmese "for medicine:" observed by Voight, and Mason v. 436 to 816, the flowers said to be odorous.

"In this year" (Clint. ii. p. 384, = 332 + "4 years" of the Afr.-Maneth. table = 330 + "6 years" of the Euseb.-Maneth. table, see Astronom. can.), Arses succeeded by Darius III. Codomanus, thirteenth Persian emperor. The name of Darius III. has not been found on the Egyptian monuments.

Rice, called in Arabic "arz" or "rouz" (Del.), heard of by the Greeks as a production of Hindustan as early probably as this date, — for "ōinōn ōruzēs" *arrack* is mentioned by Aristotle viii. 26 as sometimes given to elephants: "ōruza" was found by Alexander's Expedition under cultivation in Hindustan (Aristob.), and the account by Theophrastus iv. 4. 10 seems to imply that the living plant continued unknown in the Mediterranean countries. If the above names are derived from the Malay "bras," this may prove the earliest instance of the incorporation of a *Malay word* in the Greek language (see *Oryza sativa*).

"335 B. C." (Plut., Arrian, and Clint.), Boeotian Thebes, having revolted, destroyed by Alexander, and Pindar's house alone left standing. Next sending to Athens, Alexander demanded the persons of the orators; but was propitiated by Demades. The following orators were named, Demosthenes, Polyeuctus, Ephialtes, Lycurgus, Moerocles, Damon, and Callisthenes, with the Athenian general Charidemus; according to other accounts, the demand was for "ten;" and (according to Arrian), Hyperides, Diotimus, and the Athenian general Chares, were included.

"The same year" (Suid., and Clint.), comedy exhibited by Philippides; by grammarians regarded as one of the six standard poets of the "New Comedy."

"In this year" (Evaenetus being archon, according to the inscription), building at Athens of the choragic monument of Lysicrates.

"The same year" (Sm. b. d.), Aristotle returning from Macedonia to Athens.

Aristotle meteor. i. 3 speaks of the Earth as shown by astronomical theorems to be "much smaller than some of the stars;" and that these are far more distant from us than the sun; the sun being at the same time more distant than the moon (i. 8).

The phenomenon of *red snow* described by Aristotle animal. v. 19; and "red and hairy $\varepsilon\kappa\omega\lambda\eta\kappa\epsilon$ worms" mentioned in connexion.

The $\iota\pi\pi\epsilon\lambda\lambda\alpha\phi\omicron\varsigma$ described by Aristotle ii. 1 as inhabiting Arachosia — (South of the Paropamisus), is admitted to be the *Indian stag*, *Cervus hippelaphus*.

The "badizahr," mentioned by Aristotle — according to Ebn Baitar, also by Rhazes, Haly Abbas, Avicenna, and Serapion, is admitted to be *bezoar stones*; highly prized among Orientals, and ascertained by Bontius to be alvine concretions formed in various quadrupeds, in goats, gazelles, and monkeys.

The $\mu\upsilon\varsigma\colon\tau\omicron\colon\kappa\eta\tau\omicron\varsigma$ described by Aristotle an. iii. 12 as having in the mouth instead of teeth bristles like those of the swine, — is referred by writers to the *right whale*, *Balæna mysticetus*. Confirmation is found in the $\kappa\eta\tau\eta$ being enumerated in iii. 20 among other sea-animals having mammæ and milk.

The insect produced among books, described by Aristotle an. v. 32 as resembling the garment moth, — may be compared with the *Lepisma*. This insect has been introduced by European colonists into North America; where it is now often seen in houses and among heaps of paper.

The other insect produced among books, described by Aristotle as small and like $\varepsilon\kappa\omicron\pi\pi\iota\omicron\iota\varsigma$; $\alpha\eta\epsilon\upsilon\colon\tau\eta\varsigma$; $\omicron\upsilon\pi\alpha\varsigma$, scorpions without the tail, — is clearly the false-scorpion or Chelifer. This insect has been introduced by European colonists into North America; where it is now occasionally met with in houses.

Habzelia Æthiopica of Equatorial Africa. A tree whose transported fruit is called in Darfour "kumba" (Browne), in Egypt "amama" (. . .); in which we recognize the $\alpha\mu\omega\mu\omicron\nu$ of Aristotle, — Theophrastus ix. 7. 2 and od. 32, described by Dioscorides as woody and convoluted in the form of grapes, termed "amomi uva" by Pliny xii. 28, mentioned also by Athenæus xi. 11, and Isidorus: the dried fruit of *H. Æthiopica* was received from Egypt by Matthioli; is termed "piper Æthiopicum" by Lobel pl. 205, "habzeli" and "piper nigrorum" by C. Bauhin pin. 412; was seen by Forskal mat. med. p. 164, and Delile, in the drug-shops of Egypt; by Browne, brought by the Soudan caravans to Darfour; and according to Lindley, the tree grows in Sierra Leone and in the "palmwoods of Senegambia." and its "fruit, pungent aromatic and often substituted for other spices, is the "piper æthiopicum" of commerce. *H. aromatica* found by Aublet i. pl. 243 in the woods of Guiana, the fruit "employed by the Blacks in lieu of spice" (Lindl.), is described as distinct, but is at least an introduced tree, indigenous according to Bojer on the Mauritius Islands.

Phaca Boetica of the Mediterranean countries. Called in Greece "agriōkōukia" or "agriōlōupinō" (Sibth.); and the $\varepsilon\iota\varsigma\tau\pi\omicron\nu$ plant growing along the Scamander according to Aristotle probl. 160, resembling the $\epsilon\pi\epsilon\beta\iota\nu\theta\omega$ and named from the rattling seeds, — may be compared: *P. Boetica* was observed by Sibthorp, and Chaubard, on mountains from the Peloponnesus to Cyprus. Westward, is termed "astragalus primus sive boeticus" by Clusius hist. ii. 233, "astra-

galoides lusitanica” by Tournefort inst. 399; and is known to grow in Barbary, Spain, and Portugal (Desf. atl. ii. 180, Pers., and Spreng.).

Rosa glutinosa of Crete. The ΡΟΔΑ with ΟΜΦΑΛΟΞ : ΤΡΑΧΥΞ mentioned by Aristotle probl. v. 8,—by Theophrastus vi. 6. 4 as large and sweet-scented “trahu tō katō,” may be compared: *R. glutinosa* is termed “*r. cretica montana foliis subrotundis glutinosis et villosis*” by Tournefort cor. 43; is described by Sibthorp “*fructibus globosis pedunculisque hispidis*,” as observed on the mountains of Crete.

Picris? asplenoides of the Mediterranean countries. An herb called in Greece “*pikralitha*” (Sibth.), in which we recognize the ΠΙΚΡΙΔΟΞ of Aristotle an. ix. 8,—named from its bitterness and flowering throughout the year according to Theophrastus vii. 11. 4, mentioned as edible in the Septuagint translation of ex. xii. 8: *P. asplenoides* is regarded by Chaubard as a species of *Apargia*, and was observed by him and Sibthorp, in the Peloponnesus and on Zacynthus. Westward, is described by Linnæus sp. 1115; is termed “*leontodon muricatum*” by L’Heritier pl. 82; was observed by Scopoli in Italy; by Desfontaines 222, in the maritime sands of Barbary (Pers.).

Carthamus leucocaulos of the East Mediterranean countries. A thistle-like plant called in Greece “*atraktuli*” or “*stauragkathi*” (Sibth.); in which we recognize the ΑΤΡΑΚΤΥΛΙΞ of Aristotle an. ix. 30,—whiter than others according to Theophrastus vi. 4. 6, emitting blood-like juice and therefore termed “*phōnōn*,” having also the smell of blood: the “*atraktulis*” is mentioned also by Theocritus iv. 52, is prescribed by Paulus Aegineta; and the description by Dioscorides so far as relates to the flowers being sometimes purplish, may belong here: *C. leucocaulos* is termed “*cnicus creticus atractylidis folio et facie flore leucophæo sive candidissimo*” by Tournefort cor. 33; and was observed by Sibthorp, and D’Urville frequent in Southern Greece and on the Greek islands. Westward, the “*atractylis*” emitting “*sanguineum succum*” seems known to Pliny xxi. 56 only from the account of Theophrastus. (See *C. lanatus*).

Convolvulus dorycnium of the East Mediterranean countries. A branching erect species; and the “*dorycnium*” of Aristotle—(Plin. xxviii. 21), Demophon, Lysimachus the Hippocratean, Nicander alex. 376, growing according to Dioscorides in stony places not far from the sea and resembling a young olive but with smaller and very rough leaves, its branches not a cubit long, flower white, “*ērēvinthōu*”-like follicles containing five or six round variegated seeds almost like “*ōrōvōi mikrōi*,” root a cubit long and believed to induce sleep and even death, is referred here by Linnæus, and Fraas: the “*thōrukiōn*” is identified in Syn. Diosc. with the “*kalēan*” or “*alikakavōn*” of Cratevas; and there is further confusion in names, as appears from Pliny xxi. 105, Galen comp. med. loc. x. 356, and the author of Delet. pharm. 6: *C. dorycnium* is termed “*c. ramosus incanus foliis pilosellæ*” by Tournefort inst. 84; was observed by Sibthorp, Chaubard, and Fraas, in dry stony places near the sea from Crete to the Peloponnesus and Attica.

Stachys lanata of the East Mediterranean countries and Siberia. Called in Greece “*stahus*” (Sibth.); in which we recognize the ΣΤΑΧΥΞ of Aristotle probl. ined. ii. 80,—Aratus, Theocritus x. 47, Apollonius Rhodius, and Nicander ther. 803, growing according to Dioscorides in mountainous and broken places and resembling “*prasiō*,” but whiter and somewhat longer with more stems from the root, the leaves numerous and subrotund hard fragrant hairy and white. *S. lanata* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Smyrna and Constantinople; is known to grow also in Siberia (Jacq. rar. pl. 107, and Pers.).

Avicennia tomentosa of Tropical shores. A *mangrove* called in Yemen “*schura*,” at Muscat “*germ*” (Forsk.); and trees growing in salt-water around the Indian Ocean are mentioned by Aristotle mund. c. 4—(Callim., and Antig. mirab. 147): the “*ēlaa*” growing in the Red Sea beyond Coptum and having fruit like an olive, is mentioned by Theophrastus iv. 7. 1; and the sea-washed “*ēlaian*” with fruit like a chestnut, by Agatharchides 43: *A. tomentosa* was observed by Forskal p. 37 frequent along the islands and shores of the Red Sea, the wood used for fuel, and the leaves eaten by camels, donkeys, and sheep. Eastward, is called in Bengalee “*bina*,” in Telinga “*nalla-madu*” (Drury); was observed by Rheede iv. pl. 45 in Malabar; by Graham, abundant about Bombay; by Roxburgh, Wallich. Wight, as far as the mouths of the Ganges; and by Mason, along the shores of Burmah.

Rhizophora conjugata of the shores of the Indian Ocean. Another *mangrove* included doubtless among the salt-water trees of the Indian Ocean mentioned by Aristotle:—at the mouth of the Indus, the companions of Alexander found trees nearly covered at high-water, one of the two kinds having lupine-like fruit; and Theophrastus iv. 7. 1 to 5 further speaks of a “*thaphnēn*” besides the “*ēlaan*” growing in the Red Sea beyond Coptum: Megasthenes also mentions “*trees growing in the Indian Sea*” (Callim., and Antig. mirab. 147): *R. conjugata* was observed by Rheede vi. pl. 34 in Malabar; by Graham, “*abundantly in salt marshes all along the coast*,” by Roxburgh, and Wight, along the Eastern coast of Hindustan; by Mason, along the coast of Burmah, and called “*pyu*,” by Rumphius iii. pl. 71 and 72, among the Moluccas; by Blanco, around the Philippines, and called in Tagalo “*bacao*” or “*bacavan*.” (Compare *R. Mangle*.)

One hundred and nineteenth generation. Sept. 1st, 334, mostly beyond youth : the Greek poet Myro of Byzantium ; the comic poets, Stephanus, Straton, Euphron, Philemon, Menander, Apollodorus of Gela, Dionysius of Sinope, Timocles, Theophilus, Sosippus, Anaxippus, Demetrius, Archedicus, and Sopater ; the culinary poet, Archestratus of Syracuse ; the philosophers, Crates the cynic, Crates of Tarsus, Stilpo, Polemon, Crantor, Pyrrhon, and Anaxarchus ; the mathematician, Diodorates (Blair) ; the medical writers, Dieuches (Bussem.) ; the historians, Leo of Byzantium, Callisthenes, Anaximenes of Lampsacus, Palaephatus, Marsyas of Pella, Demophilus, Cleitarchus, Ephippus, Cyrsilus, Medius, Clytus of Miletus, and Hecataeus of Abdera ; the orators, Dinarchus, Stratoles, Philinus, Hegemon, and Pythocles ; the grammarian Zoilus ; the musician Aristoxenus ; writers on other subjects, Eudemus, Heracleides of Pontus, Clearchus of Soli, Theocritus of Chios, Chamaeleon, Menaechmus, and Euhemerus ; the sculptor Lysippus ; the painters, Protogenes, Apelles, Melanthus, Nicophanes, and Nicomachus (Bryan).

"The same year" (Lubke and Lutrow), at Athens, building of the Choragic monument of Lysicrates.

The Laocoon group, "the joint work of Agesander, Polydorus, and Athenodorus," is regarded as "probably belonging to the time of Alexander" — (Lubke and Lutrow).

Astragalus Creticus of the East Mediterranean countries. As early probably as this date, "tragakantha" gum *tragacanth* brought from Crete, and supposed to be produced only on that island — (Theophrast. ix. 1. 3) : A. Creticus, termed "tr. cretica incana flore parvo lineis purpureis striato" by Tournefort cor. 29 and trav. i. pl. 21, was observed by him on Crete, yielding white gum tragacanth ; by Sibthorp, on Crete as well as on sandy hills in Ionia as far as the Bithynian Olympus, also yielding tragacanth. A small quantity according to Lindley, supposed by Th. Martius to be the sort "received in the form of threads or slender strips." (See A. aristatus, and A. verus.)

"333 B. C." (. . Sm. b. d.), the consuls at Rome for this year, not mentioned by any ancient authority.

Apollonius of Myndus, educated among the Chaldeans, teaching that *comets* return in long regulated paths — (Senec. quaest. nat. vii. 3 to 17).

Mencius or Meng-tseu ii. 8. 38 (according to his own account) writing more than a hundred years after Confucius.* — He died in his "eighty-fourth year about B. C. 314" (Stan.-Julien).

"332 B. C." (Sm. b. d.), A. Cornelius Cossus Arvina and Cn. Domitius Calvinus consuls at Rome. Alexander uncle of the Macedonian and king of Epirus, at the request of the Tarentines entering Italy ; the Lucanians and Samnites defeated by him near Paestum, and a treaty entered into with the Romans.

About this time (Strab., and Pliny ii. 77). Pytheas from Massalia (near Marseilles) after traversing the whole of Britain on foot, sailed "six days North to ΘΟΥΛΗ" (identified by Claudius Ptolemy with the Shetland Islands, "called by seamen Thylensel" to the present day, according to Ainsworth dict.). In the deficiency of cattle and cultivated fruits, some grain was produced on "Thōulē," as "kēghrō" millet, "sitōs" wheat ; besides "lahanōis" vegetables, and roots for food, and even "mēli" honey ; also that the wheat, on account of the climate, was threshed in "ōikōis mēgalōis" barns. Pytheas sailed far enough North to see *icebergs* ; described by him as something neither air, sea, nor land ; but a concretion of these resembling jelly-fish (Medusa) ; and he was informed that such bound the Universe in this direction, being inaccessible alike to ships and the foot of man. Pytheas also speaks of the Polar circle, where the longest day continues twenty-four hours ; and of the region beyond, where there is constant day during the six summer months and constant night during the six winter ones.

The KANTION described by Pytheas as "some days sail from Kēltikēs" (Strab. i. 4. 3), is possibly Kent ; but may be in Scotland. — The "Kantai" are described by Claudius Ptolemy as dwelling "Northeast of the Caledonian forest" (which would place them at or near the Northern extremity of Scotland).

The ΩΞΤΙΜΙΟΥΞ are described by Pytheas as inhabiting the KABAION promontory (Bretagne in Northern France). — By Cæsar, Strabo iv. 4. 1 and 5, Mela, Pliny, and Claudius Ptolemy, they are called "Osismii."

The island ΟΥΞΙΞΑΜΗ, described by Pytheas as the last one at the extremity of the promontory (Strab. i. 4. 5), is clearly Ushant. Pytheas also maintained, That the Northern portion of Spain is more accessible across France, than by way of the ocean : — a statement repeated by Eratosthenes, but opposed by Artemidorus (Strab. iii. 2. 11).

* *Salix Japonica* of Japan. The "k'i-lieou" according to Meng-tseu ii. 5. 1 woven into baskets, — may be compared with some species of *willow* : *S. Japonica* is described by Thunberg p. 24 as observed in Japan (Pers., and Steud.).

Pytheas mentions "mentonomon," an estuary or bay of the Northern Ocean, upon which the Guttones dwelt (compare Gothland); and a day's sail from this, the amber-producing island named "abalus" — (Plin. xxxvii. 7 or 11). By Timaeus, this island is called "basilia;" a name identified by Zeuss p. 270 with Oesel. The "vasilēiōi" and "ōurgōi" are also mentioned by Strabo, and (according to Talvi introd. and iii. 3) the "idols" also of the Slavonian population of this quarter. The "rugii" are mentioned by Tacitus germ. 43; and are referred by Latham to the people around the Gulf of Riga. In that vicinity, idol-worship and widows "burning themselves with the corpses of their husbands" continued to a comparatively recent period: indicating connexion with Hindustan.

"The same year" (Q. Curt. iv., Churchill coll., and Clint.), at Tyre, a wooden mole built by Alexander destroyed by the besieged citizens by means of a *fire-ship*: a novelty in warfare.

After the fall of Tyre, Alexander entered Egypt, where he founded the city of Alexandria; and after visiting the Oasis of Ammon, returned to Memphis (see Clint.). The city wall of Alexandria — continued standing to the time of the visit of Baumgarten i. 14.

Hieroglyphic ovals of Alexander occur in Egypt (Leps. k. pl. 51): from this date, — the monuments becoming comparatively uninteresting. The imposing temples by no means devoid of taste and all in the Egyptian style of art erected by Alexander's successors, are chiefly inscribed with representations of deities and the ostentatious enumeration of conquests, yet present genealogies, astronomical records, and dates, that the historian might consult with advantage.

From this date also, — *Greek inscriptions* become frequent in Egypt: *Greek papyri* or books also make their appearance; the lost oration of Hyperides discovered by A. C. Harris, being probably among the earliest of these papyri.

"331, in the spring" (. . .), Alexander leaving Egypt, on his expedition Eastward.

"Sept. 30th" (Blair, and Clint.), *eclipse of the moon*. Eleven days afterwards, the army of Darius III. defeated at Arbela by Alexander, and Persian dominion brought to a close. A few days after the battle, Alexander entered Babylon.

The magian, Osthanes the younger, accompanying Alexander on his Eastern expedition — (Plin. xxx. 2).

Pyrethrum parthenium of the Taurian and Caucasian mountains. Called in Britain *feverfew* or *may-weed* or *maghet* or *maithys*, in old English "maydenwede" or "mayde-wede" or "maythys" from the Anglo-Saxon "mægth" maid, by Galfridus pr. pm. "feder-foy" (Prior), in Germany "mutterkraut," in Italy "matricale doppio" (Lenz), in Greece "asprōkhi" (Fraas), in Egypt "achaoan" (Alpin.); in which we recognize the "parthenium" used against intermittent fevers by the Magians — (Plin. xxi. 104), and the "anthēmis" used also according to Dioscorides iii. 144 for the same purpose: the "anthēmōn phullōthēs" having stem-leaves according to Theophrastus vii. 8. 3, is referred here by Fraas: the "duhn el-ukhuwan" is mentioned by Ebn Baitar: and the "ukhowan" in the Thousand-and-one Nights: *P. parthenium* was observed by Guldenstadt on the Beschtau peak of Caucasus (Ledeb.); by Grisebach ii. 203, in mountain meads on the Bithynian Olympus and in European Turkey; by Sibthorp, and Fraas, frequent about dwellings from Euboea throughout Greece; by Alpinus pl. 39, in Egypt; and perhaps the same species, by Forskal on the mountains of Yemen and called "mōniat." Westward, is regarded by A. Decandolle as introduced anciently into Britain, perhaps before the visits of the Romans; was already there in the days of Gerarde; is described by Brunfels iii. 63 (Spreng.); is termed "m. vulgaris seu sativa" by Tournefort inst. 493; seems unknown in Sicily and Barbary (Guss., and Munby); but was observed by Moris on Sardinia, by Lenz seemingly wild in Italy; is known to occur in waste places in Spain and Portugal and throughout middle Europe as far as Denmark (fl. Dan. pl. 674. Brot., and Colm.). By European colonists, was carried before 1669 (Joss.) to Northeast America, where it continues under cultivation in our Northern and middle States, and according to A. Gray "escaped from gardens in some places." The plant according to Lindley is reckoned tonic stimulant and anti-hysterical, was "once a popular remedy in ague," and its odour is said to be peculiarly disagreeable to bees.

"330, July 1st" (Blair, see also Arrian iii. 22. p. 213, and Clint. ii. p. 410 to 419), the dethroned emperor Darius III. put to death; the beginning of the *Cycle of Calippus*, of 76 years = 27,759 days = 940 lunations

"After the death of Darius III." (Arrian, and Clint.), Alexander entered Hyrcania, subduing the country along the Caspian, and next proceeded to Bactra in Central Asia.

"329 B. C." (Arrian, and Clint.), Alexander on his "Sixth" campaign proceeding across the Oxus, and "about four hundred and twenty miles North of Bactra" founding Alexandria on the Jaxartes; changing the name of this river to "Tanais" (Strab. xi. 7. 4). Crossing the river, he next attacked the Scythians; and returned to Bactra, where he passed the winter.

Astragalus aristatus of the mountainous portion of the Mediterranean countries. Called in Greece "köllöstōupa" or "tétragathō" or "tragakantha" (Sibth.); in which we recognize the "tragakantha" *gum tragacanth* found about this time to be produced in other countries besides Crete, and especially of excellent quality in the Peloponnesus — (Theophrast. ix. 1. 3 to 15. 8), mentioned also by Dioscorides, and Galen: *A. aristatus* was observed by Sibthorp, and Fraas, on mountains from the Peloponnesus to Thessalonica and Cyprus, and the collected gum exported from Patras; a fact confirmed by Bory and Chaubard. Westward, "tragakantha" is mentioned by Celsus iv. 4, and Pliny xxvi. 87, doubtless the imported article; but the living *A. aristatus* is described by Garidel pl. 104, and is known to grow on the Alps, and Pyrenees (Hall. 177, All., Pers., and Spreng.).

Astragalus verus of Persia. Perhaps yielding the "tragakantha" about the same time ascertained to be produced in Media — (Theophr. ix. 1. 3): *A. verus* was observed by Michaux in Persia, and was found by Olivier trav. iii. pl. 44 to yield the principal part of the *gum tragacanth* of commerce: "ketire adjami" from Persia was found by Forskal mat. med. in the drug-shops of Egypt; and "cake tragacanth" is regarded by Th. Martius as the product of *A. verus* (Lindl.; see *A. gummifer*).

"328 B. C." (Arrian, and Clint.), after spending in the same quarter his "Seventh" campaign, Alexander wintered at Nautaca "about twenty-two miles from Samarcand, and two hundred and thirty miles North of Bactra."

Amygdalus persica of Central Asia. Called in Britain *peach*, by old writers "peshe" or "peesk," in France "peche," in Old French "pesche," in Spain and Persia "al-berchigo" (Prior), in Germany "pfrsiche," in Italy "peskanoco" or "perseg nos" (Lenz), in Greece "rōthakēkēa" and its fruit "rōthakēna" (Fraas), in Egypt "khokh" (Del.), in Yemen "choch" or "fersik" (Forsk.); and possibly in this campaign first made known to the Greeks: — Theophrastus iv. 4. 2 to vii. 13. 7 had heard of the "pērsikōn" as growing in Media and Persia, yet supposed the almond to be the only tree that puts forth flowers before the leaves; the "persica" was planted in the East Mediterranean countries in the days of Diphilus Siphnius, Philotimus, Dioscorides, Athenaeus iii. 24, and according to Pliny xv. 13 came by the way of Egypt: the "choch" is mentioned by Ebn Baitar: *A. persica* was observed in Egypt by Forskal, Delile, and Clot-Bey; by Forskal, under cultivation on the mountains of Yemen; and by Fraas, cultivated with great success in Greece. Westward, is not mentioned by Cato, and only at a late period came from Asia and Greece into Italy (Plin.); is not mentioned by Virgil, but is figured in the Herculean paintings; and at the present day, is cultivated from Italy throughout middle Europe (Pers., and Lenz). Eastward from Persia, is called in Hindustanee "shaftalu" or "alubalu" or "alubukhara" (D'roz.); has been long known in Northern Hindustan (A. Dec.), and within the Tropics according to Graham "thrives well in the Deccan." Farther East, several kinds came from Persia, Samarcand, and Thibet into China, and the emperor "Vou-ty who began to reign B. C. 130" had in his garden from distant lands peaches, some yellow, others with cloven fruit, and others with fruit detaching itself from the stone (Cibot mem. Chin. xi. 280). By European traders and colonists, *A. persica* was carried to America and the islands of the Pacific, succeeding very generally in Temperate climates, in our Middle States, Chili and Juan Fernandez, New Zealand, and Australia; but in low moist Tropical countries rarely ripening fruit.

Pistacia vera of Central Asia. The *pistachio nut* is called in Italy "pistacchio" or "pistacchio verde" (Lenz), in Greece "phistakia" or "psittakia" (Fraas), in Egypt "festoq" (Del.), in Persia "bstk" (Spreng.); and the rare "tērmīnthōu" bushes, the only thing like a tree found by Alexander in crossing the mountains into Bactria — (Strab. xv. 2. 10), may be compared: a Bactrian tree resembling the terebinth but bearing almond-like nuts, is mentioned by Theophrastus iv. 4. 7: pistachio nuts are called in Hindustanee "pista" or "fistak" (D'roz.), and *P. vera* is known to grow wild in Affghanistan (Royle). The tree was afterwards introduced into the Mediterranean countries, for "pistaki amugthalōēnta" are mentioned by Nicander ther. 891; the "vistakiōn" by Posidonius the Stoic, Athenaeus, and Hesychius; "pistakia" growing in Syria, by Dioscorides; "psittakia" from growing in the city of Psittace on the Tigris, by Damophilus, Athenaeus, Eustathius, Stephanus Byzantinus, Nonus morb. cur. 91 to 240, and the Geoponica: *P. vera* was observed by Chaubard, and Fraas, under cultivation in the Peloponnesus; by Forskal, and Clot-Bey, in the gardens of Egypt, and the importation besides of the nuts from Aleppo is mentioned by Abd-allatif, and Delile. Farther West, the "pistacia" tree was introduced into Italy by Vitellius, and at the same time into Spain by Flaccus Pompeius (Plin. xv. 24); its cultivation in Italy is mentioned by Palladius xi. 12. 3; *P. vera* was observed there under cultivation by Lenz, and is known to have become naturalized in various parts of Southern Europe (Pers., and Lindl.).

"327 B. C." (Aristobul, and Clint.), Alexander next proceeded South, to and across the Paropamisus ridge of mountains; and spent "about ten months" in the country West of the Upper Indus. A "cave" in the Paropamisus was regarded by the Greeks as the one in which

Prometheus was chained (Arrian ind. 5); probably the great *cave-temples* at Baymian, — extant to the present day.

Prangos pabularia of the Northern slope of the Himalayan mountains. Called in Indian bazaars "fiturasuloon" (Royle); and the $\Sigma\Lambda\Phi\text{ION}$ observed on the Indian Caucasus by Aristobulus, eaten by cattle — (Arrian ind.), is referred here by Royle ill. 230, and Burnes: *P. pabularia* was re-discovered by Moorcroft on the border of Thibet near Draz, the leaves dried as winter fodder for cattle; was observed also by Burnes in crossing in the direction of Alexander's route, greedily cropped by sheep and eaten even by his fellow-travellers; a statement confirmed by Kinnier (Lindl.).

Ferula asafetida of Eastern Persia. The "silphiōn" product seen by Aristobulus, — was doubtless *asafetida*: an imported drug "much used by" Burmese physicians, and the plant producing it described in Buddhist books "as one of the ornaments of the Himmalay forest" (Mason v. 497): Burnes trav. ii. 243 found the *asafetida* plant at the elevation of seven thousand feet on the Hindu Kush, eaten by sheep, and its hardened milk put into hair bags and exported, but its root "annual;" and two different fruits were obtained by Royle from the bazaars of India: *F. asafetida*, having a perennial root and growing in Beloochistan, around Herat and on the mountains of Laristan, is described by Kaempfer am. pl. 536 as the *asafetida* plant. Farther West, the "ōpōs mēthikōs" is mentioned by Strabo xi; the "silphiōn" of Media Armenia and Syria, by Dioscorides as having a stronger odour than that of Cyrene; and the "laser" from Persia Media and Armenia was the only kind brought to Rome in the days of Pliny xix. 15: the *asafetida* seen in Egypt by Forskal mat. med. came from "India." (See *F. Persica*).

"In this year" (= 355 — "28 yrs," Puranas, and Wilford as. res. viii. 87), death of the Hindu king Nanda. He was succeeded by his sons.

"326 B. C." (Sm. b. d.), C. Poetelius Libo Visolus and L. Papirius Mugillanus consuls at Rome. Alexander king of Epirus hitherto successful in Italy, defeated and slain near Pandosia by the Bruttians and Lucanians: war now re-commenced between the Romans and Samnites.

Viburnum tinus of the West Mediterranean countries. Called in Britain *laurestinus* (Prior), in Italy "tino" or "lauro tino" (Lenz); in which we recognize the "tinus" identified by Pliny xv. 39 with the "silvestrem laurum:" clearly the $\Delta\Lambda\Phi\text{NHN}$ $\text{A}\Gamma\text{PIAN}$ of Antigonos (the historian of Italy?), — and schol. Nicand. ther. 575, enumerated among evergreen trees by Theophrastus i. 93, although *V. tinus* has not been observed in Greece by modern travellers. Westward, the "*laurus silvatica*" is mentioned by Cato r. r. 3; the "tinus" by Ovid as having blue berries, by Pliny as by some authorities regarded a tree "sui generis:" *V. tinus* is described by Linnæus, and is known to grow wild in Italy, Barbary, Spain, and Portugal; is besides cultivated for ornament throughout middle Europe (Lam. fl. fr., Pers. and Lenz). By European colonists, was carried to Northeast America, where it has become frequent in greenhouses.

"The same year" (Arrian, and Clint.), crossing the Indus, Alexander reached the city of Taxila; whose inhabitants are described by Aristobulus as "exposing their dead to the vultures" (Parsees); and as having in use the *war-conch* (Strab. xv. i. 62).

Continuing Southward across the Hydaspes and other tributaries of the Indus, Alexander defeated the army and *elephants* of Porus; and building boats for his own army, proceeded in them down the river.

Cedrus deodara of the Himalayan mountains. The timber of which these boats were built was doubtless in part *deodar* or *Himalayan cedar*, — known to abound on the tributaries of the Upper Indus, the forests on the mountain-slopes extending from the elevation of "three thousand to nine thousand feet" (Drur.): Royle met with temples and palaces built exclusively of this timber, and leaves and twigs exported Southward are much employed in native medicine (Kitt. bibl. cycl.). Westward, the "diwdar" is mentioned by Avicenna, and according to Ebn Baitar the name is Persian.

Pinus excelsa of the Himalayan mountains. Called there "cheel" (Drur.), growing with the preceding, and its timber doubtless also used by Alexander in building the boats: — tar according to Cleghorn is also afforded by this *pine* (Drur.). Westward, at the distance of "twenty-two hundred miles." *P. excelsa* was observed by Grisebach on the mountains bordering Northern Greece (J. D. Hook. linn. soc. viii. 31, and Daub. 136); if really indigenous there, must exist also on some of the connecting mountain-chains.

Pinus longifolia of the Himalayan mountains. Called there "cheer" or "cheersullah" or "sarul" or "thansa" (Drur.), growing lower down than the two preceding species, from "six thousand to two thousand feet," and its timber or product doubtless used by Alexander in building the boats: — the "sarala" tree to which elephants are tied, and exhaling a pleasant odour when rubbed by them, is mentioned by Kalidasa kum. i. 9 and raghuv. iv. 75: *P. longifolia* was observed by Pearson forming extensive forests towards the sources of the Jumna and Tonse rivers; and tar and turpentine

continue to be obtained from this *pine* by the natives of Upper India (Drur.). From transported specimens, described by Lambert pl. 21.

Euphorbia nereifolia of Tropical Hindustan. Cactiform, called in the environs of Bombay "thor" or "seej" (Graham), in Bengalee "shij," in Hindustanee "ptoon," in Telinga "akoo-jemmoodoo," in Tamil "elakullie" (Drur.); and probably included in the KAYAO Σ with stout spines and copious fig-like juice seen by Aristobulus — (Arr. exp. vi. 22): *E. nereifolia* was observed by Preedy "about Karrachee in Scinde," becoming "a small tree," by Graham all over the "rocky parts of the Deccan," also "common in the Concans," affording "shelter to tigers and other wild animals," and "for a short period during the rains" putting "forth a few leaves;" by myself, in scattered clumps in the open country to the end of my journey; by Rheede ii. pl. 43 in Malabar, employed medicinally by the natives; by Buchanan, and Roxburgh, in other parts of Hindustan as far as Coromandel and Bengal.

Euphorbia ligularia of Tropical Hindustan and the Siamese countries. Cactiform, sacred to Munsu the goddess of serpents, and called in Bengalee "munsa sij" (Drur.); possibly included in the "kaulös" seen by Aristobulus: — *E. ligularia* was observed by Graham "common in Bombay;" by Roxburgh, in Bengal: and according to Drury, is employed as a remedy in snake-bites, and offerings are made to the tree on certain days in July and August; the trunk is used besides by the natives to purify arsenic (journ. agri. Ind. x. 37). Farther East, was observed by Mason indigenous in Burmah and called "sha-zoung;" is known to grow in the Malayan archipelago (Lindl.); "*E. pentagona*" observed on the Philippines by Blanco, and called in Tagalo Pampango and Bisaya "sorosoro" or "sorogsorog" or "bait," in Ylocano "carambuaya," may also be compared.

Cassia (Cathartocarpus) fistula of Tropical Hindustan and Burmah. Called in Egypt and Yemen "chiar schambar" (Forsk.), in the environs of Bombay "bhawa" (Graham), in Hindustanee "amultas," in Telinga "rela," in Tamil "koannay," in Bengalee "sonaloo" (Drur.) or "soondali," in Sanscrit "soovurnuka" (Lindl.); and the small tree seen by Aristobulus in Hindustan, its KYAMO Σ -like pods ten inches long and full of honey which whoever eats will hardly escape death — (Strab. xv. i. 21), may be compared; also the poisonous "kinnam" fruit sweet as honey, of the Mahavamsa iv. p. 44: *C. fistula* was observed by Rheede i. pl. 22 in Malabar; by Graham, on "the Ghauts and hilly parts of the Concan;" by Buchanan, in Karnata held sacred to Ganeshwar and called "cacay," in Mysore stakes of it put in the ground and worshipped; by Roxburgh, Wight, and Drury, in other parts of the peninsula. Farther East, its Pali name "chaturengula" four fingers, is translated in Burmese books, but the tree is at present called "gnu-gyee," is further enumerated by Mason v. 404 to 530 as indigenous, its wood valuable, and selected in preference by the Karens for making bows; was observed by Linschoten in Malacca and Cambaia. Westward, is mentioned by Priscianus (Rhaz.), Nicolaus Myrepsus, and Actuarius; and the "khiar janbar" by Ebn Masawia, Maserjawia, Rhazes, Haly Abbas, and Ebn Gnefith: *C. fistula* was observed by Forskal among the mountains of Yemen, and I found quantities of the pods stored at Mocha for exportation up the Red Sea; the living tree was observed by Abu'l Abbas Nebati, Abd-allatif, Ebn Baitar, Belon, Forskal, Delile, and myself, under cultivation in Egypt; is said to occur also in "Tropical Africa" (Lindl.). By the first Spanish colonists, was carried from Egypt to the West Indies (Sloane ii. 42).

Ficus Indica of Tropical Hindustan. The *Banyan tree* is called in the environs of Bombay "wur" (Graham), in Telinga "marri," in Tamil "ala-marum," in Bengalee "bur" or "but" (Drur.), in Sanscrit "vuta," in Cingalese "bagha" (Lindl.); and the tree seen by Aristobulus and Onesicritus along the Acesines and Indus, its branches descending to the ground, rooting and becoming trunks, — or the "inthikēs sukēs" of Theophrastus i. 7. 3 to iv. 4. 4, and Strabo xv. i. 21, clearly belongs here: *F. Indica* in Hindu mythology is "one of the four shadow-giving trees that grow on mount Meru" (Mason v. 415); was observed by Rheede i. pl. 28 in Malabar; by myself, from Bombay to the end of my journey on the Deccan only in places where it had been planted, trees with more than a single trunk being rare; by Roxburgh, and Drury, in other parts of Hindustan, used medicinally by the natives, and bird-lime manufactured from the milky glutinous juice. Farther East, was observed by Mason "exotic" in Burmah; by Blanco, on the Philippines, and called in Tagalo and Pampango "baliti," in Bisaya "dalaguit" or "nonoc," its inner bark employed by the Negrillos of the mountains to cover their nakedness.

Dillenia pentagyna of Tropical Hindustan. A stately forest-tree called in the environs of Bombay "kurmul" (Graham), in Telinga "rawadarn" or "chinna-kalinga," in Tamil "rai" or "pinē" or "nai-tek" (Drur.); and the leaves large as a shield or buckler attributed to the preceding tree — (Theophr. iv. 4. 4, and Plin. xii. 11), may belong here: *D. pentagyna* is "common along the West face of the Ghauts," its leaves are sold in market "as a substratum for chuppered roofs," and a tree in Kennery forests having "leaves four or five feet long" is regarded by Graham as probably this species, whose leaves diminish in size as the tree grows older: *D. pentagyna* was observed by Law

in the Southern Mahratta country; by Roxburgh cor. i. pl. 20, Wight, and Drury, in other parts of Hindustan, its wood close-grained and used for a variety of purposes, and in Assam for canoes.

Phenix sylvestris of Tropical Hindustan. The *wild date* is called in the environs of Bombay "sindee" (Graham), in Hindustanee "seyndie," in Telinga "eeta," in Tamil "eetchum-pannay," in Bengalee "khajoor" (Drur.); and the trees resembling "ficis" and called "occhi," from which honey flows for two hours in the morning, growing according to Onesicritus in the valleys of Hyrcania — (Plin. xii. 18), may be compared ("ook" being Bengalee and "uch" Hindustanee names of sugar-cane): "phōinikas" were seen by Androstenes on the isle of Tyle (Theophr. iv. 7. 8); *P. sylvestris* was observed by Rheede iii. pl. 22 to 25 in Malabar; by Graham, in the environs of Bombay; by Roxburgh, Royle, and Drury, common all over India, and on the Coromandel coast "as well as in Guzerat and especially in Bengal," is "the only tree whose sap is much employed for boiling down to sugar." Farther East, was observed by Mason "exotic" in Burmah. (See *P. dactylifera*, and *Arenga saccharifera*).

Asclepias (Calotropis) procera of the Tropical portion of the Desert from the Cape Verd Islands and shores of the Atlantic to the Red Sea and Hindustan. Large-leaved and chiefly herbaceous in defiance of the surrounding aridity, and called in Nubia "abouk," in Egypt "o'char" (Del.); in Yemen "oschar" (Forsk.); and possibly the "occhi" of Onesicritus: — "sukkar eluscher" is mentioned by Israeli or Ishak ben Soliman, Avicenna, Serapion temp. simpl. 50, Edrisi, Ebn Baitar, and was ascertained by Ange de Saint-Joseph pharm. pers. 361 to be a kind of sugar produced by an insect puncturing the plant, the geographical limits of the insect not extending beyond Persia: *C. procera* was observed by myself on the Deccan, apparently the same termed "*c. Hamiltonii*" by Don, Wight, and Graham. Westward, was observed by Hasselquist in the heated deeply sunk valley containing the Dead Sea, and again on the Sinai peninsula; by Forskal, everywhere in Tropical Arabia; by Grant, as far as "3° 15' N." on the Nile; by myself, in Upper Egypt in the Desert; by Alpinus, Norden, and Delile, also in Egypt, its juice employed against ringworm and other cutaneous affections, also a powerful depilatory; and again by myself, on the Cape Verd Islands.

"Brahmanas" were brought to Alexander (*Brahminism* being already in existence). The burning of widows with their dead husbands, among the Kathaians, is also mentioned by Onesicritus (Strab. xv. 1. 30 to 66).

The flute or pipe ΑΥΛΟΣ, according to Onesicritus (Strab. xv. 1. 22) unknown to the Indians; their only musical instruments being the ΚΥΜΒΑΛΛΟΝ cymbals, ΤΥΜΠΑΝΟΝ drum, and ΚΡΟΤΑΛΟΝ little bells, used by *conjurers*. ΣΚΙΑΔΙΑ *umbrellas*, according to Nearchus (Arrian ind. 16) were carried before persons of any note.

Onesicritus obtained information of Taprōvanē, an island five thousand stadia in diameter and twenty days sail from the main land, but the vessels badly provided with sails and otherwise imperfectly constructed (undecked?); between this and India there are intervening islands, but Taprōvanē is the Southernmost of all; — is also placed by Eratosthenes seven days sail South from the Southern extreme of India (Strab. xv. 1. 14): the name seems derived from the Negro class of languages, and the descriptions agree with Madagascar. (In later times, the name Taprōvanē was transferred by the Greeks to Ceylon. See Cosmas Indicopleustes).

The ΚΗΤΗ: Δ. ΑΜΦΙΒΙΑ described to Onesicritus as inhabiting the coast of Taprōvanē, — may have been the *dugong*. Not far distant at Zanzibar, a dugong captured by the native fishermen was sketched by myself.

"325 B. C." (Sm. b. d.). L. Furius Camillus and D. Junius Brutus Scaeva consuls at Rome. Victory over the Samnites gained by Q. Fabius Maximus "magister equitum" in the absence and contrary to orders from the dictator: flight to Rome and the intercession of the senate, people, and his own family, barely saved his life.

"The same year" (Clint., see also Quint. Curt.), after witnessing the bore or overwhelming tide-wave at the mouth of the Indus, Alexander and his army commenced their return Westward. Leaving Nearchus and the ships to follow by sea; the navigation of the Persian Gulf being as yet unknown to the Greeks.

Artocarpus integrifolia of Ceylon and Java. The *jack tree* is called in Tamil "pila" (Yule), in the environs of Bombay "phunnus" (Graham), in Telinga "panasa," in Bengalee "kantal," and its fruit in Sanscrit "tchackka" (Drur.); in which we recognize the "mégalo-karpōn" tree, remarkable for the size and sweetness of its fruit, on which the naked wise men of India live — (Theophr. iv. 4. 5), also the "palae" tree of Pliny xii. 12 putting forth from its bark fruit called "arienae," a single one satisfying four persons: the "chaqui" was seen in Hindustan by Jordanus mirab. (soc. Hakl.), and the "shaki" producing fruit at the base of the trunk, by Ebn Batuta: *A. integrifolia* was observed by Rheede iii. pl. 26 to 28 in Malabar; by Graham, "generally to be met with about villages throughout the Concans, the large fruit" an article of diet with the natives, "and the wood

in common use" for household furniture; by Roxburgh cor. iii. pl. 250, Wight, and Drury, planted in other parts of Hindustan as far as Bengal; but by Rumphius i. 106, wild in the Ceylon forest. Farther East, was observed by Mason "exotic" in Burmah and called "peing-nai;" by Loureiro, under cultivation in Anam and Tropical China; by Rumphius i. 105, becoming rare in the Eastern portion of the Malayan archipelago and devoid of a native name; by Blume, a wild kind on Java. Westward from Hindustan, was observed by myself on Zanzibar, introduced probably by either Banyans or Arabs. By European colonists, was carried to the Mauritius Islands, observed by Bojer inclining to become naturalized; about A. D. 1800 to the West Indies, where it continues under successful cultivation (Hook. bot. mag. pl. 2833, and A. Dec.).

Areca catechu of the Malayan archipelago. The *betel palm* is called in the environs of Bombay "foffee-sooparee" (Graham), in Telinga "poka-chettu," in Tamil "paak-marum" or "camooghoo," in Bengalee "gooa" (Drur.); and the tree with leaves like ostrich plumes on helmets, but two cubits long — (Theophr. iv. 4. 5), mistranslated by Pliny xii. 12, may be compared: *A. catechu* was observed by Rheede i. pl. 5 to 8 in Malabar; by Graham, "commonly cultivated" in the environs of Bombay, also by myself; by Roxburgh cor. i. pl. 76, Simmonds, and Drury, in other parts of Hindustan, and from Ceylon to Northern Bengal. Farther East, by Mason "exotic" in Burmah and called "kwoon-thee;" by myself, under cultivation throughout the Malayan archipelago as far as the Philippines, where according to Blanco it is called in Tagalo and Bisaya "boña," in Pampango "luyos." Westward from Hindustan, was observed by myself under cultivation on Zanzibar: the "pétrōs" of the Erythraean Periplus is regarded as the imported nut; and "areca" nuts according to Wilkinson have been exhumed in ancient Egyptian tombs: the "fawfal" is mentioned by Maserjavia, Ebn Amran, Abu Hanifa, Gafeki, Mesue, Avicenna, Serapion, Ebn Redwhan, and Ebn Baitar; and "arica" nuts called "fufal" were found by Forskal mat. med. imported into Egypt. (See *Acacia catechu*, and *Piper betle*).

Inga bigemina of Tropical Hindustan and Burmah. The tree with long twisted fruit sweet to the taste, but inducing dysentery and therefore prohibited by Alexander — (Theophr. iv. 4. 5), an account copied by Pliny xii. 12, may be compared: *I. bigemina* was observed by Rheede vi. pl. 12 in Malabar; by Nimmo, in the Concan as far as Bombay (Graham); by Roxburgh, and Wight, in other parts of Hindustan. Farther East, by Mason v. 459 to 772 indigenous in Burmah and called "ta-nyen," planted besides by the natives who "are extravagantly fond" of the seeds as "a condiment" to preserved fish, notwithstanding sometimes disastrous consequences.

Mimusops hexandra of Tropical Hindustan. Called in the environs of Bombay "kerne" or "rayanee" or "rajun" (Graham), in Telinga "palla," in Tamil "palloe" (Drur.); and the tree with fruit like that of the cornel "kranēōis" — (Theophr. iv. 4. 5), may be compared: *M. hexandra* was observed by Gibson, and Graham, planted by Muslims, "very common on Malabar hill" near Bombay, the fruit eaten, and in Guzerat the wood much used for a variety of purposes where toughness is required; by myself, planted trees around the Imampoor station where we rested for a night; by Roxburgh cor. pl. 15, on the Circar mountains (Pers.); and according to Drury, the berry is of the "size and shape of an olive."

Diospyros ebenum of Ceylon. Of the two kinds of *ebony* met with, that with good and beautiful wood, but rare — (Theophr. iv. 4. 6), may be compared: "*nigrum ebenum*" produced only in India, is mentioned by Virgil geor. ii. 117: *D. ebenum* is described by Rumphius viii. pl. 6; is termed "*ebenoxyllum verum*" by Loureiro, "*d. glaberrima*" by Roxburgh (Steud.); was observed by Retz v. 31 in the Ceylon forest (Pers.); and according to Tennent i. 117, grows in great abundance throughout all the flat country West of Trincomalee, and so large that the central black portion furnishes logs two feet in diameter by ten or fifteen long, excelling all other kinds in the evenness and intensity of its colour (Drury). The living tree has recently been introduced by Nimmo into the environs of Bombay (Graham).

Diospyros melanoxylon of Tropical Hindustan and the Siamese countries. The *Coromandel ebony* is called in Tamil "tumballi," in Telinga "toomida," in Hindustanee "tindoo," in Bengalee "kendoo" or "kiew" (Drur.); and is possibly the beautiful kind of "ēvēnē" in question: — "ēvēnōs" was also seen in India by Megasthenes (Strab. xv. i. 37): *D. melanoxylon* is described by Roxburgh cor. i. pl. 46; is known to grow from Malabar to Orissa, a large tree "twenty to twenty-five feet to the branches" with the trunk "eight or ten in circumference," yielding according to Drury "a fine kind of ebony" exported in small quantities "from Madras;" the bark astringent and taken by the natives in dysentery (Lindl.). Farther East, was observed by McClelland in Pegu and called "ouk-chin-ya" (Mason v. 542); "bonus qe est mout noir" was observed by Marco Polo 162 abounding in the forests of "Cianba" (Tsiompa), the species doubtless the same seen by Loureiro p. 752 throughout the forests of Anam.

Diospyros montana of Tropical Hindustan. Called in Mysore "ingalagunte" scolding wife (Buch.); and the second kind of "ēvēnē" met with, inferior in quality but abundant — (Theophr.

iv. 4. 6), may be compared: *D. montana* was observed by Graham on hills in the environs of Bombay, growing "probably throughout the Concans;" by Roxburgh cor. i. pl. 48, and Buchanan, in other parts of Hindustan, the wood very hard and durable, variegated with dark and white-coloured veins, but from some prejudice not used by the natives (Beddome, and Drur.).

Phaseolus trilobus of Tropical Hindustan and Burmah. Procumbent, and called in Telinga "pelli pessara," in Hindustanee "kakhal kuluy" (Lindl.) or "triangguli," in Bengalee "mooganee" (Drur.); and the "phakōs"-like pulse met with — (Theophr. iv. 4. 9), may be compared: *P. trilobus* was observed by Lush, and Graham, "common in the Deccan;" by myself, wild there on the arid plain; by Roxburgh, as far as Bengal but only in its wild state; by Ainslie, in Behar, given by the Vytians in irregular fever: was also seen in Hindustan by Burmann ind. pl. 50, and Wight; and according to Drury, "is cultivated for its seeds which are eaten by the poorer classes," and "affords good fodder." Farther East, was observed by Mason v. 467 in Burmah, "spontaneously everywhere in the country." Transported to Europe, is described by Plukenet alm. pl. 120, and Linnæus.

Dolichos uniflorus of Tropical Eastern Asia. The *gram* or *horse gram* is an annual plant called in Hindustanee "koaltee," in Bengalee "koolthee," in Tamil "kolloo," in Telinga "woolawaloo" (Drur.); and the "érēvinthōs"-like pulse met with — (Theophr. iv. 4. 9), may be compared: the "kulatt'ha" or "yavaka" commended for food in the stanzas of the Ayurvedas (Susrut. sarir. 2), is referred here by Hessler: *D. uniflorus* was observed by Lush "cultivated in the Deccan;" by Roxburgh, and Wight, as far as Coromandel and Bengal, the seeds according to Drury eaten by the natives in curries, and everywhere in the peninsula given to cattle, but the "plant has never been seen in a wild state." Transported to Europe, is described by Plukenet pl. 113, and Lamarck.

Paspalum scrobiculatum of Tropical Hindustan. A grain called in Guzerat "menya," in the environs of Bombay "kodro" (Graham); and the kind of "agriōn krithōn" furnishing good bread and gruel, but which at first killed the horses of the Greeks until by degrees they became accustomed to it (Theophr. iv. 4. 9), may be compared with the "vōsmōrōu" of Onesicritus, — planted according to Eratosthenes together with "kēghros" in the rainy season (Strab. xv. 1. 13 to 18): the "kodru," a sort of millet, was observed by Ebn Batuta plentiful in Hindustan: *P. scrobiculatum* was observed there by Roxburgh, and Sykes; by Gibson, and Graham, in the environs of Bombay, "a very common and cheap grain but not wholesome, the natives say it will keep good for twenty years," a variety called "hareek" is "narcotic, and in this respect resembles *Lolium temulentum*." Farther East, *P. scrobiculatum* is described by Houttuyn pl. 89 (Pers.).

Cyamopsis psoraleoides of Tropical Asia. An erect annual called in the environs of Bombay "mutkee" or "gaur" or "goor" (Graham); and the other plant called by Alexander's army "phakōn" but having the aspect of the "vōukēras" — (Theophr. iv. 4. 10), may be compared: *C. psoraleoides*, having small purplish flowers, was observed by Graham in the environs of Bombay, "cultivated for the sake of the pods which are eaten like French beans;" by Roxburgh, and Wight, in other parts of Hindustan; is known to occur also in Arabia (Pers.). Farther East, was observed by Mason v. 467 "exotic" in Burmah and called "pai-pa-soon," cultivated by the natives and "esteemed by them a good vegetable." Transported to Europe, is termed "dolichos fabaeformis" and "indigofera tetragonoloba" by L'Heritier pl. 78, "psoralea tetragonoloba" by Linnæus, "dolichos psoraleoides" by Lamarck, and "lupinus trifolius" by Cavanilles i. pl. 59.

Vitis Indica of Tropical Hindustan and Burmah. The "ampelon" growing in the mountain-region — (Theophr. iv. 4. 11), may be compared: *V. Indica* was observed by Rheede vii. pl. 6 in Malabar; by Graham, in "the Concans" as far North as Bombay; by Wight, in other parts of Hindustan. Farther East, by Mason, indigenous in Burmah and called "yen-doung."

Olea? dioica of Tropical Hindustan. The *Indian olive* is called in the environs of Bombay "Parr jamb" (Graham); and the "ēlaan" growing in the mountain-region, barren and as if intermediate in nature and form between the "ēlaas" and "kōtinōu" — (Theophr. iv. 4. 11), an account copied by Pliny xii. 14, may be compared: the "jummum" seen by Ebn Batuta in Hindustan, a "high tree with black fruit resembling that of the olive as does likewise its stone," seems distinguished by him from that met with in East Africa (see *Chionanthus* sp. . .): *O. dioica* was observed by Rheede iv. pl. 54 in Malabar; by Graham, "a large tree" with fruit much resembling a sloe, growing "near Kandalla" and "very common towards the top of the Rotunda ghaut, Mahableschwur;" by Roxburgh, Hamilton, and Wallich, in other parts of Hindustan (Drury); and the "Tetrapilus brachiatus" found by Loureiro in Anam, is regarded by Graham as not distinct.

Sterculia foetida of Tropical Eastern Asia. Called in Bengalee jungle-"baddam," in Tamil "kudrapdukku" or "peenaree-marum;" (Drur.); and possibly included among the "akrōthrua" nut-bearing trees of the mountain-region — (Theophr. iv. 4. 11): *S. foetida* was observed by Graham in woods near Bombay "but evidently planted," a "very stately tree" furnishing masts called *poon spars*, its leaves deciduous in the cool season, and seeds "roasted and eaten like chestnuts;" by Roxburgh, Wight, and Drury, in other parts of Hindustan as far as Travancore and Bengal. Farther

East, by Mason 457 to 487 "not uncommon in the forests" of Burmah and called "let-khok," yielding with other species a gum "similar to tragacanth," and its seeds "eaten like filberts;" by Horsfield, on Java; is described by Rumphius iii. pl. 107, and Sonnerat pl. 132; was observed by Blanco on the Philippines, in Tagalo called "calumpang," in Ylocano "bangar," and its seeds eaten.

Sterculia guttata of Tropical Hindustan. A large tree called in the environs of Bombay "kookur" or "goldar" (Graham), in Tamil "pee-marum" (Drur.); and included perhaps among the "akrōthrua" of the mountain-region — (Theophr. iv. 4. 11): *S. guttata* was observed by Rheede iv. pl. 61 in Malabar; by Graham, "common along the Ghauts" as far as Bombay, the seeds size of a chestnut "roasted and eaten by the natives;" by Roxburgh, Royle, and Wight ii. pl. 487, in other portions of the peninsula, clothing and cordage made of the inner bark.

Sterculia balanghas of Tropical Eastern Asia. A tree possibly included among the "akrōthrua" of the mountain-region — (Theophr. iv. 4. 11): *S. balanghas* was observed by Rheede i. pl. 49 in Malabar; by Nimmo, in the Concan South of Bombay (Graham); by Wight v. pl. 30, in other parts of the peninsula; and according to Roxburgh, the seeds when roasted are nearly as palatable as chestnuts (Drur.). Farther East, is described by Rumphius iii. 107 (Pers.), and in Amboyna according to Hooker a pigment called "cassoumba" is made from the burnt pericarp (Drur.).

Sterculia (Cavallium) urens of Tropical Hindustan. A large tree called in the environs of Bombay "kavalee" (Graham), in Telinga "kavalee," in Hindustanee "bulee" (Lindl.), in Tamil "vellay bootalli" (Drur.); and possibly included among the "akrōthrua" of the mountain-region — (Theophr. iv. 4. 11): *S. urens* was observed by Gibson, and Graham, "common throughout the Concans" and Hindu guitars "made of the wood;" by Roxburgh cor. i. pl. 24, Royle, and Wight, as far as Courtallum and the mountainous parts of Coromandel, yielding a gum extremely like tragacanth; and the seeds according to Drury "are roasted and eaten."

Guarea binectarifera of Tropical Hindustan. A Meliaceous pinnate-leaved tree called in the environs of Bombay "yerindee" (Graham); and possibly included among the "akrōthrua" of the mountain-region — (Theophr. iv. 4. 11): *G. binectarifera* was observed by Graham in ravines near Bombay "not common," the fruit with hard rind containing seeds "size of a chestnut, monkeys are very fond of them:" is however not certainly identical with the "*G. binectarifera*" of Roxburgh.

Buchanania latifolia of Tropical Hindustan and Burmah. A tree called in the environs of Bombay "pyal" or "char" or "charolee" (Graham), in Hindustanee "pee-yar cheroonjie," in Bengalee "piyala," in Telinga "chara puppoe," in Tamil "mowda" or "moræda" or "kat mango marum" (Drur.); and probably included among the "akrōthrua" of the mountain-region — (Theophr. iv. 4. 11): dust of the flowers of the "priyala" tree is mentioned by Kalidasa kum. iii. 31, and the "priyala" or "piyala" or "rajavruksha" of Susrutas sutr. 36 and 46 to chikits. 2 is referred here by Hessler: *B. latifolia* was observed by Gibson, Law, and Graham, in the environs of Bombay, also "common in the Barria jungles east of Baroda" and its kernels collected and sold by the Bheels; by Roxburgh, Wight, and Drury, in Mysore and on the mountains of Malabar and Coromandel, the kernels "a general substitute for almonds among the natives," yielding an oil called *cheroonjie oil*, also a black varnish, and the wood "used for various purposes." Farther East, was observed by Mason indigenous in Burmah.

Balsamodendron mukul of Scinde. Called there "googul" (Drur.); and the "akantha" of the bordering Arian district, yielding under the rays of the sun an exudation that resembles myrrh in aspect and odour — (Theophr. iv. 4. 12), may be compared: *B. mukul* according to Stocks, and Drury, has been ascertained to be a peculiar species. (See *B. agallocha*, *B. myrrha*, and *Borassus dichotomus*).

Carissa diffusa of the country on the Lower Indus. A thorny shrub whose wood is called "ajar" (Drur.); and the "akantha lêukē triōzōs" growing in the Arian district and called "ēraklēōus," juicy and spongy and its wood made into staffs and clubs — (Theophr. iv. 4. 12), may be compared: *C. diffusa* was observed by Powell in the Punjaub, bearing a small black edible fruit, its wood used for fences and for making "native combs," that of a very old tree turning quite black and acquiring a strong fragrance, and sold at a high price as a medicine (Drur.).

Gnidia eriocephala of Western Hindustan. Called in the environs of Bombay "rameta" (Graham); and the other bush growing in the Arian district and as large as a "raphanōs," its leaves laurel-like and fatal to whoever eats, so that horses are always held by hand on alighting near — (Theophr. iv. 4. 12), may be compared: *G. eriocephala* is described by Wallich; was observed by Murray very common at Mahabeshwur, by Law on the hilly parts of the Southern Mahratta country, by Graham on the Ghauts and about Karlee caves, "a highly ornamental shrub" with "willow-like leaves" and "large terminal umbels" of "yellow flowers," the "natives attribute poisonous qualities to it."

Stylocoryne webera of Tropical Hindustan. A large-branched Coffeaceous shrub called in

Malabar "cupi," in Telinga "commi" (Drur.); and the tree on Tyle furnishing staffs variegated like a tiger's skin — (Theophr. v. 4. 7), may be compared: the "karenu" of Susrutas sarir. 4 to chikits. 30, is referred here by Hessler: *S. webera* was observed by Rheede ii. pl. 23 in Malabar; by Nimmo in the Concan South of Bombay, and by Lush in the Goa jungles (Graham); by Roxburgh, and Wight, in other parts of the peninsula as far as Coromandel; is known to grow also on Ceylon (Pers. i. 200); and according to Drury, its "wood is hard and prettily marked, and is much esteemed by the natives."

Excoecaria agallocha of the Tropical seashore from Hindustan to Tongatabu. The *tiger's-milk tree* is called in Malabar "cametti" (Drur.); and the "laurino" leaved "spina" whose juice sprinkled on the eyes induces blindness — (Plin. xii. 18), may be compared: *E. agallocha* was observed by Rheede v. pl. 45 in Malabar: by Nimmo, and Graham, "in salt marshes along with the" mangroves as far as Bombay; by Drury, in Travancore and Cochín, the natives "afraid almost to cut the branches;" by Roxburgh, at the Sunderbunds or mouths of the Ganges, woodcutters complaining that the milky juice is very dangerous. Farther East, the "ta-yau" or "ka-yau" of Burmah is regarded by Mason as probably identical; *E. agallocha* was observed by Blanco frequent along the seashore of the Philippines, called in Tagalo "buta" or "butabuta," in Pampango "butabuta," in Bisaya "lipata" or "alipata" or "himbabao" or "siac," and employed medicinally, smoke from the burning wood causing intolerable pain in the eyes; is termed "arbor excoecans" by Rumphius ii. pl. 79 to 80, sailors sent to cut wood on Amboyna having been blinded by juice falling in their eyes; was observed by myself as far as the Feejeean and Tongan islands, frequent along the seashore.

Nyctanthes arbor-tristis of Hindustan and Burmah, from "Lat. 18° to 30°" along the base of the Himalayan mountains. A small tree called in the environs of Bombay "shiooli" or "har" or "singahar" (Graham), in Bengalee "singahar," in Hindustanee "hursinghar," in Tamil "pagalamully" (Drur.); and the tree large as a fig, having exceedingly fragrant flowers with inedible lupine-like fruit, seen by Androsthenes on the isle of Tyle — (Theophr. iv. 7. 7 to caus. ii. 5, and Plin. xii. 21), may be compared: the "sephalica" of the Amara-cosha is referred here by pandits and W. Jones (asiat. res. iv. 244), and the "sop hali" is mentioned by Susrutas sutr. 8 to chikits. 2: *N. arbor-tristis* was observed in Hindustan by Garcias 225 (Spreng.); by Rheede i. pl. 21, in Malabar; by Graham, very common "in gardens and about villages," by Vaupell in Guzerat "probably introduced;" by myself, clearly indigenous towards Adjunta on the Deccan; by Royle, along the base of the Himalayan mountains; by Wallich, wild on hills near Prome on the Irrawaddy; by shedding a delicious fragrance, and before morning falling and covering the ground; by Mason, Roxburgh, and Drury, under cultivation in various parts of Hindustan, the flowers opening at night, "exotic" in Burmah and called "hseik-ba-lu," cultivated for its ornamental fragrant flowers that also yield a beautiful orange dye.

Bouhinia variegata of Tropical Hindustan. A tree twenty to thirty feet high called in Sanscrit "canchanara" or "covidara" (W. Jones), in the environs of Bombay "kunchum" or "kana raj" (Graham), in Hindustanee "sona" (Drur.); and the tree seen by Androsthenes on Tyle, its flower like that of "lēukōid" but four times larger than in "iōn" and scentless — (Theophr. iv. 7. 8, and Plin. xii. 22), may be compared: the "kovidara" is mentioned in the Saddharma pundarika (Burn. ii. 219 and 416); and the "kanchana" or "kovidara" or "karbudara" or "kanaka" in the stanzas of the Ayurvedas (Susrut. sarir. 10): *B. variegata* was observed by Rheede i. pl. 32 in Malabar; by Graham, in "gardens Bombay," but "perhaps the 'apta' tree of the Concan is identical," the flowers "very beautiful:" by W. Jones (as. res. iv. 279), Roxburgh, and Wight, as far as Coromandel, Bengal, and Oude, the flowers in one variety varied with purple, in the other whitish, the buds eaten as vegetables; or in the Punjaub according to Powell dried and used medicinally by the natives (Drur.). Farther East, was observed by Mason "exotic" in Burmah, and cultivated for ornament. (See *B. purpurea*).

Averrhoa bilimbi of the Moluccas. Called in the environs of Bombay "anvulla" or "bilimbi" (Graham), in Bengalee "bilimbi," in Hindustanee "kamarunga" (Drur.); and the tree seen by Androsthenes on Tyle, "pōluphullōn" like the rose, the flower closing at night, opening again with the rising sun, and fully expanding at noon — (Theophr. iv. 7. 8, and Plin. xii. 23), is referred here by Link: *A. bilimbi* was observed by Rheede iii. pl. 45 to 46 in Malabar; by Graham, "in gardens Bombay," the fruit growing "on the trunk and branches," of "an agreeable acid flavor," and "sold in the bazar;" by Roxburgh, Wight, and Drury, under cultivation in other parts of Hindustan. Farther East, by Mason v. 454 "exotic" in Burmah; by Nieuhoff, the "bilinbing" fruit among the Javanese and Malaysans; by Navarrete, in Tropical China and the Malayan archipelago, the "milinbines or carambolas of Terranate" being the most famous; by Blanco, on the Philippines; and is figured by Rumphius i. pl. 36.

Ficus comosa of Tropical Hindustan. The *tufled fig* is perhaps included among the evergreen

"sukas" seen by Androstenes on Tyle — (Theophr. iv. 7. 8): *F. comosa* was observed by Graham "on the Ghauts and hilly parts of the Concans" as far as Bombay, a tree with smooth shining leaves, "fruit size of a gooseberry;" by Roxburgh cor. ii. pl. 125, in other parts of Hindustan.

Ficus benjamina of Tropical Hindustan. A beautiful tree called in the environs of Bombay "nandrook" (Graham), in Telinga "tella barinka" (Drur.); and perhaps included among the evergreen "sukas" on Tyle — (Theophr. iv. 7. 8): *F. benjamina* was observed by Rheede i. pl. 26 in Malabar, a decoction of the leaves mixed with oil applied to ulcers; by Graham, "between the Kamatkee Ghaut and Wye," and "common throughout the Mawul districts," the leaves polished shining; by Roxburgh, Wight pl. 642 and 648, and Drury, in other portions of the peninsula.

Ficus racemosa of Tropical Hindustan. The *red-wood fig-tree* is called in Hindustanee "gooler," in Telinga "maydi," in Tamil "attie marum" (Drur.); and is perhaps included among the evergreen "sukas" on Tyle — (Theophr. iv. 7. 8): *F. racemosa* was observed by Rheede i. pl. 25 in Malabar; by Graham, in "the Concans" as far as Bombay; by Ainslie, and Drury, in other parts of Hindustan, the fruit edible, and the leaves root and bark employed medicinally by the natives; the leaves according to Lindley are "on the upper side dark-green and shining;" the tree is termed "grossularia domestica" by Rumphius iii. pl. 87 to 88.

November, when the "Etesian winds" or Southwest *monsoon* ceased (Arrian ind. 21), Nearchus sailed from the mouth of the Indus and "Krökala" (to the present day called Crocola), passing the Araviōs (Araba-il-mend), and continuing along the Desert coast Westward. The people of this coast were found to be exclusively fishermen, living on fish which in the cooked state were sometimes ground into meal; a few date-palms were met with, also some gardens, with *sheep* and *goats* fed however mainly on fish-meal (the detailed description of the natives and their habits being, according to Kempthorne, "strictly correct even to the present day"). The bones of *whales* were used in constructing dwellings; and on afterwards meeting with living whales (a novelty to the Greeks) the sailors were much terrified; but Nearchus bearing down with the clang of arms and the ships in battle array, put the dreaded monsters to flight: a dead whale fallen in with, measured "fifty cubits," having many $O\Xi TPEA$ shell-fish, $\Lambda O\Gamma A\Delta A\Xi$ *barnacles*, and $\Phi YKIA$ sea-weed, adhering to the skin (Arrian l. c. 30 and 39).

Hydnocarpus inebrians of Tropical Hindustan and Ceylon. Called in Malabar "morotti," in Tamil "maravuttie" (Drur.). and the tree seen by Nearchus whose fruit inebriates if eaten, and from which honey also is extracted — (Strab. xv. l. 20), may be compared: *H. inebrians* was observed by Rheede i. pl. 30 in Malabar; by Nimmo, and Graham, in the Concan, "common" as far at least as Bombay; by Buchanan, Wight i. pl. 16, and Drury, very common on the Western coast as far as Travancore, the fruit if eaten occasioning giddiness, and on Ceylon the seeds used for poisoning fish: oil from the seeds is used medicinally by the natives (Rheede, and Ainslie).

Arenga saccharifera of Tropical Eastern Asia. A very stately palm called in the environs of Bombay "bhirlee" (Graham); and the "phlōiōu phoinikinōu" of which fishermen seen by Nearchus made their nets — (Strab. xv. 2. 2), may be compared: *A. saccharifera* was observed by Graham planted near Bombay, affording "tolerably good *sago*, the sap palm wine and sugar, and the black horse-hair like fibres of the trunk are converted into excellent cordage;" by Roxburgh iii. 626, and Buchanan, under cultivation in other parts of Hindustan. Farther East, by Mason v. 506 indigenous in Burmah "on the mountains north-east of Toungoo;" by Parish, observed also in Siam; by Loureiro 759, in Anam: by Marsden, and Crawford, on Sumatra and the neighbouring islands, planted according to Griffith very commonly by the Malays, the cordage from black fibres of the trunk renowned for its power of resisting wet, the sap drunk as toddy or converted into sugar, and the young albumen in syrup forming one of the well-known preserves of the Straits; the palm is termed "gomutus gomuto" by Rumphius i. pl. 13; and according to a writer in soc. tract Lond., its very acid fruit, exciting inflammation when chewed, was the basis of the "infernal water" used by the Molucans in war to pour over their enemies. Is termed also "saguerus Rumphii" by Roxburgh, and "gomutus saccharifer" by Sprengel. (See *Caryota urens*, and *Phoenix sylvestris*.)

Michelia champaca of Ciampa and Anam. The *peela* or *golden-flowered chumpā* is a tree thirty to forty feet high called in Sanscrit "champaca" or "champeya" or "hemapushpaca" (W. Jones), in Bengalee "chumpaka" or "chumpa" (Drur.); and the "alla anthēa" seen in a garden by Nearchus, the flowers worn in the hair — (Arrian ind. 27), may be compared: the fragrant "champa" is mentioned in the *Mrichchhakati* iv; garments scented with a "champa flower," by Vachespati Misra *tatwa-kaum.* (Wils. sankh.); and the "katu" or "kanaka" or "kanchana" or "gand'ha" or "nagapushpa" or "surab'hi" or "hemanga" of *Susrutas* sutr. 28, is referred here by Hessler: *M. champaca* was observed by Graham "in gardens" around Bombay, "a highly ornamental and sacred tree;" by W. Jones as. res. iv. 287, Roxburgh, and Wight i. 13, in gardens throughout the peninsula and as far as Bengal, dedicated according to Drury to Vishnu, and its flowers used by the natives to adorn their heads. Farther East, was observed by Mason v. 402 "exotic" in Burmah, planted about

villages, and its "golden flowers" in the "dark long hair," of the maidens celebrated in Burmese poetry; is known to grow wild in Ciampa (Drur.); was observed by Blanco on the Philippines, around villages in the environs of Manila, and called in Tagalo "sampac," its flowers sold in the market. By European colonists, was carried to the Mauritius Islands, where it continues under cultivation (Boj.).

Andropogon Martini of Tropical Hindustan. The *roussa grass* is called in Tamil "kamakshi-pullu" or "kasattam-pullu," in Telinga "kamakshi-kasuvu" or "kamanchi-gaddi," in Bengalee "khama-kher," in Hindustanee and on the Deccan "ganjni" (Drur.); in which we recognize the grass West of the Indus recognized by Phoenicians in Alexander's army as one of the perfumes of commerce; also the "kömakön" enumerated by Theophrastus ix. 7. 2 among imported perfumes: A. Martini is termed "a. nardus" by Linnæus; "a. calamus-aromaticus" by Royle (in Kitt. bibl. cycl.), who further states that it grows from Nagpore as far North as Delhi, its "leaves culms and roots" yielding the fragrant *grass oil* called "oil of Namur," much used in perfumery, also medicinally by the natives, but in the shops is often confounded with "oil of spikenard." the grass was brought by Martin from the highlands of Balaghaut to Lucknow and Calcutta (Roxb. fl. i. 277), and abounds on the Deccan, universally spread over the trap districts (Drur.).

Andropogon pachnodes of Tropical Hindustan. Said to yield also a volatile oil (Drur.); and possibly the grass in question: — the "nartē" enumerated among perfumes by Theophrastus ix. 7. 3, may be compared: A. pachnodes is described by Trinius. The *ginger grass* of Ainslie ii. 401, yielding an essential oil called by the natives "koshel," was observed by Law in the environs of Bombay "common between Howe and Krishna," by Nimmo in the Concan North and South, by Hedde in the "vale of the Nerbudda," and is further identified by Graham with the "nardus indica" of Lamarck enc. ii. 375.

Caryota urens of Tropical Hindustan and Ceylon. A stately palm called in the environs of Bombay "bherlee-mhar" (Graham), in Telinga "mari" (J. F. Wats., and Beddome 60) or "jeeroogoo" (Lindl.), in Tamil "coonda-panna" (Drur.); and the "phōinikōn" in Gedrosia inducing "kata-nōthēnai" if eaten crude — (Theophr. iv. 4 13), "strangulati" as translated by Pliny xiii. 9, may be compared: the "marīh" is mentioned by Rhazes, by Ebn Baitar as an Indian seed; and the "belluri" met with by Jordanus, yielding toddy of superior quality, is referred here by Yule: C. urens was observed by Rheede i. pl. 11 in Malabar; by Graham, "common on the Ghauts and Concans," also "in gardens," its pith yielding *sago*, and its sap or toddy in common use for yeast: by myself, clearly indigencous on the Ghaut; by Buchanan, the trunk the favourite food of elephants; by Roxburgh, Ainslie, Royle, and Drury, in Travancore, Coromandel, and other parts of Hindustan, fifty to sixty feet high, the thin rind of the fruit very acrid and producing a burning sensation on the tongue; is termed "saguaster major" by Rumphius i. pl. 14, and is known to grow on Ceylon, where the split trunks are used as rafters, and the fibre of the leaf-stalks made into ropes for tying wild elephants (fl. zeyl. 369, and Drur.). Farther East, a species of *Caryota* yielding *sago* was observed by Blanco on the Philippines, common in many parts and called "pugaham." (See Arenga saccharifera).

Nerium oleander of Subtropical Persia. The *oleander* is called in France "laurier-rose" (Nugent), in Italy "oleandro" or "alloro indiano" (Lenz), in Greece "pikrōthaphnē" or "rōthōthaphnē" (Sibth.) or "arōthaphnē," in Egypt "tiflæ" (Forsk.) in Egyptian "skinphē" (Syn. Diosc.); and the "thaphnē"-like plant that poisoned cattle of Alexander's army in Gedrosia along the Persian Gulf — (Strab. xv. 2. 7), may be compared: in the days of Dioscorides, the "nērion" having a rose-like flower and fruit in the form of horns, was a well known shrub in gardens, growing also by the seaside and along streams; and somewhat later, the "wild laurel bearing roses" is mentioned by Apuleius asin., and Lucian: N. oleander was observed by Forskal, Sibthorp, Bory, and Fraas, frequent along streams from the Peloponnesus to Constantinople; is known to occur also seemingly wild in Syria . . . ; and was observed by Forskal, and Delile, in the gardens of Egypt. Westward, the "nērion" or "rōthōthaphnē" or "rōthōthēnthrōn" is identified in Syn. Diosc. with the "ikmanē" of the Lucanians (of Southern Italy), and "laurōrōsa" or "ōlēanthrōum" of the Romans; the "nerion" or "rhododendron," from having no Latin name, is regarded by Pliny xvi. 33 to xxiv. 53 as brought from Greece; and the "rhododaphne" is mentioned in the Virgilian Culex, and by Palladius i. 35. 9, and Vegetius: N. oleander is termed "n. floribus rubescentibus" by Tournefort inst. 605; was observed by Desfontaines i. 208 along streams on the Atlas mountains (Pers.); and is known to occur seemingly wild from Italy to Portugal (A. Dec., and Lenz). By European colonists, was carried to Northeast America, where it continues under cultivation as a hardy greenhouse plant. A decoction of the leaves and bark according to Lindley is employed "in the South of France to cure the itch and to destroy cutaneous vermin," and "the powdered bark and wood to poison rats."

Nerium odorum of Hindustan. An allied species called in Upper India "hayamaraca" horse-killer (W. Jones), in Broach "nermudda," in the environs of Bombay "kunher" (Graham), in Hin-

dustanee "karpud," in Bengalee "kurubee" (Lindl.), and possibly the plant in question: — the "karavira" is mentioned in the Mrichchhakati x., and by Susrutas; and the "hayamaraka" by Susrutas sutr. 36 to chikits. 18: N. odorum was observed in Hindustan by Hermann lugdb. pl. 448, Rheede ix. pl. 2, and Roxburgh; by Graham, "in gardens" and "wild by the banks of Deccan rivers;" by myself, clearly indigenous along the river-bank of the Godaveri; and according to Lindley, "the bark of the root and the sweet-smelling leaves are considered by the" natives "powerful repellants, applied externally." Farther East, the shrub is enumerated by Mason as "exotic" in Burmah; and is known to occur in gardens in China and Japan (Barrow trav. p. 505, and Blume).

At Armōzēia (Ormuz) opposite the projecting promontory of Arabia, a man was seen who wore the Greek dress and spoke Greek, and who proved to be a straggler from Alexander's army; then, according to his account, only "five days journey" distant. After an interview with Alexander, Nearchus resumed his voyage; and in the inner portion of the Gulf, in addition to *canoes* propelled not by oars attached to the sides but paddled, met with ships of burden (Arrian l. c. 27 and 38). Continuing along the coast of Carmania, Persis proper, and Susiana, Nearchus and the fleet at length reached Thirithōtis or Teredon at the mouth of the Euphrates. By this voyage, a more accurate idea of the configuration of a large portion of Asia was made known to the Greeks.

"324 B. C." (Sm. b. d.), at Rome by decree of the senate, the dictator L. Papirius Cursor and the "magister equitum" L. Papirius Crassus continued in office without any consuls. The Samnites defeated.

"323 B. C." (Clint.), death of Alexander. In the ensuing partition, Ptolemy obtained the government of Egypt. His earliest buildings there bear the hieroglyphic ovals of Philippus Aridaeus and Alexander IV.; nominal successors to the whole Empire.

The first mention of the lunate sigma C is ascribed to the poet Aeschryon, a pupil of Aristotle and said to have accompanied Alexander on some of his expeditions — (Tzet., Franz, and Sm. b. d.). This form of sigma occurs in an inscription found on Sicily and perhaps anterior to "B. C. 282;" also in an inscription under Ptolemy III.

Campanula ramosissima of the East Mediterranean countries. A species of *bell-flower* called in Greece "agria gōulia" (Sibth.); and the EPINON of Diocles of Carystus, growing about springs and streams and at the base of mountains, — giving out according to Dioscorides five to seven branches a span long, its leaves incised at the apex, flowers white, fruit or seed small black and austere, the stem and leaves abounding in juice, is referred here by Fraas: *C. ramosissima* is described by Sibthorp: and was observed by him, Chaubard, and Fraas, from Zacynthus and the Peloponnesus to the Bithynian Olympus. Westward, the "ērīnōs" or "ōkimōēithēs" or "uthrērōn" is identified in Syn. Diosc. with the "ōkimōum akōuatikōum" of the Romans; the account by Pliny of the "herba" called by the Greeks "erineon" seems chiefly taken from Dioscorides, but he adds that its juice is milky and sweet.

Bupleurum protractum of the East Mediterranean countries. A simple-leaved Umbelliferous plant called in Greece "skullōmarathrōn" (Fraas); and the "aliud hippomarathri genus" having according to Diocles long narrow leaves and coriander-like seed — (Plin. xx. 96), according to Dioscorides small narrow oblong leaves and round coriander-like fruit fragrant and heating, the medicinal properties as in the first kind but weaker, may be compared: *B. protractum* is described by Link, and was observed by Fraas in vineyards and cultivated ground in Southern Greece.

"322 B. C." (Plut., and Clint), submission of Athens to Antipater; by whom, "twelve thousand" of the poorer citizens were disfranchised, and some of them carried into Thrace.

Montia fontana of extreme Northern and Austral Climates. A diminutive subaquatic, growing around springs, and called in Britain *blinks* or *blinking chickweed* or *water chickweed* or *water binks* (Prior); in which we recognize the ΜΥΩΨ herb of Dercylus, growing in the Achelous, and inducing blindness if mixed in water for washing sight to be recovered by appeasing Diana — (Plut. fluv. 22, 5): *M. fontana* was observed by Sibthorp, and Chaubard, in the Peloponnesus; by Grisebach, in Roumelia; by Savi, in Italy; by Moris, in Sardinia; by Boissonade, on the mountains of Southern Spain; by Brotero, in Portugal; and is known to grow from the environs of Paris and London to Ireland and Lapland (Pers., Curt. fl. lond. iii. pl. 8, Fries, and Wats.). Farther West, was observed by Hooker on Iceland; by Lapylaie, as far South as Lat. 52° on Newfoundland; by Mertens, at Norfolk Sound on the Pacific coast; by Chamisso, on Unalascha and throughout the Arctic portion of Northwest America; is known to grow also in East Siberia (Ledeb.); and on Antisana and Pichinca, peaks of the Equatorial Andes (Kunth). In the Southern Hemisphere, was observed by C. Gay in Chili; by J. D. Hooker, on the Falkland Islands, New Zealand, the Auckland Islands, Campbell Island, and Kerguelen Island (A. Dec.).

In this year (= 288 + "34 years reign" in the Mahavamsa v.), through the brahmin Chanacca, Danepala-Nandeya (Nanda) slain and succeeded by prince Chandragutta or Sandracottus.

"321 B. C." (Clint., see Strab. xvii. i. 8), the body of Alexander brought into Egypt by Perdiccas,

Philippus Aridaeus, Alexander IV., and their mother Roxana. Perdiccas in reality seeking the government, was prevented by Ptolemy and put to death. The body of Alexander was then buried, and the Royal family departed for Macedonia. — In the time of Strabo, the original golden sarcophagus having disappeared, the body was contained in one of glass. A sarcophagus of solid gold is mentioned by Bonomi as recently discovered by Arabs in Egypt.

"The same year" (Blair, and Sm. b. d.), near Beneventum in Italy, the defeated Romans passing under the Samnite yoke. The peace made by the consuls, was however not ratified by the home government, and war continued.

Trigonella elatior of the Mediterranean countries. Called in Greece "ēmērōn triphullī" or "agria murōthia" (Fraas); in which we recognize the "murōlōtōs" of ancient Greek writers — (J. P. lex.): the "lōtōs" herb according to Theophrastus vii. 8. 3 to 15. 3 has stem-leaves only, and there are several kinds; is mentioned as coronary by Theocritus xvii. 43; and the "lōtōs agrios" of Dioscorides, growing mostly in Libya, two cubits high with leaves like those of the "lōtō triphullō" of gardens, and seed like fenugreek but much smaller, is referred here by writers: T. elatior is termed "melilotus syriaca odora" by Lobel ii. pl. 42; was observed by Sibthorp, Chaubard, and Fraas, frequent in cultivated ground from the Peloponnesus to Cyprus and Asia Minor. Westward, the "lōtōs agriōs" or "livuōn" or "triphullōn" is identified in Syn. Diosc. with the "triphōliōn minous" of the Romans; and the "trifolium cujus minima sint folia" is mentioned by Pliny xxi. 88: T. elatior is termed "lotus sylvestris ex codice cæsareo" (illustr. ms. Diosc.), also "trifolium italicum sive melilotus itilica corniculis incurvis" by Bauhin hist. ii. 372. *T. corniculata*, called in Greece "nikaki" (Sibth.), but regarded as perhaps not distinct (Steud.), was observed by Sibthorp, and D'Urville, from the Peloponnesus throughout the Greek islands; and Westward, is described by Gesner hort. f. 265; is termed "melilotus major" by Tragus 592, "m. italica" by Fuchsius 528, "trifolium corniculatum alterum" by Dodoens 573, "fœnum-græcum sylvestre meliloti facie" by Tournefort cor. 28; and is known to grow in various parts of Southern Europe (All., and Pers.).

Melilotus Messanensis of the East Mediterranean countries. Also called in Greece "ēmērōn triphullī" (Fraas); and probably one of the kinds of "lōtōs" already known to the Greeks: — the "lōtōs ēmērōs" of Dioscorides, springing up in gardens, its juice removing spots and cloudiness from the eyes, identified in the added Synonyms with the "triphullōn" or "trivōliōn" or "tripōthiōn," is referred here by Sibthorp, and Fraas: M. Messanensis is termed "m. m. procumbens folliculis rugosis sublongis spicis florum brevibus" by Tournefort inst. 407; was observed by Sibthorp, Bory, and Fraas, in cultivated ground from the Peloponnesus throughout Greece; by Delile, around Rosetta, Damietta, and Cairo. Westward, was observed by Desfontaines ii. 192 in Barbary; is said to occur also in Italy and Sicily (Pers.), but seems unknown around Messina (Arrosti, and Sibth. 1782).

Trifolium resupinatum of the Mediterranean countries. Called in Egypt "djulban" or "gurt" (Forsk.); and possibly one of the kinds of "lōtōs" in question: the "lōtō triphullō" springing up in "hōrtōkōpēiōis" is mentioned by Dioscorides iv. 110 and 111; the "gramine herba" called "chortinon" from which oil is procured in Egypt, by Pliny xv. 7; and the "kurth," by Abu Hanifa, Ebn Redwhan, and Ebn Baitar: T. resupinatum is termed "t. melilotus diffusa vel bicornis" by Forskal, and was observed by him, and Delile, at Rosetta Damietta and Cairo; by Sibthorp, and Chaubard, frequent throughout Greece and the Greek islands. Westward, is described by Bauhin hist. ii. 379, and Barrelier pl. 872; is termed "t. pratense folliculatum" by Tournefort inst. 404; and is known to grow seemingly wild as far as middle Europe: was once introduced into England, where it continued many years, but finally disappeared (Wals. cyb. 301, and A. Dec.).

"320 B. C. = 1st year of Chin-tseng-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table).

In his reign (Pauth. 193), more than "eighty thousand" persons slain in civil or rather feudatory warfare by the adherents of the prince of Tshin.

Taheiti colonized directly or indirectly from the Samoan Islands, the "mother country" of the Polynesians (next after "Pulotu" or "Purotu"), long before — the Marquesas (J. Williams miss. ent. 57, and Hale ethnog. Expl. exp. 120 to 148. See Taumaco).

Urena lobata of Tropical Africa and Asia. A suffruticose weed called on the Upper Nile "milenda" (Grant), in Hindustanee and Bengalee "bun-okra" (Drur. p. 483); and carried to Taheiti possibly by the first colonists: * — occurring on the islands of the Pacific in the days of Rumphius

* *Urena sinuata*, closely allied, but regarded as distinct. Called in the environs of Bombay "jungly kapas" (Graham); and known as far as the Feejeean Islands as early perhaps as this date: — observed a weed there by myself; is described by Rumphius vi. pl. 25; was observed by Rheede x. pl. 2, in Malabar; by Graham, "common in waste lands" in the environs of Bombay; by Rox-

vi. pl. 25 (A. Dec.); observed by myself in cultivated ground and neglected clearings on the Taheitian, Samoan, Tongan, and Feejeean Islands; by Rumphius, and myself, in the Malayan archipelago; known to occur also in China (Pers.); was observed by Mason v. 519 in Burmah, "a weed which abounds all over the coast" and is used for making cordage; by Roxburgh, Royle, and Wight, "common in most parts of India" and useful for its fibres; by Graham, as far as Bombay, "common in waste places during the rains;" but according to A. Decandolle is not known to have a Sanscrit name. Westward, was observed by Grant from "2° to 3° N." along the Nile, frequent and its bark made into cordage; is known to grow also in Western Equatorial Africa (J. D. Hook., and Benth. fl. nigr. 226). By European colonists, was carried to the Mauritius Islands and the West Indies (Descourtillz), no Carib name being given; to Southern Brazil, observed by myself frequent in the outskirts of Rio Janeiro. Transported to Europe, is described by Dillenius elth. pl. 319, and Linnæus.

"318 B. C." (Sm. b. d.), M. Foslius Flaccinator and L. Plautius Venno consuls at Rome. Truce with the Samnites for two years.

"The same year" (Lubke and Lutrow), at Athens, the Choragic monument of Thrasyllus erected.

As early perhaps as this year, the physician Apollodorus writing to king Ptolemy on the different kinds of wine, those of Italy being as yet unknown — (Plin. xiv. 9).

Ajuga iva of the Mediterranean countries. Called in Egypt "missæka" (Forsk.) or "meskeh" (Del); and the ΧΑΜΑΙΠΙΤΥC identified by Apollodorus with the ΙΩΝΙΑΝ of the Athenians or ΚΙΔΗΠΙΤΙΝ of Euboea or ΟΛΟΚΥΡΟΝ — (Athen. xv. 28), may be compared: the "iōnia" is enumerated by Theophrastus ii. 1. 3 to vi. 1. 1 among frutescent small-leaved coronary plants; is identified through Syn. Diosc. with the "ōlōkurōn" of Pontus; and according to Dioscorides, the "hamaipitus" having leaves like "aëizōō mikrō" is used at Heraclea in Pontus as an antidote against "akōnītōn;" is further identified in the added Synonyms with the "aima athēnas" of the prophets: A. iva is termed "c. moschata foliis serratis, an prima Dioscoridis" by Tournefort inst. 208; was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus and Crete throughout the Greek islands; by Forskal p. 158, and Delile, on the Mediterranean border of Egypt. Westward, the "hamaipitus" or "pītusōrusin" or "orēizēlōn" or "vruōnian agrian" is identified in Syn. Diosc. with the "thōhēla" of the Dacians, and "kupripōm" of the Romans: A. iva is described by Clusius hist. ii. 186; was observed by Lenz in Italy; and is known to grow in dry sandy situations throughout Southern Europe (Cav. pl. 120, and Pers.).

Asclepias Dioscoridis of the East Mediterranean countries. The ΚΙΡΚΑΙΑΝ: ΠΙΖΑΝ prescribed by Apollodorus — (Athen. iii. 15. 6), clearing the matrix according to Dioscorides, growing in stony airy and sunny situations, its several shoots with numerous small black flowers, "kēghrōēithē" fruit within as if horns inducing abundance of milk, may be compared: is identified in the added Synonyms with the "thirkaian:" A. Dioscoridis with flowers "nigro purpureis" is described by Fraas, as observed at Delphi on Euboea, at the elevation of three thousand feet.

Cynanchum nigrum of the West Mediterranean countries. — Referred here by Anguillara p. 229 (Spreng.): C. nigrum has not been observed in Greece, but is known to grow on the hills of Italy and Southern France (Pers., and Lenz).

Heliotropium Europæum of Tropical Arabia. Called in Italian drug-shops "verrucaria" (Lenz),

burgh, Royle, and Wight, as far as Bengal, the fibres of its bark of like quality with those of U. lobata. Transported to Europe, is described by Linnæus

Colubrina Asiatica of Tropical Eastern Asia and the Malayan archipelago. A shrub called in the environs of Bombay "gootee" (Graham); and known doubtless to the first colonists of Taheiti: — observed by myself in clearings and natural openings on the Taheitian, Samoan, Tongan, and Feejeean Islands, but not in the inland forest, seemingly indigenous also in the Malayan archipelago; is known to grow on Luzon (Pers.); is enumerated by Mason as indigenous in Burmah; was observed by Burmann pl. 48 on Ceylon; by Rheede v. pl. 47, in Malabar; by Roxburgh, and Wight, in other parts of Hindustan; and by Graham, as far as Bombay, "common on Elephanta and the Ghauts."

Melastoma Malabathrica of Tropical Eastern Asia and the Malayan archipelago. A shrub called in Tagalo "buyong" (Blanco); and known at least to the first colonists of Taheiti: — observed by myself in clearings and natural openings on the Taheitian, Samoan, and Feejeean Islands and in the Malayan archipelago, but nowhere producing edible fruit; by Blanco on the Philippines, a single branch brought from Cebu; by Jack (linn. trans. xiv. 4), abundant on Sumatra and the neighbouring islands; by Burmann pl. 73, on Ceylon; by Rheede iv. pl. 42, in Malabar; by Nimmo, in the Southern Concan, and by Lush "about Asunwaree" in the Southern Mahratta country (Graham); by Roxburgh, and Wight, in other parts of Hindustan.

in Greece "vrōmōhōrtōn" or "ēliōtrōpiōn," by the Turks "bambal otu" (Sibth.), in Egypt "sackran" inebriating, its leaves if eaten believed to induce vertigo, in Yemen "kerir" or "akrir" (Forsk.); in which we recognize the "verrucariam" identified by Pliny with the "heliotropium" prescribed by Apollodorus, — and Apollophanes; also the "eliōtrōpiōn mēga" of Dioscorides, with leaves following the sun, and from the fashion of its whitish or ruddy flowers sometimes called "skōrpiōurōn:" the "ikrar" is mentioned by Abul Abbas, and Ebn Baitar. H. Europæum was observed by Forskal p. 38 near Mor in Yemen; by Grant from "Lat. 16°" on the Nile banks near cultivation; by Forskal, and Delile, in Egypt; by him, and Sibthorp, abounding in cultivated ground from the Peloponnesus throughout the Greek islands to Marmora. Westward, the "heliotropium" is mentioned by Varro i. 46, and that following the sun is described by Pliny xxii. 19 as occurring chiefly in cultivated ground, half a foot high and having blue flowers; the "solago major" is mentioned by Apuleius 49, and the "verrucaria" by Isidorus Hispalensis: H. Europæum is termed "h. majus Dioscoridi" by Tournefort inst. 139, "h. erectum" by Lamarck fl. fr.; was observed by Lenz in Italy, and is known to occur in other parts of Southern Europe (Jacq. austr. pl. 207, and Pers.). By European colonists, was carried to Northeast America, where it continues in "waste places, Maryland, Virginia etc. in a few places" (A. Gray). "H. villosum," observed by Tournefort cor. 7 on the island of Melo (Pers.), and by Fraas in continental Greece, is regarded by Bory as perhaps not distinct.

"317 B. C." (Diodor., and Clint.), Philippus Aridaeus put to death by Olympias. Who was at once besieged at Pydna by Cassander. — and after two years, captured and slain.

"The same year" (Diod. xviii. 3, xix. 14, and Buns. iv. 7. 2), Porus decoyed into the power of Eudemus Greek king of Bactria, and put to death: Sandracottus being present.

Not earlier than the last-named year (D. Laert., and Clint.), commencement of the government of Demetrius Phalerius over Athens. — He ruled "ten" years.

Stachys betonica of Europe and the adjoining portion of Asia. Called in Britain *betony* (Prior, and Lindl.), in France "betoine" (Nugent), in Germany "betonic," in Italy "betona" or "betonega" (Lenz), in Greece "prionētēs" (Sibth.); in which we recognize the "vettonica" of the Gauls, discovered in Spain by the Vettones (Plin.) and hardly later than this date, — being identified through Pliny with the "kēstrōn" prescribed in 1 Mul. morb. 111 to 119 and 2 Mul. morb. 63: while in Syn. Diosc. the "kēstrōn" called "psuchōtrōphōn" from growing in the coldest places is identified with the "ōuēttonikēn" of the Romans: "herba vettonica" is prescribed by Celsus v. 27 against the bite of serpents; and in the days of Pliny xxv. 46 was called in Italy "serratula:" the "prionitis" (a Greek translation of this name) is mentioned by Alexander Trallianus (Billerb.): *S. betonica* was observed by Sibthorp in the Peloponnesus, by Forskal near Constantinople; is known to grow also in Asiatic Russia; and "aquæ betonicæ" was found by Alpinus, and "betonica" syrup "from Europe" by Forskal mat. med., employed medicinally in Egypt. Westward, *s. betonica* is described by Brunfels f. 89, Tragus f. 180, Valerius Cordus f. 165, and Clusius hist. ii. 38 (Spreng.); is termed "b. purpurea" by Tournefort inst. 203, "b. officinalis" by Linnæus; was observed by Lenz wild in North Italy; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 726, Curt. lond. iii. pl. 33, and Pers.). Continues in medicinal use as appears from Lindley, and from "the fine rigid hairs" when powdered inducing sneezing "is generally made an ingredient in herb-snuffs."

"315 B. C." (Sm. b. d.), coalition of Seleucus, Ptolemy, Cassander, and Lysimachus, and war commenced against Antigonus.

"In this year" (Sm. b. d.), at Athens, death of Xenocrates. He was succeeded by Polemon as head of the Academic school of philosophy.

Sisymbrium polyceratium of Europe and the adjoining portion of Asia. Called in Greece "agriōpra" (Forsk. and Sibth.) or "skullōvrōuva" (Fraas), by the prophets "ēraklēōus alphita," in Egyptian "ērēthmōu" (Syn. Diosc.); and the EPYCIMON enumerated as esculent by Polemon dict. 14, — mentioned also in 2 Mul. morb. 81, by Dioscorides as growing around towns and dwellings and having leaves like those of "ēuzōmō agriō," yellow flowers, and at the summit slender horned fenugreek-like pods containing small seeds that are used medicinally, is referred here by writers: *S. polyceratium* was observed by Forskal, Sibthorp, Chaubard, and Fraas, in waste places and around villages from the Peloponnesus throughout Greece and the Greek islands. Westward, the "ērusimōn" or "hamaiplōn" is identified in Syn. Diosc. with the "ēriōnēm" of the Romans; the "irio" is mentioned by Columella, by Pliny xviii. 10 as cultivated in Italy: *S. polyceratium* was described by Anguillara p. 173 (Spreng.); is termed "erysimum polyceration vel corniculatum" by Tournefort inst. 228; is known to occur in Italy and throughout Southern Europe as far as Portugal (Pers., Brot., and Lenz), and escaping from gardens has been found springing up spontaneously in Britain (Wats. cyb. i. p. 152 and iii. p. 384, and A. Dec.; see *S. irio*).

Avena sativa of Abyssinia. Called in Britain *haver* or *oat*, in Anglo-Saxon "ata" meaning originally food, in Holland "haver," in Germany "hafer" or "haber," in old high German "haparo"

(Prior), in Bohemian and Russian "oves" or "owes," in Hungary "zab" (Moritz.), in France "avoine" or "aveine" (Nugent), in Italy "avena coltivata" (Lenz), in Greece "vrōmōs" (Zalikogl. and Fraas), in Egypt "zammeyr" (Clot-Bey); in which we recognize the ΒΡΟΜΟC commended for food by Polemon diæt. ii. 12—(Athen. xi. 56), and Dioscorides ii. 116, mentioned also by Dieuches, Theophrastus viii. 4. 1 to 9. 2, Oribasius, Hesychius, by Galen alim. fac. i. 14 as abundant in Asia Minor, especially in Mysia, and made into bread as well as given to horses: *A. sativa* was observed by Chaubard under cultivation in Greece and springing up spontaneously; by Fraas, cultivated only as a curiosity; ten varieties according to Clot-Bey were introduced under Mohammed Ali into Egypt and cultivated for fodder; was observed by Bové in the Desert around Sinai (Decaisne ann. sc. nat. ii. 13); by Bruce, wild in Abyssinia and sometimes tall enough to conceal horse and rider, the straw "thick as the little finger" formed into huts "like bee-hives," the grain "not valued but the taste is good" and cakes of the meal were often made by him "in remembrance of Scotland" (Grev.). Westward, the cultivated "avena" is mentioned by Horace sat. ii. 80; by Pliny iv. 27 to xviii. 44 as the only "pulte" of the Germans, and with bird-eggs the only food of the Oonae of the Baltic: *A. sativa* continues under cultivation from Italy to "65°" in the Scandinavian peninsula, but remains unknown on the Faroe Islands (A. Dec.). Eastward from Syria, is called "sulu" by the Tartars (Moritz.); was observed by Kaempfer, and Thunberg, in Japan, and called "ienbaku," or usually "karasmuggi;" and var. "nuda" by Bunge in waste ground around Pekin. By European colonists, was carried to Northeast America, where it continues under cultivation; to Austral America, observed by A. Saint-Hilaire naturalized around Montevideo; to Juan Fernandez (Bertero); to California, observed by myself naturalized and covering hills for many miles around San Francisco Bay, but in Oregon under cultivation only; to the Mauritius Islands (Boj.); and to Hindustan (Royle himal. 419).

"314 B. C. = 1st year of Nan-wang, of the Tcheou" or Fifth dynasty (Chinese chron. table). In his reign, walls were built on the Tartar frontier, from the Hoang-ho river to Pe-tchi-li, and from the border of Chan-si to the Gulf of Liao-toung.

Cerionilla securidaca of the Mediterranean countries. Called in Greece "pikrōlouvi" (Sibth.); and the ΠΕΛΕΚΙΝΟΙ: EN: CΙΤΩ prescribed by (Soranus?) mul. morb. ii. 63,—or "pēlēkinōs" of ointment-makers identified by Dioscorides with the "ēthusrōn" growing among wheat and barley, its horn-like pods containing bitter seeds shaped like a two-edged axe, is referred here by writers: *C. securidaca* was observed by Sibthorp, Chaubard, and Fraas, frequent in cultivated and fallow ground from the Pelopōnnesus to Asia Minor. Westward, the "pelecium" is described by Pliny xxvii. 95 as springing up among grain and having pods by threes or fours and curved or hooked in the manner of horns: *C. securidaca* is described by Matthioli p. 641 (Spreng.); is termed "securidaca lutea major" by Tournefort inst. 399; and is known to occur in Italy, Southern France, and Spain (Dec. fl. fr., Pers., and Lenz).

Biserrula pelecinus of the Mediterranean countries. Possibly the plant prescribed,—for the "pēlēkinōs" of Theophrastus viii. 8. 3 springing up among "aphakais" (in one ms. "phakōis" as read by Pliny xviii. 44) and named from the resemblance to an axe, is referred here by some writers: *B. pelecinus* was observed by Sibthorp, Chaubard, and Fraas, in various parts of the Peloponnesus. Westward, the "pelecium" that destroys "lentem" is identified by Pliny with the "herba securidaca:" *B. pelecinus* is described by Clusius hist. ii. 347; is termed "pelecinus vulgaris" by Tournefort inst. 417; and is known to grow in various parts of Southern Europe (Pers.).

Cotyledon umbilicus of Europe and the adjoining portion of Asia. Called in Britain *navel-wort* (Prior), in Germany "nabelblatt," in Greece "zōumēra" or "sompouni" (Fraas) or "samvōuni" or "kōtulētha" (Sibth.); in which we recognize the ΚΟΤΥΛΗΔΟΝΟC whose leaves are prescribed in 1 Mul. morb. 117,—mentioned also by Nicander, Cratevas, and according to Dioscorides its saucer-like leaves used medicinally: *C. umbilicus* was observed by Sibthorp, Chaubard, and Fraas, frequent on walls and rocks from the Peloponnesus throughout the Greek islands. Westward, the "kōtulēthōn" or "skutaliōn" or "kumvaliōn" or "kēpōs aphrōthitēs" or "gēs ōmphalōs" is identified in Syn. Diosc. with the "ōumvilikōum vēnēris" of the Romans; the "cotyledon" having a fleshy concave leaf and growing in maritime and stony places, is mentioned by Pliny xxv. 101; and the "umbilicus veneris," by Apuleius 43: *C. umbilicus* is termed "c. major" by Tournefort inst. 90; was observed by Forskal near Marseilles; is known to grow also in Spain and Portugal and as far as Britain (Engl. bot. pl. 325, and Pers.).

Sedum stellatum of the Mediterranean countries. A species of *stone-crop* called in Greece "agria anthrakla" (Fraas); in which we recognize the "anthrahnēn agrian" identified through Syn. Diosc. with the ΘΑΛΕΦΙΟΝ of 2 Mul. morb. 80,—its leaves according to Nicander ther. 873 employed against bites of venomous animals; also with the "tritōn ēithōs aēizōōu" of Dioscorides, pungent and ulcerating, growing on rocks, its leaves broader than those of "anthrahnēs" and hairy: *S. stellatum* was observed by Sibthorp, Chaubard, and Fraas, in clefts of rock on the mountains of

Crete and Southern Greece. Westward, the "anthrhnēn agrian" is further identified in Syn. Diosc., and by Pliny, with the "illēkēvran" of the Romans; "illecebrae" is prescribed against calculus by Scribonius Largus, and according to Pliny xxv. 103 is besides collected for food: *S. stellatum* is described by Camerarius hort. pl. 2, and Columna phyt. pl. 11; is termed "s. echinatum vel stellatum flore albo" by Tournefort inst. 263; and is known to grow in Italy and Southern France (Pers., and Spreng.; see *S. telephium*, and *S. altissimum*).

Bupleurum junceum of the Mediterranean countries. The name "bupleuro" is given in Italy to an allied species (Lenz), but the ΒΟΥΠΛΕΥΡΟΝ or ΒΟΥΠΡΗΧΤΙΣ of 1 Mul. morb. 619, commended as food by "Hippocrates," — Lycon, Epænetus, Antigonos, and as medicine by "Glaucôn, and Nicander" (Plin. xxii. 35), seems referred here by Dodoens: the "vōuprēstis" herb is mentioned also by Theophrastus vii. 7. 3, and Galen: *B. junceum* "a foot and a half high" was observed by Sibthorp near Smyrna. Westward, the "bupleuron" classed by the Greeks among spontaneous potherbs, is according to Pliny xxii. 35 a cubit high with numerous long leaves and "capite anethi." *B. junceum* is described by Dodoens pempt. pl. 633; is termed "b. annum angustifolium" by Tournefort inst. 310, "isophyllum junceum" by Hoffmann, as observed by him in Germany; is known to grow also in Italy, Switzerland, and France (Pers.).

Laserpitium siler of the mountains of middle and Eastern Europe. The ΚΕΚΕΛΙ:ΜΑΚΚΑΛΙΩ ΤΙΚΟΝ prescribed in 1 Mul. morb. 108, — having according to Dioscorides "marathrō"-like leaves, an "anēthō"-like umbel, fruit quickly "thrimus" acrid or bitter, and in the added Synonyms identified with the "sphagnōn," is referred here by Valerius Cordus (Spreng.): *L. siler* was observed by Sibthorp at Delphi and on other high mountains of Greece, the seeds as in all the species intensely bitter. Westward, is described by C. Bauhin pin. 162, and Morison ix. pl. 3; is termed "ligusticum quod seseli officinarum" by Tournefort inst. 323; and is known to grow in Austria, Switzerland, and France (Jacq. austr. pl. 145, and Pers.).

Seseli tortuosum of the Mediterranean countries. The "sēsēli massalōdōtikōn" — is however referred here by Anguillara, Matthioli, Lobel, Clusius, and Sprengel: *S. tortuosum* is known to grow in Albania (Fraas); was observed by Sibthorp, and Gittard, in Greece; and by Pallas, and Gueldenstaedt, farther East (Steud.). Westward, is described by Anguillara, Lobel adv. 352, and Bauhin hist. iii. pl. 16; is termed "foeniculum tortuosum" by Tournefort inst. 311; is known to grow in North Italy (Lenz); and was observed by Forskal near Marseilles.

Ferula Persica of Persia. The *sagapenum* of commerce is called in Persian "sagapina" (Jao de Sousa), in Arabic "sekhbinedsch" (Spreng.); in which we recognize the ΣΑΓΑΠΕΝΟΥ of 1 Mul. morb. 108, — described by Dioscorides as the juice of a Ferulaceous plant growing in Media, mentioned also by Celsus, Galen, Marcellus, Oribasius, Paulus Aegineta, and in the days of Pliny xix. 15 used for adulterating the "laser" *asafetida* of Persia, Media, and Armenia: "sekhbinej" is mentioned by Rhazes, Avicenna, Ebn Baitar, and according to Mesue 79 is the product of a "tree, an oleander of the mountains." *F. Persica* was sent from Persia by Michaux as the source of *asafetida*; is regarded by Nees and Ebermaier "as one of the plants yielding" this substance, and according to Lindley "probably with justice."

Pseudanum nodosum of Crete. The ΔΑΥΚΟΥ:ΑΙΘΙΟΠΙΚΟΥ whose root and fruits are prescribed in 1 Mul. morb. 56, — may be compared, one of the kinds of "thaukōs" being referred here by Honorius Bellus (ad Clus. 301): the "thaukōn thaphnōithēs krōkōēn" is enumerated by Theophrastus ix. 15. 5 to 8 as growing in Arcadia and of excellent quality about Patras, heating, the root black; and four kinds of "dauci" are distinguished by Petronius Diodotus (Plin. xxv. 64): *P. nodosum*, yellow-flowered, is described by Linnæus, and is known to grow on Crete, where it is extremely rare (Pers., and Spreng.). "*P. creticum*" of Decandolle is regarded by Chaubard, as perhaps not distinct, together with "*Ferula geniculata*" observed by him, and Fraas, on high mountains of the Peloponnesus and Southern Greece, and by Gussone prodr. as *fur* as Sicily.

Thapsia fœtida of the Mediterranean countries. An Umbelliferous plant called in Greece "pōlukarpōs" (Sibth.); and possibly the ΠΟΛΥΚΑΡΠΟΝ prescribed in 1 Mul. morb. 90: — *T. fœtida* was observed by Sibthorp on Zacynthus and Cyprus. Westward, is described by Lobel ic. 780, Morison ix. pl. 18, and Blackwell pl. 459; and is known to grow in Spain (Pers.; see *T. Garganica*, and *Opanax chironium*).

Crucianella Monspeliaca of the Mediterranean countries. A Rubiaceous plant called in Germany "kreuzblatt," in Greece "agriōsitarō" (Fraas); and the "pōlukarpōn" in question — is identified by Galen with the "krataiōgōnōn," described by Theophrastus ix. 18. 6 as springing up like "linōn purinōn" its fruit as in "kēghrōs," by Dioscorides as growing in shady bushy places and very acrid, and referred here by Fraas: the "krataiōgōnōn" is identified in Syn. Diosc. with the "krataiōnōn," is mentioned also by Paulus Aegineta: *C. Monspeliaca* was observed by Sibthorp, Chaubard, and Fraas, frequent in hilly situations from the Peloponnesus throughout the Greek islands; is known to grow also in Palestine (Pers.). Westward, the "crataegonon" is described by

Pliny xxvii. 40 as "spicae tritici simile" with many much-geniculated stems from one root, yet his account seems chiefly taken from the Greek: *C. Monspelica* is termed "rubeola supina spica longissima" by Tournefort inst. 130; and is known to grow in Southern France (Pers.).

Pulicaria dysenterica of Europe and the adjoining portion of Asia. Called in Britain *fleabane* (Prior and Lindl.); and the ΚΟΝΥΖΗC:ΗΔΥΟCΜΟΥ prescribed in 1 Mul. morb. 108, — or "ἐὐο-
θῆους" of Apollonius (Galen comp. med. loc. ii. 1), may be compared: *P. dysenterica* was observed by Sibthorp, and Chaubard, in moist places from the Peloponnesus to Constantinople. Westward, the leaves of the coronary "conyzae feminae" according to Pliny xxi. 32 have the odour of honey: the "policarie" is mentioned by Franciscus Pedemontium: *P. dysenterica* is termed "aster pratensis autumnalis conyzae folio" by Tournefort inst. 482, "inula conyzaea" by Lamarck fl. fr.; was observed by Scopoli in Carniolia, by Allioni in Piedmont (Steud.); and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 410, and Pers.). The herb according to Lindley is "more or less woolly or cottony, glutinous, with a peculiar acid aromatic scent, somewhat like the flavour of peaches;" and according to Keith cured the Russian army of dysentery (Linn. fl. suec. 294), but its medicinal virtues are discredited by Haller.

Onosma echioides of Europe and the adjoining portion of Asia. A Boragineous plant called in Greece "vrahōtzikla" (Fraas); by whom the ΧΕΔΙΑC:ΜΕΓΑΛΗ of 1 Mul. morb. 101 — is referred here conjecturally: *O. echioides* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to the shores of the Black Sea; and is known to grow farther East (Bieb.). Westward, is termed "symphytum echii folio ampliore radice rubra flore luteo" by Tournefort inst. 138; was observed by Lenz in Italy; and is known to grow as far as middle Europe (Jacq. austr. pl. 295, and Pers.).

Satureja juliana of the Mediterranean countries. A species of *savoury* called in Greece "ussōpō" (Sibth.), in Egyptian "pēsālēm" (Syn. Diosc.); in which we recognize the ΥCΩΠΟC of 3 Mul. morb. 490, — Nicander ther. 872, Cratevas (Anguillar 198), produced according to Dioscorides of the best quality in Cilicia: *S. juliana* was observed by Sibthorp, Chaubard, and Fraas, abounding on Crete and the Peloponnesus. Westward, the "ussōpōs" is identified in Syn. Diosc. with the "ussōpōum" or "latēr" or "kassiala" of the Romans; "hyssopum" is mentioned as edible by Celsus ii. 21, "vinum hyssopiten" by Columella xii 35, and "hyssopum cum vino decoctum" by Pliny xxvi. 11. *S. juliana* is described by Matthioli p. 693, and Cæsalpinus xi. 39 (Spreng.); is termed "thymbra Sancti Juliani sive satureja vera" by Tournefort inst. 198; and is known to grow wild in Italy (Pers., and Lenz).

Satureja Græca, regarded by Bory as perhaps not distinct, is also called in Greece "ussōpō," but sometimes "thrōumpi," and by the Turks "supha" (Forsk.); was observed by Alpinus exot. pl. 264. Sibthorp, and Chaubard, on Crete and the Peloponnesus: eating "Greek hyssop" is mentioned in the Talmud (Kitt. bibl. cycl. ii. 533); "zufa" is compared with maiorana by Isaac Ebn Amran, with thyme by Mesue; and "hyssopus" from Palestine, and "syrupus hyssopi" called "scherab zufe," were found by Forskal mat. med. employed medicinally in Egypt. *S. nervosa*, also regarded by Bory as not distinct, was observed by Sibthorp on Zacynthus and called there "ēzōpōn;" and by Desfontaines pl. 121 on the Atlas mountains (Pers.).

Satureja montana of the Mediterranean countries. Called in Italy "santoreggia" or at Verona "isopo" (Lenz); in which we recognize the "ussōpōum" of the Romans identified through Syn. Diosc. with the "ussōpōs" in question: — the "ōrēinē" kind distinguished by Dioscorides, seems to correspond: *S. montana* was observed by Sibthorp on mount Athos; and is known to grow farther East (Pall., and Steud.). Westward, is termed "calamintha frutescens saturejæ folio facie et odore" by Tournefort inst. 194; was observed by Lenz wild in Italy; and is known to grow in other parts of Southern Europe (Pers.).

Ziziphora capitata of the East Mediterranean countries. The ΠΟΛΥΚΝΗΜΟΝ of 1 Mul. morb. 90, whose leaves are prescribed in Sterilib. 24, — mentioned also by Nicander, and fragrant according to Dioscorides, is referred here by Fraas: *Z. capitata* is described by Plukenet alm. pl. 164; is termed "thymus humilis latifolius" by Buxbaum cent. iii. pl. 51; was observed by Sibthorp, and Fraas, from Boeotia to Cyprus; is known to grow also in Syria, Armenia, and Siberia (Pers.). Westward, the "pōluknēmōn" or "klinōpēthiōn" or "pōlugōnatōn" or "thiōs ēlakatē" or "ēlēōnūmōn" is identified in Syn. Diosc. with the "pōutialōgōnthria" of the Romans; the "polycnemon" is mentioned also by Pliny xxvi. 88, but his account seems taken from Dioscorides.

Chenopodium (Agathophytum) bonus-henricus of Europe and the adjoining portion of Asia. Called in Britain *wild spinage* (Petiv.) or *allgood* or *good henry*, in Holland "goeden henrik," by Cordus "weyss heyderich" or "gut heynrich." in Germany "guter heinrich" (Prior) or "schmerbel," in Old French "sars" or "sarron" or "serrones," in Switzerland "mangauns" or "vaungas" or "voungas" or "heilmeln" (A. Dec.), in Greece "agriōspanakia" (Sibth.); and possibly the ΑΝΔΡΑΦΑΞΙΔΟC ΑΓΡΙΗC whose fruit is prescribed in 1 Mul. morb. 31, —

both kinds it would seem from Dioscorides being eaten as potherbs, and their fruit used medicinally; Pliny xx. 83 expressly states that the "atriplex silvestre" is used for the same purposes as the cultivated kind, and besides for dyeing the hair: *C. bonus-henricus* was observed by Sibthorp, Chaubard, and Fraas, frequent in mountainous situations from the Peloponnesus to Aetolia Westward, is described by Gerarde, Bauhin hist. ii. 965, and Parkinson; is termed "ch. folio triangulo" by Tournefort inst. 506; is known to occur in waste places throughout middle Europe as far as Denmark (fl. Dan. pl. 579, and Pers.); was once much cultivated in Britain, but is regarded by Babington, and Watson, as probably exotic and now naturalized. By European colonists, was carried to Northeast America, observed by myself in cultivated ground in the environs of Salem.

Arum arisarum of the Mediterranean countries. A small species called in Greece "thrakōntia" (Sibth.); and clearly the ΔΡΙΜΥ acrid BOABION: EN: ΠΥΡΟΙC prescribed, especially that from Egypt, in 2 Mul. morb. 63:—the "aris" growing in Egypt and resembling the "aro" but smaller with smaller leaves and a root not exceeding the size of a large olive, is mentioned by Pliny xxiv. 98, also by Galen voc. Hipp. 442, and Hesychius; and the "arisarōn" having according to Dioscorides an olive-like root and more acrid than the "arōu." is referred here by writers: *A. arisarum* was observed by Sibthorp, Chaubard, and Fraas, extremely frequent from the Peloponnesus throughout Greece; by Delile, on the Mediterranean border of Egypt, and by myself in winter near the pyramids. Westward, is termed "*arisarum latifolium majus*" by Tournefort inst. 161; was observed by Savi iv. 101 in Italy (Spreng.); and is known to grow in other parts of Southern Europe, as well as in Barbary (Pers.).

Polypodium vulgare of Northern Climates. Called in Britain *polypody* or by the older herbalists *oak fern* (Prior), in Italy "felce quercina" or "polipodio quercino" (Lenz), in Greece "thēnthrōphthēiri" (Fraas) or "polupōthi" (Sibth.); in which we recognize the ΠΟΛΥΠΟΔΙΟΝ prescribed in 1 Mul. morb. 45,—mentioned by Theophrastus caus. ii. 17. 4 as sometimes growing on trees, by Dioscorides as a span high and growing on mossy rocks and trunks of trees: *P. vulgare* was observed by Sibthorp, Chaubard, and Fraas, frequent in such situations in Greece; is known to grow also in Siberia (Hook.). Westward, the *polupōthiōn* or "skōlōpēnthrōn" or "pōlurriōn" is identified in Syn. Diosc. with the "philikōula phlōukitalis" of the Romans, by Pliny xxvi. 37 with the "filiculam": *P. vulgare* was observed by Desfontaines in Barbary, by Lenz in Italy; and is known to grow throughout middle and Northern Europe as far as Iceland (Hook., and Bory). Farther West, is known to grow in Subarctic America from Lat. 64° to 54° (Hook.), has been observed by myself along the Atlantic from Northern New England to Lat. 39°, is known to grow on the Alleghanies as far as Alabama (Chapm.), was observed by Nuttall along the Arkansas, and again by myself along the Pacific at Puget Sound.

Piper nigrum of Tropical Hindustan. The *black pepper* of commerce is called in Tamil "molagoo-vully," in Telinga "moloovoo-kodi" (Drur.), in Bengalee "golmarich," in Hindustanee "fifil" or "golmirch" (Droz.) or "mirtsh" (Fleming), in the environs of Bombay "miree" or "kala miree" (Graham); in which we recognize the Indian round pepper called ΜΥΡΤΙΔΑΝΟΝ of 2 Mul. morb.,—the "strōnglōn pēpēri" distinguished by Theophrastus ix. 20. 1, and "mēlan" kind of Dioscorides, Pliny xii. 14, and Galen fac. simpl. iii. 97; also the "fulful" of Rhazes, Avicenna, Abd-allatif, and Ebn Baitar: pepper is termed "sacrum" by Persius, and down to the Fifth century was so highly valued as to be enumerated by Attila among other things required for the ransom of the city of Rome (Drur.): in regard to the ancient route of importation, I saw on the Nile a quantity of black pepper that had been brought from Mecca across the Red Sea and through the Thebaid. Eastward from Arabia, the vine producing it was observed by Rheede vii. 12, Roxburgh, and Graham, under cultivation in Hindustan; by Mason v. 494 "exotic" in Burmah, "often seen creeping up the trees" and called "nya-yoke-koung;" by Marsden, on Sumatra, at the present day the principal seat of its cultivation. By European colonists, was carried to the West Indies, where according to Lindley it is also successfully cultivated.

Piper trioicum, regarded as the original state of the same plant by Wight, and Miquel, is called in Telinga "mural-tiga" (Roxb.), in the environs of Bombay "cockewail" (Grah.); was found by Roxburgh wild in moist rich soil shaded with trees among the Circar mountains; by Graham, "clothing the trunks of high trees" at Lanowlee not far from Bombay. Roxburgh commenced a plantation of some fifty acres, which from 1789 yielded abundantly, and the product was rated by the merchants equal to the best Malabar pepper (Lindl. and Drur.).

Piper betle of the Malayan archipelago. The *betel vine* is called in Sanscrit "nagurulee" or "tamboolee" or "tambooluvulle," in Bengalee "pan" (Lindl.), in Hindustanee "pan" or "tambol" (Droz.), and at Bombay the roots as a stimulant medicine "paun-ka jhar" or "pippla mool" (Vaupell); in which we recognize the ΙΝΔΙΚΟΥ of 2 Mul. morb. 47—identified through Galen with the "pēpērēōs riza" of Dioscorides ii. 188; also the "fulful mujah" root of pepper plant mentioned by Ishak ben Amran, Ebn Masah, Avicenna p. 237, and Ebn Baitar. The plant itself is

called "tanbul" or "tamul" by Maserjawia, Abu Hanifa, Masudi, Haly Abbas, Gafeki, Avicenna, Edrisi, and Ebn Baitar; and the imported folded leaves have sometimes reached Egypt, where "fufal" or "areca & betel" are enumerated by Forskal mat. med. as "masticatorium." Farther South, *P. betle* was observed by myself under cultivation on Zanzibar. Eastward, by Rheede vii. pl. 15, Roxburgh, Graham, and myself, under cultivation in Hindustan; by Burmann pl. 82, on Ceylon; by Mason v. 495 "exotic" in Burmah, extensively cultivated by the natives and called "kwon-rwet;" by Rumphius v. pl. 116, and myself, under cultivation throughout the Malayan archipelago, but by Blume once found wild in a marsh among mountains on Java (Lindl.). By European colonists, was carried to the West Indies, where according to Lindley it is now cultivated. (See *Areca catechu*).

"313 B. C." (Hindu narr., Benfey, and Buns.), Pataliputra* on the Ganges captured and the sons of Nanda dethroned; Sandracottus establishing himself there as king. — Pataliputra (not far from Patna) was visited by Fa-hian.

"312 B. C." (Diodor., and Clint.), at Gaza, Demetrius Poliorcetes defeated by Ptolemy and Seleucus Nicator. Babylonia was now seized by Seleucus; whose entrance into Babylon "March 13th, Tuesday" (Blair) marks the *Era of the Seleucidae*. — Used especially by the Jews, under the name "Dhilcarnain" or "Era of contracts."

Clearchus of Soli, a pupil of Aristotle, possibly at this time writing.

Prunus domestica of Europe and the adjoining portion of Asia. In its wild state called in France "prunelle," in Lorraine "brimbelle" (Fée); in which we recognize the *BPABYΛON* growing according to Clearchus on Sicily and Rhodes, — mentioned also by Seleucus, Theocritus vii. 145, Athenaeus ii. 10, and Galen alim. fac. ii. 38; and "brabyla" by Pliny xxvii. 32. Cultivated kinds are called in Britain *prune* or *damson* (Prior), in Greece "thamaskēnē" (Fraas), in which we recognize the "prōumnēs" having a gum of Theophrastus ix. 1, the "kökkumēlēa" called in Asia "prōumnōn" of Galen simpl. med. fac. vii. 35, and the Syrian "kökkumēlēa" growing according to Dioscorides especially at Damascus and the fruit dried: *P. domestica* was observed by Sibthorp, Chaubard, and Fraas, under cultivation in Greece and sometimes growing spontaneously; is known to grow wild around Caucasus and the Talysch mountains (Pall. fl. ross. i. p. 18, Ledeb., and A. Dec.); was observed by Forskal, Delile, and Clot-Bey, under cultivation in Egypt; and by Forskal, under cultivation on the mountains of Yemen. Westward, the "cereolum et damasci prunum" is mentioned by Columella x. 405, the "damascena" or "pruna in damasco monte nata" is enumerated by Pliny xiii. 10 and xv. 12 as a tree but recently introduced into Italy, and the dried fruit "pruna peregrinae senectae" is mentioned as laxative by Martial xiii. 29: *P. domestica* is termed "p. fructu cerei coloris" by Tournefort inst. 622, and cultivated varieties are familiarly known in the gardens of Europe. By European colonists, some of these varieties have been carried to Northeast America, where they continue frequent in gardens in our Northern and Middle States.

"The same year" (Sm. b. d., and Lubke and Lutrow), the "via Appia" or oldest Italian road, built by the censor Appius Claudius Caecus; the earliest literary Roman, writing however in Greek. He also built the oldest of the fourteen aqueducts that supply Rome with water.

"311 B. C." (Sm. b. d.), C. Junius Bubulcus Brutus and Q. Aemilius Barbula consuls, the Etruscans having declared war, defeated by the Romans.

"In this year" (Sm. b. d.), Roxana widow of Alexander, and her son Alexander Aegus, put to death by Cassander.

Pisum ochrus of the Mediterranean countries. A species of *pea* called in Italy "araco nero" (Lenz), in Greece "aukōs agriōs" (Sibth.); in which we recognize the *ΑΡΑΚΩΝ* of Dieuches — (Orifbas. iv. 8), mentioned as a cultivated pulse by Phanias of Eresus (Athen. ix. 71), and Clemens Alexandrinus strom. i. 7; by Theophrastus viii. 8. 3 as springing up among lentils, its seeds hard and rough: *P. ochrus* was observed by Sibthorp, and Chaubard, frequent in cultivated ground from the Peloponnesus to Cyprus; and the "aracus" is enumerated by Alpinus among the esculent plants of Egypt. Westward, the "cicer nigrum" is distinguished by Pliny xviii. 32 to xxii. 71: *P. ochrus* is

* *Bignonia suaveolens* of Tropical Hindustan. A flowering tree called in the environs of Bombay "purul" (Graham), in Sanscrit "patali" (Koenig); and giving its name to the city of Pat'ali putra on the Ganges — (C. Mull. note to Arrian ind. 10): "patala" flowers are mentioned in the Saddharma pundarika (Burn. ii. 218 to 415), by Jayadeva (res. asiat. iv. 291), Susrutas, Harivansa 18, and as red by Kalidasa raghuv. xvi. 52 to xix. 46: the "po-tch'a-li" seen by Hiouen-Thsang 8 in Hindustan, is referred here by Stanislaus-Julien: *B. suaveolens* was observed by Gibson, and Graham, on the Deccan, its "flowers in terminal panicles, of a dark purple colour and very fragrant;" is termed "b. gratissima" by Koenig; and was observed by him, and Roxburgh, in Tranquebar and other parts of Hindustan.

described by Morison ii. pl. 3; is termed "ochrus folio integro capreolos emittente semine subluteo" by Tournefort inst. 396, "ochrus uniflorus" by Moench; was observed by Lenz in Italy; and is known to occur in cultivated ground in Southern France and as far as Portugal (Lam. fl. fr., Dec., and Pers.).

Arum Dioscoridis of the East Mediterranean countries. Called in Greece "vōurvōs" (Fraas) or "agriōkōlōkuthia" (Sibth.); and the "aron" commended by Dieuches, — Cleophrantus, and Diodotus (Plin. xxiv. 92), stemless according to Theophrastus vii. 12. 2 to 13. 2 and its root and leaves steeped in vinegar and eaten, described by Dioscorides as having smaller leaves than those of "thrakōntiōu" and less spotted, is referred here by writers: the "arōn" called on Cyprus "kōlō-kassiōn" is identified in Syn. Diosc. with the "lōupha" of the Syrians, and the "luf" of Ebn Baitar is admitted to be an Arum: A. Dioscoridis is described by Sabbati hort. rom. ii. pl. 75 (Bory); was observed by Sibthorp, Chaubard, and Fraas, in waste and cultivated ground from the Peloponnesus and Boeotia to Cyprus, the root cooked and eaten.

"310, Aug. 15th, about 8 A.M." (Diodor., Blair, and Clint.), *eclipse of the sun*, nearly total, "being eleven digits 10." Agathocles after defeat in Sicily by the Carthaginians transporting his army to carry the war into Africa, with the co-operation of Olynthius or Ophelas of Cyrene, marching by land (pseud-Aristot. oecon. ii. 35, Diodor. xx. 40. 1, Marcian, and C. Mull. geogr. min. p. xxiv).

"The same year" (Sm. geogr. dict.), Q. Fabius Maximus and C. Marcius consuls, the Ciminian forest first crossed by the Romans, and the Etruscans and their allies defeated at the Vadimonian lake by Q. Fabius Maximus: the first decisive blow to the ancient power of Etruria — (according to Livy ix. 39).

Boswellia sp. of Equatorial Eastern Africa. A stunted tree only five feet high, affording a kind of "looban" (Grant) or *frankincense*, perhaps the "livanōtōs" tree (according to Juba) transplanted under the Ptolemys into Egypt: observed by Grant "growing locally in patches in 3° N." on the Nile.

Boswellia papyrifera of Abyssini. Called there "makar" or "makkar" (Rich.); and possibly the "livanōtōs" tree in question, — and that known to Theophrastus ix. 4. 2 as growing near Saba on a mountain whose summit was covered with snow: B. papyrifera was received by Richard from Abyssinia, where it grows at the elevation of about "four thousand" feet on the mountains (C. Mull. geogr. min. i. p. cvii).

"309 B. C." (Sm. b. d.), Heracles, only surviving son of Alexander, put to death by Polysperchon and Cassander.

As early perhaps as this date (Sm. b. d.), Herophilus removing to Alexandria, as affording opportunities for dissecting: — he there made important discoveries in Anatomy, and became eminent as a physician.

Plantago coronopus of the Mediterranean countries and middle Europe. Called in Britain *star of the earth* (Prior), in Italy "piantaccine coronopo" (Lenz), in Greece "kuparissōhōrtōn" (Sibth.), by the Arabs "atariabelal" (Spreng.); in which we recognize the ΓΗC: ΑCΤΕΡΟC prescribed against bleeding by Herophilus — (Gal. comp. med. vii. 4); also the "astrion" of Syn. Diosc. ii. 157, and Actuarii, referred here by Stapel: the "radschil elgorab" of Ebn Baitar is referred here by Sprengel, and Sontheimer: P. coronopus was observed by Forskal, Sibthorp, and Chaubard, frequent on the seashore of Greece and the Greek islands; by Forskal, and Delile, around Alexandria and Cairo. Westward, the "astriōn" or "ammōnōs" is identified in Syn. Diosc. with the "atirsiptē" of the Numidians, and "kakiatrikēm" or "stilagō" or "saggōuinariam" of the Romans: P. coronopus is termed "coronopus hortensis" by Tournefort inst. 128; was observed by Forskal on Malta, as well as near Marseilles; and is known to grow throughout middle Europe as far as Britain (Blackw. pl. 460, Hall. helv. 658, Pers., Engl. bot. pl. 892).

Symphytum officinale of Europe and the adjoining portion of Asia. Called in Britain *comfrey* (Prior), in Sweden "vallört," in Germany "beinwelle" or "beinheil," in France "consoude" (Spreng.), in Italy "consolida maggiore" or "sinfito consolida" (Lenz), in Greece "xēkōuli" (Sibth.); in which we recognize the CYMΦΥΤΟΥ whose root is prescribed against bleeding by Herophilus — (Gal. comp. med. vii. 4), not named but alluded to by Theophrastus ix. 18. 2: S. officinale was observed by Sibthorp in Greece and on the Greek islands. Westward, the "sumphutōn allō" or "pēktēn" is identified in Syn. Diosc. with the "söldaginēm" of the Romans; and the "consolida" is mentioned by Apuleius Barbarus 60: S. officinale is described by Brunfels i. 75 (Spreng.); is termed "s. consolida major flore purpureo quæ mas" by Tournefort inst. 138; was observed by Lenz in Italy; and is known to grow in moist shady situations as far as Britain (Engl. bot. pl. 215, and Pers.). By European colonists, was carried prior to 1669 (Jossel.) to Northeast America, where it continues about dwellings, the flowers according to A. Gray "yellowish-white, rarely purplish." Formerly according to Lindley was "in much repute as a vulnerary, but not now used;" the root however yielding mucilage and "useful in coughs and all internal irritation."

Symphytum brochum of the East Mediterranean countries. Called in Greece "hōnthrōutikō" (Fraas); and probably included in the "sumphutōu" of Herophilus, — and others: the "sumphutōn allō" of Dioscorides, two cubits or more high covered with roughish pubescence that excites itching, stem empty like that of "sōghōu" and rendered angular by adnate "vougloussou"-like leaves, flowers white or yellow, roots black but within white and mucilaginous, is referred here by Fraas: *S. brochum* is described by Chaubard, and was observed by him, and Fraas, in cool situations in Attica and the Peloponnesus.

Ajuga reptans of Europe and the adjoining portion of Asia. Called in France and Britain *bugle*, in mediæval Latin "bugulus" or "consolida," in old English "consound" or "consoud" (Prior); and possibly the "sumphutōu" of Herophilus, — and "sumphutōn pētraion" growing according to Dioscorides among rocks and having "ōrganō"-like branches, "thumōu"-like heads, a long reddish root, and employed against spitting blood and among other medicinal purposes for agglutinating wounds. *A. reptans* was observed by Sibthorp, and Chaubard, in woods from the subalpine portion of the Peloponnesus to Constantinople. Westward, the "symphyti" is identified by Scribonius Largus 83 with the "inulam rusticam" or "alum gallicum" and its root prescribed against bleeding from the lungs, chest, or arteries; the "symphyton petraeum" of the Greeks is identified by Pliny xxvii. 24 with the "alum" of the Romans, resembling "cunilae bubulae," healing broken bones and agglutinating flesh even in cooking, but his further account seems chiefly taken from Dioscorides: *A. reptans* is termed "bugula" by Tournefort inst. 209; and is known to grow in woods and meads throughout middle Europe as far as Denmark (fl. Dan. pl. 925, Curt. lond. ii. pl. 43, and Pers.).

"308 B. C. = beginning of the Eleventh manwantara" among the Hindus — (Graham Munjari tables, and Bentr.).

"The same year" (= 543 — "235 yrs." of the Mahavams. v. p. 68, and Mason iii. 40), at Pataliputra (near Patna on the Ganges) meeting of the Third great Buddhist council.

Corypha umbraculifera of Ceylon. The *talipot palm* is called in Tamil "condapana," in Telinga "sidalum," in Bengalee "talee" (Drur.); and the "tala" leaves on which the early Buddhist Scriptures of Kasyapa's council were written — (according to tradition current in the days of Hiouen-thsang 158), may be compared: "the leaf used for writing on" is described by Nicolo Conti as "six cubits long and almost as many broad:" *C. umbraculifera* was observed by Rheede iii. 1 to 12 in Malabar; by Knox, wild on Ceylon; and according to Roxburgh, and Drury, the leaves are used for writing on with an iron style, for portable tents and for covering houses, for umbrellas by all classes, and the seeds are used as beads by certain sects of Hindus, and the pith converted into a kind of *sago*. Farther East, "leaves so big that five or six men can stand in the shade" were seen by Jordanus mirab. in "India major:" *C. umbraculifera* was observed by Mason "exotic" in Burmah and called "pæ;" by myself, under cultivation on the Philippines, where according to Blanco it is called in Tagalo and Bisaya "buri" or "buli." By Nimmo, was introduced "in 1833" into the environs of Bombay (Graham).

Corypha taliera of Eastern Hindustan. The *book palm*, an allied species, is perhaps the "tala" in question: — the "tali" of Kalidasa ragh. xiii. 15, and Susrutas chik. 17, is referred here by Hessler. *C. taliera* was observed by Roxburgh cor. iii. pl. 255 to 256 in Bengal, its leaves used for writing on with an iron style, for thatching roofs, and hats and umbrellas are made from them (Drur.). Farther East, was observed by Mason v. 425 to 812 in Burmah and called "pæ," planted near "religious edifices" and its leaves used for writing on. By Nimmo, was introduced "in 1833" into the environs of Bombay (Graham).

"In this year" (Sm. b. d.), Ptolemy visiting Greece as liberator, obtained possession of Corinth and Sicyon, where he left garrisons.

About this time, "at the expense of kings" (Plin. ii. 65, and Gemin.), the *height of mountains*, Pelion, Cyllene, and others in Greece, measured by Dicaearchus a pupil of Aristotle. Dicaearchus also collected statistics tending to show, that more human beings perish through the violence of man, than from all other causes combined.

"307 B. C." (= 543 — "236 yrs.," Turnour mahavams. xiii., and Elphinst. ii. 4), the *Budhist* religion introduced from Hindustan into Ceylon* (compare B. C. 246).

* *Odina wodier* of Tropical Hindustan and Burmah. A Terebinthaceous tree called in Sanscrit "ajasringha" (Pidd.), in Tamil "kulleyum" or "woodian," in Telinga "waddi gampina," in Hindustanee "cushmulla," in Bengalee "jiwul" (Drur.), in the environs of Bombay "shimtee" (Graham), in Burmah "hnan-bai" (Mason); in which we recognize the "coliya" tree on the site of and giving its name to a new city — (Mahavams. i p. 24), and the "ajasringi" of Susrutas sutr. 36: *O. wodier* was observed by Rheede iv. pl. 32 in Malabar; by Graham, "on the Ghauts pretty common," also

"In this year" (Diodor., and Clint.), by Demetrius Poliorcetes, Athens liberated; Demetrius Phalerius escaping to Egypt.

Phanias of Eresus, a pupil of Aristotle and the contemporary and friend of Theophrastus (Sm. b. d.).

Malva rotundifolia of Europe and the adjoining portion of Asia. Called in Britain *mallows* (Jossel. and Ainsw.), in France "mauve" (Nugent), in Germany "runde käsepappel" (Fraas), in Italy "malva" (Lenz), in Greece "mölōha" or "mölōhē" (Sibth.) or "agria mölōha" (Fraas), in Yemen "hobsen" (Forsk.); in which we recognize the ΜΑΛΑΧΗ whose seed-vessel resembling a sea-urchin in its markings according to Phanias is called ΠΛΑΚΟΥΣ cakes, — described by Theophrastus vii. 8. 1 as "epigēiōkaula" its stem resting on the ground, and called "mölōhē" before the days of Athenaeus ii. 52: the "malahē hērsaia" of Dioscorides may also be compared: *M. rotundifolia* was observed by Sibthorp, Chaubard, and Fraas, frequent in fallow ground from the Peloponnesus to Asia Minor; by Forskal, among the mountains of Yemen, and "aqua Malv. rotundifol." called "habize" in the drug-shops of Egypt. Westward, the "moloche" is mentioned by Columella x. 247; several kinds of "malva," by Pliny xx. 84; and the "malva" flagging in the heat as understood by Gildas ep. 59 writing in Britain, seems to belong here: *M. rotundifolia* is termed "m. vulgaris flore minore folio rotundo" by Tournefort inst. 95; was observed by Lenz in Italy, used there medicinally; and is known to occur in waste places as far as Denmark (fl. Dan. pl. 721, and Pers.). By European colonists, was carried before 1669 (Joss.) to Northeast America, where it continues along roadsides and around dwellings in our Atlantic States, even according to Chapman in the far South. (See *M. sylvestris*).

Echinophora tenuifolia of the East Mediterranean countries. Called in Greece "valtōhōrtōn" (Fraas); and the ΜΥΗΦΟΝΟΝ of Phanias, — enumerated by Theophrastus vi. 1. 4 among striate-stemmed ferulaceous plants, by Pliny xxi. 30 as coronary, may be compared: *E. tenuifolia* is described by Columella ecclhr. i. pl. 101; is termed "e. pastinacæ folio" by Tournefort inst. 656; was observed by Sibthorp, and Fraas, frequent from the Peloponnesus to Smyrna, by Chaubard on Antiparos, one of the two plants surviving the September heat of the sun: is known to grow as far West as the Southern extreme of Italy; and as cultivated by Sprengel proved extremely fragrant.

"306 B. C." (Diodor., and Clint.), the forces of Ptolemy defeated in *naval combat* by Demetrius Poliorcetes. The title of "king" now assumed by Ptolemy and three other of Alexander's generals, Seleucus, Lysimachus, and Antigonus. A daughter of Antigonus, Berenice, became the wife of Ptolemy (Plin. xxvii. 8, and Tzetz.).

The hieroglyphic ovals of Ptolemy, not earlier therefore than this date. Obelisks now for the first time removed from their original site; two being brought by Ptolemy from Heliopolis to Alexandria: — where they remain, one of them upright to the present day.

"In this year" (D. Laert. v. 38, Spreng., and Sm. b. d.), the philosophers, including Theophrastus, banished from Athens. — The law was repealed in the following year, and the philosophers returned.

The ΜΥΚΗΤΕΣ: ΑΠΟΛΙΘΟΥΜΕΝΟΙ of the Erythræan Sea mentioned by Theophrastus iv. 7 — are referred by Lenz to *corals*: and may be compared especially with the genus *Fungia*.

Uvaria narum of Western Hindustan. A climbing shrub called in Malabar "narum-panel" (Drur.); in which we recognize the ΝΑΙΡΟΝ enumerated among perfumes by Theophrastus ix. 7. 3: — *U. narum* was observed by Rheede ii. pl. 19 in Malabar, the roots fragrant and aromatic, yielding a sweet-scented greenish oil which is employed medicinally; by Graham, in "the Concans" as far North as Bombay: by Wight, and Drury, Southward to Travancore.

Diospyros ebenaster of Tropical Hindustan and Ceylon. A sort of ΕΒΕΝΟΥ: ΠΟΙΚΙΛΗC variegated ebony is mentioned by Theophrastus v. 3. 2 as the product of a large tree with beautiful foliage and resembling the pear: — the Indian "ēvēnōs" is described by Dioscorides as inferior to the Ethiopian kind and marked with light or tawny bands and spots (see also Salmas. comm. Solin. 727): *D. ebenaster* is described by Rumphius i. pl. 6; was observed by Retz v. 33 near Calcutta (Pers.); is known to grow in other parts of Hindustan and on Ceylon, the wood according to Tennent i. 117 of extreme beauty; the prevailing black stained with stripes of rich brown, approaching to yellow and pink, but the heart never sound (Drury).

around Bombay, its "leaves deciduous after the rains;" by Wight, one of the most commonly cultivated and best known trees in the peninsula, planted in avenues, and its wood useful; by Roxburgh, Ainslie, and Royle, as far as Bengal, its bark leaves and exuded gum employed medicinally; by Mason v. 540, in Burmah, "not uncommon from Maulmain to Toungoo" and producing "a valuable timber," the trunk according to Berdmore attaining "a girth of twelve feet."

Euphorbia heptagona of Southern Africa. The ΠΙΖΑ: ΘΑΝΗΤΟΦΟΡΟΣ of Ethiopia in which arrows are dipped, mentioned by Theophrastus ix. 15. 2, — may be compared: *E. heptagona* is described by Bradley succ. ii. pl. 13, Boerhave lugd. i. pl. 258, and according to Virey "the Ethiopians tip their arrows with the milk which is a mortal poison;" is further attributed by Lindley to the "Cape of Good Hope." The Wazaramo, a Negro tribe inhabiting the coast opposite Zanzibar, were found by Speke ii. 2 to keep their arrows "well poisoned."

Zygia sp. of Eastern Equatorial Africa. A very large tree, the largest in Uhiyow in "7° S.," called "m'koondee" (Grant), and the pods probably already "used for lashing round poisoned arrows instead of leather:" — the pods also "said to be edible," and the wood which "takes a fine polish" used for boats and drums (Speke trav. app.).

Scirpus (Eleocharis) palustris of Temperate Climates. Called in Britain *club-rush* (Prior); and the ΤΥΦΗ of Theophrastus iv. 10, leafless and growing in and around the Orchomenian lake, — its smooth stem according to Dioscorides having around the summit a densely-crowded "ἐκπappōumēnōn" flower, may be compared: *E. palustris* was observed by Sibthorp, and Chaubard, in marshes from the Peloponnesus throughout the Greek islands; by Forskal, Jomard, and Delile, in Egypt as far as the Fayoum; is known to grow in the Tauro-Caspian countries (Bieb.) and Siberia (Wats.). Westward, is termed "s. equiseti capitulo majori" by Tournefort inst. 528; was observed by Brotero in Portugal; and is known to grow throughout middle and Northern Europe as far as Lapland and Iceland (Hook., fl. Dan. pl. 273, and Wats.). Farther West, is known to grow throughout our Atlantic States as far as Florida (Muhl., Nutt., A. Gray, and Chapm.); was observed by Short in Kentucky; by Nuttall, along the Arkansas; and was received by Kunth from the Hawaiian Islands. In the Southern Hemisphere, was observed by Baldwin in the Banda Oriental; by J. D. Hooker, in Patagonia and on the Falkland Islands (A. Dec.); and was received by Kunth from Austral Africa.

Phalaris paradoxa of the Mediterranean countries. A grass called in Greece "alēpōunōura" (Sibth.); in which we recognize the ΑΛΩΠΕΚΟΥΡΟΣ of Theophrastus vii. 11. 2 having a spike neither acute nor pointed, but soft and downy like a fox's tail, and flowering in successive portions: — *P. paradoxa* was observed by Sibthorp, and Bory, frequent in cultivated ground from the Peloponnesus throughout Greece; by Delile, around Salehyeh in Lower Egypt. Westward, is termed "gramen spicatum perenne semine miliceo radice repente," by Tournefort inst. 519 (Desf.); and is known to occur as far as Portugal (Pers.).

Alopecurus utriculatus of Europe and the adjoining portion of Asia. Also called in Greece "alēpōunōura" (Sibth.); and possibly included in the "alōpēkōurōs" of Theophrastus: — *A. utriculatus* was observed by Forskal, Sibthorp, and Chaubard, in waste places and grassy situations from the Peloponnesus to Constantinople. Westward, is termed "gramen spicatum pratense spica ex utriculo prodeunte" by Tournefort inst. 519, "phalaris utriculata" by Linnæus; was observed by Scopoli insubr. pl. 12, and Savi, in Italy as far as Milan (Pers.).

Polypogon Monspelienae of the shores of the Mediterranean and adjoining portion of the Atlantic. A grass called in Greece "alōpēnōura" (Fraas), in Egypt "deyl el-far" mouse tail (Del.); and the "alōpēkōurōs" of Theophrastus — is referred here by Fraas: the "teil" grass is mentioned in Stephanus' translation of Haly Abbas; and the "thil" grass by Ebn Baitar: *P. Monspelienae* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to Smyrna; by Forskal, and Delile, as far as Cairo; and by myself frequent on the river-flat of the Nile as far as Thebes. Westward, the account of the "alopecuros" by Pliny xxi. 61 seems taken from Theophrastus; but the "teil" grass is mentioned by Michael de Capella: *P. Monspelienae* is described by Barrelier pl. 115; is termed "panicum maritimum spica longiore villosa" by Tournefort inst. 515; was observed by Scopoli in Carniolia, by Savi in Italy, by Desfontaines atl. in Barbary; and is known to grow along the Atlantic as far as Britain (Huds., Lam. fl. fr., and Pers.). By European traders and colonists, was carried to Northeast America, where it has become naturalized on the Isle of Shoals (A. Gray), and near the sea in South Carolina (Ell., and Chapm.).

Hordeum bulbosum of the Mediterranean countries. The CΤΕΛΕΦΟΥΡΟΣ according to Theophrastus vii. 11. 2 by some called ΑΡΝΟΓΛΩCCON or ΟΡΤΥΞ, its spike flowering throughout at once like that of wheat, and the whole plant resembling wheat ΠΥΡΩ except that the leaves are broader. — may be compared: *H. bulbosum* is termed "gramen creticum spicatum secalinum altissimum tuberosa radice" by Tournefort cor. 39; was observed by Chaubard in all grassy places in the Peloponnesus; by Sibthorp in maritime sand on Cyprus; and was received by Fischer from the Tauro-Caspian countries (Steud.). Westward, is described by Barrelier pl. 112; is known to grow in Italy (Pers.), and on the arid plains of Tunis (Desf. i. pl. 37, and Schousb. maroc.).

Aegilops ovata of the Mediterranean countries. A grass called in Italy "cerere" or "grano delle formiche" or "egilope" (Lenz), in Greece "makrōgēnni" or "agriōsitarō" or "sithērōstarō" (Sibth.); in which we recognize the ΑΓΓΙΑΩΠΙΟΣ of Theophrastus vii. 13. 5 to caus. iv. 16. 2, growing among barley and ΠΟΛΥΧΙΤΩΝ having many tunics, — mentioned also by Nicander ther. 857,

by Dioscorides as having leaves like wheat, seeds in two or three husks in a terminal head from which bristles arise: *Ae. ovata* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands to the Dardanelles: and "*Ae. triaristata*" (seen in Greece by Bory and regarded by him as perhaps not distinct) was observed by Delile near Alexandria on the Mediterranean border of Egypt. Westward, the "*festuca*" called "*aegilops*" is mentioned by Pliny xviii. 44 and xxv. 93, and as killing barley: *Ae. ovata* is described by Dodoens, p. 539; is termed "*gramen spicatum durioribus et crassioribus locustis spica brevi*" by Tournefort inst. 519; was observed by Lenz in Italy; is known to occur also in Barbary, and in various parts of Southern Europe (Scop., Pers., and Spreng.). The traditional belief that wheat changes into this grass, was ascertained by Godron to arise from hybridization, lasting only a single generation (A. Dec. p. 933).

Galanthus nivalis of Europe and the adjoining portion of Asia. Called in Britain *snowdrop*, in Germany "*schneetropfen*" (Prior), in France "*perce-neige*" (Nugent); the $\Lambda\epsilon\gamma\kappa\omicron\iota\omicron\upsilon\omicron\upsilon\iota\omicron\upsilon\iota\omicron\upsilon$ described by Theophrastus vii. 13. 9 as bulbous with a round root, — is referred here by Dodoens, and Fée: *G. nivalis* was observed by Sibthorp around Constantinople, and by Chaubard in the Peloponnesus. Westward, is termed "*narcisso-leucoium trifolium minus*" by Tournefort inst. 387; and is known to grow throughout middle Europe as far as Holland (Jacq. austr. pl. 330, prodr. fl. Bat., and A. Dec.); but in Britain was known to Gerarde, and Ray, under cultivation only, and is regarded by Watson as exotic and naturalized. By European colonists, was carried to Northeast America, where it continues under cultivation as a garden flower.

Leucoium aestivum of Europe and the adjoining portion of Asia. The $\omicron\omicron\pi\iota\tau\iota\omicron\upsilon\iota\omicron\upsilon$ of Theophrastus vii. 13. 9 — is referred to this genus by Camerarius; and *L. aestivum*, observed by Sibthorp around Constantinople, seems the only species known in Greece. Westward, the "*calathis virentia lilia canis*" of Columella x. 99 is referred here by Sprengel: *L. aestivum* is termed "*narcisso-leucoium pratense multiflorum*" by Tournefort inst. 387; is known to grow in Austria (Jacq. austr. pl. 202, and Pers.); but is regarded by Watson as cultivated only and naturalized in Britain, and by A. Decandolle as probably also exotic in Holland and Denmark.

Lloydia Graeca of the East Mediterranean countries. The $\kappa\iota\kappa\upsilon\pi\iota\gamma\iota\chi\iota\omicron\upsilon$ of Theophrastus i. 10. 7 to caus. vi. 11. 11, an edible bulb having leaves from the root only, and none from the stem, — may be compared: the "*sisyrinchion*" is enumerated by Pliny xix. 30 among bulbs known to the Greeks: *L. Graeca* is termed "*bulbocodium graecum myosotidis flore*" by Tournefort cor. 50; was observed by Sibthorp, and Chaubard, frequent on the loftier mountains from Crete and the Peloponnesus to Cyprus; and by Labillardière v. pl. 8, in Syria.

Scilla hyacinthoides of the West Mediterranean countries. The $\beta\omicron\alpha\beta\omicron\kappa\colon\epsilon\pi\iota\omicron\phi\omicron\rho\omicron\varsigma$ of Theophrastus vii. 13, having an esculent root covered inside of the bark with a woolly substance of which garments are made, — unknown to Pliny xix. 10, but termed "*bulbus fabrilis*" by Apicius, is referred here by Dierbach, and Sprengel: *S. hyacinthoides* is termed "*s. eriophora*" by Miller; and is known to grow in Portugal and on Madeira (Linn., Ait. i. p. 445, and Pers.).

Ledebouria hyacinthoides of Hindustan. Called in Hindustanee "*bankanda*" (D'roz.), in the environs of Bombay "*boe-kunda*" (Graham); and the Indian kind differing according to Theophrastus vii. 13. 8 in being hairy rather than woolly, — may be compared: *L. hyacinthoides* was observed by Nimmo in "*both Concans, with two or three other undetermined species*" (Graham); by Ainslie, and Rottler, in other parts of Hindustan as far as Bundelkund, the bulbs "*employed in cases of strangury and fever in horses,*" and according to Theodore Martius also "*as a substitute for squills*" (Lindl.). Transported to Europe, is described by Sprengel ii. 97, and Boyle bot. mag. pl. 3226.

Urginea Indica of the seashore of Hindustan and Burmah. The *Indian squill* is called in Hindustanee "*janglipiyaz*" (D'roz.), in Bengalee "*kanda*," in Tamil "*nurivungayum*," in Telinga "*addivi-tella-guddaloo*" (Drur.); and is possibly the Indian $\beta\omicron\alpha\beta\omicron\kappa$ in question: — *U. Indica* was observed by Graham "*common on the sandy shores of both Concans,*" and "*usually employed as a succedaneum for the true squill;*" by Roxburgh, Wight pl. 2063, and Drury, in waste sandy situations near the sea in other parts of the peninsula, the burnt bulb according to Ainslie applied to the soles of the feet when suffering from any burning sensation: was observed by Mason v. 491 "*green flowered,*" and frequent "*on the seashore at Monmagon*" in Burmah.

Tulipa Celsiana of the East Mediterranean countries. The $\lambda\epsilon\iota\pi\iota\omicron\upsilon$ of Theophrastus vi. 6. 9 to 8. 1, vernal, having a broad leaf spreading on the ground, and a leafless stem bearing a terminal flower, — may be compared: *T. Celsiana* is described by Gouan; was observed by Gittard along the Alps; by Bieberstein, in the Tauro-Caspian countries (Steud.).

Tulipa Sibthorpiana of the East Mediterranean countries. The $\epsilon\tau\epsilon\pi\omicron\upsilon$ of Theophrastus vi. 6. 9 to 8. 3, flowering in autumn, — may be compared: *T. Sibthorpiana* was observed by Hawkins, and Sibthorp pl. 330, in the Peloponnesus and Asia Minor.

Erythronium dens canis of Europe and Northern Asia. The unnamed plant, aphrodisiac by

contact according to Theophrastus — (Plin. xxvi. 63), or “saturiōn ēruthrōniōn” of Dioscorides, growing in mountainous situations, its seed like flax, root pleasant tasted and said to be aphrodisiac if held in the hand, is referred here by Lobel: the “saturiōn ēruthrōniōn” or “s. ēruthraikōn” or “mēliōn tō ēn udasin” or “ēntatikōn” or “priapiskōn ē mōriōn” or “saturiskōs” or “ōrhis saturōu” is identified in Syn. Diosc. with the “mōlōrtikōulōum vēnēris” of the Romans; “satyrii erythraicon” according to Pliny xxvi. 63 is administered to rams and goats, and by the Sarmatians to horses: *E. dens canis* is described by Gesner hort. f. 261, and Lobel obs. 97 (Spreng.); has not been observed in Greece; but is known to grow throughout middle Europe (Lam. fl. fr.); was observed by Gmelin i. pl. 7 in Siberia; by Siebold on Yesso, and by the Japanese called “katakuri,” by the Ainos “kiktōri.”

Muscari racemosum of the Mediterranean countries. Called in Britain *grape-hyacinth* (Prior), in Greece “vōurvōs” (Sibth.); and the ΒΟΑΒΙΝΗ of Theophrastus vii. 13. 9 — may be compared: *M. racemosum* is among the kinds found by Anguillara sempl. p. 120 eaten on Crete, Zacynthus, and Corcyra, as well as in Italy (Spreng.); was observed by Sibthorp, and Chaubard, in the Peloponnesus and on the mountains of Crete. Westward, is described by Dodoens hist. p. 217, and Dalechamps 1502 (Spreng.); is termed “*m. arvense juncifolium cæruleum minus*” by Tournefort inst. 348; is known to occur in France and middle Europe (Jacq. austr. pl. 187, and A. Dec.), but is regarded by Watson cyb. ii. 461 as exotic in Britain.

Crocus nudiflorus of the mountains of the Mediterranean countries. The scentless ΚΡΟΚΟΣ: Ο: ΑΕΥΚΟC of Theophrastus vii. 7. 4 — may be compared: *C. nudiflorus* was observed by Sibthorp on mount Athos. Westward, is termed “*c. autumnalis sativo similis florum capillamentis tenuissimis minus odoris flore candidissimo*” by Tournefort cor. 25; and is known to grow along the Pyrenees (Ramond, Lapeyr., Brot, Engl. bot. pl. 491, and Pers.).

Crocus minimus of the mountains of the East Mediterranean countries. The ΚΡΟΚΟΣ: ΑΚΑΝ ΘΩΔΗC: ΚΑΙ: ΑΟCΜΟC of Theophrastus vii. 7. 4 — is referred here by Fraas: *C. minimus* was observed by him in the middle region of the loftier mountains of Greece. Farther West, is termed “*c. Imperati*” by Tenore as observed in Italy; is described also by Decandolle.

Iris foetidissima of Europe and the adjoining portion of Asia. Called in Britain *gladston* (Prior), in Italy “*ricottaria*” or “*spatula fetida*” (Lenz); in which we recognize the “*glathiōlōum*” or “*irim agrēstēm*” of the Romans identified through Syn. Diosc. with the ΞΙΡΙC of Theophrastus ix. 8. 7, — or “*xuris*” having according to Dioscorides red seeds and the flowers purple with a dark red centre: *I. foetidissima* was observed by Sibthorp around Constantinople. Westward, the “*xuris*” or “*irin agrian*” or “*kakōs*” is identified in Syn. Diosc. with the “*aprōus*” of the Dacians, and the *irin* “*sylvestrem*” called “*xyrin*” is enumerated by Pliny xxi. 83: *I. foetidissima* is described by Matthioli (Spreng.); is termed “*i. foetidissima seu xyris*” by Tournefort inst. 360; and is known to grow in Italy, Barbary, and throughout middle Europe as far as Britain (Pers.).

Lemna trisulca of Northern and Austral Climates. An aquatic plant; and the ΛΕΜΝΑ of Theophrastus iv. 10. 1, growing under the water of the Orchomenian Lake, — is referred here by Billerbeck, and others: *L. trisulca* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Constantinople; is known to grow also around Caucasus and in Northern Asia (Bieb., and A. Dec.), and as far even as Bengal (Kunth). Westward, is described by Micheli pl. 11; was observed by Scopoli in Carniola, by Haller 1901 in Switzerland; is known to grow from Italy to Lapland (Pers., Fries, and Wats.), also on the Canaries, Madeira, and the Azores (A. Dec. 1004). Farther West, is known to grow in North America as far as Lat. 58° (Hook.); was observed by Drummond at 54° on the Saskatchewan, by Short in Kentucky, by myself near Boston, by Conrad near Philadelphia, and was received by Muhlenberg from the Cherokee country on the Southern extreme of the Alleghanies. In the Southern Hemisphere, was observed by R. Brown p. 345 in Tasmania and Southeast Australia.

Clematis viticella of the Mediterranean countries. The ΟΙΝΑΝΘΗ: ΑΓΡΙΑ described by Theophrastus v. 9. 6 as a woody vine climbing around trees, — may be compared. *C. viticella* was observed by Sibthorp in hedges around the Nicæan Lake in Bithynia. Westward, is termed “*c. purpurea repens*” by Tournefort inst., 294, “*c. lugubris*” by Salisbury (Steud.); and is known to grow in hedges in Italy and Spain (Pers.).

Anemone nemorosa of Northern climates. The ΑΝΕΜΩΝΗC: ΟΡΕΙΟΝ flowering according to Theophrastus vi. 8. 1 in the early spring, — may be compared: *A. nemorosa* was observed by Sibthorp in woods on mount Parnassus; is known to grow also on Caucasus (Bieb.), on the Volga as far as “Lat. 53°” (Pall.), and in Siberia (Dec.). Westward, is termed “*wood-crowfoot*” by Parkinson (Prior), “*ranunculus phragmites albus vernus*” by Tournefort inst. 285; was observed by Savi on the Apennines; by Brotero, on the mountains of Portugal; and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 549, Curt. lond. ii. pl. 38, and Pers.). Farther West, is known to grow in North America from the Lower St. Lawrence to Lat. 40° along the Atlan-

tic (Conrad), and on the Alleghanies to Carolina (Mx.); was observed by Short in Kentucky; by Drummond, "not North of 53°" as far as the Rocky mountains; was observed West of those mountains by Douglas (Hook.).

Aquilegia vulgaris of Europe and the adjoining portion of Asia. Called in Britain *columbine* (Prior), in France "ancolie" (Nugent), in Turkish "kanthili zitzēi" (Forsk.); and the ΠΟΘΟC, æstival according to Theophrastus vi. 7 and of two kinds, one having its flower hyacinth-like, the other white and placed on sepulchres, — is referred here by Zalikoglous lex. mod.: *A. vulgaris* was observed by Sibthorp in the Peloponnesus; by Forskal, in gardens at Constantinople; and is known to grow in Siberia as far as the Altaian mountains (Ledeb.). Westward, the "spectabilis pothos" is mentioned by Pliny xxi. 39: *A. vulgaris* is described by Columna phytob. p. 1; is termed "a. sylvestris" by Tournefort inst. 428; is known to grow on Corsica and throughout middle and Northern Europe as far as Lat. 63° 15' in Norway (Gunner p. 80, and A. Dec.). By European colonists, was carried to Northeast America, where it continues a favourite garden flower, and according to A. Gray "is beginning to escape from cultivation in some places."

Caltha palustris of Northern climates. Called in Anglo-Saxon "mersc-mear-gealla," in current English *gool* or *golds* or *mare-blobs* or *marsh marigold* (Prior); in which we recognize the ΕΛΕΙΟ ΧΡΥCOC enumerated as vernal by Theophrastus vi. 8. 1, — and referred here by Dumolin: *C. palustris* was observed by Sibthorp, and Chaubard, in the marshes of the Peloponnesus. Westward, is described by Lyte; is termed "populago flore majore" by Tournefort inst. 273; was observed by Savi in Italy, by Brotero in Portugal, and is known to grow throughout middle and Northern Europe as far as Denmark and Iceland (fl. Dan. pl. 668, Hook., and Wats.). Eastward from Greece, is known to grow about Caucasus (Ledeb.) and throughout Siberia as far as Lake Baikal and Kamtschatka (Gmel, Pall, and A. Dec.); was observed by Thunberg in Japan, in a flower-vase and called "ienko so." Farther East, is known to grow along the Columbia river and from Lat. 60° in Canada and Labrador (Hook.), 51° in Newfoundland (La Pylaie), to 39° along the Atlantic and on the Mississippi (Conrad, and Beck). The plant according to A. Gray "is used as a potherb in spring."

Brassica Cretica of the East Mediterranean shores. Called in Greece "skarōlahanōn" (Sibth.) or "mōrōlahanōn" (Fraas); and the ΑΓΡΙΑ: ΡΑΦΑΝOC having according to Theophrastus vii. 4. 4 to 6. 2 small smooth and round leaves, — is referred here by Fraas: *B. Cretica* is termed "b. cretica fruticosa folio subrotundo" by Tournefort cor. 16; was observed by Sibthorp, Grisebach, and Fraas, frequent on the sea cliffs of Greece and the Greek islands. (See *B. incana*).

Hesperis acris of the Egyptian Desert. Called in Egypt "sphæri" (Forsk.), the probable origin of the Greek name "ēspēris" transferred to an allied species: — *H. acris*, unknown in Greece, was observed by Forskal p. 118, and Delile pl. 35, in the environs of Cairo frequent in the Desert and having the taste and odour of *Brassica eruca*.

Hesperis matronalis of middle Europe. Called in Britain *dame's violet* or *Damask violet*, in medieval Latin "viola Damascena," in France "violetle de Damas" (Prior) or "julienne" (Del.); and the ΕCΠΕΡΙC of Theophrastus caus. vi. 17. 3 more odorous in the evening, — and hence the name according to Pliny xxi. 18, is referred here by writers: the "philēspērōn anthōs" is mentioned by the poet Dioscorides anth. pal. vii. 31, living in Egypt; and the "violā matrōnalēm" of the Romans in Syn. Diosc. iii. 128 (cod. n.) may also be compared: *H. matronalis* is described by Ray, and Miller; and is known to grow wild throughout middle Europe from Switzerland to Denmark (Pers., Fries, and A. Dec.). By European colonists, was carried to Northeast America, where it continues under cultivation for ornament, and according to A. Gray "begins to escape from gardens." A cultivated variety with numerous white petals "odoratissimis," is mentioned by Persoon.

Coronopus Ruellii of Europe and the adjoining portion of Asia. Called in Britain *wart cress* or *swine's cress* (Prior), in Greece "ēmēra almurithra" or "armurithra" (Fraas), in Egypt "hab raschat" (Forsk.); and the ΚΟΡΩΝΟΠΟΥC, bitter according to Theophrastus vii. 8. 3 to caus. ii. 5. 4 and its leaves spread upon the ground, — growing according to Dioscorides in waste places and along roadsides, an edible prostrate little herb with incised leaves, is referred here by writers: *C. Ruellii* was observed by Sibthorp, Chaubard, and Fraas, in waste places in the Peloponnesus and Attica; by Forskal p. 117, and Delile, from Alexandria to Cairo. Westward, the "coronopus" is described by Pliny xxi. 59 to xxii. 22 as prickly with a creeping stem, and sometimes cultivated: *C. Ruellii* is described by Ruel, Matthioli, Dodoens, and Dalechamp (Spreng.); is termed "nasturtium sylvestre capsulis cristatis" by Tournefort inst. 214; and is known to occur in waste places from the Canary Islands to Sweden (fl. Dan. pl. 202, Pers., and Wats.). By European colonists, was carried to Northeast America, where it continues in fallow ground from Rhode Island to South Carolina (Pursh, Ell., and A. Gray).

Camelina sativa of the Uralian and Tartarean plains. Called in Britain *gold of pleasure*, even in the days of Gerarde (Prior), in Germany "leindotter" (Grieb), in Italy "camellina" or "dorella" or "miagro" (Lenz), in the Sixteenth century "pseudolinum" (Lonic. p. 154); in which we recog-

nize the "muagrōs" identified through Syn. Diosc. with the ΜΕΛΑΜΠΥΡΟΝ infesting the wheat-fields of Sicily according to Theophrastus viii. 4. 6, — mentioned also by Galen: the "muagrōs" is described by Dioscorides as two cubits high with pale yellow flowers, seeds resembling those of fenugreek but yielding fat which is smeared on twigs and burned as a lamp: *C. sativa* was observed by Sibthorp in cultivated ground on Cyprus; is known to grow also in the Tauro-Caspian countries, and in Siberia as far as Lake Baical (Ledeb.). Westward, the account of the "myagros" by Pliny xxvii. 81 seems chiefly taken from Dioscorides: the "dornella" is mentioned by Hildegard ii. 158, and the "dorella" by Cæsalpinus (Spreng.): *C. sativa* was regularly cultivated in the middle ages, its cultivation commencing probably in Russia or Germany (A. Dec.); is described by Anguillara p. 285, and Parkinson; is termed "a. segetum foliis auriculatis acutis" by Tournefort inst. 217, "myagrū sativum" by Linnæus; was observed by Lenz in grain-fields in Italy and sometimes cultivated for its oil; is known also as a weed among flax in Spain and Western Europe (Cav. i. pl. 60, and Pers.). By European colonists, was carried to Northeast America, where it continues a weed in cultivated ground from Salem in New England (observed by myself) to North Carolina (Chapm.).

Viola tricolor of Europe and the adjoining portion of Asia. Called in Britain *flamy* (Kent fl. dom.) or *paunce* or *pansy*, in France "pensée" or formerly "menues pensées," in Italy "pensieri menuti" in Germany "unnütze sorge," in medieval Latin "viola flammea" (Prior); in which we recognize the "flammea" identified through Pliny with the ΦΛΟΓΙΝΟΝ: ΙΟΝ or ΦΛΟΞ of Theophrastus vi. 6. 2 to 8. 1, wild and cultivated, the flower scentless and coronary: — *V. tricolor* was observed by Sibthorp, and Chaubard, in cultivated ground from the Peloponnesus throughout the Greek islands; is known to grow also in Syria, and as far as Bagdad (Dec.). Westward, the account by Pliny xxi. 38 to 76 of the "flammea quæ et phlox vocatur" seems taken from Theophrastus, his "lutea viola" curing "capitis hulcera" is also *V. tricolor*, to the present day according to Lindley "employed in Italy in tinea capitis:" *V. tricolor* is termed "jacea vel herba clavelata" in *Ortus Sanitatis* 49 (Brunswyck), "herba trinitatis" by Brunfels ii. pl. 69, "v. bicolor arvensis" by Tournefort inst. 421; is described also by Fuchsius 803, Dodoens, Castor Durantes, Stapel 651, and Gerarde; and in its wild form is known to grow on the mountains of Teneriffe, and in cultivated and fallow ground throughout Europe as far as Lapland and Iceland (fl. Dan. pl. 623, Pers., Hook., and Wats.). Eastward from the Euphrates, is known to grow in Siberia (Dec.); was observed by Kaempfer, and Thunberg, along roadsides in Japan and called "kinsai," or usually "komafisiko:" but possibly by European colonists was carried to Tropical Hindustan, observed by Graham "in gardens" at Bombay and no native name is given. Clearly by European colonists, was carried to Northeast America, where it continues a favourite garden flower, and in the form of "*V. arvensis*" has become naturalized in "dry or sandy soil New York to Kentucky and Southward" (A. Gray), in our Southern States according to Chapman in "cultivated ground."

Drypis spinosa of the Mediterranean countries. The ΔΡΥΠΙΟΝ of Theophrastus i. 10. 6, having thorns in place of leaves, — and named from wounding persons handling it, is referred here by writers: *D. spinosa* was observed by Sibthorp, and Fraas, on Parnassus. Westward, is described by Micheli gen. pl. 23; and is known to grow in Istria, Italy, and Mauritania (Pers.).

Silene behen of the East Mediterranean countries. An annual called in Greece "strōuthōni" (Sibth.); in which we recognize the ΣΤΡΥΘΙΟΝ of Theophrastus vi. 4. 3 to 8. 3, prickly-leaved and flowering in summer, but its beautiful flower not fragrant: — *S. behen* is termed "lychnis cretica parvo flore calyce striato purpurascens" by Tournefort cor. 24; and was observed by Sibthorp, and Chaubard, from the Peloponnesus to Caria.

Dianthus fruticosus of Crete and the Greek islands. A showy species of *pink*; and the ΔΙΟΚ. ΑΝΘΟΣ of Theophrastus vi. 1. 1 to 8. 3, cultivated and coronary but the flower scentless, — may be compared: *D. fruticosus* is termed "caryophyllus græcus arboreus leucoii folio peramaro" by Tournefort cor. 23 and trav. i. pl. 9; and was observed by Sibthorp on Crete and Seriphus. Westward, is enumerated by Persoon as a garden flower in France. (See *D. arboreus*.)

Lavatera arborea of the West Mediterranean countries. Called in Greece "thēnthrōmōlōha" (Fraas); in which we recognize the ΜΑΛΑΧΗ: ΑΠΟΔΕΝΔΡΟΥΜΕΝΗ increasing in size after seven months growth according to Theophrastus i. 3. 2 to 9. 2 and used for a staff, — also the "thēnthrōmalahē" of Galen fac. simpl. vii. p. 67, and Geoponica xv. 5. 4: *L. arborea* was observed by Sibthorp, and Fraas, in maritime situations near Athens, also planted in gardens; by Delile, in gardens at Alexandria. Westward, an "arbor malvæ" near Lixus estuary on the Atlantic in Mauritania, said to be twenty feet high with the trunk too large to be "circumplecti" clasped or embraced, is mentioned by Pliny xix. 22: *L. arborea* is termed "althæa maritima arborea veneta" by Tournefort inst. 97; and is known to grow along the seashore of Italy, Barbary, and Spain (Cav. v. pl. 139, and Pers.).

Acer campestre of Europe and the adjoining portion of Asia. Called in Britain *maser-tree* or

maple, in Anglo-Saxon "mapel-treow" or "mapulder," by Galfridus pr. pm. "mapulle," in Germany "massholder," in old high German "mazel-dera" (Prior), in Italy "oppio" or "loppo" or "acero" (Lenz); and the second kind of $\text{C}\Phi\text{E}\text{N}\Delta\text{A}\text{M}\text{N}\text{O}\text{Y}$, rare according to Theophrastus iii. 11. 1 and called $\text{Z}\Upsilon\Gamma\text{I}\text{A}$, its wood yellow soft and $\text{O}\Upsilon\text{A}\text{O}\text{N}$ curled in fibre, — is referred here by writers: *A. campestre* was observed by Forskal, Sibthorp, and Fraas, from the mountains of the Peloponnesus to Constantinople; by Clot-Bey, in the gardens of Egypt. Westward, the "acer" prized for its variegated wood is mentioned by Ovid; that with spots resembling a peacock's tail produced according to Pliny xvi. 26 chiefly in Istria and Rhaetia: *A. campestre* is termed "a. *campestre et minus*" by Tournefort inst. 615; was observed by Lenz in Italy; and is known to grow wild throughout middle Europe (Pers.); drinking-bowls made of the knotty parts of its wood are called in medieval Latin "scyphi maserini," in old high German "masar" (Prior).

Acer platanoides of Europe and the adjoining portion of Asia. Called in Italy "acero platanoides" or "acero riccio" (Lenz); and the $\text{C}\Phi\text{E}\text{N}\Delta\text{A}\text{M}\text{N}\text{O}\text{C} : \text{A}\Gamma\text{P}\text{I}\text{A}$ useless for timber according to Theophrastus, — may be compared: *A. platanoides* was observed by Fraas in Greece; by Clot-Bey in the gardens of Egypt. Westward, "nuper vile fuistis acer" according to Ovid *elog.* i. 11; and the "vilioris genere" called "crassivenium" is distinguished by Pliny xvi. 26: *A. platanoides* is known to grow wild in Italy and in the mountain forest of middle Europe (Duham. pl. 10, Pers., Lenz, and Daub.), is besides planted for ornament. By European colonists, was carried to North-east America, where it continues "occasionally planted" (A. Gray).

Staphylea pinnata of Europe and the adjoining portion of Asia. Called in Britain *bladder-nut* (Prior), in Germany "pimpernuss" (Grieb), in Italy "pistacchio falso" (Lenz); and the $\text{C}\text{H}\text{M}\Upsilon\Delta\text{A}$ of Theophrastus iii. 14. 4 to v. 7. 7, having leaves like those of $\text{Π}\text{E}\text{P}\text{C}\text{I}\text{K}\text{H} : \text{K}\text{A}\text{P}\Upsilon\text{A}$ but a little narrower, and wood suitable only for staffs, — may be compared: *S. pinnata* was observed by Sibthorp, and Fraas, from mount Pindus to the environs of Smyrna. Westward, the "staphylodendron" of Pliny xvi. 27, a tree growing beyond the Alps and bearing pods that contain a nut tasting like filberts, is referred here by writers: *S. pinnata* is termed "staphylodendron" by Tournefort inst. 616; was observed by Scopoli in Carniola; by Lenz, in North Italy; and is known to grow throughout middle Europe as far as Britain (Pers., and Engl. bot. pl. 1560).

Rhamnus infectorius of the Mediterranean countries. Called in Greece "lathziehēri" or "apēiliras" (Sibth.); and the $\Phi\text{I}\text{A}\Upsilon\text{P}\text{E}\text{A} : \text{A}\text{E}\text{I}\Phi\Upsilon\text{A}\text{A}\text{O}\text{C}$ enumerated among wild trees by Theophrastus i. 9. 3, — large as the "kuprō" according to Dioscorides and growing in rugged places, its fruit "shinō"-like black sweetish and in clusters, leaves astringent and like those of the olive but broader, may be compared: the "philurēa" is mentioned also by Paulus Aegineta; and the "hudhudh" by Ibn Baitar: *R. infectorius* was observed by Sibthorp, Chaubard, and Fraas, frequent in rough and stony situations in Southern Greece, the unripe berries dyeing Morocco leather yellow and exported in large quantities. Westward, *R. infectorius* is described by Clusius i. p. 111; is termed "r. catharticus minor" by Tournefort inst. 593; was observed by Lenz in Italy: is known to grow also in Carniola, Spain, and Southern France (Scop., and Pers.). The dried fruit according to Lindley "is purgative," and is called in commerce *French berries* or "graines d'Avignon."

Euphorbia myrsinites of the Mediterranean countries. Called in Greece "galazitha" (Sibth.); and the $\text{T}\text{I}\Theta\Upsilon\text{M}\text{A}\text{A}\text{A}\text{O}\text{C} : \text{A}\text{E}\Upsilon\text{K}\text{O}\text{C}$ called $\text{M}\Upsilon\text{P}\text{T}\text{I}\text{T}\text{H}\text{C}$ according to Theophrastus ix. 11. 9 to caus. iv. 6. 9, growing in mountainous situations, its leaves myrtle-like but prickly at the apex, suckers flowering in alternate years and fruit called $\text{K}\text{A}\text{P}\Upsilon\text{O}\text{N}$, — mentioned also by Micion, and Cratevas (schol. Nic. ther. 617), is referred here by writers: the "tithumalōs murtitēs" according to Dioscorides resembles the "thaphnōēithēi" and is whitish in aspect, its leaves larger than in the myrtle with the apex pointed, is by some called "mursinitēn" or "karuitēn:" *E. myrsinites* was observed by Sibthorp, Chaubard, and Fraas, frequent on mountains from the Peloponnesus and Parnassus to Cyprus. Westward, the account by Pliny xxvi. 40 of the "tithymali myrsiniten" or "caryiten" seems taken from the Greek, and follows second in order as in Dioscorides: *E. myrsinites* is termed "tithymalus myrsinites latifolius" by Tournefort inst. 86; and is known to grow in Italy and Southern France (Sauv. monsp. 51, Pers., Spreng., and Lenz).

Mercurialis perennis of Europe and the adjoining portion of Asia. Called in Britain *dog's cole* or *dog's mercury* (Prior), in Germany "bingelkraut" (Grieb); and the $\Phi\Upsilon\text{A}\text{A}\text{O}\text{N}$ of two kinds according to Theophrastus ix. 18. 5, the fruit of the $\text{A}\text{P}\text{P}\text{E}\text{N}\text{O}\Gamma\text{O}\text{N}\text{O}\Upsilon$ being double, and that of the $\Theta\text{H}\text{A}\Upsilon\Gamma\text{O}\text{N}\text{O}\Upsilon$ like olive budding, — mentioned also by Cratevas, and Dioscorides, is referred here by writers: *M. perennis* was observed by Sibthorp, Chaubard, and Fraas, in woods from the Peloponnesus to Constantinople. Westward, the account of the "phyllon" and "thelygonon" by Pliny xxvi. 91 to xxvii. 100 seems chiefly taken from the Greek: *M. perennis* is described in Gerarde em. 333; is termed "m. montana testiculata et spicata" by Tournefort inst. 534; was observed by Gussone near Naples, and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 400, and Pers.). Is "very poisonous" according to Lindley, instances "of the fatal consequences of its use" are mentioned by Sloane, and Smith.

Spartium scorpius of the Mediterranean countries. Called in Greece "aphanna" (Sibth.); and the ΣΚΟΡΠΙΟC, one of the two plants known to Theophrastus vi. 1. 3 to 4. 2 as having thorns in place of leaves, its flowers developing below the pointed apex,—is referred here by Linnæus: *S. scorpius* was observed by Sibthorp on the mountains of Greece and the Greek islands; is known to be frequent also in Asia Minor (Spreng.). Westward, the account by Pliny xxi. 54 of the "in totum spina scorpio" seems taken from Theophrastus: *S. scorpius* was observed by Anguillara p. 63 on Corsica (Spreng.); is described also by Lobel ii. pl. 94; is termed "genista-spartium spinosum majus primum flore luteo" by Tournefort inst. 645, "frutex totus ex spinis alternis quibus flor. insident" by Linnæus; is known to grow in Southern France and as far as Spain (Pers.).

Colutea arborescens of the Mediterranean countries. The bladder senna is a large loose-branched shrub called in France "baguenaudier" (Fée), in Germany "blasenbaum" (Grieb), in Greece "phōuska" (Fraas); and the ΚΟΛΥΤΕΑ of Theophrastus iii. 14. 4, a leguminous tree with willow-like foliage and small seeds in broad pods,—is referred here by Robertus Constantinus and writers generally: *C. arborescens* was observed by him, probably on Crete; by Sibthorp, Chaubard, and Fraas, in thickets and rugged places from the Peloponnesus to Smyrna. Westward, is termed "c. vesicaria" by Tournefort inst. 649; is known to grow from Italy to the Pyrenees, and in limestone districts as far as Ratisbon and Lorraine in middle Europe (Roth, Pers., Mohl, and A. Dec.). The leaves according to Lindley are "purgative, used for adulterating senna."

Cytisus laburnum of Switzerland. Called in English gardens *laburnum* (Prior), in France "aubour" (A. Dec.), in Italy "mazi" or "egano" or "eghelo" (Lenz), by Crescenzo "avornus" (Spreng.); and the ΚΟΛΟΥΤΕΑ around Lipara, a cultivated tree according to Theophrastus iii. 17. 2, in three years yielding a staff, and when cut off perishing without giving out suckers, its leaves like those of ΤΗΛΕΙ, pod fattening sheep,—is referred here by writers: *C. laburnum* was observed by Forskal in gardens at Constantinople and Smyrna. Westward, the "laburnum" is described by Pliny xvi. 31 as a tree growing in dry situations on the Alps, its wood hard and white, flower (-raceme) a cubit long avoided by bees: *C. laburnum* is described by Haller helv. 360; is known to grow wild in Switzerland and North Italy (Jacq. austr. pl. 306, Pers., and Lenz); and is besides cultivated throughout Europe. By European colonists, was carried to Northeast America, where it continues to be planted for ornament. Its seeds according to Lindley are "highly poisonous, possessing narcotico-acrid properties."

Planera abelicea of Crete. The ΚΟΛΟΙΤΙΑΝ tree of Theophrastus iii. 17. 3, growing on mount Ida, rare and said to produce neither flowers nor fruit, its leaves rounder than those of laurel, elm-like and many-nerved beneath,—may be compared: *P. abelicea* is termed "abelicea di Candia" by Pona bald. pl. 112, "pseudosantalum Creticum" by C. Baulin pin. 393; and was observed by Sibthorp on Crete.

Lupinus angustifolius of the Mediterranean countries. Called in Greece "agriō lupōni" or "lōupini" (Sibth.), in Egypt "termis el sjæitan" Satan's lupine (Forsk.); in which we recognize the ΘΕΡΜΟC becoming according to Theophrastus viii. 1. 3 to 11. 8 and caus. iv. 1. 7 ΟCΠΕΡ: ΑΓΡΙΟC and altogether ΑΠΕΠΤΟΝ unconcocted,—and the "thērmōs agriōs" of Dioscorides: *L. angustifolius* was observed by Sibthorp, Chaubard, and Fraas, abounding from the Peloponnesus throughout the Greek islands; by Forskal, and Delile, a weed in Egypt among crops of cultivated lupine. Westward, the "thērmōs agriōs" is identified in Syn. Diosc. with the "lōupinōm agrēstēm" of the Romans: *L. angustifolius* is termed "l. angustifolius cæruleus elatior" by Tournefort inst. 392; and is known to occur in grain-fields at Messana and as far as Spain (Knorr ii. pl. 50, and Pers.).

Lathyrus amphicarpos of the East Mediterranean countries. The ΑΡΑΧΙΔΑΝΑ producing fruit under ground according to Theophrastus i. 1. 7 to 6. 12,—is referred here by writers: *L. amphicarpos* was observed by Sibthorp on Rhodes and Cyprus; is known to grow also in Syria (Pers.). As cultivated in Britain, is termed "l. amphicarpos seu supra infraque terram siliquas gerens nobis" by Morison ii. 2. pl. 23. (The account of the "arachidna" by Pliny xxi. 52 seems taken from Theophrastus.)

Vicia amphicarpos of the Mediterranean countries. The ΑΡΑΚΩΔΕC according to Theophrastus i. 6. 12 also producing fruit on its roots as well as above, otherwise resembling the ΑΡΑΚΩ,—is referred here by Clusius, and Sprengel: *V. amphicarpos* was observed by Gittard on the plain of Nisi in the Peloponnesus (Chaub.). Westward, is described by Clusius exot. pl. 88; was observed by Gouan herboris. 48 in Southern France, and according to Persoon has subterranean fruit. (The account of the "aracos" by Pliny xxi. 52 seems taken from Theophrastus.)

Vicia lathyroides of Europe and the adjoining portion of Asia. Called in Britain *strangle-tare* (Prior); in which we recognize the ΟΡΟΒΑΓΓΗ overcoming ΟΡΟΒΩΝ according to Theophrastus viii. 8. 4:—*V. lathyroides* is termed "ervum Soloniense" by Linnæus; was observed by Sibthorp from the Peloponnesus to Asia Minor, and in cultivated ground on Cyprus. Westward, the "oro-

banche" killing "ervum" and "cicer" by tying around, is mentioned by Pliny xviii. 44. 3: *V. lathyroides* is termed "v. minima præcox parisiensium" by Tournefort inst. 397; and is known to occur in cultivated ground throughout middle Europe as far as Norway (fl. Dan. pl. 58, and Pers.).

Cercis siliquastrum of the wooded portion of the Mediterranean countries. Called in English gardens *Judas tree* (Prior), in Italy "albero di Giuda" or "siliquastrum" (Lenz), in Greece "agria xulôkératēa" (Fraas) or "kôukourôvithia" or by the Turks "ergavan" (Sibth.); and the ΚΕΡΚΙΚ or ΚΙΚΙΚ enumerated among leguminous trees by Theophrastus i. 11. 2 — is referred here by writers: *C. siliquastrum* was observed by Sibthorp, Chaubard, and Fraas, one of the most frequent trees from the Peloponnesus to Smyrna; by Hasselquist on Lebanon; and according to Clot-Bey has recently been introduced into Egypt. Westward, is termed "siliquastrum" by Tournefort inst. 647; was observed by Lenz frequent in Italy; and is known to grow in other parts of Southern Europe (Pers., and Daub.).

Sorbus chamaemespilus of the mountains of Europe and adjoining portion of Asia. The ΑΝΘΗΔΟΝΟΕΙΔΗΣ according to Theophrastus iii. 12. 5 another of the three kinds of ΜΕΣΠΙΛΗΣ distinguished by the inhabitants of Ida, — is referred here by Fraas: *S. chamaemespilus* was observed by Sibthorp, and Griesebach, on mount Athos. Westward, the third kind of "mespilis" is described by Pliny xv. 22 "anthedoni tamen similis quod gallicum vocant:" *S. chamaemespilus* is termed "cratægus folio oblongo serrato utrinque virente" by Tournefort inst. 633, "mespilus chamæmespilus" by Linnæus sp. pl. 685; and is known to grow on the mountains of middle Europe (Crantz, Jacq. austr. pl. 231, and Pers.).

Amelanchier vulgaris of the mountains of Europe and adjoining portion of Asia. The wild CYKH on mount Ida, described by Theophrastus iii. 17. 4 as a shrub with broad leaves in shape like those of the linden, the flower ΜΕΣΠΙΛΩΔΕΣ, red fruit of the size of an olive but rounder and in taste also ΜΕΣΠΙΛΩΔΕΣ, — may be compared: *A. vulgaris* was observed by Sibthorp on the mountains of Crete. Westward, is termed "m. folio rotundiori fructu nigro subdulci" by Tournefort inst. 642, "mespilus amelanchier" by Linnæus, "aronia rotundifolia" by Persoon; and is known to grow on limestone districts from Switzerland to the Pyrenees (Crantz, Jacq. austr. pl. 300, Pers., Mohl, and A. Dec.). *A. Cretica*, figured by Alpinus exot. pl. 2, termed "mespilus cretica folio circinato et quasi cordiformi" by Tournefort cor. 43, was also observed by Sibthorp on the mountains of Crete, but is regarded by him as possibly not distinct.

Cratægus pyracantha of the Mediterranean countries. Called in France "buisson ardent" (Pers.), in Italy "piracanto" (Lenz); in which we recognize the "purinan" or "purakanthên" identified through Syn. Diosc. with the ΟΞΥΑΚΑΝΘΟΣ: ΑΕΙΦΥΛΛΟΝ growing according to Theophrastus i. 9. 3 to vi. 8. 3 both on mountains and plains, and ripening fruit late in the autumn: — the "purakantha" is mentioned by Alciphron fragm. 6; the "ôxuakantha" is described by Dioscorides as resembling the "ahrathi" but smaller and very spiny with red fruit like myrtle berries: *C. pyracantha* was observed by Forskal, and Sibthorp, frequent in the woods of Northern Greece as far as Constantinople. Westward, a drink made of berries of "pyracanthæ" was employed in the days of Pliny xxiv. 70 against bites of serpents: *C. pyracantha* is described by Matthioli, and Dodoens (Spreng.); is termed "m. aculeata amygdali folio" by Tournefort inst. 642: was observed by Lenz wild in Italy; and according to Persoon occurs in hedges in Southern France, "sempervirens" and the globose berries "autumno amoene coccinei."

Pyrus cuneifolia of the mountains of the East Mediterranean countries. The ΚΗΛΑΚΤΡΟΝ of Theophrastus i. 3. 6 to v. 7. 7, an evergreen tree that does not admit of cultivation, growing in the highest and coldest situations as well as on the plains, its wood white, — may be compared: *P. cuneifolia* was observed by Chaubard, one of the most frequent trees in the subalpine region of Koubeh, its wood suitable for statues; is described by Gussone, as observed by him as far West as Sicily.

Cerasus mahaleb of Europe and the adjoining portion of Asia. Called in France "cerisiers de Sainte-Lucie" (A. Dec.); and the ΛΑΚΑΦΗ growing according to Theophrastus iii. 3. 1 and 3 to 6. 1 both on mountains and plains, deciduous-leaved, and multiplying with the greatest facility. — may be compared: the "mahaleb" is mentioned by Arab writers (Spreng.): *C. mahaleb* was observed by Sibthorp, Chaubard, and Fraas, a small tree frequent from the Peloponnesus to Constantinople. Westward, remnants of the fruit have been found in debris of the early lake-villages of Switzerland (Heer); the tree is termed "cerasus sylvestris amara mahaleb putata" by Tournefort inst. 627; and is known to grow as far as France and middle Europe (Jacq. austr. pl. 227, Lam. fl. fr., and Pers.).

Prunus prostrata of the mountains of the East Mediterranean countries. A depressed subalpine tree or shrub; and the ΔΙΟΚΡΥΡΩ of Theophrastus iii. 13. 3, having fruit similar in form to that of ΚΕΡΑΚΟΚ but the nucleus harder, — enumerated among esculents by Galen (Orib. iii. 14), may be compared: *P. prostrata* is termed "p. cretica montana minima humifusa flore suave rubente" by Tournefort cor. 43; was observed by him, Sibthorp, and Fraas, on the subalpine summits of the

loftier mountains of Crete and Greece, the fruit eaten and red when ripe (in the unripe state figured by Sibthorp 478 not unlike a plump grain of wheat); was observed also by Labillardière pl. 6 on Lebanon (Pers.). "*Amygdalus incana*," growing on Caucasus (Pall. i. pl. 7), is regarded by Poiret as identical (Steud.).

Rubus cæsius of Europe and Northern Asia. Called in Britain *dew-berry* from the Anglo-Saxon "duwa" dove, in Germany "tauben-beere," in Norway "col-bar" (Fraas); and the ΧΑΜΑΙΒΑΤΟΝ of Theophrastus iii. 18. 4, extending along the ground and rooting at intervals, — mentioned also in the addition to Dioscorides i. 180, is referred here by Sprengel: *R. cæsius* was observed by Sibthorp, and Fraas, on the mountains of Greece and the Bithynian Olympus. Westward, is termed "*r. repens fructu cæsius*" by Tournefort inst. 614; and is known to grow throughout middle and Northern Europe (fl. Dan. pl. 1213, and Pers.).

Potentilla speciosa of the mountains of Greece and the Greek islands. An odorous kind of ΟΙΝΑΝΘΗ growing on the mountains of Cyprus is distinguished by Theophrastus odor. 6: — *P. speciosa* is termed "*fragaria cretica saxatilis fruticosa folio subtus argenteo*" by Tournefort cor. 21, and was observed by Sibthorp on Parnassus and the mountains of Crete.

Chamaenerium angustifolium of Europe and Northern Asia. Called in Britain *willow-herb*, in Germany "weidenroschen" (Grieb), in Italy "camenerio" or "sfenice" or "epilobio" (Lenz); and the ΟΝΟΘΗΡΑC of Theophrastus ix. 19. 1, a large shrub growing on mountains, its leaves like those of the almond, flower red as in the rose, dried root smelling of wine and mixed in wine to promote hilarity, — even according to Cratevas mitigating the ferocity of animals (Plin. xxiv. 102), is referred here by writers: this power of taming animals is attributed by Dioscorides to the "ōnagra," identified in the added Synonyms with the "ōnōurin" or "ōnōthuran": *C. angustifolium* was observed by Sibthorp in shady situations on the Bithynian Olympus; is known to grow throughout Northern Asia, and its pith is mixed in a spirituous liquor prepared by the natives of East Siberia and Kamtschatka (Spreng.). Westward, the account by Pliny xxvi. 69 to 87 of the "oenotheras" or "onuris" seems taken from the Greek: *C. angustifolium* is described by Cæsalpinus vi. 70; is termed "*chamaenerium latifolium vulgare*" by Tournefort inst. 302; was observed by Lenz in Italy; and is known to grow from Switzerland as far as Sweden, where according to Linnæus the young shoots are eaten (fl. Dan. pl. 289, All. and Pers.). "*C. angustissimum*," termed "*ch. angustifolium alpinum flore purpureo*" by Tournefort inst. 302, known to grow in Switzerland, and observed by Sibthorp on mount Athos, is regarded by Persoon as not distinct.

Myrrhis buniū of middle Europe. Called in Britain *earth-nut* or *ground-nut* from its nutty esculent tubers (Prior); and the ΜΥΡΡΙC of Theophrastus causs. vi. 13 ΛΑΧΑΝΗΡΟΝ: ΕΥCΤΟΜΟΝ: ΚΑΙ: ΕΥΟCΜΟΝ — (Spreng.), having according to Dioscorides the stem and leaves of "kō-nējō" with a fragrant oblong roundish root grateful for food, — and identified in the added Synonyms with the "muran" or "kōnilēn," is referred by Anguillara 284 to a cicuta-like plant with hairy stem and leaves, anetho-like yellow umbels, seeds of cumini, and a turnip-shaped fragrant root tender and well-flavoured, observed by him in Greece and Slavonia (Spreng.). Westward, the "myrrhis" or "myrrham" or "smyrrhizam" is mentioned by Pliny xxiv. 97, his account seeming chiefly taken from the Greek: *M. buniū* is termed "*buniū majus*" by Gouan ill. p. 10, "*b. flexuosum*" by Withering; was observed by Persoon frequent near "Mont d'or in Auvergne;" and is known to grow as far as Britain (Huds., and Curt. lond. pl.).

Cachrys alata of the region around Caucasus. The ΜΑΓΥΔΑΡΙC seed, called ΦΥΛΛΟΝ according to Theophrastus vi. 3. 4, — is referred here by Sprengel: *C. alata* was observed by Tournefort trav. ii. pl. 121 near Erzeroum, by Bieberstein on Eastern Caucasus.

Thapsia villosa of the Mediterranean countries. Called in Greece "ōmōiōplēurōn" (Sibth.); in which we recognize the ΜΑΓΥΔΑΡΙC ΕΤΕΡΟΝ of Theophrastus vi. 3. 7, distinguished at once by experts from the CΙΑΦΙΟΥ, less acrid and devoid of juice, growing not in Cyrene but in Syria, and it is said also on Parnassus: — *T. villosa* was observed by Sibthorp on Patmos and Cyprus. Westward, is described by Dodoens, Lobel (Spreng.), and Clusius hist. ii. pl. 192; is termed "*th. latifolia villosa*" by Tournefort inst. 322, "*t. decussata*" by Lagasca; is known to grow in Barbary (Lindl.), Spain, Portugal, and as far as Southern France (Morison ix. pl. 18, and Pers.). "The roots are acrid and corrosive," have been "reputed purgative in a high degree," but this seems contradicted by recent experiments (Fée, and Lindl.).

Ferula nodiflora of the Mediterranean countries. The ΝΑΡΘΗΚΙΑ of Theophrastus vi. 1. 4 to 2. 8, differing from the ΝΑΡΘΗΞ chiefly in being smaller, — is referred here by writers: *F. nodiflora* was observed by Sibthorp on Cyprus; is known to grow also in Asia Minor and as far as Caucasus (Bieb., and Spreng.). Westward, the "narthecyan" is distinguished by Pliny as always depressed: *F. nodiflora* is termed "*f. minor ad singulos rodos umbellifera*" by Tournefort inst. 321; was observed by Lenz in Italy, by Desfontaines pl. 253 in Algeria; and is known to grow in Sicily (Steud., and Spreng.).

Oenanthe fistulosa of Europe and the adjoining portion of Asia. Called in Britain *water-drop-wort* (Prior); and the root growing according to Theophrastus ix. 13. 4 at the mines in Thrace, pleasant to the taste but if eaten inducing sleep-like easy death, — may be compared: *Oe. fistulosa* is termed “*oe aquatica*” by Tournefort inst. 313; is known to grow from Denmark throughout middle Europe (Moris. ix. pl. 7, fl. Dan. pl. 846, and Engl. bot. pl. 363); was observed by Sibthorp in the environs of Constantinople.

Peucedanum oreoselinum of hilly situations in middle Europe and as far as Caucasus. Called in the drug-shops “*herba oreoselini*” (Lindl.), and the ΟΡΕΟCEΛΙΝΟΝ of Theophrastus vii. 64, having leaves like ΚΩΝΕΙΩ, and given in female complaints, — is referred here by writers: *P. oreoselinum* is described by Dodoens p. 696 (Spreng.); is known to grow on the hills of Southern France (Lapeyr., Delarbre auverg. i. p. 428, and Pers.); and Eastward as far as Austria and Caucasus (Jacq. austr. pl. 68, and Bieb.). The leaves and stem according to Lindley “are bitter and aromatic, as is the fruit but in a higher degree: they were used as powerful stimulants of the intestinal canal, and are still esteemed in some countries.”

Amni visnaga of the Mediterranean countries. Called in Southern France “*herbe aux cure-dents*” (Pers.), in Greece “*phōlēa*” (Fraas); and the CΤΑΦΥΛΙΝΟC: ΑΓΡΙΟC (in approved ms. “*raphanōn agrian*”) of Theophrastus ix. 15. 5, called by some physicians ΚΕΡΑΙΝ, — is referred here by Sprengel: the “*kēaskōmēn*” of Syn. Diosc. iii. 52 may also be compared: *A. visnaga* was observed by Forskal, Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to Smyrna; by Hasselquist on Lebanon; by Alpinus iv. 14, and Delile, in Lower Egypt, the spoke-like pedicels of the umbel used for tooth-picks, and the seeds employed medicinally. Westward, is described by Lobel pl. 716; is termed “*foeniculum annuum umbella contracta oblonga*” by Tournefort inst. 311; was observed by Desfontaines i. 245 in Barbary, and is known to grow in Southern France (Pers.).

Valeriana Celtica of Switzerland and the Eastern Alps. Called in Italy “*nardo celtico*” or “*spica celtica*” (Lenz); and the ΠΙΖΙΑ of Thrace, having according to Theophrastus ix. 7. 4 a nard-like odour, — may be compared: the “*kēltikē narthōs*” is mentioned by Dioscorides as growing in Istria: and the imported root was known to Avicenna (Spreng.): *V. Celtica* is known to grow on the Carinthian and Styrian Alps, and according to Wulffenius, and Sprengel, its roots in large quantities are exported from Trieste Eastward to mix in ointments. Farther West, “*narthōu*” brought by a Gaul, is prescribed by Andromachus ther.; “*nardum gallicum*” is mentioned by Pliny xiii. 2, and “*celtica spica*” by Macer Floridus 75: *V. Celtica* was observed by Haller 209 in Switzerland (Pers.), and by Lenz in North Italy. (See *V. salunca*.)

Valeriana saxatilis of Switzerland and the Eastern Alps. The ΕΤΕΡ: ΑΤΤΑ having according to Theophrastus but slight fragrance, — may be compared with the “*tragōn*” gathered according to Dioscorides indiscriminately with the preceding for adulteration, and referred here conjecturally by Sprengel: the “*hirculus*” of Pliny xii. 26 corresponds: *V. saxatilis* is described by Clusius hist. i. 56, and Plukenet alm. pl. 232, and is known to grow on the Eastern Alps (Jacq. austr. iii. pl. 267).

Arnica scorpioides of the mountains of middle and Southern Europe. The CΚΟΡΠΙΟΥ whose root according to Theophrastus ix. 13. 6 resembles a scorpion, and is useful against scorpion stings, — may be compared: *A. scorpioides* was observed by Sibthorp on mount Parnassus. Westward, is described by Matthioli p. 762 (Spreng.), and Lobel pl. 649; is termed “*doronicum radice scorpii brachiata*” by Tournefort inst. 487, “*aster scorpioides*” by Scopoli; and is known to grow on the subalpine portion of the mountains of middle Europe (Jacq. austr. pl. 349, and Pers.).

Artemisia Pontica of Europe and the adjoining portion of Asia. Called in Yemen “*rand*” or “*bætran*” or “*ghobæjre*” (Forsk.); and the ΑΨΙΝΘΙΟΝ of Pontus on which sheep fatten according to Theophrastus ix. 17. 4. — is referred here by Linnæus and others: the kind growing in Pontus is mentioned also by Dioscorides, Galen meth. med. xi. 16; and “*absinthium ponticum*,” by Cato 159, Columella xii. 35, and Pliny xi. 75: “*wormwood*” in the days of Duarte Barbosa was exported in great quantities from Xelher on the Southern coast of Arabia; and *A. Pontica* was observed by Forskal under cultivation on the plains and mountains of Yemen. Farther North, is described by Fuchs (Spreng.); is termed “*a. Gmelini*” by Stechmann (Steud.); and is known to grow in dry mountainous situations from Italy, Switzerland, and Germany (Jacq. austr. pl. 99, and Pers.) as far as middle Asia in flavour differing according to Sprengel in being slightly aromatic.

Artemisia abrotanum of the Tauro-Caspian Countries. Called in English gardens *southern-wood* or *old-man*, in Anglo-Saxon “*sæthrene-wudu*” or “*suthernewude*” (Prior), in France “*auronne des jardins*” (Pers.), in Italy “*abrotano*” (Lenz), in Greece “*pikrōthanōs*” (Fraas), in Egypt “*semsæk*” or “*msæka*” (Forsk.) or “*meskeh*” (Del.), by the prophets “*nēura phoinikōs*” or “*kunaghitēn*” (Syn. Diosc.); in which we recognize the ΑΒΡΟΤΟΝΟΝ of Theophrastus i. 9. 4 to caus. vi. 16. 7, cultivated and coronary with persistent foliage: — the “*avrōtōnōn arrēn*” is described by Dioscorides as growing in Cappadocia, Asiatic Galatia, and near Hierapolis in Syria, branchy with slender twigs like “*apsinthōn*”: *A. abrotanum* is known to grow wild in Asia Minor

(Cæsalp. xii. 6); was observed by Fraas under cultivation in Greece; by Forskal, and Delile, in the gardens of Egypt. Westward, the "abrotonum" is mentioned by Lucretius vi. 123, Horace, Lucan; and as "subiiciatur pulvino," by Pliny xxi. 92, and Macer Floridus: A. abrotonum is described by Bauhin, and Morison vi. pl. 2; and is well known in gardens from Italy throughout middle Europe (Lenz, and Fraas). Eastward from Syria, was observed by Graham "in gardens" at Bombay, but no native name is given. By European colonists, was carried to Northeast America, where it continues in gardens. Is enumerated by Lindley as "a powerful anthelmintic." (See *Santolina chamæcyparissus*).

Atractylis cancellata of the Mediterranean countries. The ΤΕΤΡΑΛΙΞ springing up in summer, thorny-leaved, and enumerated among thistles by Theophrastus vi. 4. 4, — may be compared: A. cancellata was observed by Sibthorp, and Chaubard, from the Peloponnesus and Crete to Rhodes and Cyprus. Westward, the account of the "tetralix" by Pliny xxi. 56 seems taken from Theophrastus: A. cancellata is described by Morison vii. pl. 39; is termed "cnicus exiguus capite cancellato semine tomentosum" by Tournefort inst. 451, "circellium" by Lamarck ill. pl. 662; was observed by Brotero in Portugal; is known to grow also in Spain and Barbary, its cancellated involucre imprisoning flies (Pers.).

Carthamus dentatus of the East Mediterranean countries. The ΕΤΕΡΑ: ΑΓΡΙΑΚ: ΚΝΗΚΟΥ of Theophrastus vi. 4. 5, hairy with stems ΣΟΓΚΩΔΕΙΣ Sonchus-like and in a manner ΕΠΙΓΕΙΟ-ΚΑΥΛΟC from weakness resting on cultivated land, — may be compared: C. dentatus is termed "cnicus atractylidis folio et facie incanus patulus flore purpurascens" by Tournefort cor. 33; was observed by Forskal, and Sibthorp, somewhat rare on the Greek islands and in Asia Minor. Westward, the account by Pliny xxi. 53 of the "cnicon silvestris altera," more hairy with "torosiore caule," seems taken from Theophrastus; but C. dentatus was observed by Forskal p. 217 frequent in waste places on Malta, a foot high branching above "raro infra," the flowers "flavi."

Carlina lanata of the Mediterranean countries. Called in Greece "kökkinagathō (Sibth.); and the ΑΚΟΡΝΑ of Theophrastus vi. 4. 3 to 6, having almost the aspect of ΚΝΗΚΩ: ΗΜΕΡΩ but in colour ΕΠΙΞΑΝΘΟΝ (translated "rufo" by Pliny) and its juice fatty, — may be compared: C. lanata was observed by Sibthorp, and Chaubard, frequent from the Peloponnesus throughout the Greek islands; by Delile, on the Mediterranean border of Egypt. Westward, the "acorna" is enumerated among pubescent thistles by Pliny xxi. 56: C. lanata seems described by Anguillara as observed by him in Italy (Spreng.); is termed "c. flore purpureo-rubente patulo" by Tournefort inst. 500; was observed by Garidel pl. 21 in Southern France, and is known to grow in Italy and Barbary (Pers.).

Carlina acanthifolia of the Mediterranean countries. The ΑΕΥΚΑΚΑΝΘΑ enumerated among thorny-leaved plants by Theophrastus vi. 4. 3, — mentioned also by Hicesius, by Dioscorides as having a "kupēirō"-like bitter root, chewed to alleviate toothache, may be compared: C. acanthifolia was observed by Gittard (Chaub.) about Arcadia in the Peloponnesus. Westward, the "leucacantha" or "pōlugōnatōn" or "phullōn" or "ishiatha" is identified in Syn. Diosc. with the "spina alva" of the Tuscans, and "gniakarthōus" of the Romans; but the account of the "leucacanthos" by Pliny xxi. 56 to xxii. 18 seems taken from the Greek: C. acanthifolia is termed "c. chardousae" by Villars; was observed by Hacquet pl. 1 in Carniola; by Allioni pl. 51, in Piedmont; and is known to grow on the Pyrenees (Pers.).

Carduus pycnocephalus of the Mediterranean countries. The ΑΚΑΝΟC of Theophrastus i. 10. 6 to vi. 4. 9, having many stems and branching, and the only species of its kind, — may be compared: C. pycnocephalus was observed by Chaubard, in grassy places in the Peloponnesus. Westward, the "acanon" by some classed with the "eryngio" is described by Pliny xxii. 10 as a low spreading herb with broader spines, applied externally with wonderful effect in stanching blood: C. pycnocephalus is described by Barrelier pl. 417; and is known to grow in various parts of Southern Europe, the calyx-scales deciduous (Pers.).

Cirsium cynaroides of the East Mediterranean countries. A thistle with glistening leaves; and the ΧΑΑΚΕΙΟC of Theophrastus vi. 4. 3, — enumerated among pubescent kinds by Pliny xxi. 56, identified by Skarlatos with the "gaithōuragkathōn," may be compared: C. cynaroides is termed "carduus creticus foliis lanceolatis splendentibus subtus incanis flore purpurascens" by Tournefort cor. 31; and was observed by Sibthorp, and Chaubard, from the Peloponnesus to the vicinity of Constantinople.

Cirsium palustre of Europe and the adjoining portion of Asia. The thorny-leaved ΑΕΙΜΩΝΙΑ of Theophrastus vi. 4. 3, — is referred here conjecturally by Sprengel: C. palustre was observed by Sibthorp on mount Athos. Westward, the "limonium" is identified by Pliny xxi. 99 to xxii. 43 with the "scolymon," and the "scolymon" with the "carduus alter silvestris" single-stemmed and having a purple flower: the "wulfes teasl" of the Anglo-Saxon transl. Diosc. 156, as figured in manuscript V, is referred here by Harley and Cockayne: C. palustre is described by Morison vii. pl. 32; is termed "cirsium pratense polycephalon vulgare" by Tournefort inst. 448; and is known to grow

in meads and swamps throughout middle Europe as far as Britain (Pers., and Curt. lond. vi. pl. 56).

Cirsium rivulare of the East Mediterranean countries. A thistle called in Greece "nērōagkathi" (Sibth.); and the ΑΚΑΝΘΑ:ΚΕΑΝΩΝΟC extending itself by sending up shoots from its root, mentioned by Theophrastus iv. 10. 6 among plants growing around the Orchomenian lake, — may be compared: *C. rivulare* was observed by Sibthorp frequent in watery situations in the Peloponnesus. Westward, is described by Plukenet phyt. pl. 154; was observed by Jacquin austr. pl. 91 in Pannonia; by Allioni, and Villars, in Piedmont and Southern France (Pers., and Steud.).

Cirsium arvense of Europe and Northern Asia. Called in Sweden "korntistel" or "akertistel" or "görtistel" or "skrof-tistel" (Linn.), in Greece "nērōagkathi" (Sibth.); and the "akantha kēanōnōs" — is referred here by Columna: the "segnisque horreret in arvis carduus" of Virgil seems also referred here by C. Bauhin: *C. arvense* is termed "ceonanthos Theophrasti" by Columna ecphr. pl. 45, "carduus in avena proveniens" by C. Bauhin pin. 377, "cirsium arvense sonchi folio radice repente flore purpurascens" by Tournefort inst. 448, "serratura arvensis" by Linnæus, and is known to grow from Lapland to the Mediterranean (Curt. lond. vi. pl. 57, Pers., and Wats.): was observed by Linnæus in Sweden; by Scopoli, in Carniola; by Sibthorp, on mount Athos; by Bieberstein, along the Taurian mountains; and by Pallas, as far as 49° on the Yaic. Westward, by Hooker on Iceland (probably, as farther South, brought by European colonists); is known to occur on Newfoundland and throughout Canada as far as the Saskatchewan (Hook., and A. Dec.), and spreading thence into our Northern States has received the name of *Canada thistle*; was observed by myself abounding along the Lower St Lawrence, and a frequent weed as far as the outskirts of Philadelphia, but has disappeared from the last-named locality, and I have not heard of its occurring farther South.

Cirsium tuberosum of middle Europe. The ΑΚΑΝΘΑ:ΒΑCΙΑΙΚΗ enumerated by Theophrastus caus. i. 10. 5 as ΠΙΖΟΚΕΦΑΛΑ tuberos-rooted, — may be compared: *C. tuberosum* has not been observed by modern travellers in Greece; but was found by Anguillara 147 in Tuscany; is described also by Lobel pl. 10; is termed "carduus pratensis asphodeli radice fol. tenuiter incisus" by C. Bauhin pin. 377; and is known to grow in Germany and France.

Cirsium Syriacum of the Mediterranean countries. Called in Greece "agriōagkathi" or "kōuphagkathō" (Sibth.), in Egypt "chouk" thorn (Del) or "læläh" (Forsk.); and possibly the "agriagkathōn" identified by Skarlatos with the ΠΟΛΥΑΚΑΝΘΟC of Theophrastus vi. 4. 3: — *C. Syriacum* was observed by Forskal, Sibthorp, and Chaubard, frequent in grain-fields from the Peloponnesus throughout the Greek islands to Cyprus; by Forskal, and Delile, about Cairo; is known to grow also in Syria (Pers.). Westward, is termed "c. albis maculis notatus flore purpureo" by Tournefort inst. 450; was observed by Forskal on Malta; and according to Persoon grows also in Barbary and Spain. (See *C. acarna*).

Echinops Graecus of the East Mediterranean countries. A species of *globe thistle* called in Greece "képhalagkatha" or "hōnthrōkēphala" (Fraas); and the ΠΥΤΡΟC of Theophrastus vi. 4. 4, prickly-leaved and branching towards the summit, — is referred here by Fraas: *E. Graecus* is termed "echinopus graecus tenuissime divisus et lanuginosus capite minore cæruleo" by Tournefort cor. 34, "e. lanuginosus" by Lamarck enc.; was observed by Sibthorp, and Fraas, frequent on barren hills in Attica.

Sarothamnus dubia of the Mediterranean countries. The ΟΝΟΠΥΞΟC enumerated among thistle-headed thorny-leaved plants by Theophrastus vi. 4. 3, — may be compared: *S. dubia* was observed by Gittard in the Peloponnesus (Chaub.). Westward, the account of the "onopyxos" by Pliny xxi. 56 seems taken from Theophrastus: *S. dubia* is described by Barrelier pl. 406; and is known to grow in Italy, Southern France, and Spain (Pers.).

Centaurea centauroides of the East Mediterranean countries. A yellow-flowered species called in Greece "saitagathō" (Forsk.); and the ΚΕΝΤΑΥΡΙΑ having red juice according to Theophrastus ix. 1. 1, called "triorchis" from being defended by the buzzard — (quoted by Pliny xxv. 32), and difficult to cut without wounding one's self, is referred here conjecturally by Sprengel: *C. centauroides* is described by Columna ecph. pl. 35; is termed "carduus centaurii majoris facie flore luteo capitulo longis aculeis munitis" by Tournefort cor. 31; and was observed by Forskal, and Sibthorp, from the Peloponnesus to Constantinople.

Centaurea spinosa of the East Mediterranean countries. Full of spinescent branches, and called in Greece "jala stuvia," or by the Turks "djevann" (Forsk.); and the ΠΑΝΤΑΔΟΥCΑ enumerated by Theophrastus vi. 5. 1 among plants having spines separate from the leaves, — may be compared: *C. spinosa* is described by Alpinus exot. pl. 162; is termed "jacea cretica aculeata incana" by Tournefort inst. 445; was observed by Forskal p. 217, Sibthorp, and Chaubard, in the sand of the seashore and other arid situations from Crete and Athens to Tenedos and Asia Minor, and on account of its defensive spines placed in garden-hedges.

Tragopogon crocifolius of the Mediterranean countries. The ΤΡΑΓΟΠΩΓΩΝ by some called ΚΟΜΗΝ, having according to Theophrastus vii. 7. 1 a long sweet root, short stem, crocus-like leaves, and a large calyx filled with hoary pappus, — an account repeated by Dioscorides, is referred here by Sprengel: the “tragopōgōn” is enumerated by Nicander fr. as coronary; and the “kome” of Gafeki, Rhazes, and Ebn Baitar, is referred here by Sontheimer: *T. crocifolius* was observed by Sibthorp, Chaubard, and Fraas, from the Peloponnesus to Cyprus. Westward, the “tragopogon foliis croco similimis” enumerated by Pliny xxi. 52 among the esculent plants of Egypt, seems the same described in xxvii. 117 as growing in rugged places and “sine usu” useless: *T. crocifolius* is described by Columna ecphr. i. pl. 230; is termed “t. purpuro-cæruleum crocifolium” by Tournefort inst. 477; was observed by Lenz in Italy; is known to grow in Southern France (Pers.), and according to Sprengel the root is edible. (See *T. porrifolius*).

Rhagadiolus stellatus of the Mediterranean countries. Called in Italy “ragaggiolo” (Caesalp.), in Greece “sphalaggōhōrtōn” (Sibth.); in which we recognize the ΣΠΑΛΛΑΞ of Theophrastus i. 6. 11: — *R. stellatus* was observed by Sibthorp, and Chaubard, from Crete and the Peloponnesus to Cyprus. Westward, the “aspalax” is enumerated by Pliny xix. 31 among plants growing wild and having roots more numerous than the leaves: *R. stellatus* is described by Caesalpinus xiii. 10; is termed “rh. alter” by Tournefort inst. 480; and is known to grow in Italy and Southern France (Pers.). “*R. edulis*,” termed “rh. lamsanæ foliis” by Tournefort cor. 36, observed by Sibthorp on Cyprus, and known to grow from Carniolia to Portugal (Pers.), is regarded by Gerard, and Bory, as not distinct.

Prenanthes chondrilloides of the East Mediterranean countries and mountains of Yemen. Called in Yemen “kat er ræjan” (Forsk.); and the ΥΠΟΧΟΙΡΙΣ of Theophrastus vii. 7. 1 to 11. 4, a spontaneously-growing potherb, smooth, sweet, and ΗΜΕΡΩΤΕΡΑ having the aspect of cultivation, — may be compared: *P. chondrilloides* has not been observed in Greece by modern travellers; but is known to grow as far as Carniolia and Italy (Arduin, ii. pl. 7, Scop., and Pers.). Farther South, the “hypochoeris” is enumerated by Pliny xxi. 52 among the esculent plants of Egypt: *P. chondrilloides* was observed by Forskal p. 144 on mountains about Kurma in Yemen, and eaten crude.

Prenanthes muralis of Europe and the adjoining portion of Asia. Called in Britain *wall-lettuce* (Prior), in Greece “thrithax” (Sibth.); and the ΘΡΙΔΑΚΙΝΗC : ΠΙΚΡΑC of Theophrastus ix. 11. 11 — may be compared: *P. muralis* was observed by Sibthorp, and Chaubard, frequent in shaded stony situations from the Peloponnesus to mount Athos and the Bithynian Olympus. Westward, the “hare’s lettuce” of the Anglo-Saxon transl. Apuleius 114, distinguished from the “sow thystyll” in gloss. Sloane 135, is referred here by Cockayne: *P. muralis* is termed “chondrilla sonchi folio flore luteo-pallescente” by Tournefort inst. 475; and is known to grow along walls and in shaded places throughout middle Europe as far as Denmark (fl. Dan. pl. 509, and Pers.).

Hieracium bulbosum of the Mediterranean countries. Called in Greece “hēlōnōhōrtōn” (Sibth.); and the ΠΕΡΔΙΚΙΟΝ of Theophrastus i. 6. 11, pulled up by partridges and having large fleshy roots more numerous than the leaves, — may be compared: *H. bulbosum* was observed by Sibthorp in the Peloponnesus and on Zacynthus; by Delile, near Alexandria in Egypt. Westward, is termed “dens leonis tuberosa radice” by Tournefort inst. 468; and is known to grow in Barbary, Italy, and as far as Montpellier (Pers.).

Lapsana communis of Europe and the adjoining portion of Asia. Called in Britain *nipple-wort* from its use in cases of sore nipple (Prior); and the ΚΡΗΠΙC of Theophrastus vii. 8. 3, having stem leaves only, — may be compared: *L. communis* was observed by Sibthorp, and Chaubard, from the Peloponnesus to Asia Minor. Westward, the account of the “crepis” by Pliny xxi. 59 seems taken from Theophrastus: *L. communis* is described by Tournefort inst. 479; was observed by Scopoli 988 in Carniolia; and is known to occur in cultivated ground as far as Denmark (fl. Dan. pl. 500, Lam. fl. fr., and Pers.). By European colonists, was carried to Northeast America, observed by myself in cultivated ground near Quebec, and “in 1843” made its appearance as far South as Boston (Torr. and Gray, and A. Dec.).

Hyoseris lucida of the East Mediterranean countries. The ΑΠΑΠΗ enumerated among potherbs by Theophrastus vi. 4. 8 to vii. 11. 4, its leaves spreading on the ground, flower yellow and in growing old ΕΚΠΑΠΠΟΥΤΑΙ, flowering with the first showers after the equinox and new flowers successively making their appearance throughout the winter and spring until the ensuing summer, — may be compared: the account of the “aequinotio nascens aphace” by Pliny xxi. 52 seems taken from Theophrastus, with the addition that it is one of the esculent plants of Egypt: the *Hyoseris* tribe according to Persoon have “sem. marginalia saepius cal. squamis involuta pappo subobsoleto:” *H. lucida* is described by Linnæus; is termed “lapsana taraxacoides” by Forskal p. 145; was observed by him, and Delile, near Alexandria; and by Bory and Chaubard in the Peloponnesus.

Apargia hirta of Europe and the adjoining portion of Asia. The ΑΠΑΡΓΙΑ enumerated by Theophrastus vii. 8. 3 among plants having radical leaves only, — may be compared. *A. hirta* was

observed by Sibthorp, and Chaubard, throughout the lower portion of the Peloponnesus. Westward, is termed "dens leonis foliis hirsutis et asperis saxatilis" by Tournefort inst. 468, "leontodon hirtum" by Linnæus; and is known to grow from Italy throughout middle Europe as far as Britain (Scop., Vill., Hoffm., Curt. lond. vi. pl. 59, and Pers.).

Fraxinus excelsior of Northern Europe and as far as the Oural and Caucasus. Called in Britain *ash*, in Anglo-Saxon "æsc," in Denmark and Sweden "ask," in ancient Danish "askr," in Holland and Germany "esche," in old high German "asc," in France "fresne" (Prior), in Italy "frassine" or "frassino" (Lenz); in which we recognize the larger "fraxinum" of the Greeks identified by Pliny with the ΒΟΥΜΕΛΙΟC, growing according to Theophrastus iii. 11. 4 to iv. 8. 2 in Macedonia, and even in Egypt: — *F. excelsior* is known to grow wild in the Crimea and Caucasus, but seems unknown beyond the Oural (Bieb., and A. Dec.); was observed by Clot-Bey in the gardens of Egypt. Westward, the "fraxinus" is mentioned by Virgil, Ovid, and Columella; by Pliny xvi. 24 to xvii. 15 as planted in Italy: *F. excelsior* was observed by Lenz on the Italian slope of the Alps; and is known to grow wild as far as Lat. 63° in Norway (Scop., Lam. fl. fr., Pers., and A. Dec.), its tough wood used in former times for spear-shafts, also for building boats, and in all times "preferred for axe handles" and axles (Prior).

Syringa vulgaris of Eastern Europe. A shrub called in English gardens *lilac*, a Persian name (Prior, see *Ligustrum vulgare*); and the С П Е И П А И A flowering from the apex according to Theophrastus i. 14. 2 to vi. 1. 4, — and enumerated by Pliny xxi. 27 among coronary plants, may be compared: the "blue-flowered jasmine" of Ishak ben Amran (Ebn Serap. 176), is referred here by Parkinson: *S. vulgaris* was observed by Sibthorp wild on mount Haemus, but not within the limits of Greece (Smith in Rees cycl.); by Forskal, in the gardens of Constantinople; and by Alpinus, in Egypt (Parkinson). Westward, was brought according to Matthioli from Constantinople to Italy; is termed "*lilac vulgaris*" by Lamarck ill. pl. 1; and has become frequent, cultivated and naturalized, in middle Europe (Pers.). By European colonists, was carried to Northeast America, where it continues in gardens in our Northern and Middle States, but beyond Charleston I was assured does not succeed (in conformity with its rareness in the same Latitude in Egypt). The unripe fruit according to Lindley "is singularly bitter without any acrimony," and an extract is regarded by Curveiller as "a remarkably good tonic and febrifuge."

Phillyrea angustifolia of the mountains of the Mediterranean countries. The ΑΦΑΡΚΗ of Theophrastus i. 9. 3 to v. 7. 7, evergreen, growing only on mountains, and its wood suitable for stakes or props and for burning, — is referred here by some writers: *P. angustifolia* was observed by Gittard in the Peloponnesus. Westward, is described by Camerarius pl. 90; is known to grow in Italy, Spain, and on the Atlas mountains (Pers.).

Vaccinium myrtillus of Europe and Northern Asia. Called in Britain *bilberry* or *bulberry* or *huckleberry* or *hurtle-berry* or *whortle-berry*, in Danish "bollebar" (Prior), in Germany "heidelbeere" (Grieb), in France "vaciet" (Nugent), in Italy "baccole" or "mirtillo" (Lenz); and the ΑΜΠΕΛΟC: ΤΗC:ΙΔΗC according to Theophrastus iii. 17. 6 a slender-branched shrub with lateral sweet black berries as large as a KYAMOC, the leaves small rounded and not fissured, — is referred here by writers: *V. myrtillus* was observed by Sibthorp on the Bithynian Olympus; is known to grow also on the Taurian mountains and in Siberia (Bieb., and Wats.). Westward, is termed "vitis idæa foliis oblongis crenatis fructu nigricante" by Tournefort inst. 608; was observed by Lenz on the mountains of Italy; is known to grow also on the mountains of middle Europe, and in Northern Europe as far as Lapland and Iceland (Hook., and Wats.).

Villarsia nymphoides of Europe and Northern Asia. Called in Britain *fringed water-lily* (Prior); and the ΜΗΝΑΝΘΟC of Theophrastus iv. 10. 1, growing around the Orchomenian lake, — is referred here by writers: *V. nymphoides* was observed by Sibthorp in the waters of Greece as far as Constantinople: and is known to grow from Eastern Russia to Lake Baikal (Ledeb.). Westward, from the current name of an allied plant (Cockayne), the parti-coloured "ram geallan" of the Anglo-Saxon leechbook i. 51 seems to belong here: *V. nymphæoides* is termed "nymphoides aquis innatans" by Tournefort inst. 153; and is known to grow from Italy and the Pyrenees as far as Denmark (fl. Dan. pl. 339, and A. Dec.). Its floating leaves according to Lindley "are mottled above, purplish beneath," and its stems continue in medicinal use as "bitter, tonic, and febrifugal."

Convolvulus althæoides of open situations in the Mediterranean countries. Called in Spain "campanilla," in Portugal "verdezilla" (Lob.), in Greece "tōu kilogērōu tō hōrtōn" (Sibth.); and the ΙΑCΙΩΝΗC of Theophrastus i. 13. 2 to caus. ii. 18. 3, creeping on the ground when no other plant is near and its lily-like flower monopetalous with only angular indications of separation at the summit, — may be compared: *C. althæoides* was observed by Delile on the Mediterranean border of Egypt; by Forskal, Sibthorp, Chaubard, Fraas, and Aucher, frequent on barren hills from Crete and the Peloponnesus to the Marmora shore and Asia Minor; but according to A. Decandolle is not known farther East. Westward, the "iasione in terra repens" of Pliny xxi. 65 to xxii. 39 is edible,

and is sometimes called "concilium," its leaf being so implicated as to seem several: *C. althæoides* is termed "c. peregrinus" by Clusius (Lobel hist. 340), "c. argenteus elegantissimus foliis tenuiter incisus" by Tournefort inst. 85; was observed by Tenore in Italy (Steud.), by myself on Malta; and is known to grow near Mogador in Morocco, and on the Canary Islands (A. Dec.). Probably by European colonists was carried to Madeira; and to North America, observed by Nuttall along the Red and Arkansas rivers. Its roots according to L. Deslongchamps "contain a purgative resin" (Lindl.).

Heliotropium supinum of the Mediterranean countries. The ΗΛΙΟΤΡΟΠΙΟΝ of Theophrastus vii. 3. 1 to 8. 1 and 15. 1, ΕΠΙΓΕΙΟΚΑΥΛΑ prostrate, having persistent leaves, and at the time of the solstice flowering from below upwards, — may be compared: the "ēlīōiō trōpais ērnōs" is mentioned by Nicander ther. 677 to 885; and the "ēlīōtrōpiōn mikrōn" of Dioscorides, having round fruit, and called "skōrpiōurōn" in the added Synonyms, is referred here by Fraas: *H. supinum* was observed by Tournefort trav. i. pl. 85, Sibthorp, Chaubard, and Fraas, frequent in moist places especially maritime from the Peloponnesus throughout the Greek islands; by Forskal p. 39, and Delile, from Alexandria to Cairo. Westward, is termed "h. minus supinum" by Tournefort inst. 139; and is known to grow in Barbary, near Salmantica, and on the Mediterranean shore of France (Pers.).

Cerinthæ aspera of the Mediterranean countries. Called in Greece "nērōlahana" or "nērōulakia" (Fraas) or "skalizōnaki" or "palathrakōulia" (Sibth.); and the ΚΗΡΙΝΘΟΝ of Theophrastus vi. 7 — is referred here by writers: *C. aspera* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus to mount Athos. Westward, the "cerintha" is mentioned by Virgil georg. iv. 63; by Pliny xxi. 41 as "folio candido incurvo cubitalis capite concavo mellis succum habente:" *C. aspera* is termed "c. quorundam major spinoso folio flavo flore" by Tournefort inst. 80; was observed by Hogg on Sicily; and is known to grow in various parts of Southern Europe (Pers.).

Cerinthæ minor of the East Mediterranean countries. Included perhaps in the "kerinthōn," mentioned as vernal by Theophrastus, — according to Fraas: *C. minor* was observed by Forskal, Sibthorp, and Fraas, in cultivated ground from the Peloponnesus to Constantinople, and especially in vineyards in the spring. Westward, the "cerintha" of Virgil, and Pliny, is referred here by Lenz: *C. minor* is termed "c. quorundam minor flavo flore" by Tournefort inst. 80; was observed by Lenz in Italy; and is known to grow in Styria, Austria, and as far North as Jena (Jacq. austr. pl. 124, and Pers.).

Lycium Barbarum of Barbary. A weak-stemmed shrub with long trailing branches slightly thorny; and the ΠΑΜΝΟC: ΜΕΛΑC agreeing with the other kind according to Theophrastus iii. 18. 2 in having thorns, but differing in the fruit, — may be compared: the "ramnōs tritē mēlantēra" is described by Dioscorides as having twigs five cubits long, and follicle-shaped fruit: *L. Barbarum* was observed by Sibthorp on the island of Naxos. Westward, a "silvestre nigrius" kind of "rhamnos" bearing "veluti folliculos," is mentioned by Pliny xxiv. 76: *L. Barbarum* is described Sloan. afric. pl. 349 (Pers.); was observed by Shaw trav. ii. in Barbary; and is well known in the gardens of Europe. By European colonists, was carried to Northeast America, where it continues to be planted for trellis work, but according to A. Gray, is as "yet hardly spontaneous." (See *L. Europæum* and *L. Afrum*).

Orobanche cruenta of the East Mediterranean countries. The ΑΙΜΟΔΩΡΟΝ of Theophrastus viii. 8. 5 to caus. v. 15. 5, having a short simple stem and destroying fenugreek by growing on the roots, — is referred here by Fraas: *O. cruenta* was observed by Spruner near Nauplia on Lagoecia cuminoides; and by Fraas on fenugreek near Haliartus. Westward, is described by Bertoloni; and is known to grow as far as North Italy (Pollini, and Lenz).

Melissa officinalis of the Mediterranean countries. Called in Britain *garden balm*, in France "melisse" (Nugent), in Italy "melissa" or "cedronella" (Lenz), in Greece "mēlissōvōtanōn" or "mēlissōhōrtōn" (Sibth.); in which we recognize the ΜΕΛΙC CΟΦΥΛΛΟΝ of Theophrastus vi. 1. 4, — named according to Dioscorides from bees delighting in it, also the "mēlitēia" termed fragrant by Theocritus iv. 25, "mēliphullōn" and "mēlissōphutōn" of Nicander ther. 554 to 677, "mēlitaina" of Hesychius, and "mēlittēōn" of the Geoponica xv. 5. 4: the "badrandschabuje," a Persian name according to Ebn Baitar, is referred here by Sontheimer: *M. officinalis* was observed by Forskal in gardens at Constantinople, and by him, Sibthorp, Chaubard, and Fraas, wild in the environs and in mountain woods as far as Parnassus and the Peloponnesus; by Hasselquist in Palestine, as well as near Damietta; and "spiritus melissæ" is enumerated by Forskal mat med as used medicinally in Egypt. Westward, the "mēlissōphullōn" is identified in Syn. Diosc. with the "mērisēimōriōn" of the Gauls, and "kitragō" or "apiastrōm" of the Romans; by Pliny xxi. 29 and 86 with the "apiastrum" rubbed on bees to keep the bees from deserting; the "apiastrum" is mentioned also by Varro iii. 16, and Columella, and the "melisphyllum" by Virgil georg. iv. 64: *M. officinalis* is termed "m. hortensis" by Tournefort inst. 193; is known to grow wild in Italy (Lenz), is besides cultivated

and naturalized throughout middle Europe as far as Britain (Pers., Wats., and A. Dec.). By European colonists, was carried to Northeast America, where according to A. Gray it has "sparingly escaped from gardens;" to the island of Juan Fernandez, observed by Bertero abundantly naturalized. The plant according to Lindley is "aromatic and slightly bitter," and is used "in the form of tea as a grateful fever drink."

Melissa altissima, frequent in the lower country as far as Crete, and regarded by Fraas and others as distinct from the preceding; is admitted to be included in the accounts of the "mélissophyllōn" by Greek writers.

Salvia sylvestris of Eastern Europe and the adjoining portion of Asia. The *ΣΦΑΚΕΛΟΣ* herb of Theophrastus, its leaf "squalens" — (Dod. pempt. ii. 4. 23), may be compared: *S. sylvestris* is termed "sclarea folio salviæ major vel maculata" by Tournefort inst. 179; *S. sylvestris* is known to grow in Bohemia (Crantz, Jacq. austr. pl. 212, and Pers.); was observed by Scopoli ed. 2. n. 32 in Carniolia; and by Sibthorp, in the environs of Constantinople.

Teucrium chamædrys of Europe and the adjoining portion of Asia. Called in Britain *germander*, in France "gamandree" (Prior), in Greece "hamaithrua" (Sibth.); in which we recognize the *ΧΑΜΑΙΔΡΥΣ* used medicinally according to Theophrastus ix. 9. 5, — growing according to Dioscorides in rough stony places and having small purplish flowers: *T. chamædrys* was observed by Sibthorp, and Chaubard, in dry stony places from the Peloponnesus throughout the Greek islands; and dried "*chamædrys*" is enumerated by Alpinus, and Forskal mat. med., as used medicinally in Egypt. Westward, the "hamaithrus" by some called "tëukriōn" is identified in Syn. Diosc. with the "trip-sagō minor" of the Romans: the "trixago" or "trisago" is mentioned by Celsus, Scribonius Largus, and is identified by Pliny xxiv. 80 with the "chamaeropem" or "chamaedrys, but his account seems chiefly taken from Dioscorides: *T. chamædrys* is described by Fuchsius, Tragus, Matthioli, Lobel, and Dodoens; is termed "*chamædrys major et minor repens*" by Tournefort inst. 204, "t. officinale" by Lamarck fl. fr.; is known to grow throughout middle Europe as far as Normandy (Pers., and A. Dec.); but in Britain in the days of Ray occurred only on the walls of a castle, and is regarded by Watson as exotic and hardly naturalized.

Teucrium flavum of Europe and the adjoining portion of Asia. Called in Italy "teucro" (Targ.), in Greece "hamaithrua" (Sibth.), and possibly included in the "hamaithrus" of Theophrastus: — the "hamaithrun" identified in Syn. Diosc. iii. 101 with the "tëukriōn" of Dioscorides abounding in Cilicia, is referred here by writers: *T. flavum* was observed by Sibthorp, Chaubard, and Fraas, frequent from Crete and the Peloponnesus throughout the Greek islands. Westward, the account by Pliny xxv. 20 of the "teucron" having "ramis hyssopi" seems in part taken from Dioscorides: *T. flavum* is described by Fuchsius, Matthioli, Anguillara, Dodoens, and Clusius; is termed "*chamædrys frutescens teucrium vulgo*" by Tournefort inst. 205; and is known to grow in Italy and as far as middle Europe (Pers., and Lenz).

Teucrium lucidum, termed "*chamædrys alpina frutescens folio splendente*" by Tournefort inst. 205, observed by Sibthorp, Chaubard, and Fraas, from Cyprus to the Peloponnesus, and known to grow in Italy (Pers., and Lenz), is regarded by Chaubard as not distinct.

Origanum Sipyllum of the East Mediterranean countries. The *ΜΑΡΟΝ* perfume lasting two years according to Theophrastus odor. 34. — seems the product of the "marōn" of Dioscorides, growing mostly about Magnesia and Tralles and having odorous flowers resembling those of "*origanō*," its medicinal properties as in "*sisumvriō*," and referred here by Sibthorp, and Fraas the "marōn" is identified in Syn. Diosc. with the "*origanitha*" or "*isōvruōn*;" and Lydian "marōn" is mentioned by Pliny xii. 53: *O. Sipyllum* is described by Morison iii. pl. 4; is termed "*o. montis Sipyli*" by Tournefort inst. 199; was observed by Sibthorp near Smyrna and on mount Sipylo in Phrygia, but in Greece confined to the Euboean Delphi, a fact confirmed by Fraas. (See *Teucrium marum*).

Origanum maru of Crete and Cyzicus. The *ΟΡΙΓΑΝΟΥ ΜΕΛΑΙΝΑ: ΑΚΑΡΠΟC* of Theophrastus vi. 2. 3 — is referred conjecturally by Sprengel to the variety becoming seedless under cultivation: *O. maru* is termed "*maru creticum*" by Alpinus exot. pl. 288, "*majorana cretica rotundifolia lavandulæ odore capitulis minoribus incanis flore purpurascens*" by Tournefort cor. 13; was observed by Sibthorp on the mountains of Crete: is known to grow wild also on Cyzicus (Spreng.). Westward, the "*amaracum mollem*" of Virgil aen. i. 698 is referred here by Sprengel: "*O. majoranoides*," perennial and well known in European gardens (Pers.), is regarded as not distinct.

Daphne jasminea of the East Mediterranean countries. The *ΚΝΕΩΡΟC: ΛΕΥΚΟC* of Theophrastus vi. 2. 2, fragrant and more depressed with oblong coriaceous leaves resembling those of the olive, and flowering after the autumnal equinox, — may be compared: the "*cneori candidi*" is further mentioned as coronary by Pliny xxi. 30: *D. jasminea*, said to be fragrant, was observed by Sibthorp, and Fraas, on the subalpine portion of the mountains of Southern Greece. "*D. oleoides*," described by Alpinus exot. pl. 43, termed "*thymelæa cretica oleæ folio utrinque glabro*" by Tourne-

fort cor. 41, observed by Sibthorp, and Fraas, on the subalpine portion of mountains from Crete to the Peloponnesus and Bithynian Olympus, known to grow also on Caucasus (Pall.), and Westward on the mountains of Corsica and Sardinia (Spreng.), is regarded by Fraas as not distinct. (See *D. sericea*.)

Daphne tartonraira of the Mediterranean countries. The ΚΝΕΩΡΟC: ΜΕΛΑC of Theophrastus i. 10. 4 to vi. 2. 2, scentless, having fleshy leaves like tamarisk cypress and ΜΗΛΕΑ quince, and flowering after the autumnal equinox, — may be compared: the “cneori nigri” is also enumerated as coronary by Pliny xxi. 30: *D. tartonraira* was observed by Sibthorp, and Chaubard, from the Peloponnesus to the Black Sea, flowering according to Fraas at the time of autumnal equinox. Westward, is described by Dalechamp p. 1669 (Spreng.); is termed “tarton-raire galloprovinciæ monspeliensium” by Lobel pl. 371, “thymelæa foliis candicantibus serici instar mollibus” by Tournefort inst. 595; is known to grow in Italy and Southern France (All. Lam. fl. fr., Pers., and Lenz), where according to Smith fl. gr. pl. 354 it is much used medicinally.

Passerina dioica of the Mediterranean countries. Called in Greece “ēmērō thērōkallō” (Sibth.); in which we recognize the ΗΜΕΡΟΚΑΛΛΕC enumerated by Theophrastus vi. 1. 1 to 6. 11 among small-leaved woody plants, cultivated and coronary: — *P. dioica* was observed by Sibthorp, and Chaubard, on the mountains of the Peloponnesus and Attica, furnishing a yellow dye. Westward, is termed “daphne dioica” in Linn. suppl. 223, “thymelæa dioica” by Allioni; and is known to grow on the Pyrenees (Lapeyr., and Pers.).

Plantago (Psyllium) cynops of Europe and the adjoining portion of Asia. The ΚΥΝΩΠΟC springing up with the first showers after the equinox, or ΑΧΥΝΩΨ having a spike, of Theophrastus vii. 7. 3 to 11. 1, — is referred here by Linnæus: *P. cynops*, distinguished by its round leafy bracts, was observed by Sibthorp in Bithynia. Westward, the “cynops” having a spike, is enumerated by Pliny xxi. 61 as distinct from the “cynoides” or “psyllion”: *P. cynops* is described by Bauhin hist. iii. 513 (J. E. Smith); is termed “psyllium majus supinum” by Tournefort inst. 128, “p. genevensis” by Poirét; and is known to grow in Italy and Southern France (Lam. fl. fr., and Pers.).

Rumex (Emex) spinosus of the Mediterranean countries. Called in Greece “agriō sēuklōn” (Sibth.), in Egypt “figl el djebbel” Desert radish, or “sagarat el aguz” (Forsk.); and the ΑΑΠΑΘΟΝ: ΑΓΡΙΟΝ of Theophrastus vii. 2. 7, having a shorter and less enduring root, numerous stems and branches, and in its whole aspect resembling ΤΕΥΤΑΙΟΥ, — may be compared: the “lēmōnion” is described by Dioscorides as growing in meads and moist places, its leaves like those of “sēutlō,” stem equal as in “krinōu” and slender straight full of red astringent fruit; is identified in the added Synonyms with the “nēurōēithēs” or “napēion ōninōu,” with the “mēnthrōuta” of the Mysians, “mēōutha” or “ēllēvōrōsēmata” or “skullōn” or “lukōsēmphullōn” of the Syrians, and “lukōu karthia” of the prophets: the “lapathōn ē agriōn tēutlōn” is also mentioned by Galen alim. fac. ii. 47: *R. spinosus* is termed “beta cretica semine aculeato” by Bauhin prodr. pl. 57; was observed by Sibthorp, and Bory, in Attica and the Peloponnesus; by Forskal p. 75, and Delile, in Egypt from Alexandria to Cairo. Westward, the “lēmōnion” is further identified in Syn. Diosc. with the “thakina” of the Dacians, “iōumvarōum” of the Gauls, and “ōuēratrōum nigrōum” or “tintinnavōulōum tērrai” of the Romans; but the account by Pliny xx. 28 of the “limonion” or “neuroides” or “beta silvestris” seems chiefly taken from the Greek: *R. spinosus* was observed by Schousboe in moist places in Morocco as far as Tangier on the Atlantic (Pers., and Necker).

Rumex (Acetosa) acetosa of Europe and the adjoining portion of Asia. Called in Britain *sorrel* (Prior), in France “surelle” or “oseille” (Nugent), in Germany “sauerampfer” (Grieb), in Italy “acetina” or “acetosa” or “ossalida” (Lenz), in Greece “xunēthra” (Fraas) or “zinitra” or “ōxulithi” (Sibth.); in which we recognize the “oxalidem” identified through Pliny with the ΑΑΠΑΘΟΝ: ΑΓΡΙΟΝ of Theophrastus vii. 6. 1, better flavoured than the ΗΜΕΡΟΥ kind but more acid: — the “ōxalis” is mentioned by Nicander ther. 840; by Dioscorides ii. 140 as not large and having acrid red fruit, and called by some “anaxuritha” or “lapathōn”: *R. acetosa* was observed by Sibthorp, and Fraas, from the Peloponnesus to Constantinople; is known to grow also along the Taurian mountains; and seeds of “acetosa obtusifolia” were found by Forskal mat. med. employed medicinally in Egypt: the living *R. acetosa* was seen by him in gardens at Constantinople, and according to Clot-Bey has recently been introduced into the gardens of Egypt. Westward, the “oxalidem” or “lapathum silvestre” is further identified by Pliny xx. 85 with the “rumicem” or “lapathum cantherinum” of the Romans, having pointed leaves and “radice minima” the root not swollen; the “rumex” is mentioned by Plautus pseudol. iii. 2. 26, Apicius i. 1, and Apuleius d. h. 13: *R. acetosa* is termed “a. pratensis” by Tournefort inst. 502; was observed by Pollini wild in Italy; is known to grow throughout middle and Northern Europe as far as Lapland and Iceland (Hook., Pers., Wats., and A. Dec.) is besides regularly cultivated. By European colonists, was carried to Northeast America before 1669 (Jossel.), but has disappeared; was also carried to Alaska (Wats.). “An agreeably acid plant” according to Lindley, “refrigerant and diuretic,” its root “long and tapering, astringent, somewhat woody.”

Rumex (Acetosa) acetosella of Northern climates. Called in Britain *sheep's sorrel* (Prior), in Italy "acetosella" or "acetosa minore" or "ossalide minore" (Lenz), in Greece "ōxulithi" (Sibth.), and possibly included in the "lapathōn agriōn" of Theophrastus, — and "ōxalis" of Nicander: the "lapathōn agriōn mikrōn" is described by Dioscorides as humble and having leaves like those of "ōxalitha." *R. acetosella* was observed by Sibthorp, Chaubard, and Fraas, frequent from the Peloponnesus throughout the Greek islands to the Bithynian Olympus; by Hasselquist, at Damietta in Egypt; is known to grow also in Siberia (Wats.). Westward, is described by Dodoens pl. 639; is termed "*acetosa arvensis lanceolata*" by Tournefort inst. 503; was observed by Pollini in Italy, by Forskal near Marseilles; and is known to grow in siliceous soil throughout middle and Northern Europe as far as Lapland (Pers., Wats., and A. Dec.). Farther West, is known to grow on Iceland and Greenland; was observed by Higgeson, one of the first settlers, around Salem in New England; by Nuttall, "indubitably native" along the Arkansas river; but throughout our Atlantic States has greatly multiplied in sterile soil wherever the forest has been removed. Clearly by European colonists, was carried to Austral Africa (Drège and Mey.); to the Falkland Islands, observed around dwellings there by J. D. Hooker ii. 341.

Beta maritima of the shores of the Mediterranean and adjoining portion of the Atlantic. Called in Britain *sea beet* (Prior), in Greece "*agria sēsōula*" (Fraas); and the ΤΕΥΤΑΙC of Theophrastus vii. 7. 2, a potherb requiring cooking, — is referred here by Fraas: *B. maritima* was observed by Sibthorp, and Fraas, in salt marshes and on muddy shores from the Peloponnesus to the Black Sea; by Delile, from the Mediterranean shore as far as Cairo. Westward, is termed "*b. sylvestris maritima*" by Tournefort inst. 502, "*b. decumbens*" by Moench; and is known to grow along the seashore as far as Britain (Mill.), decumbent according to Persoon with triangular leaves. (See *B. vulgaris*).

Ficus sur of the mountains of Yemen. Called there "*sur*" (Forsk.); and the tree called in Crete ΚΥΠΡΙΑC: CYKHC, resembling according to Theophrastus iv. 2. 3 the sycamore and in like manner bearing fruit on its trunk and old branches, this fruit resembling a fig and edible, as large as a ΚΟΚΚΥΜΗΛΟΝ. — translated "sorbi" by Pliny xiii. 15. is referred here by Sprengel: *F. sur* was observed by Forskal p. 180 near Djöblæ, a tree "*sycomoro similis*," fruit crowded "prope truncum," as large as a pigeon's egg and edible.

Herniaria glabra of Europe and the adjoining portion of Asia. Called in Britain *rupture wort* (Prior), in Italy "millegrana," in Greece "asphēthila" (Anguill.); and the ΕΛΛΕΒΟΡΙΝΗC of Theophrastus ix. 10. 2, a little herb whose seed is taken with hellebore to promote vomiting, — is identified through Syn. Diosc. with the "ēpipaktis" of Dioscorides, referred here by Anguillara (Spreng.): the "ēpipaktis" is described by Dioscorides as a diminutive shrub with most diminutive leaves, drank in deadly affections and against diseases of the liver, is further identified in the added Synonyms with the "ōriōn." *H. glabra* was observed by Anguillara p. 282 in Macedonia and Greece, employed in conformity with the account of Dioscorides (Spreng.); by Sibthorp, and Chaubard, frequent from the Peloponnesus throughout the Greek islands. Westward, the account by Pliny xxvii. 52 of the "ēpipaktis" or "elleborine" seems taken from Dioscorides; *H. glabra* was observed by Anguillara in Illyria and Italy; is described also by Tragus f. 200, and Tournefort inst. 507; is termed "*h. fruticosa*" by Gouan (Steud.); and is known to grow throughout middle Europe as far as Denmark (fl. Dan. pl. 529, and Pers.).

Herniaria fruticosa of the Mediterranean countries. Possibly included with the preceding: — observed by Delile near Alexandria on the Mediterranean border of Egypt. Westward, described by Lobel pl. 85; and known to grow in Spain and Southern France (Pers.).
